PLACE, FRANCIS (1771-1854), English radical. Place was closely connected with almost every aspect of the radical and working class movement between the 1790's and about 1840. He left behind an immense mass of writings and printed papers and documents bearing on every phase of radical activity in which he participated. Now located in the British Museum, this material constitutes the most valuable storehouse of information for all students of the period and one which has not by any means been completely explored.

Place is remembered chiefly for his connection with Westminster radical politics in the early nineteenth century and with the agitation for the repeal of the combination laws and of the stamp duties on newspapers and periodicals. At first a journeyman breeches maker and secretary to the Breeches Makers' Union, he soon became an independent master tailor, and his shop in Charing Cross was from 1799 a well known meeting place for radical politicians. Place belonged to the London Corresponding Society, formed after the French Revolution, but resigned in 1797 when the society became definitely revolutionary. He became later a close friend of Bentham and James Mill, whose utilitarian views he accepted; but he continued to work closely with the trade union and working class movement and organized the successful campaign for the repeal of the combination laws in 1824-25. He was also associated with Lovett in the drafting of the People's Charter, but took no part in the later stages of the Chartist movement.

Place was no speaker and a dull and diffuse writer. In addition to his one book, *Illustrations and Proofs of the Principle of Population* (London 1822; new ed. by N. E. Himes, London 1930), which represents one of the earliest unequivocal statements of neo-Malthusianism, he published pamphlets on the stamp duties and on other questions; but most of his writings, including his autobiography, remain even now in manuscript. He was an indefatigable organizer, constantly consulted by radicals of every sort. He was, however, vain and somewhat quarrelsome, caustic in his comments on those who ventured to differ from him and inclined in his writings to take exclusive credit to himself for everything he approved in the movements with which he came into contact. His *Life* (London 1898, rev. ed. 1918) by Graham Wallas is a classic study of the radical movements in the early nineteenth century but is written too much under the influ-

ence of Place's strongly biased opinions about his contemporaries.

PLACENTINUS (d. 1192), Italian legist. Placentinus was born in Piacenza in the first half of the twelfth century—indeed he has no known name other than this indication of origin—and died in Montpellier. He taught first at Mantua and then at Bologna, from which he was driven by the hostility of a rival legist, Henricus de Baila; this sort of an occurrence was quite common in the early histories of the universities. Placentinus then went to Montpellier, which in the twelfth century was a thriving and agitated center. Here he founded a law school, the first in France, and hence the first non-Italian outpost of the new Bolognese learning. Later he went back to Bologna under powerful feudal protection but finally returned to Montpellier.

Placentinus carried the methods of legal interpretation a few steps further than the founders of the Bologna school. He laid emphasis upon the application of formal logical categories to the difficult materials with which he dealt. His masters had already emancipated themselves from the interlinear gloss which had dominated the older systems. Placentinus completed the first *Summa* (systematic exposition) of the Codex, which had been begun by Rogerius. He himself wrote a *Summa*, called in mediaeval fashion after its opening words, *Cum essem Mantuae*, which, as is shown by its later title *De varietate actionum*, was an exposition of an important branch of law which cut across the separate parts of the legislation of Justinian. It was really a general introduction to law and probably the first of its kind since the revival of jurisprudence. Besides several smaller treatises on special titles or fragments of the Digest Placentinus wrote a *Summa* on the Institutes and one on the *Tres libri*, the last part of the Codex, which in mediaeval studies was a separate book.

MAX RADIN

Consult: Tourtoulon, Pierre de, *Placentin 1: sa vie, les œuvres* (Paris 1896), and earlier literature which is cited there.

PLACING OUT is a term used to define the provision made for the care of a child with a family other than his own. The foster home in which the child is placed may be one in which the foster family provides for him as it would for an own child or may be one in which payment is made for the child's maintenance. Older children may be required to give some service in return for a home. The children who are most likely to be placed in foster homes are the orphaned, the abandoned, those whose parents are too ill, incompetent or irresponsible to provide properly for them and the children who, because of some special physical or mental handicap or some unusual social situation in the home, require care which their own families cannot furnish. Placing out may be done by the children's relatives, by public welfare or health departments, by courts or by philanthropic organizations. Placing out is usually regulated by statute. Adults who are sick, aged, mentally disturbed or otherwise handicapped may also be placed with families other than their own, but this type of placement, known as "boarding out," is used only to a limited degree.

In the United States, where public relief patterned after the English Poor Law system was well established by the early nineteenth century, needy children were for the most part cared for by relief given to families in their homes. It was also part of the accepted plan to place them in foster homes, usually by indenture or by auctioning them off to the highest bidder. In the early days many of the placed-out children apparently chanced to find homes in which they received good care. Later, as industry became highly organized and living conditions more complicated, the bound-out child was frequently a victim of exploitation by those whose sole concern was his productive capacity, usually in some form of domestic or industrial service. With the growth of humanitarian consideration for the less fortunate of the community the position of these children was improved, and the systems by which they were indentured and apprenticed gradually fell into disuse. During the middle of the nineteenth century private child placing agencies began to be organized, and the emphasis shifted from that of gain on the part of the person taking the child to that of mutual benefit and satisfaction to both the child and his foster parents. In many localities children were removed from the almshouses, where they had been indiscriminately housed with the sick, the feeble-minded and the

aged, and were placed in orphan asylums established under both public and private auspices.

By the end of the century leaders in child welfare increasingly expressed themselves in favor of individual foster homes for dependent or neglected children. In 1909 at the White House Conference, held in Washington, experts in child welfare clearly stated the basic principles that "children should not be deprived of it [home life] except for urgent and compelling reasons" and that a "carefully selected foster home is for the normal child the best substitute for the natural home." These principles have been repeatedly endorsed since that time and have gained widespread support. The extension of public aid to mothers to enable them to provide for their children at home is one evidence of this trend. It has been estimated that at the end of June, 1931, more than 253,000 children were cared for in their own homes by some provision of the Mother's Allowance Law. A large proportion of these would unquestionably have had to be placed out in foster family homes or brought up in institutions had there been no provision for keeping them with their own families. Other factors which have been effective in strengthening the family status and thus obviating the necessity for the placing out of children are: improved standards of social case work and home relief by both public and private agencies; more adequate maternity protection, particularly in the case of the unmarried mother and her child; advanced public health measures which prevent premature death and illness of parents; and compensation to parents for industrial accidents.

It has been estimated that approximately 112,000 children in the United States were cared for in foster family homes in 1930. This is nearly two fifths of the total of 287,500 children who were provided for under the supervision of child caring institutions and agencies during that year. While the number of children cared for outside their own homes is decreasing, the proportion of dependent children who are provided for in foster families is increasing as compared with those living in institutions. This extension of foster family care has come about through a growing public conviction that family life meets a child's basic needs and provides a more normal environment than is possible in an institution. It gives him a sense of belonging, experience in close human relationships and opportunities for participation in family and community activities.

The home in which a child is placed out may

be an adoption home, a free home, a boarding home, a work home (sometimes called an opportunity or school home) or a wage home. An adoption home is one in which the child placed is accepted as an own child and has substantially all the rights, privileges and obligations of an own child. The legal act of adoption may be consummated immediately after placement or after a period of residence with the foster family. The laws governing details as to rights of inheritance of the adopted child vary in the different states and countries. Adoption in its legal aspects and in human relationship is hardly distinguishable from the natural relationship between parents and child. A free home is one in which a child is placed with a foster family without the transfer of legal guardianship to the foster family. The foster family provides care for the child, clothes him and treats him as a member of the family. Usually the organization responsible for placing the child supervises him and his foster home, giving such assistance as may be necessary for the child's growth and development. A boarding home is one in which the family with whom the child lives receives some remuneration in money, ordinarily little more than the actual cost of maintenance. The placing organization supervises the child and frequently his parents or relatives keep in touch with him as well. A work home is one in which a child of school age is placed and given care, clothing and an opportunity to continue his education in return for some assistance to the family. A wage home is one in which a child who is beyond school age is placed and given regular wages. These are the definitions in common usage by welfare agencies. They are not legal definitions nor are they all inclusive.

Child placing agencies have made marked progress in the application of scientific knowledge in their work for children and in more effective attempts at preserving human values. Through the development of modern social case work and mental hygiene children have been individualized, their social, physical and personal needs recognized and respected. Prospective foster homes are evaluated not only with respect to their ability to furnish shelter and maintenance to a child, but in terms of their capacity to understand the child and give intelligent care and guidance. Placing out agencies have developed skills in the selection of the particular foster home best suited to the individual child and in the supervision of both child and foster family after placement. As a result

of the realization that no one kind of care will meet the needs of all types of children, communities have organized facilities which are flexible and provide specialized care according to the children's needs. Placing out in boarding homes has been extended not only for the dependent and neglected children but for special groups, such as problem children, convalescent children, backward children and those who have some physical handicap.

Child placing in the United States varies widely with respect to financial support and responsibility for administration. It may be organized and administered wholly as a public function or under private auspices or in some combination of the two. In general, however, most of the placing out work is administered by private charitable agencies which have been organized by sectarian, non-sectarian, fraternal, regional, racial or other groups for the benefit of children of these particular groups. But in the majority of states some form of public aid is given to private charitable child caring institutions and agencies, including those which place out children. This subsidy may be appropriated in a lump sum or in specified amounts on a per capita basis.

Among the other countries in which placing out in family homes is well established as a system of care for dependent and neglected children are France, Germany, Soviet Russia, Sweden, Norway, Denmark, Holland, Great Britain and Canada. It is less prevalent in Italy and only slightly known in Latin American countries. Placing out is done either by public authorities or through private charitable agencies or both. There are, however, varying governmental provisions and restrictions which regulate the details of the work. In some countries a uniform system prevails; in Germany, for example, the placing out of all children is regulated by a federal child welfare law passed in 1922. On March 31, 1930, there were 698,467 placed-out children under government supervision in Germany. Recent figures from England indicate that with the extension of the various forms of social insurance and mothers' pensions larger numbers of dependent children are able to remain at home with their families. The number of homeless children under the care of public assistance authorities in England decreased more than 20 percent between 1926 and 1932; this applies both to children under institutional care and to those placed in family homes. In practically all countries there is in-

creasing evidence of the tendency to shift emphasis from the child to the foster parent in order to insure not merely minimum essentials of shelter and maintenance for the child but an adequate environment conducive to his complete development, physical, mental and social. Only through such provision can placing out prove effective as a means of safeguarding the children from whom the protection of an own home or family has been removed.

PLANCK, GOTTLIEB (1824-1910), German jurist and statesman. Planck was a grandson of Gottlieb Jakob Planck, professor of Protestant theology. Following the example of his father, a respected Hanoverian jurist, he embarked upon a judicial career. His intellectual interests led him to make an early entrance into political life. Since the Kingdom of Hanover was still an absolute monarchy and his own sympathies were democratic, he found himself subjected to a series of penal and disciplinary measures. Put upon half pay for a time, he continued his education by travel and further study at the University of Göttingen. During this time he became interested in modern legal reform, particularly

in the creation of a German code of civil procedure. He was very active in the Deutscher Juristentag as well as in the Deutscher Nationalverein, which had for its ultimate goal the political unification of Germany.

The second great epoch in Planck's life begins with the annexation of Hanover by Prussia in 1866. As a member of the National Liberal party he entered the Reichstag of the North German Confederation, whose constitution he had helped to draft. He also played an important part in the legislative work of the reestablished German Empire, for instance, in the preparation of the German Criminal Code and the new Code of Civil Procedure. His permanent place in German legal history, however, is the result of his participation in the creation of the present German Civil Code, the *Bürgerliches Gesetzbuch*. Planck was one of the most active members of the first commission (1874-87) and general reporter of the second commission (1890-95), and he drafted the book of the code dealing with family law. His activities are the more remarkable in view of the total blindness which afflicted him in 1873. After completion of this great work in 1897 he retired laden with honors to Göttingen, where as honorary professor he lectured upon its provisions and founded the great commentary upon it (7 vols., 1897-1902; 4th-5th ed., 5 vols., 1913-32), the first part of which he himself prepared.

The scientific character of Planck's personality is clearly reflected in the German Civil Code: his calm and unimpassioned manner, his terse and lucid mode of expression, his strong inclination toward conceptual clarity and casuistic statement, his scrupulous working up of existing legal material and also his devotion to Romanistic modes of thought, a certain imperiousness toward the fundamental ideas of Germanic law as well as toward life and the pressure of new social forces. When a new economic and social epoch was beginning, he bent his energies toward the legal regulation and sanction of the declining liberal and individualistic order.

HEINRICH LEHMANN

Consult: Frensdorff, F., *Gottlieb Planck, deutscher Jurist und Politiker* (Berlin 1914).

PLANCK, GOTTLIEB JAKOB (1751-1833), German church historian. Planck, who was born in Württemberg, pursued both an academic and an ecclesiastical career. In 1775 he was a tutor on the Tübingen foundation, in 1780 pastor in Stuttgart, in 1781 professor in the Stuttgart

Karlschule, in 1784 professor of theology in the University of Göttingen; from 1792 on he was active in high posts in the Lutheran church of Hanover, in 1805 general superintendent, in 1828 abbot of Bursfelde, in 1830 superior councillor of the consistory.

Two of his many publications are of particular importance: the *Geschichte der Entstehung der Veränderungen und der Bildung unseres protestantischen Lehrbegriffs vom Anfang der Reformation bis zu der Einführung der Konkordienformel* (6 vols., Leipsic 1781-1800), continued in the *Geschichte der protestantischen Theologie von der Konkordienformel bis in die Mitte des achtzehnten Jahrhunderts* (Göttingen 1831), and the *Geschichte der christlich-kirchlichen Gesellschaftsverfassung* (5 vols., Hanover 1803-09). The basic idea of both works was novel. Planck, unlike his predecessors, did not merely offer an external presentation of the development of the church but tried to show how, on the one hand, the Reformation worked out a particular doctrine and how, on the other hand, Christianity throughout its history created fixed social forms. The latter study emphasizes the establishment of the constitutional forms of the church itself, the clerical offices, bishoprics, patriarchates, papacies, synods, diocesan unions, monastic systems and the like. The relation of state and church also is portrayed. Planck was concerned not so much with showing to what extent state institutions were penetrated by the Christian spirit as with the endeavors of the Catholic church to subordinate secular power to itself. Planck's historical method was that of individual pragmatism. The forms of things, the changes, according to this theory, are determined by the activity, "character, passions and prejudices" of individuals and the course of history is not planned but rather influenced by accident. Through his *Historische und vergleichende Darstellung der dogmatischen Systeme unserer verschiedenen christlichen Hauptparteien* (Göttingen 1796, 3rd ed. 1822) Planck was the founder of the comparative study of denominations. His *Einleitung in die theologischen Wissenschaften* (2 vols., Leipsic 1794-95; sect. i of pt. iii tr. by S. H. Turner as *Introduction to Sacred Philology and Interpretation*, New York 1834) and his *Grundriss der theologischen Enzyklopädie* (Göttingen 1813) materially advanced the development of this discipline. Planck was a confirmed advocate of tolerance.

KARL VÖLKER

Consult: Lücke, Friedrich, *Dr. Gottlieb Jakob Planck*

Encyclopaedia of the Social Sciences

(Göttingen 1835); Baur, F. Christian, *Die Epochen der kirchlichen Geschichtsschreibung* (Tübingen 1852) p. 174-92; Völker, Karl, *Die Kirchengeschichtsschreibung der Aufklärung* (Tübingen 1921) p. 48-90.

PLANCK, JOHANN JULIUS WILHELM VON (1817-1900), German jurist. Planck studied at Göttingen and at Jena, where his uncle Christoph Martin, the proceduralist, influenced him to choose procedural law as his special field. In 1839 he became an instructor at Göttingen, teaching criminal and civil procedure and civil and Roman law. He was appointed professor successively at Basel, Greifswald, Kiel and finally at Munich, where he remained from 1867 until his retirement in 1895. Planck was one of the outstanding legal scholars of the nineteenth century and is considered a master of internal comparative procedural law; that is, of the comparative study of civil and criminal procedure by the historical method.

Planck's thesis, *De legitimatione ad causam* (Göttingen 1837), pointed out that the *Sachlegitimation*, the establishment of the plaintiff and defendant as proper parties to the action, was not a precondition of a suit but pertained to the facts constituting the cause of action. His first important work, *Mehrheit der Rechtsstreitigkeiten* (Göttingen 1844), together with his earlier study, *Continentia causae* (written in 1839 but never published), constituted a historical survey of the "cumulation" or joinder of actions, of counterclaims, joint parties and "principal intervention" and also of the influence of one action upon another, from the period of Roman law to modern times. These works were followed by *Die Lehre von dem Beweisurteil* (Göttingen 1848), in which Planck took Germanic law as his starting point, showing how it was the source of the Saxon and common law interlocutory proof judgment. He explained how the latter separated the action into two parts, the phase of allegations and the phase of proof; how it standardized the rules of evidence and the burden of proof and was itself unimpeachable. In 1854 appeared his *Systematische Darstellung des deutschen Strafverfahrens auf Grundlage der neueren Strafprozessordnungen seit 1848* (Göttingen), which traced by particular laws the development beginning in 1848 of reformed criminal procedure, the change from the inquisitorial to the accusatorial principle, from the written and secret to the oral and public form and from trial by judges to trial by jury.

Planck's greatest works, however, are *Das deutsche Gerichtsverfahren im Mittelalter* (2 vols.,

Brunswick 1879) and *Lehrbuch des deutschen Civilprozessrechts* (3 vols., Nördlingen and Munich 1887-96). The former is a historical and systematic presentation of court organization of civil and criminal procedure in the late Middle Ages in the territories under Saxon law. It is based upon the *Sachsenspiegel* and related law books and is the most comprehensive history of mediaeval Saxon procedure. The *Lehrbuch* deals with civil procedure on the basis of the imperial arrangement of 1877 but takes cognizance always of the historical connection of modern legal principles with those of earlier law.

JAMES GOLDSCHMIDT

Consult: Seuffert, L., in *Zeitschrift für deutschen Zivilprozess*, vol. xxviii (1901) v-xviii; Mayer, Ernst, in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte, Germanistische Abteilung*, vol. xxii (1901) xvii-xxii.

PLANTATION. The term plantation was originally used to designate a plot of ground set with plants; during the period of British colonization of the West Indies and North America it came to denote a group of settlers or even the political unit constructed by such a group. Thus the colony of Rhode Island was long known as the Providence Plantations, the colonies in the West Indies as the Caribbean Plantations; and the term was applied also to the English and Scotch settlements in Ulster after the expropriation of the Irish from the land in the seventeenth century. When in 1768 the British government created the Office of Secretary of State for the Colonies, it was popularly known as the Plantations Office. As oversea possessions came to be called colonies the term plantation was restricted to the large scale agricultural units in the warmer climates. It is commonly applied moreover only to a property producing a single crop or possibly two crops grown primarily for export. Plantations accordingly are a form of great landed estate, usually in colonial or semicolonial countries, which raise such tropical or semitropical products as cotton, sugar, rubber, coffee, tea, rice, pineapples and bananas, with a laboring class kept in economic if not political servitude.

Plantations are essentially tropical institutions; they are not found in regions where winters are cold or where altitude results in year round temperatures too low for the typical plantation crops. Only in location, however, is the plantation tropical: the owners and managers are mostly from the middle latitudes, the laborers alone being from the warm lands to

which its crops belong. It represents therefore an invasion of the tropics prompted by the growing desire among non-tropical peoples for the objects (mainly edible, but including two important industrial raw materials, cotton and rubber) which only the warmer lands can furnish. Plantations are intimately bound up with colonial and imperialist conquest and exploitation.

In the British North American colonies the plantations of the south at first depended upon growing tobacco, but precedence was soon yielded to cotton. While these plantations were bound up with the colonial system, they lost their colonial character after the War of Independence and never acquired an imperialist character; but their general economic and labor relations bear striking similarity to those of plantations in colonial and semicolonial countries. Originally the plantations relied for labor upon free or indentured white laborers; but their persistence and expansion were made possible by Negro slavery, without which the plantations could not have developed as they did notwithstanding favorable climatic conditions. The planters, a small group owning millions of slaves, became a sectional ruling class, dominating the economics and politics of the southern states until their power was broken by the Civil War. The abolition of slavery imposed new relations between master and man. Many of the plantations ceased to exist; others, however, adjusted themselves to the changed conditions and operated with Negro tenants, croppers or cash renters; while still others employed their former slaves at a nominal wage or under a system of peonage. In all these cases the laborers were still in a semiservile state. Moreover, while the plantation was usually divided into tracts or parcels of land, instead of being cultivated as a whole by gangs of laborers under direct control of an overseer, it did not lose its distinguishing feature of unified supervision over the choice of crop, the methods of cultivation and the marketing of the yield. In this form the plantation continues to exist in the American south, where it is the characteristic agricultural type.

There are few plantations in the United States north of the Mason and Dixon's line; in climatic rather than in political terms, almost none are found far enough north to have fewer than two hundred days of frostless season. The usual plantation crops, if raised beyond this frost line, are grown on small holdings or with

independent laborers. Westward too of such a line which passes through northwest Oklahoma and cuts off the western third of Texas the plantation is practically unknown; it is supplanted by the cattle ranch or the irrigation farm, reappearing only, and then in small numbers and in a modified form, upon the delta of the Colorado River and in the mild climate of California. While plantations are thus limited almost entirely to the southern states, none is found in the hill country or in the less fertile areas, where agriculture is carried on in other forms. The plantations are restricted to the regions where soil is best and where land is level or nearly level. Within these areas, according to government estimates of 1910, there were 39,073 plantations, averaging in size from a few hundred acres to several thousand and containing an aggregate of over 11,000,000 acres of improved land—equivalent approximately to the entire improved land in such states as Michigan or Indiana. As the plantations averaged ten families each, they represented a population of about 2,000,000. Cotton, the major plantation crop, is grown in practically all the southern states (*see* COTTON); many of the great plantations in the delta of the Mississippi are devoted to the growing of sugar cane, while rice is cultivated along the gulf coastal plain in Texas and Louisiana and tobacco on the piedmont slopes of the Carolinas and Virginia.

Plantations in the West Indies developed sugar as their principal crop. In Cuba, Porto Rico and several of the other islands of the Lesser Antilles the plantation is still the customary unit of production for this commodity. Tobacco figures, although not as prominently, chiefly in the Vuelta Abajo region and adjoining districts of western Cuba and banana plantations are found in Jamaica, northeastern Cuba and a few other districts. No other crops are grown extensively by this system, the main native food supplies such as corn, beans, casaba, sweet potatoes, yams and fruits being produced on small holdings or as incidental crops on the larger ones. It was as sugar estates that these islands first became of value to the British, the French, the Dutch and to a lesser degree to the Spaniards. Throughout their history the plantations have played a conspicuous part and planters have largely dominated in all affairs. In Jamaica during the seventeenth and eighteenth centuries most of the cultivated land was in this form; much the same was true in the Barbados and other British islands. Many of the planta-

tions disappeared with the rise in the price of slaves, the numerous Negro insurrections and finally the abolition of slavery, but many still survive. In Cuba most of the sugar growing, which makes that island the foremost producer in the world, is carried on under the plantation system with hired labor but under conditions that leave little economic independence to the laborer. Many of the sugar plantations are owned by American capital, which dominates the sugar industry as a whole.

Although in Central America and Mexico the hacienda type of property devoted to mixed farming is more prevalent than the plantation proper, there are some estates which fall definitely into this latter category. Such are the relatively few sugar and tobacco farms in Mexico, centered chiefly in the Valle Nacional district in southern Vera Cruz, the maguey bearing lands about Mexico city and the henequen, or sisal, estates of Yucatan. These properties in all essential points belong in the plantation class, and labor is still in a semiservile state despite the recent agrarian revolution. In Central America there are also a few properties of similar character, but the great plantations of this region are the banana estates, for the most part strung along the low, warm, humid coast of the Caribbean. These estates, which conform in all particulars to the definition of plantation, embrace large areas; they are the property of absentee foreign owners, mainly American; they depend upon cheap, native semiservile labor and are devoted to a single crop, which is shipped to distant consuming centers. The development of banana plantations in the Caribbeans was bound up with the penetration of American economic and political influence; the United Fruit Company owns plantations of 470,000 acres, in addition to about 2,830,000 acres of unimproved land.

South America's agricultural holdings, despite their large extent, belong, like those of Mexico and Central America, mainly to the hacienda class. In a few regions, however, agriculture is of the plantation type. The coffee estates of Brazil and Colombia constitute the bulk of this kind of property, although in the latter country much of the coffee grown is on small holdings. In Brazil the coffee *fazendas*, as distinguished from the many small farms which also grow this plant and from the great estates given over to stock raising or mixed farming, are definitely in the plantation class. Most of the coffee exported from the country is the product

of these large properties, where thousands of acres are devoted to a single crop and where the land is worked by low class labor and owned and administered in huge units. On the lower eastern slopes of the Andes plantations yield coca, sugar and coffee, although their number is not great or their production important. Cacao growing plantations occur about the Gulf of Guayaquil and along the Brazilian coast near Bahia. This latter region has numerous sugar plantations also, some of them of large size and dating back to early colonial days. Plantations in the Guianas are devoted chiefly to sugar cane cultivation along the narrow coastal plain. Some of the irrigated sugar estates of the Peruvian littoral likewise differ little from the typical plantation. Elsewhere in South America this type of property is little known. Labor conditions vary on these plantations; but it is seldom better than semiservile and often much worse.

In the British and Portuguese possessions of tropical east and west Africa there are many large plantations owned by Europeans and worked under their supervision by native laborers; the chief crops are cotton, sugar, maize, tobacco and coconuts. Cotton is grown also upon enormous plantations in the Gezira of the Sudan and in other sections along the Nile. American tire interests have for some time contemplated the development of huge rubber plantations in Liberia. In all the African plantations labor is servile or semiservile and frequently exploited brutally.

The plantations of the Hawaiian Islands are devoted to two principal export crops, sugar and pineapples. Their combined acreage constitutes probably 50 percent of all the improved land on the islands. Ownership and management are in the hands of Americans, while Asiatic labor is used generally. Plantations are maintained in a few other islands of the Pacific, native labor being employed to cultivate such crops as coconuts, sugar and rice.

The plantation is the typical unit for the raising of export products in India, Indo-China, the Straits Settlements and the Dutch East Indies. It is devoted mainly to rubber, sugar, tea, coffee, tobacco, rice and coconuts, which are for the most part produced on large holdings, real plantations in the strict meaning of the word. These generally contain from a few hundred to several thousand acres, employ a large force of dependent laborers, mainly Chinese, Javanese and Indians, and are managed as large units with or without subdivisions. The

rubber plantations, which supply the greater part of the world's rubber, are located chiefly in Malaya, Sumatra, Java, Borneo, Ceylon and Burma. They are mainly owned or controlled by British and Dutch interests, frequently corporations. An increasing number are owned by Chinese, Japanese and other Asiatics; in recent years American corporations have a considerable interest in rubber plantations in British Malaya and the Dutch East Indies. Plantations depend exclusively upon native labor. In the case of rubber plantations there is a considerable importation of labor from India, China and Java, which is recruited and transported at the expense of planters. Despite its own large plantations Java has such an abundance of labor that much of it migrates to other countries. The hiring and maintenance of a plantation labor force are frequently in the hands of a native contractor, who receives a fee for each worker in his gang; the system has developed serious abuses. Labor has still a forced character, despite the abolition of indentured labor. The pay is low, the work is hard and the living conditions are bad. Labor conditions are particularly bad in the Dutch colonies. At first the Dutch merely traded and levied tribute; then the government formed plantations with forced labor, the cruelties of which finally compelled abandonment of the system in the 1860's and 1870's. Now "free" labor is employed, but the planters have developed various devices which practically enslave the workers. Penal sanctions still exist, giving government support to labor contracts and making it a criminal offense for a worker to quit the employer who hired him. Labor troubles of a revolutionary character have developed here in recent years.

The plantation has come into far greater prominence within the last half century. This development has been made possible by the improvement in ocean transportation, including refrigeration and ventilation systems, which permit the shipping of products to the distant regions where large industrial populations are concentrated. The demand for automobile tires has fostered the growth of rubber cultivation. In recent decades the extension of plantations has far outstripped older types of agriculture, including the one-family farm. Most of the plantations in such regions as the Straits Settlements, the Caribbean coasts of Central and South America, and Brazil date from the beginning of the twentieth century. If the demand for tropical products continues to increase, it is

probable that the plantation system will be still more widely extended, since under proper management it yields extremely high profits to the planter. Owned almost wholly by foreigners and dependent almost exclusively upon foreign markets for the sale of its products, the plantation can afford to pay low wages, which, while exerting a restrictive influence on the purchasing power of local markets, have no adverse effect upon consumption abroad.

Plantation agriculture is probably the only system by which large scale production can be carried on at present in the warmer regions of the earth. The natives of such climates are usually lacking in energy and are not inclined to steady, hard work except under pressure. The white foreigner also loses much of his accustomed physical activity, does not become sufficiently acclimated to produce by his own labor and must depend upon forcing others to work for him. This was formerly done by means of slavery. Almost the same results are now accomplished by less direct methods, such as peonage, serfdom or indentured labor. Many plantations are worked by nominally free men, but the wage scale is so low that it restricts the liberty of the individual and keeps him in semi-servitude. Properly regulated, plantations might be operated with completely free labor; but the profit to the owner would be reduced, possibly to the point where under present conditions capital would not be available for such undertakings. It is true that many of the typical plantation crops—bananas, rubber and sugar, for example—are grown successfully also on small properties. But so long as the colonialism and imperialism of the industrialized nations continue to dominate the colored races of the tropics, the plantation system is likely to persist.

Plantations, in most parts of the world, are organized avowedly for the purpose of large scale production and accumulation of wealth. In general there has been no other objective. The planters regard them not as social or political agencies but simply as money making institutions. In so far as law and expediency permit, they adopt whatever methods or organizations lead most directly to this goal. Wage scale, living conditions, systems of securing labor, size of holdings, methods of marketing, relation to the existing order of society, are all determined solely by the desire for profit. The large scale production of plantations, the fact that they are frequently the property of corporations, their distance from the absentee owners, their fre-

quent administration by managers whose sole obligation is to get results and the fact that they involve relations between diverse racial groups, all these considerations remove from the plantation system much of that human element characteristic of most other systems of agricultural production, leaving the economic element dominant, largely at the expense of the workers.

A plantation society develops a character of its own. The native order is usually disrupted seriously, as families or members of families are uprooted and moved into a new environment, under new superiors who know little of the hereditary customs and institutions of their laborers. In this new setting people of diverse customs must adjust their ways to the habits of their fellows. Such a mingling was strikingly apparent in the slave communities of the southern United States, where Negroes from several parts of Africa were assembled without regard to the differences among them and where the elements of several diverse primitive cultures were further modified by the white civilization into which they had been introduced. The planters' culture too suffered a modification, its language, customs, art, music, literature and even its religion being affected by the slaves. Much the same situation existed in the plantations of Brazil and the West Indies. Something of this social amalgamation is in process in Malaya, where Indian, Javanese and Chinese laborers meet under supervision of Anglo-Saxon, Japanese or Chinese planters, and in Hawaii, where Hawaiian, European and Asiatic cultures mingle.

At the same time the plantation exerts a conspicuous influence in its introduction of new tools, machinery, systems of wages, fashions in clothing, standards of living, notions of sanitation, types of organization, methods of work, sometimes educational institutions and ideas and not infrequently religious beliefs and practises. The effect of these changes is extended beyond the bounds of the plantation and helps to mold the general social order of the district. In these respects at least the plantation is a civilizing force, although its destructive effect upon native cultures appears sometimes to overshadow any constructive influence it may have.

A further consequence, and one which seems inherent in the system, is the stratification of society. Upon the plantation and in a plantation society there is a sharp differentiation between the upper class, represented by the owners and

the higher (particularly the white) agents of the plantation, and the laboring class. As the line of cleavage between the upper and lower classes is at least partly racial as well as economic, it becomes firmly fixed and individuals seldom pass from one to the other. This division runs through all phases of life, economic, social and political. The laborer may be completely free and still considered of a lower order. The higher foreign employees may be of low social origin in their native land, yet on the plantation they belong distinctly to the upper class. Distinctions grow up, such as that in Panama between "gold employees" and "silver employees." Where such a class division becomes typical of the agricultural population, it inevitably characterizes most if not all of the spheres of life, since the planters generally dominate all circles of society. These differences are emphasized by their introduction into industrial and commercial enterprises, where employees are drawn largely from the rural laboring class and where the lowest foreign employee lords it over the native workers. The aristocracy, mainly agrarian, is sharply separated from the servile class of workers.

In such a social order there is little room for a middle class. The plantation largely markets its own crops; it procures supplies, directly or indirectly, for its entire population; hence the trader class is small and usually dependent upon the estate. Economic groups outside of the plantations are also decidedly limited. The professional class is not numerous. Most of the population bears some relation to the plantation and falls into one or the other of the categories into which its people are divided. Furthermore the plantation tends, precisely as in the old plantation system of the southern United States, to prevent the development of a middle class farming population, in that it crowds out the small agricultural holding. This process was particularly conspicuous in the British West Indies, where the planters made success for the small farmer virtually impossible. The consequent stratification of society results in political oligarchy. In many regions where the plantation regime is established the laborers are imported from other sections and have no more share in governmental affairs than if they were slaves. Such is the status of the laborers from India, China and the Dutch East Indies employed on the plantations of the Middle East, of many laborers on the banana plantations of Central America and on numerous plantations in Africa. Even where the laborer is a native of the region

in which he works, he generally has no legal part in the government or, if accorded such rights by law, he has little opportunity of exercising his privileges. The political situation in the southern United States, in Cuba, Java and Malaya, is characteristic of a society built upon a plantation regime.

The political oligarchy of a plantation country is intimately tied up with foreign interests. Where the country is independent the connection is economic and financial, with an indirect political character. The political connection becomes direct where the plantation country occupies a colonial or semicolonial status, as is usually the case. From the beginning the plantation has been a colonizing force, a means of occupying new lands effectively and of initiating their development. This was true of Spain in the Antilles; of Portugal in its African possessions; of the United States in Hawaii; of Great Britain in Borneo, the Straits Settlements and Africa; of Holland in the East Indies. The planter consolidates the occupation of the conquering power. Where there is no direct conquest, as in the case of the American banana plantations in the Caribbean, a "sphere of influence" is created. As colonialism merged into modern imperialism, plantations acquired an increasingly imperialistic character, becoming entangled with corporate ownership, the export of capital and the domination of an international financial oligarchy. Plantation countries are producers of agricultural commodities and are dominated by the highly industrialized, imperialistic nations, which supply plantations with both capital and markets.

PLANTATION WARES. The typical plantation products are mostly tropical, subtropical or at least exotic to the north Atlantic nucleus of modern industrialized nations. They include cotton, rubber, sugar, tobacco, spices, coffee, tea, cocoa, bananas and some other fruits and some industrial raw materials. Certain items, like indigo and sugar, have to some extent moved out of the plantation group as a result of changes in production and transportation, while rubber is an outstanding example of a product which

has shifted in the opposite direction for similar reasons.

Historically the spices have been the most consistently interesting group. Far from being the relatively cheap staple groceries that they are now, the tropical spices, such as cinnamon, cloves and pepper, played a dramatic role in the luxury trade between Europe and Asia in ancient as well as in later times. The world was knit together commercially as much by the quest for spices as by the search for gold. The trade in spices was an important aspect of the commercial awakening in Europe after the thirteenth century. Factual accounts of the effects of greed and conflicting cultures present this history as incomprehensibly atrocious, and some of the chapters are so recent as to be disturbing. To maintain control over the market the Portuguese and the Dutch not only destroyed accumulated supplies and plantations but even massacred native populations to prevent selling to other countries—methods generally characteristic of civilized peoples engaged in the production of plantation wares in the colonies.

The term spices refers to all aromatic vegetable products used chiefly for the seasoning of foods and the flavoring of drinks. Many spices have other uses, however, their essential oils being consumed in the manufacture of perfumes, soap, incense and medicines. The most important spices of general modern consumption are pepper, ginger, vanilla, nutmegs, mace and cloves. From the standpoints of value and quantity the Asiatic tropics are overwhelmingly the most important source of spices, especially the Dutch East Indies and the Malay Peninsula. Other tropical areas have a much more limited range of products, and with very few exceptions they are less important as producers of outstanding single wares. Most of the pepper comes from Malacca, Java, Siam and Singapore. Vanilla, originally from Mexico, is now cultivated extensively in the Seychelles islands, Mauritius, Java, Tahiti, the Fiji Islands and the West Indies. Nutmegs and mace are grown principally in the Dutch East Indies. Ginger production is well scattered through the tropics, with the great volume in the East and West Indies. The British Empire is self-sufficient in the production of spices, except vanilla, and exports large amounts.

Spices are cultivated either as permanent plantation crops (nutmegs, cloves, cardamoms, cinnamon and vanilla), as garden crops (ginger, pepper), often subsidiary to other products, or as field crops on a large scale. In this last case

the spice may be rotated with other crops, as are cumin and coriander. The spices proper have lost a very large part of their earlier relative importance. Swift and cheap transportation, variegated diets, the variety of available flavorings and refrigeration are among the factors which have effected this change. Sugar and chocolate in their various forms and combinations, coffee, tea and tobacco are probably all more interesting to our palates than the mediæval luxury of pepper.

Cocoa, tea and coffee are all great quantity crops which play a role in the contemporary world comparable to that of the spices proper in earlier times. Cocoa, one of the most concentrated foods, has the widest range of uses, including flavoring, beverages, confections and desserts. The raw product of commerce is sometimes called cacao after the tree (*Theobroma cacao*), which the first white men found in various parts of tropical America. Cocoa as it is sold in grocery stores today consists of the pulverized seeds, dried and with the fat, or cocoa butter, extracted. Chocolate is cocoa plus sugar and flavoring, usually cinnamon or vanilla. The United States consumes about a third of the world's cacao, Europe practically all of the remaining two thirds. Germany is the largest consumer next to the United States, with about half the American imports and roughly the same per capita consumption; the other large importers are Great Britain, the Netherlands and France.

According to tradition Bernal Díaz, one of the Spanish officers with Cortés, was the first to report the beverage known to the Mexicans as *chocolatl*, made from the *cacauatl*, a word quickly corrupted into cacao. Introduced into Spain and Portugal, the new luxury soon spread to Italy and thence to France and England. Chocolate factories existed in the south of Europe as early as 1550, but nearly two centuries passed before the product came into anything like general use. The really phenomenal increase has taken place since 1850. Nearly two thirds of the world supply of this originally American product comes from west Africa, the Gold Coast alone accounting for over two fifths of the total. Until the twentieth century tropical America produced around three fifths of the world supply. The decline there has been relative only, Brazil's output nearly doubling between 1910 and 1925 and the American crop as a whole increasing substantially. What upset the ratio was a sixfold increase in the production of the Gold Coast, where the

government authorities planned and directed the production of cocoa. The output of St. Thomas and Principe—Portuguese islands off the west coast of Africa—dropped sharply from first rank during the period when world production was more than doubling. Practically the entire world supply of cocoa is produced in British colonies.

The fermenting and drying of cacao seeds, or beans, requires no such expensive machinery on the ground as a sugar mill; nor is there any problem of swift transport to distant markets, as in the case of bananas. Native farmers can easily be taught to prune cacao trees as well as the more complicated technique of preparing the beans without destroying the flavor or food values. This shift from the plantation system was made deliberately in Nigeria and the Gold Coast after investigations in 1908-09 by Joseph Burtt and W. A. Cadbury had shown the prevalence of forced labor in St. Thomas and Principe. The largest British buyers promoted the small farming system both directly and by giving preference to its product; with the exception of a few large plantations, practically the whole output of cocoa in west Africa comes from small native plantings, the product being bought from the farmers through a system of native brokers and storekeepers, who get substantial commissions. This system has been little better than the other from the standpoint of limiting output and thus maintaining prices which would enable the actual cultivator to live decently from his labor. While at first it easily absorbed the net increase, the world market showed distinct signs of saturation by 1928. The suddenness of the change has been explained not only by the increasing supply but also by shifts in eating and drinking habits in consuming countries, such as the use of tobacco by women, dieting and the rise of fruit consumption.

There are several species of coffee tree, all indigenous to Africa. The best varieties come from tropical plateaus and valleys. Introduced into Arabia probably in the eleventh century, coffee drinking spread rapidly to Persia, Syria, Cairo, Constantinople and finally to western Europe, where, although a comparatively expensive luxury item, it was popular in London and Paris in the seventeenth century. The Arabian species is the important one in world trade. Spaniards early introduced the crop into the West Indies, which were long the center of quantity production. Then came the shift to Java, and lastly—late in the nineteenth century

—to Brazil. Brazil now produces a little over two thirds of the world's export coffee by weight, although its preeminence would be lessened somewhat in terms of value. Many of the higher priced blending coffees are grown elsewhere, especially in Colombia and Central America. Brazilian attempts to support prices by curtailing production and marketing in the present century have encouraged planting elsewhere, including the Dutch East Indies, partially recovered from the pest disasters of the 1880's. For the production of especially high grades of coffee in relatively small quantities the historic big plantation system used in Brazil has its disadvantages. The usual practise on these plantations is to use the "dry" process of depulping the coffee bean with machinery; the finer Colombian coffees are depulped by hand labor in the more careful and tedious "wet" process.

The large Brazilian plantations have their own equipment for preparing coffee for market and their own railways; the capital requirements are comparatively large. These plantations also produce the main food crops for their workers, who number roughly five millions and work under conditions of low wage servitude. In Brazil the small planter is usually financed by the exporting firms or by the owners of the processing plants. Large planters often obtain advances on crops from foreign importing houses. In Colombia, Venezuela and Central America the planters are financed to a large extent by importers in the United States. Coffee is raised on large European owned plantations in the Dutch East Indies and either shipped direct to Amsterdam or sold at public auctions. The greatest coffee exchange is in New York, that of Le Havre occupying second place, and the only exchange in an exporting country is in Santos, Brazil. Export taxes are high in some smaller producing countries, such as Haiti, where this method of raising revenue is convenient as compared with others which would distribute the burden of government more equitably. South America provides 75 percent of the world's coffee imports, Central America 9 percent, Asia 8 percent and Africa 3 percent.

Brazil and Colombia, two large producers, consume less than 5 percent of their own coffee. This one item makes up roughly three fourths of Brazil's exports (by value) and about two thirds of Colombia's. After early attempts to prevent the extension of planting Brazil used foreign loans in 1906 and currency inflation in 1917-18 to buy and store coffee. Since both

operations turned out profitably because of later rises in prices (largely independent, however, of the government's efforts), it was decided in 1921-22 to make such a program permanent, and a "defense institute" was accordingly set up. The stocks increased to hundreds and then thousands of millions of pounds, and with them the burden of financing the growers whose crops did not flow to consumers. Already weakened, prices fell nearly 50 percent in four months, beginning with September, 1929. A loan of \$100,000,000 was subscribed in London and New York in the spring of 1930 to bring the coffee situation under control. One condition was the orderly marketing of coffee, so that the old stocks would be liquidated within ten years and one twenty-fourth of the estimated production of two years disposed of monthly. Destruction on a grand scale was part of the plan adopted. It is estimated that 10,500,000 bags, or roughly 3,860,000,000 pounds, were destroyed in sixteen months following June, 1931. A successful revolution on the fringes of the country against the coffee districts and a fierce but unsuccessful counter-revolution complicated the government's problem. Early in 1932 the world's coffee stocks were still sufficient for fifteen months' consumption. How Brazil's economic situation was hit by the fall in price of one commodity may be seen from the fact that its 1931 exports were down in value almost to half those of 1929, although the export of its great staple was greater in quantity by a sixth in the later year.

During the decade after the World War the world's coffee consumption increased to roughly 22.5 percent above the average for the five years before the war. The chief importers of about 3,000,000,000 pounds annually are roughly as follows, by percentages: United States, 47.5 percent; France, 11.1; and Germany, 10.1. Denmark ranks first in per capita consumption (16.09 pounds). Sweden and Norway also outrank the United States, where the consumption per capita is 11 pounds. Great Britain is far down in the list because of the wide use of tea and cocoa. Coffee is treated as a necessity in the American tariff system and is thus admitted free of duty. Other large consumers, like Germany, impose heavy duties, and there has been a general tendency since the war to treat coffee as a luxury in this respect.

Tea (Chinese *ch'a*, Amoy dialect *te*) is the name given to the dried leaves of a group of shrubs or trees allied to the camellia. The origi-

nal home of the shrub seems to have been the province of Assam, India, whence it spread to China in the third century A.D. It was introduced into Europe by the Dutch, reaching England in 1645. At that time it sold at £3 per pound. Tea is today surpassed only by water as a beverage, its supremacy being most notable in Asia, the United Kingdom and Russia.

After the tea leaves are gathered they are put through four distinct processes, withering, rolling, fermenting and drying; fermenting is omitted in the case of green tea. Large and hygienic machines are now used for rolling on the great tea plantations of India, Ceylon and Java. Drying is done either in the sun or in firing machines. Brick tea, largely for Russian consumption, is generally made of inferior leaves, residue, stocks and dust. Recently, however, high grade tea dust has been compressed by steam machinery into tablets for shipment to Soviet Russia. Practically all tea is selected, graded and priced by sample, taste being the basis of choice.

World production of tea increased from an annual average of 721,000 tons in 1909-13 to 810,000 tons in 1924-28, or 12.5 percent. (This includes estimates of China's total production. The much lower figures frequently encountered count only the tea exported from China, not that consumed there.) The annual export value in 1924-29 was roughly \$210,000,000. China, still the chief producer and for centuries the main exporter of tea, now takes fourth place as an exporting country, following India, Ceylon and the Dutch East Indies. Around 1890 tea made up over a fourth of China's exports, but by 1925-29 it had fallen to 3.3 percent. Japan ranks a rather weak fifth even with the addition of the Formosan crop, which about equals that of Japan proper. There has been a considerable decline since the World War. Even after a sixteenfold rise since the period 1870-75, the value of India's tea exports in 1924-29 was only 8.5 percent of its total exports. India furnished about 40 percent of the world's tea exports by weight but over 50 percent by value. Ceylon exports about two thirds as much tea as India, but this one item constitutes roughly 50 percent of the total exports. Thus the major share of the world's tea imports is supplied by British possessions.

The plantation system, with British capital, prevails in India and Ceylon. Big holdings, cheap labor, mechanization and rational management have led to relatively cheap production

and controlled grades, which simplify marketing. The rapid rise of tea growing in the Dutch East Indies in the present century has been founded on similar methods. Calcutta is the immediate destination of the bulk of the India tea, although Colombo is also an export center. From Calcutta the tea is either sent direct to London on consignment or it is sold at auctions to export buyers. In Ceylon perhaps 10 percent of the tea is disposed of directly from estates to large buyers, 40 percent is auctioned off in Colombo, and the remainder is sold through brokers operating on the London exchange. Tea is grown in China and Japan mainly as a side line on small scattered holdings. The want of organization, machinery and capital has made competition with British and Dutch growers increasingly severe. As in the case of coffee, tea growing is menaced by overproduction; and the chief exporters have been considering various schemes for the restriction of output.

London has suffered as a central distributing market since the rise of steam navigation and the opening of the Suez Canal, but it still has the central market, which determines the value of tea in every country save perhaps China. Much tea is now shipped directly from producing to consuming countries.

With some exceptions, for example, American cotton and tobacco, plantation wares are for the most part grown in colonial or semicolonial countries and are usually financed by foreign capital. Wages are low and forced labor is common. The movement in the production and export of plantation wares played a decisive part in the development of colonialism and constitutes an important aspect of modern imperialism. The colonial character of these wares and the fact that their production is disproportionate in terms of the whole local economy mean that the bulk is absorbed by the more industrialized nations. Thus an unusually large proportion of plantation wares is exported; in 1929 exports were as follows: 3,762,000 tons of cotton, or 60 percent; 1,511,000 tons of coffee, or 60 percent; 863,558 tons of rubber, or 90 percent; 13,574,000 tons of sugar, or 44 percent; 700,000 tons of tobacco, or 36 percent. World exports of tea were 430,000 tons. This is 98 percent of production outside China; but the inclusion of any reasonable estimate of the Chinese output would bring the percentage below 60. The export of 540,000 tons of cocoa was 98 percent of the total product. Figures on the wide range of spices are of course extremely complicated, but they

also indicate nearly 100 percent exported.

Like all raw materials and agricultural products sold in considerable quantities on the world market, nearly all plantation wares are confronted with the problem of adequate markets because of overproduction. Hitherto unimagined possibilities for overproduction have been opened up by the migration of crops under more recent economic conditions. Control by peaceful assignment of production quotas and by holding back supplies from the market has never succeeded very long. There are many areas where most of the wares can be grown, and the differences in transport costs are now slight.

Shifts of any of these products into or out of the plantation groups still depend as in the past upon economic, social and geographic differentials. The advantage of cheap labor tends to disappear with time. A high degree of specialization, coupled with a large initial investment and heavy fixed costs, has advantages which evidently depend largely upon the size and reliability of the market outlets to be reached by the advertising and the large scale handling of a uniform product.

PLATFORM, POLITICAL. See CAMPAIGN, POLITICAL.

PLATO AND PLATONISM. In the eyes of posterity the philosophy of Plato (427-347 B.C.) has all the appearance of a finished type of speculative idealism, while its social conceptions are looked upon as a plan for utopia. But the more the real Plato is known, the more is it perceived that what dominated his life was a political interest—an interest moreover that was closely tied up with the conditions of Greek civilization and particularly of post-Periclean Athens. Plato was profoundly shaken by the condemnation of Socrates, whose enthusiastic disciple he had been and who died the victim of the prejudices and passions of the very people whom he had striven ceaselessly to lead into the ways of methodical reflection and true justice. It is thus understandable that Plato's efforts should have been directed toward inquiring into the causes of Socrates' failure, which cast such a sinister shadow over the destiny of his country, and toward discovering the means to rectify the situation.

Socrates doubtless believed too readily in the harmony between the positive laws and ideal justice, between the habits of language and universal reason. This, however, was not such an error as it might seem. Is it not self-evident that if virtue is to be a science, moral practise must depend upon a speculative theory which is valid in its own right—temporarily putting aside all question of application? The originality of Plato with reference to Socrates—that which gives Plato his place in history—is that he planted himself squarely on the terrain of pure theory and sought to delve more deeply into the sources of strict scientific truth. Using the rigorous postu-

lates of mathematical demonstration already formulated by the Pythagoreans, Plato constructed a doctrine in terms of principles which were to be intelligible in themselves, to have a truth independent of the appearance and flux of things as also of the interests or desires of men. These principles were to be immovable and eternal.

Through the progress of dialectic what was for Plato at first apparently only a means for political success thus became an essential end. The Platonic sage is not to be dazzled either by the gleam of the stars in the visible heaven or by the splendor and wealth of the oriental despot: the sole object worthy of his attachment is the Good—the Good which is perpetually identical with itself and which "in power and dignity is far above anything which presents itself to us as existing." Platonism in short stands out as a pure idealism, an asceticism of the intellect, for which the method of the exact sciences as well as the mystical devotion of love serves only as a preliminary.

It is at this point that there develops what may well be called the drama of Plato's thought. Conceived in this fashion, Platonism may be said to run the risk of missing in its turn the aim which Socrates had assigned to reason—and this time because it may overshoot the mark rather than fall short of it. Under the Platonic exaltation of disinterestedness the wise man will naturally be reluctant to enter the cave and introduce among the shadows the image of the divine order of ideas; he must therefore be constrained to enter against his will. In the *Republic*, where Plato none the less exalts the virtues of a life devoted entirely to abstract philosophy, he at the same time develops in great detail the plan of a state which the philosopher would resign himself to construct by taking very exact account of the geographic and demographic conditions that would render such a state viable. Its architecture is made to rest on a parallelism of the social and psychological functions: the temperance of the artisans and the courage of the warriors are subordinated to the wisdom of the magistrates. Moreover, under the law of the economic division of labor, the hierarchy of classes assures the equilibrium of the just state, exactly as the justice of the just man is defined in his own eyes by the dominance of the brain over the impulse of the heart or the desire of the belly. When this moral authority is lacking, however, it is inevitable that the body social should degenerate, ending in complete dissolu-

tion. In his theory of the degeneration of governmental forms Plato shows how under the pressure of material interests and selfish passions there is a natural movement from aristocracy to timocracy, to oligarchy, to democracy and finally to tyranny.

The sociology of Plato thus has a twofold significance, and it is this in fact which gives it its historic importance. Its first aspect is that of a practical idealism corresponding to the teaching of Socrates during his lifetime; the second aspect is that of a radical pessimism, provoked by reflection on the spectacle of his death. The gap between these two aspects can never be bridged until kings become philosophers or philosophers become kings. Slight as seemed to Plato the likelihood of these eventualities taking place, yet it is noteworthy that he never neglected to cultivate either one. This in fact is the key to his practical activity as well as to his literary work. Three times he went through the perilous adventure of a journey to the court of the Syracuse tyrants in the hope of converting them to his ideal of legislation. In the meanwhile he had founded his school of the Academy. And here, while he initiated his immediate disciples into the study of a dialectic that became more and more involved, subtle and esoteric, he sought in his written *Dialogues* to carry out a different and more practical aim—to rally a wide public for the reconstruction of political life and the salvaging of Hellenic civilization.

This practical, political motivation serves to explain another antithesis in Plato's thought. The same writer who in the *Republic* had banished the poets because their blasphemous fables attributed to the gods the weaknesses and the vices of men resorts to the anthropomorphic psychology of the Demiurge as a means of explaining the order and structure of the visible universe. As Plato writes in the *Timaeus*, the perfect simplicity and unity of the Ideas become damaged and coarsened in the course of their incorporation into the temporal souls—the souls of the physical world as well as the souls of men. In addition to this myth of cosmic creation Plato uses other myths to support the sovereign value of justice in the individual and in the state by giving a vision of human destiny before birth and after death. In the unfinished dialogue of the *Laws* this stiff and archaic character of Plato's thought is carried to extremes in his scheme of state organization: the state is placed under the protection of the gods and ends in a fierce authoritarianism.

The depth, the richness and the complexity of Plato's work account for the diversity of the currents of influence which surround Platonism. At first there were only speculative influences, and these were both divergent and confused. Aristotle retained from the teaching of his master the teleological and mythical elements and transposed them into the abstract language of his physics and metaphysics. Plato's successors in the Academy, on the other hand, attached themselves to the mathematical side, but without ever being quite able to define it. Platonism oscillated between the skepticism of the New Academy and the mysticism of the neo-Platonists, which rose to triumph from Plotinus to St. Augustine. The Middle Ages developed especially the mythology of the *Timaeus*, making it conform to the stories of the Bible. Platonic idealism revived, however, with the discovery of mathematical analysis in the Renaissance and in the seventeenth century; its inspiration may be recognized in the religious spiritualism of Descartes, Spinoza and Malebranche. At the present time the great emphasis upon social problems has invested with a new interest the study of the conditions which Plato, with his realistic and precise genius, had outlined for the success of rationalism in the political and moral sphere. Platonism has indeed anticipated several of the great trends of contemporary thought: eugenics, feminism, socialism. At the same time it maintains that these trends would contradict one another and become perverted if they were to be regarded merely as instruments for the egoism of mine and thine—or, in other words, if the technique of morals and laws were not placed at the service of spiritual values which produce unity in the soul of each man and in the souls of all men.

PLAY represents one of a group of problems which rose to scientific importance when, in the nineteenth century, physiological and evolutionary ways of thinking began to dominate psychology. Prior to this time the general tendency had been to regard play as natural—an attitude which in this connection as elsewhere made serious thought quite unnecessary. But beginning with Herbert Spencer there appeared a long series of so-called theories of play. Taking his cue possibly from some earlier comments by the poet Schiller, Spencer suggested that play is the result of the discharge of surplus nervous energy. He pointed out that higher organisms which live a more sheltered youth could be expected to manifest play behavior to a greater extent than do lower organisms which enter early upon the more serious business of life. Spencer made some mention also of the imitative character of play. To Moritz Lazarus is attributed the recreation theory which brings out the fact that play is frequently associated with fatigue. Recovery from overactivity of one type is brought about not by rest but by an alternative form of activity. Karl Groos in his *Die Spiele der Thiere* and later in his *Die Spiele der Menschen* developed the idea that play is preparatory for adult life; youth is a period during which instincts must be modified and adapted to later requirements. Lilla E. Appleton, after a comparative study of play in adult savages and children, brought forward the suggestion that variations in play at different ages are to be explained in terms of the somatic

changes associated with growth. A dominating conception during the period of G. Stanley Hall's leadership in American pedagogy was his theory of recapitulation: "I regard play as the motor habits and spirit of the past of the race, persisting in the present, as rudimentary functions sometimes of and always akin to rudimentary organs. . . . Thus we rehearse the activities of our ancestors, back we know not how far, and repeat their life work in summative and adumbrated ways." Alexander Shand identified play with the primary emotional system of joy. Play, he held, is a type of behavior directed at the maintenance of the emotion of joy. William McDougall in his *Introduction to Social Psychology* claimed that the impulse of rivalry is the basic and differentiating characteristic of play. Various influences of the psychoanalytic movement have appeared in some of the later interpretations. Groos himself suggested that play may have a "cathartic" action, a notion which might very easily be traced to Aristotle. Hall's theory is suggestive of Jung's idea of the racial unconscious. But it is in connection with make believe play that the relation to Freudian theory has become most apparent. It has even been suggested, following Adler, that the play of children is an expression of childhood's obvious inadequacy.

The outstanding feature of these theories is that for the most part they are not theories at all. They are mostly efforts to summarize with maximum relevancy the meaning of the word play. They are certainly not alternative explanations of a defined and accepted group of facts nor are they systematic frameworks within which can be set the multifarious facts commonly referred to under the term. The typical "theory" has simply singled out one of the accepted characteristics of play—the fact that it is associated with an abundance of energy, that it is recreative, that it is reminiscent of historical epochs or that it expresses the child's desire to be an adult—and has then proceeded to the argument that this is the fundamental fact about play. Actually, the argument is relevant only to the use of a term. There is of course nothing more revealing than the linguistic usage which a given author insists should prevail, but the revelation has to do chiefly with the intellectual attitudes of the author. The enumerated "theories" are thus mainly useful in showing the shifting psychological attitudes toward childhood which have prevailed since the days of Herbert Spencer.

Along with the development of the classical theories of play there took place another movement of possibly greater importance—that toward objective and scientific observation of the entire range of child behavior from the reflex reactions of the newborn to the subtle social and imaginative life of adolescence. Preyer, the German physiologist, set a model for much later work by his book, *Die Seele des Kindes* (1881). But interest in this field did not become widespread until, in 1891, G. Stanley Hall founded the *Pedagogical Seminary*, in which journal there appeared many empirical studies of child life. These early studies were based largely upon hearsay evidence, but they were honest searchings after empirical facts and as such they introduced a novel note into a field where sentiment and dogmatism had long been dominant. The methods employed by Hall and his students met severe criticism at the hands of the experimental psychologists of his day, and for a time this general field fell into scientific disrepute. Since the World War, however, child psychology has had a rebirth and both in Europe and in America scores of workers are carrying on studies which would have delighted Hall and his school.

A third development has involved the relationship between play and education. The old doctrine of formal discipline and the puritanical distrust of pleasure had left play as a type of activity that was tolerated but always suspect. With the rise of a scientific psychology in the latter half of the nineteenth century there appeared two important alterations of opinion: first, recognition of the fact that sufficient educational skill might transfer to the business of learning something of the vigor of motivation to be found in spontaneous play; and, second, realization that the play life of adolescent and adult, as well as that of the young child, has an important bearing upon both mental and physical health. It is the increasing acceptance of the latter theory that has given play an important place in contemporary programs of mental and social hygiene and of education.

PLAYGROUNDS. In a broad sense any area, indoor or outdoor, where play activities are conducted may be called a playground. More commonly, however, an outdoor site, whether in connection with school, park, public square or municipal institution, devoted to supervised play is known as a playground or play center. The playground movement is a broader term and refers not so much to the allotment of space or the acquisition of land as to the organization of community resources for recreation or leisure time activities. It is largely an American movement and its development lies within the present century. Although athletics, games and gymnastics occupy an important place in European countries, particularly in Scandinavia, central Europe and the British Isles, they are in most cases promoted as part of the physical education program of schools or in connection with sport organizations under religious, political or industrial auspices. Public playgrounds such as have developed in the United States and Canada are almost unknown elsewhere, and where they do exist they have been patterned after American models. It should be said, however, that systematic town planning in certain countries and the garden city movements have resulted in the provision of open spaces which to some extent obviate the need for playgrounds.

The town common of the seventeenth century, prototype of the English village green, served as the first municipal playground in the United States. Here football, cricket, races,

wrestling matches and other informal community sports were indulged in. But it was not until the nineteenth century that there was any conscious provision for organized play. Between 1820 and 1830, under the impulse of German gymnastic teachers who had come to the United States as political refugees, several New England schools and colleges established outdoor gymnasiums, where for the most part activities were conducted without supervision. In 1868 the First Church of Boston utilized the yard of a public school as a vacation playground, and in 1876 Washington Park in Chicago was opened for team games. The date generally agreed upon as the beginning of the playground movement in the narrow sense is 1885; in that year Dr. Marie Zakrzewska, who had visited Berlin and had seen children playing on sand piles in public parks, opened a similar sand garden in Boston. The idea spread to neighboring New England cities, and out of these early play centers for small children grew the model playground equipped with swings, slides and other gymnastic apparatus.

During the remainder of the century the promotion of public playgrounds came chiefly through voluntary and philanthropic effort and served as another manifestation of the humanitarian impulse which sought to counteract the effects of industrialization and urbanization, particularly the growing evil of slum congestion. The movement was at first confined to the summer months and was sponsored by settlements, social welfare organizations, churches, kindergartens and private schools. In large cities, where yards and vacant lots had disappeared and where parks and open spaces were limited, an endeavor was made to utilize school grounds, roofs, public piers or streets temporarily closed to traffic. A vacant lot playground managed by Hull House was introduced in Chicago in 1893, and in 1895 the Henry Street Settlement in New York equipped its back yard as a neighborhood playground. The success of these efforts led to popular agitation for wider provision of playground facilities and as a consequence city governments began to equip existing parks and public squares and to acquire new tracts of land for the purpose. Before 1900 New York, Chicago, Philadelphia, Pittsburgh, Baltimore, New Haven, Providence and San Francisco had begun to provide playground facilities and by 1910 more than 150 cities were operating municipal playgrounds. In 1906 the Playground and Recreation Association of America, now the

National Recreation Association, was formed, with the definite purpose of promoting the playground movement. Under its direction the movement was expanded from a summer to a year round service for adults as well as children, so that it is now practically synonymous with the community recreation movement. To the kindergarten activities for small children were added organized games, sports and outdoor activities for older boys and girls, swimming and folk dancing, camping and hiking with their related emphasis on nature study, and a wide range of manual, music and dramatic activities.

Two factors which contributed to the rapid development of the playground movement were the support of the schools and of agencies concerned with crime, especially juvenile delinquency. The latter saw in the playground an outlet for youthful energy, while educators perceived that the biological and social importance of play activity to the growing child made it necessary to supplement classroom instruction not only with formal physical exercise but with games and free play. The movement harmonized with the newer theories of progressive, socialized education and in the case of city children offered possibilities for enlarging the curriculum through the teaching of nature lore and handicraft. Certain cities, notably Newark and New York, organized playgrounds in connection with the public schools in the early years of the twentieth century, but real interest in this aspect of the movement did not come until after the World War and then largely through the expansion of physical education. Recently several states have passed laws requiring the establishment of school playgrounds.

Since 1920 the questions of municipalization of playgrounds and particularly of the agency in which their control should be vested have been most widely discussed. Park boards appear to have been the first official agencies in charge of playgrounds, followed by school boards and by playground and recreation commissions. In certain cities two or more of these bodies are in control, a system which causes confusion and duplication of effort. Recent agitation for centralized direction has resulted in the coordination of several departments under a joint executive and in the appearance of legislative enabling acts authorizing cooperation or expressly placing park and playground activities under one municipal board. The present tendency is to combine all playground and recreation activities under one administrative body with legal standing in

the community and adequate funds appropriated by the municipality.

Some idea of the extent of the playground movement in the United States may be obtained from the following figures based on statistics for 1931 presented in the 1932 yearbook of the National Recreation Association:

Cities reporting play leadership or supervised facilities	1,010
New play areas opened in 1931 for the first time	840
Total number of play areas reported	13,324
Total number of paid recreation leaders	25,508
Total number of volunteer leaders	9,704

Of the 25,508 leaders employed slightly over half were men, and 2686 were employed full time the year round. The average daily summer attendance at playgrounds in 518 cities was given as approximately 1,500,000. A total of 606 recreation buildings was reported by 203 cities, of which 33 were listed as being set aside especially for colored people. This report classifies 228 cities as controlled by park commissions, 200 by playground and recreation commissions, 167 by boards of education. These statistics are not entirely accurate, for there is considerable overlapping. Some cities have a cooperative management which is reported by one department only. The playgrounds of 672 cities are reported as financed by municipal funds, 149 by municipal and private funds, 118 by private funds and 53 by county appropriations. A total recreation expenditure of \$36,078,585.37 for the year 1931 was reported by 917 cities. This represents an increase of nearly 100 percent over the amount spent five years previously, the figure for 1926 covering 665 cities being \$19,202,123.25.

While these statistics reflect an increasing tendency on the part of municipal bodies to assume responsibility for the playground movement, there is still need for experimentation and demonstration by private agencies. Under the impetus of the latter it has been possible to undertake new types of playground organization, to publish studies inquiring into community playground needs and to emphasize the importance of training leaders. During the past ten years courses in playground leadership have been established by colleges, universities, physical education institutions and in some cases by city recreation commissions. The increasing need for expansion of the movement is apparent from reports assembled in 1930 by the White House Conference on Child Health and Pro-

tection. According to these figures only 5,000,000 of an estimated 32,000,000 children between the ages of six and eighteen in the United States are served by public playgrounds. About 4,000,000 of these children live in cities and towns while the remaining 1,000,000 live in rural districts. This means that approximately 12,000,000 urban children and more than 15,000,000 rural children have no opportunity to enjoy playground facilities. Among the recommendations of the conference were the systematic setting aside of playground areas as part of the city planning movement and the establishment of organized recreation facilities in rural communities in connection with schools, churches, county agricultural stations and grange organizations.

PLEBISCITE. A plebiscite is, literally, a popular referendum on any question; but the term is gradually acquiring the more precise connotation of a referendum concerning changes of sovereignty. Conceived in the latter sense, the plebiscite came into use in the French Revolution as a logical consequence of the doctrine of popular sovereignty and of the formal renunciation of wars of conquest voted by the Constituent Assembly on May 27, 1790. Impressed by the moral value of the principle that no change of sovereignty should be made without the consent of the people concerned as well as by its practical value in quieting European apprehension regarding aggressive aims, the Assembly in 1790-91 insisted on a plebiscite in the 98 communes of the papal territory of Avignon and the Comtat-Venaissin before annexation; and it pursued the same course regarding Savoy in

1792 and Nice in 1793. In Avignon and the Venaissin all men over twenty-five years of age who paid a small poll tax were qualified voters, and in Savoy and Nice all men over twenty-one who had taken the civic oath. In each case the result, declared by constituent assemblies, was a majority for union with France. These votes, although taken under French military occupation, appear to have represented a sincere intent to ascertain the popular will.

Faced by refusal on the part of the Belgian communes to absorb the assignats, the Constituent Assembly in 1793 determined on further annexation and, while continuing to employ the plebiscite, used it to cloak conquest. In the plebiscites in the Belgian communes and in the Palatinate pressure was exercised by the French troops and commissioners and the suffrage, limited to those taking the oath of liberty and equality and renouncing privileges, excluded a large number of the inhabitants. The Directory followed the same course in annexing the republics of Geneva and Mulhouse in 1798.

The Napoleonic era and the Congress of Vienna consigned the plebiscite to an oblivion from which it did not emerge until the resurgence of nationalism and democracy in 1848. In that year the leaders of the Risorgimento, in order to demonstrate the general desire for union with Sardinia, held plebiscites, under manhood suffrage, in Lombardy, Venetia, Parma, Piacenza, Modena and Reggio; and the decrees of the Sardinian parliament declared in each case that the union was made in view of the popular vote of the inhabitants. A plebiscite to settle the question of northern Schleswig was urged in the same year by Prussia but was refused by Denmark.

Under the Treaty of Paris, signed March 30, 1856, elections were held in the Danubian principalities of Moldavia and Wallachia for divans ad hoc to settle their reorganization. The divans, elected under a limited suffrage, voted for the same hospodar; this was in effect a vote for union, thus pleasing the powers which had proposed the election, Russia and France, and defeating the policy of disunion supported by Austria, Great Britain and Turkey. A second plebiscite, in 1866, resulted in the formal union of the two principalities as Rumania.

At Villafranca in 1859 Napoleon III had secured for the Italians only the union of Lombardy with Sardinia. As the emperor's claim to his own throne rested on the plebiscite which he had engineered to sanctify his coup d'état,

the Italian leaders, supported by Palmerston and Lord John Russell, determined again to appeal to popular consultation, a course at which Napoleon had hinted, and assemblies ad hoc were elected under a limited suffrage like that of Sardinia in Tuscany, Modena, Romagna, Parma and Piacenza. Each assembly voted for Sardinia but, Napoleon declaring himself unconvinced, plebiscites under manhood suffrage were held in the same areas in 1860, which resulted in the fulfilment of Cavour's prophecy: "The dukes, the archdukes and the grand dukes will be found buried under the pile of ballots deposited in the electoral urns. . . ." Thenceforth Cavour made the plebiscite the corner stone of his policy for the union of Italy. Plebiscites were held in 1860 in Sicily, Naples, Umbria and the Marches, in Venetia in 1866 and in Rome in 1870.

As the price for his acquiescence in the annexation of Tuscany and Emilia (Parma, Modena and Romagna) Napoleon exacted the cession of Savoy and Nice. To legitimate in the eyes of Europe a transaction likely to prove repugnant and to protect himself against attack from Italian patriots Cavour insisted on a clause in the treaty making the cession dependent upon consultation of the inhabitants. The plebiscites held in 1860 under manhood suffrage resulted in a majority for union with France. While the conditions surrounding the vote in Nice were such as to deprive it of any convincing quality, the criticisms regarding the vote in Savoy were greatly exaggerated, because of the general fear of Napoleon throughout Europe, of the unpopularity of manhood suffrage in several countries and of the dislike of the principle of self-determination felt increasingly in Germany after 1866.

In a protocol signed August 1, 1863, Austria, France, Great Britain, Prussia and Russia, the four guarantors of the Ionian Islands, agreed that Great Britain should allow the union of the islands with Greece if the Ionian assembly should choose such union rather than continuance of the British protectorate. The Ionian assembly, elected ad hoc under a limited suffrage, voted unanimously for union, and the desire was granted in another treaty between the same powers which cited the vote as the basis of union.

In 1866 Napoleon III succeeded in obtaining the insertion in the Treaty of Prague between Austria and Prussia of a stipulation (art. 5) that Prussia should cede the populations of northern Schleswig to Denmark if, by a free vote, they should express such a wish. Prussia, however,

annexed the duchies in 1867 without any consultation, as it did Alsace and Lorraine a few years later.

There are a few scattered instances of resort to a plebiscite after the Treaty of Prague. Denmark insisted on a plebiscitary clause in the treaty signed at Copenhagen on October 24, 1867, ceding the islands of St. Thomas and St. John to the United States. The plebiscite held in 1868 under manhood suffrage of native born Danish subjects resulted in an overwhelming majority for the cession, but the treaty was never ratified by the United States Senate. France similarly insisted that the treaty by which Sweden in 1877 retroceded to it the island of St. Bartholomew should make the cession conditional on a plebiscite. This was held under manhood suffrage and resulted in an almost unanimous vote for France. A clause making the cession of Tacna and Arica by Peru to Chile dependent on a plebiscite was inserted in the Treaty of Ancón, signed October 20, 1883, but was not carried out. Sweden required a plebiscite in Norway before consenting to its separation in 1905.

The annexation by Prussia of Schleswig and Alsace-Lorraine, however, without plebiscites, had dealt a severe blow to the use of the device and had greatly strengthened imperialist and antidemocratic groups in every country. The Congress of Berlin ignored the plebiscite. Diplomacy had returned to the philosophy of the Congress of Vienna. Thenceforth, until the World War, the history of the plebiscite is primarily one of discussion. Support of the plebiscite came largely from the French and Italian writers, while the German writers were unanimous in opposition. Some American writers supported the plebiscite; others attacked it, the chief of these being Francis Lieber, by birth a Prussian.

Analyzed according to legal bases the plebiscites before the World War fall into two groups, formal and informal. Held as they were without agreement between the two parties in interest, the plebiscites of the French Revolution and the Italian votes of 1848-70 must all be called informal and unilateral. The plebiscites in Moldavia and Wallachia and in the Ionian Islands, Savoy and Nice, the Danish West Indies, St. Bartholomew and Norway were all held by virtue of formal agreements to which both parties, or states representing their interests, were signatory. It should be noted that no one of these formal plebiscites sanctioned a war of conquest.

Whether taken under formal agreement or not, all of the plebiscites held before the World War were under the control of one of the parties only and usually under military occupation. The party in control, however, varied. In the informal plebiscites it was the country which stood to benefit by the cession; in the formal ones it was the party ceding the area. The only vote taken under any degree of international supervision was that in Moldavia and Wallachia; for while this vote was taken under Turkish officials, the regulations governing the voting had been drawn up in agreement with the ambassadors of Austria, France, Great Britain, Prussia, Russia and Sardinia, and the consultative European Commission set up for other purposes extended its powers so far as to be in some sense a commission of control. Although in some of the formal plebiscites the troops of the ceding party were present they apparently played no part in the result. All troops in Savoy, Moldavia and Wallachia were withdrawn previously and order was kept by local militia.

Beginning with the Italian plebiscites special regulations regarding suffrage and voting methods were drawn up. In all of the plebiscites it was required that the voter be a citizen and in some a native as well, and he had to be resident in the area at the time. In most of the plebiscites he did not have to be literate but was disqualified in all of them if he had been convicted of crime involving moral turpitude. The method of voting usually reflected the custom in ordinary elections. The votes in Avignon and most of the other plebiscites of the French Revolution were *viva voce*, in communal assemblies. In the Italian plebiscites of 1848 the voter wrote in a register, under the eyes of the plebiscite officials. Beginning with the votes in 1859 the ballot was used without exception, but with only the rather simple safeguards characteristic of the time. The existing voters' lists were usually made the basis for the plebiscite lists, those wishing to add their names having to present themselves in person to the registration authorities. The votes were always taken by communes, the drawing up of the lists and supervision of the voting being entrusted to the local communal authorities. The preliminary count of the ballots was taken first by these local plebiscite officials and a final count was made by a higher body. In all of the plebiscites before the World War, except in the Belgian and Rhenish communes, the result of the vote, whether or not given for an assembly *ad hoc*, was counted not by communes but for

the whole territory. Thus it was used not to determine a frontier line in the area but to settle the sovereignty of the whole area.

The methods followed in the pre-war plebiscites appear primitive in comparison with those of the formal post-war plebiscites, all held under international administration and policing and by secret ballot. The best to be said of the pre-war votes is that while some of the informal ones did not express the real wish of the people, the formal ones seem to have given a fairly exact picture of their desires. In any case they marked a long step in the popularizing of the principle of self-determination and paved the way for the far more important and scientific extension of the principle under the treaties of Versailles and Saint-Germain.

PLEDGE is defined in Lord Holt's famous dictum in *Coggs v. Bernard* (2 Lord Raymond 909) as a variety of bailment in which "goods or chattels are delivered to another to be a security to him for money borrowed of him by the bailor." Thus defined the pledge (as represented by the Germanic *Faustpfand*) is sharply differentiated from the mortgage and other security devices based on a title hold or power in the hands of the creditor unaccompanied by physical possession, such as the *hypotheca* of the Roman law, which extended to movables and immovables alike, and the chattel mortgage and conditional sale of Anglo-American law. The pledge is therefore closely allied to the posses-

sory lien of the common law and the rights of retention under many continental codes (see LIEN). Like the latter, the pledge has been developed chiefly for goods and chattels, while the most typical development of the mortgage or *hypotheca* idea has been in the law of immovables.

The pledge is now, as suggested in Lord Holt's dictum, an auxiliary device for the assurance of the performance of a principal contract, usually one of credit. Wigmore has shown, however, that historically the idea makes its first appearance in all known systems of law not as an auxiliary arrangement but as a primary credit device called into being precisely because early law had no adequate procedure for the enforcement of a simple contract. Conceivably the man who sold a cow on "credit" which the law failed to recognize could take back a horse with the understanding that the latter was redeemable for the price of the former. Pledges were taken also where the commission of a wrong was claimed and some assurance of righting it was necessary in order that the peace might be kept pending the final outcome of the dispute. Indeed, as in the common law action of replevin, the whole procedure might take on the form of a reclaiming of the thing taken with the true cause of the dispute appearing only as a defense. Such a practise is very similar to the holding of men as hostages in interclan disputes, a custom to which the related concepts of suretyship and bail have been traced. As Ames has shown in the case of liens, the ultimate development of a plenary remedy at law on the personal claim for the breach of a simple contract, a development which in England was not completed until the seventeenth century, has not destroyed the coexistent remedy of resort to a thing but has rendered this resort supplemental or subsidiary. In modern law the creditor may ignore the claim and proceed on the pledge or ignore the pledge and bring an action on the claim, but normally he proceeds on both and gets a deficiency judgment for any part of the debt which the pledge fails to yield.

Just how the thing pledged is to be utilized for this satisfaction of the claim is the point on which legal systems, ancient and modern, with or without the aid of contractual provisions, present the greatest diversity. Between the extreme of merely permitting the creditor to withhold the article from its owner until the debt is paid and that of permitting him to keep it as his own on default there are such requirements as

bona fide sale, as in Anglo-American common law, accompanied by publicity and preceded by fair notice; public sale after due notice, as in the French commercial pledge; the consent of a court either to hold or to sell, as in the French civil pledge; public sale after due notice, as in the German law which requires a thirty-day notice and excuses the public sale where an accounting can be rendered on the basis of market quotations for goods having such listings. The natural tendency of the creditor is to write drastic terms into his pledge agreement, such as complete forfeiture without notice, without publicity, without accounting for any surplus, without waiting for the debt to be due, with limitations on the right of redemption and so on. Equity and legislation have in all systems set a limit to this antisocial tendency by disallowing forfeiture and by keeping alive an equity of redemption even after the stipulated legal right of redemption is gone. Furthermore in German law as well as in Anglo-American law any agreement made after a pledge or mortgage is created whereby the right of redemption is cut off is void. To avoid extreme one-sidedness in small loans all countries now have strict legislation standardizing the pawnshop agreement. This is the modern counterpart of the mediaeval prohibition of usury.

Questions as to the right of the pledgee to use the thing pledged or to appropriate its profits, the right to repledge it, the duty to care for or to preserve it, are resolved in Anglo-American law on the flexible principle of contract rather than by rigid rule. Of course in the absence of a contractual stipulation the presumptions of the old Roman law are drawn upon even in the Anglo-American system, into which Lord Holt's dictum injected them: "If the pawn be such as it will be the worse for using, the pawnee cannot use it. . . ." As to the care expected from a pledgee in the absence of contractual stipulation, due diligence suffices to excuse a loss. He must not put the pledge beyond his reach or that of the pledgor; hence although he may repledge for less than the original debt, it is a conversion for him to repledge for more. He cannot hold a specific pledge for a general balance or vote pledged stock, and he is not in duty bound to incur extraordinary expenses for the protection of a pledge against deterioration, lapse or loss of value in the absence of specification. On the other hand, continental codes tend to lay down general rules which may or may not be varied by contract.

Although the pledge is one of the oldest and simplest of security devices known to the law, its applicability tended for a long time to be restricted to such articles as the debtor could afford temporarily to relinquish—little luxuries, surplus supplies or other inactive tangible wealth. On the other hand, the great increase in modern times of valuable and enduring personal property, and particularly of intangible property represented in law by tokens which pass from hand, has in recent years opened up new fields of usefulness for the pledge idea. Since, however, the handling of pledged goods and their withdrawal from the use of the pledgor and from the channels of commerce have been found inconvenient, modern law has been confronted with the necessity of reinventing hypothecary systems of dealing with chattels, and this too despite the fact that in the abrogation of the requirement of true possession on the part of the pledgee there is a latent danger of misleading a bona fide purchaser into dealing with the pledged goods in ignorance of the secret lien.

In Anglo-American law little difficulty has been experienced in giving effect to the hypothecation of chattels. The chattel mortgage was developed side by side with the pledge, and at common law it was valid without delivery except as a possible fraud against creditors under the Statute of Elizabeth. Depending upon the jurisdiction, it might be either conclusive or only presumptive evidence of fraud. Registration, however, has now been substituted for delivery under recording acts passed in England and almost all of the states of the United States, so that chattel mortgages when properly recorded are now also valid against creditors. In Anglo-American law even mortgages of stocks in trade have been widely upheld.

The conditional sale (*see SALES*) in the United States serves the purposes of credit in the more limited field of the sale of goods. Its business equivalent in England is the hire-purchase system, which is based upon the lease idea. The true physical pledge remains unsubjected to the recording acts. Particularly in the United States elaborate pledge agreements for loans on collateral security represented by negotiable warehouse receipts and bills of lading, stock certificates, corporate and governmental bonds and other valuable documents are at the very foundation of banking.

In continental countries, however, the development has been more limited despite the fact that the chattel hypothec had been intro-

duced in the last centuries of the Middle Ages under the influence of the Roman law. The nineteenth century civil codes know nothing of the chattel mortgage. Both the French Civil Code and the German Civil Code require the transfer of possession for the pledge of tangible objects, although they provide separately for the pledge of immaterial rights. On the other hand, under the commercial codes of continental countries the pledge of goods was made possible when there existed the constructive possession given by commercial documents of title. Thus under the French commercial code a pledge of negotiable instruments may be made by their endorsement, and a creditor is said to have goods in his possession when he holds their bill of lading. Similarly under the German commercial code commission merchants, forwarding agents and carriers have pledge rights over goods as long as they are possessed of the documents of title. Generally the hypothecation of ships is allowed.

The antiquated civil code provisions have moreover been undermined by judicial decision or abrogated in some respects by legislation. Thus in Germany the Civil Code has been virtually nullified by the recognition in practise of the *Sicherheitsübereignung*. This is for all practical purposes a chattel mortgage, for it consists of a transfer of title plus some arrangement for assuring the beneficial enjoyment of the property to the debtor until maturity, when the property is reconveyed upon the discharge of the obligation. In France a series of laws has made possible the hypothecation of various types of property. A law of 1906, superseding an earlier law of 1898, provides for the hypothecation of crops by means of *warrants agricoles*. A law of 1913, supplemented by a law of 1915, allows the hypothecation of hotel property. Most important is the law of 1909, relating to the hypothecation of *fonds de commerce*, under which even the goodwill of the business may be pledged. The Swiss Civil Code makes express provision for the hypothecation of cattle. Both the Swiss Civil Code and the German expressly allow conditional sales, and in most other continental countries they have quite generally been upheld by judicial decision.

PLEKHANOV, GEORGY VALENTINOVICH (1857-1918), Russian theoretician of Marxism. Plekhanov joined the underground populist movement in 1875, when he was a student at St. Petersburg, and soon became prominent as a labor organizer and as editor of party publications. When in 1879 the majority of the populists decided upon a terrorist struggle against czarism, he remained with the minority faithful to the principle of socialist work among the masses. A few years later, however, Plekhanov, already an émigré, renounced populism, with its reliance upon the collectivist instincts of the peasantry and its aversion to political action, in favor of Marxian socialism. In his pamphlets published by the Group for the Emancipation of Labor, of which he was one of the founders, Plekhanov stressed the revolutionary role of the proletariat; he maintained that only the further development of capitalism in Russia, which the populists hoped to forestall, would strengthen the working class and thereby create the conditions necessary for the realization of socialism. Plekhanov's influence in Russia became apparent only in the 1890's when his book on historical materialism directed against the subjective sociology of Mikhaylovsky made a strong impression on the intelligentsia and when labor organizations, which began to develop here and there, recognized the ideological leadership of his Group. In 1900 together with Lenin he began to publish abroad the newspaper *Iskra* (The spark), soon to become the official organ of the Russian Social Democratic party founded in 1898. Likewise the party program, adopted at its second congress in 1903, was the joint product of Plekhanov and Lenin. In the following years, however, Plekhanov broke with the majority group in the party and thereafter re-

mained consistently a right wing opponent of Bolshevik theory and tactics. At the same time he carried on a lively literary polemic directed against all varieties of Marxian revisionism: that of Eduard Bernstein in Germany; the "economism" of Russian labor groups which in the late 1890's stressed economic struggle at the expense of political action; the reformism of Struve and Tugan-Baranovsky; the empirio-criticism of Bogdanov and Lunacharsky; and the "liquidationism" of certain Menshevik groups after the collapse of the 1905 revolution. While during the Russo-Japanese War Plekhanov was an outspoken defeatist, in the World War he pleaded for the defense of Russia as the supreme task of all democratic and socialist forces. After the February revolution in 1917 he returned to Russia, where the program expounded in his paper *Edinstvo* (Unity) failed to elicit popular support.

Plekhanov's contributions to Marxian philosophy and aesthetics overshadow his role as the ideological founder of the Russian labor movement. Among the authoritative expositions of historical materialism his is at once the most lucid and detailed; in Marxian circles his writings in this field are recognized as second only to those of Engels. In his theory of art he broke new ground. Opposed to the current vulgarizations of Marx, he attempted step by step to trace the connection between art and its economic base. He warned against reducing the relationship between these facets of social reality to one of linear cause and effect; nor would he substitute the finding of the "sociological equivalent" of a literary or an art production for aesthetic criticism, the former being merely the necessary first step. Because of his interest in theoretical clarification he studied French materialist philosophy of the eighteenth century and its influence on Marx; and in his writings on literary criticism he drew inspiration from Belinsky and Chernishevsky, the two outstanding representatives of the sociological tendency in Russia. His history of Russian social thought, introduced by an interpretative exposition of Russian social history, remained unfinished at his death.

A. POTRESOFF

Works: A complete edition in 26 volumes, with D. Ryazanov as editor, was undertaken by the Marx-Engels Institute in Moscow; of this only 24 volumes were published (1923-27). It should be supplemented by the collection of Plekhanov's articles and speeches in 1917-18, *God na rodine*, with a biographical sketch by U. Arzaev, 2 vols. (Paris 1921), and the collection

of letters to and from P. B. Axelrod, ed. by P. A. Berlin, V. S. Voytinsky, and B. I. Nikolaevsky, 2 vols. (Moscow 1925). A number of articles, lectures, speeches and letters, not elsewhere collected or published, appear in the collection *Gruppa "Osvobozhdeniya Truda"* (Group for the Emancipation of Labor), 6 vols. (Moscow 1924-28). The more important titles in foreign languages are: *Fundamental Problems of Marxism*, tr. by E. and C. Paul (London 1929); *Anarchismus und Sozialismus* (Berlin 1894), tr. by E. M. Aveling (London 1895); *Beiträge zur Geschichte des Materialismus* (Stuttgart 1896); "Über die Anfänge der Lehre vom Klassenkampf" in *Neue Zeit*, vol. xxi (1903) pt. i, p. 257-86, 292-305; "Das französische Drama und die französische Malerei im achtzehnten Jahrhundert," tr. by J. Herzmark in *Neue Zeit*, vol. xxix (1911) pt. i, p. 542-51, 572-83; *N. G. Tschernischewsky* (Stuttgart 1894); *Introduction à l'histoire sociale de la Russie*, tr. by Mrs. Batault-Plékhanov, Institut d'Études Slaves, Collection historique, no. 3 (Paris 1926).

Stein (Berlin 1926).

PLUNKETT, SIR HORACE CURZON (1854-1932), Irish agricultural cooperator. Plunkett, a younger son of a prominent Anglo-Irish family, was educated at Eton and Oxford and for ten years operated a cattle ranch in the American west. At the age of thirty-five, having acquired a fortune, he returned to Ireland and was thereafter identified with agricultural development in that country. Plunkett had become convinced that the salvation of the Irish people lay in organized self-help, particularly along the lines of agricultural cooperation; he became the inspirer and outstanding leader of the movement, and through his efforts cooperation soon gained a strong foothold in rural Ireland. Within a decade Irish agriculture had become remarkably efficient, with the result that Irish primary produce became one of the chief sources of England's food supply. In 1894 Plunkett founded the Irish Agricultural Organisation Society, which was an educational and advisory body; this has continued to be the fountainhead of the Irish agricultural cooperative movement.

Plunkett entered Parliament as a Unionist in 1892. The report of his Recess Committee, a group in which almost all shades of Irish

political opinion and economic interests were represented, was responsible for the establishment by Great Britain in 1900 of the Department of Agriculture and Technical Instruction for Ireland. Plunkett was put in charge and was given ministerial rank with the post of vice president; and although he lost his parliamentary seat in the same year, he was retained in office and knighted in 1903. But his *Ireland in the New Century* (London 1904, 3rd ed. 1905) exacerbated the hostility of the Irish Nationalists, who, because they drew their chief support from the urban middle classes and also were disturbed lest home rule really be killed with kindness, forced Plunkett's dismissal by the Liberals in 1907. Government aid also was withdrawn from the Irish Agricultural Organisation Society, but in 1913 the subsidy was resumed and it was continued by the Irish Free State government after 1922.

In 1914 Plunkett himself turned to home rule, publishing a pamphlet, *A Better Way; an Appeal to Ulster Not to Desert Ireland* (Dublin 1914). From July, 1917, to April, 1918, he presided over the Irish Convention, assembled by the British government in a futile effort to undo the work of the Easter rising and its aftermath. Despite his ventures into politics Plunkett never lost sight of his main work and in 1919 he established the Horace Plunkett Foundation, an institute for research and publication in the field of cooperation.

PLURALISM. The term pluralism is applied to the somewhat varying doctrines which are alike in their common opposition to the traditional theory of state sovereignty. The general position of the uncompromising pluralist is that since the orthodox, or classical, theory ignores or takes inadequate account of the rights, interests and actual achievements of various associations smaller and more specialized than the state, political philosophy should surrender "the whole conception of sovereignty" and particu-

larly the "arid" and "unfruitful" conception of legal sovereignty. The pluralist ideas were set forth most fully during the second and third decades of the twentieth century—notably by J. Neville Figgis, Harold J. Laski, A. D. Lindsay and the guild socialists, led by G. D. H. Cole and S. G. Hobson, in England and, in a special form, by Léon Duguit in France. Ernest Barker in England and Miss M. P. Follett in the United States have endorsed many of the pluralists' criticisms and proposals, but they have avoided the confusion of the more extreme doctrine. Miss Follett has presented the most extended and discriminating discussion of the whole pluralist trend in theory and practise. All pluralist theory shows the influence, on the one hand, of earlier sociological and juristic discussions of the state's relation to economic and professional groups and, on the other hand, of broader ethical and philosophical ideas as to the value of variety and freedom in self-expression, as in J. S. Mill's moral and intellectual individualism and in T. H. Green's idealist doctrine of self-realization. The pluralist doctrines are also in close relation to certain economic and political transformations which society has undergone during the past half century.

Duguit's doctrine is concerned specifically with the nature of law. He rejected all "metaphysical," "subjective," conceptions of law or all theories which define law according to its source—whether the state, the individual conscience or the community's sense of right—and insisted upon a "realistic," "substantive," "objective" theory, which defines law according to its contents, tendencies or consequences. The obligations of law, he maintained, are based simply upon the fact that men live in society and must so live in order to survive and that life in society requires a certain manner of conduct. The state is only an organized group of men inhabiting a definite territory, in which the strong impose their will on the weak. Its authority has as such no legal (*juridique*) justification. Law is independent of, anterior to, above and more comprehensive than the state. The legal validity of any act depends not upon its origin but upon the end which it serves. The essential quality of law is its tendency to promote social solidarity. Acts which have any other object or tendency are essentially unlawful. When Duguit explained the operation of his theory in actual governmental practise, he pointed to familiar instances in which certain governmental organs hold invalid the official

acts of other governmental organs—the former, he maintained, merely adjudging the latter to have acted contrary to the ends of social solidarity.

The English pluralist doctrine is not primarily a claim for an independent power in courts or other tribunals to nullify the unlawful action of legislative and administrative bodies. It is a plea for the rights and interests of groups which form no part of the official government of the community. Since man's social nature finds expression in numerous forms of association—vocational, economic, religious, political—no one of which is supreme in moral significance or practical force over the others, the state cannot properly be said to be a sovereign organization. The pluralists generally acknowledge their indebtedness to writings of the preceding quarter century, particularly to the works of Otto von Gierke, F. W. Maitland and J. Paul-Boncour, and of Émile Durkheim and other sociologists. Gierke and Maitland, considering the legal history of corporations, maintained that the latter arise naturally and possess personalities which are real, not hypothetical or fictitious. Each association has a collective opinion and will distinct from the intentions and desires of its individual members; and each is an original organ in the elaboration of law. Functioning prior to any concessions from the state, the associations supply one of the channels through which common beliefs of a legal quality find their expression in the actual rules which the state adopts and executes. The state's role in establishing law is principal but not exclusive. It should therefore look upon the associations as having rights and duties as integral groups, whether or not its law has recognized them as corporations.

Paul-Boncour considered the actual and legal history of professional associations. Such associations, he held, arise spontaneously and in time reach a position where they are able to devise and enforce the conditions under which the several vocations are pursued; and their relations to members as well as to outsiders, although originally contractual, tend to acquire an actually obligatory character. Later the law, by recognizing a free right of association and according to the associations privileges which enable them to interdict work except under conditions they decree, tends to make them obligatory in law as well as in fact. These developments are not accidental but are inherent in the very nature of economic society; and the

resultant conditions are in accord with the true principles of popular self-government. Durkheim and other sociologists found the traditional structure of the democratic state practically inadequate for the complex structure of contemporary industrial society. The local territorial community has lost its economic and social unity. The really vital units of society are the large vocational and industrial groups; and the community can be made fully democratic only if these groups are taken over both as constituencies for political representation and as organs for an autonomous regulation of the several industries.

Figgis, Laski, Barker and Lindsay contend that the state should be looked upon less as an association of individuals than as an organization of co-equal and cooperating groups: churches, professional associations, trade unions, employers' associations, friendly societies and local communities. They condemn the recent efforts of governments to invade the proper spheres of these groups, which, because they represent closer communities of interest, often attract deeper loyalties than the state and, if permitted to act autonomously, prove to be more efficient agencies of social order and harmony. These writers diverge somewhat in the location of their principal group interests. Figgis was concerned chiefly with the autonomous rights of churches and neighborhood communities. Barker and Lindsay give more attention to economic and professional groups generally. Although Laski evidently has a special interest in trade unions, he is the most sweeping and emphatic of all the pluralists in his theoretical attack on the monistic conception. Moreover in many parts of his writings he pushes his pluralism to a further important stage, from the group to the individual, so that his ultimate doctrine is that the only tolerable sovereign in society and the only valid source of law is the individual conscience. He asserts frequently that in any case of conflicting demands the preeminence of one association over any of the others depends solely upon the superiority of its moral appeal in that instance: no association has any claim on the individual's allegiance save in so far as his own conscience gives assent.

The pluralist doctrine is in part a rationalization of recent movements in actual society, tending in various ways toward a more decentralized application of social control. This appears both outside and within the formal political government: on the one hand, in the collective bargain-

ing over wages and hours and the voluntary arbitration of industrial disputes and, on the other, in the increasing part taken by associations of laborers, professional men, farmers, manufacturers, traders and bankers in influencing governmental action. A government in formulating its policies of legislation and administration often takes the initiative in securing the cooperation of these associations. The successful operation of systems of compulsory arbitration of industrial disputes is largely dependent upon the activities of workers and employers in their respective associations; and in various other ways the state now recognizes the value of dealing with economic problems through agencies representing the organized groups immediately concerned. Recent schemes of governmental ownership, as advocated by socialists and others, generally provide for a somewhat autonomous management of each public enterprise by a board representing the working personnel of the enterprise as well as the consuming groups which make particular use of its services.

Several European countries have attempted recently to coordinate and regularize this sort of group activity by setting up national economic councils jointly representing labor organizations, associations of employers, chambers of commerce, professional associations, farming, banking and insurance groups and consumers' societies. These councils have occasionally, at the request of governmental officials, contributed useful advice on taxation, social insurance, housing, conditions of labor and the regulation and encouragement of production and trade. The advice, however, merely supplies practical information to aid public officials in pursuing policies upon which they have already decided. Where occupational groups take the initiative in pressing on a government their own opinions on general policy, they continue to do so extralegally, through lobbying and other familiar forms of political pressure.

The pluralist regards these practical movements as indicating a greater diversification in the formulation and execution of social policy than any theory of state sovereignty can account for; and he approves them as implying respect for the independence and initiative of "spontaneous" economic, professional and local groups which correspond to "natural" unities of interest and function. Neither the pluralists nor their theoretical forerunners, however, really make the groups independent of the state. Gierke maintained that the state is sovereign—supreme

in legal and moral right—where general interests require the exertion of organized social power for their maintenance. Paul-Boncour regarded the state as the sole organ of national solidarity, with a duty to prevent any group from acting oppressively toward the public, other groups or its own members. Durkheim ascribed to the state the function of defining general policies, leaving to the several associations only the task of diversifying, under state supervision, the application of the policies according to the special requirements of the several associations. Figgis described the state as the *communitas communitatum* and assigned to it distinctive tasks and a superior authority as the chief agency of social adjustment and coordination. Although the guild socialists have sought to bring the state down to the level of the numerous functional associations of society, they retain a comprehensive communal organization and endow it with a direct and extensive control over economic and other vital concerns of social life. Their state, or "commune," would have a new system of representation and would delegate administrative tasks, as far as practicable, to smaller associations; but it would have a range and strength of authority no less than those of the traditional state. Barker warns against carrying the recent pluralist trends too far: the state, as the most embracing scheme of social life, must be allowed to adjust relations of associations to one another and to their members in order to preserve the equality of associations before the law and protect the individual from the possible tyranny of his own group. Miss Follett criticizes the pluralists' conception of the state as "competing" for the citizen's loyalty; and she explains so fully the state's unifying function and its direct contacts with the individual that she is hardly to be classed among the pluralists.

Laski also, although he is the most extreme in attacking political monism, proposes an institutional scheme which involves a considerable concentration of power in a single political organization standing for the community as a whole. He advocates state ownership of those industries which, because of their monopolistic nature and their indispensability to the welfare of the community, are of such a "public" character that they should be "operated for use and not for profit"; and he allows only such devolution in management as will not interfere with the community's right to establish, through its central political agencies, minimum standards of efficiency, decency and fair play. He would also

endow the central political parliament with a wide and direct control of private industry, in defining basic standards for hours, wages and working conditions and in fixing prices for the necessities of life.

It appears then that when the pluralists set forth their abstract theory they deny the sovereign power of the state or else characterize the power of something which is properly only ultimate and reserved; but when they devise specific institutional arrangements to carry out their theory they assign to the state numerous tasks, in laying down general policies and seeing that they are observed, which obviously require, not an ultimate and reserved, but a very direct and constantly exercised, power.

It is possible of course not merely to repudiate the theory of state sovereignty but also to propose a positive scheme of social organization without a common sovereign. This was done by the anarchists and the pre-war French syndicalists, whose theoretical systems provided for completely self-determining industrial groups. The pluralists attempt to arrive at a theoretical position midway between the anarchists or syndicalists and the political monists. They would retain the state but deprive it of sovereignty. It appears, however, that they accomplish this compromise only in words. They allow the state to secure its funds through compulsory taxation, retain the whole traditional system of a compulsory allegiance applied to all members of the community and assign to this comprehensive and coercive political association extensive duties in directing the economic and social life of the community. Indeed these basic concessions to the traditional theory appear to be required by the pluralists' demand for group autonomies as well as by their recognition of unorganized interests of the general body of citizens. For experience shows, in the first place, that wage-workers attain no effective part in controlling their work unless the state intervenes in their behalf to protect peaceful strikes and outlaw contracts restricting the workers' rights to organize. Secondly, if agreements between employers and workers secure any real self-government for both sides, then state action may be required to see that the combined groups do not pursue policies which contravene the interests of the people generally. Finally, both group and community interests demand various other activities of the state in limiting unemployment, disseminating market information, checking the flow of capital into overdeveloped industries and

stabilizing price levels. The significant fact appears to be that none of the schemes of group autonomy advocated or endorsed by the pluralists seems likely soon to diminish the scope or importance of centralized political control.

The contradictions within the pluralistic doctrine are due in part, it appears, to the assertions or inferences by some of them, particularly Laski, that the traditional theory of legal sovereignty—the doctrine running through the definitions of state, sovereign and law advanced by Bodin, Grotius, Hobbes, Bentham, Austin and the later "analytical jurists"—implies not only that the state has certain unique and final functions in respect to law but also that it is morally and practically absolute over the individual. Some of the pluralists lump Bodin and Austin together with Bosanquet and other neo-Hegelians in a general theory attributing to the state a moral right and actual power to control the whole economic and cultural life of the individual. With the single exception of Hobbes, the typical exponents of the orthodox, or classical, theory were explicit in avoiding any confusion between legal unity and moral unity; and they held widely varying ideas as to the most desirable scope and method of state activity in relation to economic and cultural affairs. Most of them recognized that every political community does in fact impose, through the state and its laws, certain prevailing ideas of decency and fair play; and the pluralists, as has been indicated, admit and insist upon these morally and socially unifying tasks of the state.

The conclusion then is that the pluralists are not so far out of line with prevailing trends in modern political theory as some of them appear to believe; and yet that they have been more explicit and concrete than earlier writers in demonstrating the activities and interrelations of the numerous occupational groups in the modern community, intermediate between the individual and the state.

PLUTARCH (c.48-c.125), Greek moralist and man of letters. The life of the greatest of biographers is itself unknown, except for what can be gathered from his own writings. His family was of some wealth and position in his native town of Chaeronea in Boeotia, where, with the exception of one rather protracted visit to Rome, he seems contentedly to have passed his whole existence. It covered a highly interesting period, when paganism was dissolving and Christianity was taking root in Europe. There is no pagan writer, with the possible exception of the intense and lonely Marcus Aurelius, who comes so near the ideal of a Christian gentleman. Plutarch is no stylist, scarcely even a thinker;

although learned, he is inaccurate, discursive, uncritical, content with the obvious moral. Yet there are not many authors, ancient or modern, who have more directly affected human action. This is partly because, almost as much as Montaigne or Lamb, Plutarch gets his personality into everything he writes; partly because he has invented a new way of writing history. He makes history turn on character. If, for example, Antony and Cleopatra had been different, the history of the world would have been different too; hence we must know what sort of people they were. Thus he attaches immense importance to anecdotes, for even if false they indicate the impression made on others by the subjects of his biography. This is a dramatist's view of history or a novelist's and explains why Shakespeare delighted in Plutarch, and why the Greek is the spiritual father of Lytton Strachey and the biographical novel of today.

The surviving works of Plutarch divide themselves into two main classes: the *Parallel Lives*, a series of biographies of Greek and Roman worthies compared and contrasted; and the *Moral Essays*, a vast collection of essays on subjects of an ethical character. The *Lives* have been the inspiration of great men and great movements. Plutarch was a hero worshiper—he may be regarded as the founder of that religion—and the heroes he most admired were the champions of civic liberty, the haters of tyranny. It was at his fountain that Rousseau and even less excitable minds, like some of the founders of the American republic, drew intoxicating drafts of the spirit which created the ancient commonwealths. He gave such men the inspiration of a political faith, if he could not supply the details of a polity. This faith, which may be described as a slightly sentimental and academic republicanism, carries less conviction today than in the past. But since at bottom it is nothing else than the conviction that it is better to suffer anything than be a slave, it still has power over the minds of men.

PLUTOCRACY literally means the rule of wealth. In this simple connotation it is another of the terms which have come down from Greek political controversy and which clutter up and confuse political thinking. As with similar terms there is a difference between its original meaning in the context of Greek history and its modern variants. The personification of an impersonal thing which "rule of wealth" implies is significant, because the term is thereby made indiscriminately applicable to monarchy, aristocracy, democracy, tyranny, oligarchy and the rule of the mob. Like the modern term bureaucracy it is not a formal concept but essentially substantive, and it is correspondingly difficult to find any fitting antithesis. In other words, it is difficult to answer the question: If a community ruled by wealth is a plutocracy, what community is not a plutocracy, and what are its characteristics? Aristotle's distinction between an aristocracy and an oligarchy, that the one is based on virtue, the other on wealth, is decidedly controversial and its fundamental assumption no longer of vital significance, since it arose out of the struggle between Athens and Sparta. But it contains perhaps a key to a real distinction in the fact that in classical antiquity virtue referred primarily to the qualities of the manly warrior. It would follow from this that the antithesis of a community ruled by wealth is one ruled by the sword. But reflection upon Plato's *Republic* would suggest another possible antithesis, the rule of a religious creed. Without doubt the rule of the priest, of the warrior and of the trader were the three types which lay within the experience of the Greek world.

All this, however, is quite remote from modern experience and problems, which are centered not upon these three elements, but upon the maintenance of a balance of power between the groupings of an industrialized society, more particularly between capital and labor, to which has recently been added as another distinct group the farmer-peasant-craftsman. Marx maintained that all governments have been based upon the exploitation of the masses by comparatively small groups; in short, that all states have been plutocracies. Whatever the validity of this interpretation, it served to focus attention upon the new substantive antithesis to the rule of wealth; namely, the rule of labor. To the capitalist state was opposed the socialist state, in which the abolition of private property was to do away with the historic exploitation of the masses by the propertied classes. For a time the "dictatorship of the proletariat" was the principal program for the abolition of the rule of wealth. But in more recent times the German National Socialists, in developing the fascist doctrine, have called upon the myth of the racially pure nation to justify and legitimize a dictatorship of an élite of nationally conscious "leaders." This National Socialist creed is directed with great fervor against the rich; in combating capitalism National Socialism means to attack the rule of the wealthy, plutocracy. In view of this professed antagonism it seems curious that in coming into power it should have entered into a league with the most outspoken exponents of the rich in contemporary Germany, the Hugenberg faction of Nationalists. It was at once asserted, however, that this cooperation was merely of tactical significance—a transitional stage which the full grown National Socialist state would eliminate entirely. Whether a militant élite of priestly warriors can in the end destroy effectively the pervasive influence of wealth in an industrialized community remains to be seen. For the present the possibility continues that as in Fascist Italy the wealthy classes in Germany will themselves succeed in permeating and controlling the oligarchic machinery which the National Socialist movement has declared to be one of its primary objectives.

Historically considered the plutocratic influence has been most marked in oligarchic forms of government, which have been idealized from the time of the Greek city-states under the name of aristocracy. The identification of oligarchy with aristocracy has been stressed particularly where membership in a ruling class

has been restricted to persons belonging to a limited set of families, where, in other words, distinguished blood descent has become associated with wealth. In the England of the eighteenth and the early nineteenth century this idea was so dominant that the oligarchic and plutocratic aspects of English society were forgotten or at least neglected. The political thought of Burke is an illustration of this tendency.

The transformation of oligarchic and democratic governments into plutocracies has been most observable in those periods of world history which followed upon the most marked commercial and industrial development. Thus the age of the Greek tyrants, the Hellenistic states, the merchant state of Carthage, Rome in the period of the late republic and the early empire, Venice and some of the other Italian city-states, the cities of the Hanseatic League and the commercial-industrial states of today have shown the increasing influence of wealth in government. Although Carthage and Venice are frequently cited as states in which plutocracy was from the outset the prevailing form of government, they are in fact only extreme cases of the usual tendency of communities with growing commercial interests to evolve an oligarchy based upon wealth. Indeed both states began with a type of popular government, and their later oligarchic constitutions were thoroughly permeated by the idea of distinguished blood descent; in Venice this notion was developed most intensively.

Not the rule of wealth, but rather the use (or abuse) of governmental powers motivated by the desire to retain a monopoly on the acquisition of wealth, was the distinguishing feature of the Venetian constitution. As the trade of Venice grew, a limited group of very wealthy men felt the need of seizing the control of public affairs in order to protect their interests and forestall the rise of competitors. Since the Venetian government had been conducted in the form of a plebiscitary monarchy with the doge as monarch, elected by popular acclaim and assisted and checked by a popular assembly (*concione*), the powers of the doge and the popular assembly had to be weakened by an aristocratic, oligarchic council. After preliminary steps extending over a century and a half this development came to a head in 1171, on the morrow of a disastrous failure of the preceding government against the Byzantine Empire. A great council was created at this time which was to exercise the final authority. This body became within a hundred

years strictly oligarchic and plutocratic, membership in it being restricted to certain wealthy families. As all offices were filled by the great council, exclusion meant loss of all political influence. The result was a close political caste. A college of heralds was eventually created to insure purity of blood through a register of all marriages and births; this register became the basis of the famous Golden Book (*Libro d'oro*). It was not wealth as such, but the connection between wealth and blood which gave the Venetian constitution its peculiar character.

A very similar development took place in many of the German cities, more particularly in the towns of the Hanseatic League, which developed or rather continued oligarchic forms of government, based upon birth and wealth at the outset, but used for the retention of that wealth within certain families. The same is true of the English cities in the period of the guilds. In fact practically all European towns passed through such a stage: the families (*Geschlechter*) entitled to sit on the council (*ratsfähig*) were the wealthy merchants of the merchant guilds. Conversely, it was extremely difficult for those who did not sit on the council to become wealthy. Similarly in English towns, by reason of the distinctly oligarchic forms of English government prevailing down to the nineteenth century, the guild merchant became an instrument not only for the attainment of power through wealth but also for the exploitation of power to retain wealth.

This aspect is particularly important in any consideration of the extent to which plutocratic forces have made their way into the formally democratic states of modern times. It is an ever recurring phenomenon of constitutional history that democracy turns into an oligarchic plutocracy. There can be little doubt that at least in Athens the rise of the oligarchs was due to the hatred of the rich for the democracy, which was constantly threatening to deprive them of their wealth. In fact the Spartans built their system of alliances upon this support of the rich, which was outwardly manifested in the establishment of oligarchies based upon wealth. Similarly the almost unlimited sway of the Roman Senate after the failure of the revolution of the Gracchi (133-121 B.C.) was based essentially upon wealth, and only the rise of the popularly acclaimed princeps introduced a modification after a hundred years of violent disturbance. At the present time there are many who insist that modern democracies, like the United States and

France, have become plutocracies. This opinion is by no means confined to radical socialists: Woodrow Wilson maintained at one time that the united capitalists and industrialists are the masters of the American state, while Robert de Jouvenel in a celebrated essay proclaimed France a republic of predatory comrades. Marxist writers have of course been foremost in pointing out the essentially plutocratic nature of modern democracies, and around them has appeared an increasing amount of literature which looks upon formal democracy in that light.

The bid of the bourgeois class for political power in the period of the formation of the modern democratic state did not go unanswered. The very fact that the bourgeois had become the standard bearer of democracy brought both under the suspicion of collusion. The defenders of the existing system, in which the government had been deftly and varyingly divided between a hereditary monarch and an equally hereditary aristocracy of landowning nobles, associated with the clergy of an established church and in some cases with a bureaucracy, forthwith began to denounce as *parvenu, nouveau riche, arriviste* the successful business man who under the cover of democracy clamored for a share of governmental power. The contemptuous use of the epithet "bourgeois" is thus no invention of the Marxists, but dates back to the days of Louis XIV and the railleries of Molière's famous *Le bourgeois gentilhomme*. On the other hand, the deeper foundation of the spirit of the commercial middle class is religious; it rests upon the Calvinist conception of worldly success as the manifestation of divine favor. The idea recurrent in the history of civilization, of wealth as a gift of God, sanctions the rule of wealth and renders the possession of riches a substantial basis of true legitimacy.

The understanding of the curious bedfellowship of wealth and democracy has been emphasized of late by realistic analyses of the forces which in fact shape policy in modern democracies. As the nineteenth century unfolded, men began to realize that political parties were not factions which could be avoided but permanent divisions of the electorate necessary to mold the will of the people. It was not long until it was further realized that these parties, because they were such huge organizations, required a great deal of money, which could not be secured unless those who were to contribute it were offered a corresponding amount of influence in directing the party's policy. Two outstanding

scandals of American and French politics—Tammany Hall and the Panama canal—influenced Ostrogorsky in his epochal analysis of party machinery and led him to the discovery that democracy meant plutocracy. Under the impact of public indignation wealth commenced to organize itself into powerful interest groups, and labor as well as other interests in the community did likewise. This development had scarcely begun when acute observers announced that the end of democracy was close at hand; for the dissolution of the electorate, the people, into a plurality of groups took away that homogeneous unity and concomitant flexibility of the electorate which the doctrine of the will of the people tacitly or explicitly had assumed to exist. Wealth has in a sense lost its innocence. But out of the present struggle one conclusion has emerged with clarity about the nature of the concept of plutocracy: that it does not designate a form of government, but shows where the actual source of power in any one of the possible forms of government lies. Unless wealth is looked upon as a gift of God, it is likely that plutocracy will appear as a process of deterioration and decay of which some new leader or class must purge a community in order that a new commonwealth may be built.

POBEDONOSTSEV, KONSTANTIN PETROVICH (1827-1907) Russian jurist and statesman. Pobedonostsev was professor at the

University of Moscow, member of the senate and of the Council of State and procurator of the Holy Synod. From 1860 to 1865 he was also tutor of the grand dukes, to whom he lectured on law and politics. In this position he gained a deep and lasting influence on his pupils, particularly on the future emperor, Alexander III, whose guide in matters of policy he was later to become. After the death of Alexander III, Pobedonostsev published *Moskovsky sbornik* (Moscow 1896; tr. by R. C. Long as *Reflections of a Russian Statesman*, London 1898), which contains an exposition of his political philosophy and a sharp criticism of the western civilization as opposed to the Russian national ideal. In this work he appears as a disciple of Burke and the philosophers of the Catholic reaction but pushes their principles to their utmost limit.

The great errors of the West are democracy and the parliamentary system, leading necessarily to moral debasement, corruption and unscrupulous demagoguery. Belief in the moral value of democratic institutions is a prejudice contradicted by experience. Pobedonostsev condemns freedom of speech as freedom of lie and freedom of the press as even more nefarious, it being the freedom of every rascal to poison and pervert the minds of the people. He attacks the institution of the jury, maintaining that it is absurd to confide in the judgment of the mob, and public instruction which, he charges, destroys the robust common sense of the people. The root of all these troubles is rationalism. Pobedonostsev insists on the destructive, negative character of reason. Logical reasoning is formal, abstract and unconnected with truth and reality. Only an idiot can believe in "clear ideas." Man's deepest thoughts are not clear. Feeling and faith, not reason, enable him to arrive at truth. Truth cannot be measured and institutions cannot be invented but must grow up slowly and organically. The force of inertia is the only power which can uphold the state. Pobedonostsev therefore opposes every attempt to destroy "tradition" in life or belief; he is hostile to historical criticism since it would deprive the people of their own legendary history, which, he says, possesses a much higher truth. Absolute truth can be reached only by faith, necessarily intolerant. Pobedonostsev considered it of prime importance that the Orthodox church be given a dominating position in the state, and he inspired Alexander III's policy of persecution of nonconformists of all denomi-

nations, as well as ruthless Russification of aliens.

Pobedonostsev published a number of valuable works on the history of Russian law, in which he shows the same aversion to abstract, general ideas and principles. His *Kurs grazhdanskago prava* (Treatise of civil law, 3 vols., St. Petersburg 1896) contains no general introduction. The method is purely historical and comparative. Law arises from real economic and social relations, and positive legislation has only to give form to these relations and guarantee their application. This view implies that over and above law there must be some power or reasonable will which is obeyed by all without question. Pobedonostsev saw this power realized in the autocracy of the czar.

POCKET BOROUGHES. See ROTTEN BOROUGHS; REPRESENTATION.

POGODIN, MIKHAIL PETROVICH (1800-75), Russian historian and publicist. Pogodin was professor at the University of Moscow. From 1827 to 1830 he collaborated with the young Russian romanticists Odoevsky, Venetinov and Kireyevskiy in editing the *Moskovsky vestnik* (Moscow herald), and from 1841 to 1855 he published with Shevirev the patriotic *Moskvityanin* (Muscovite). Pogodin's historical work is a product of the nationalist and romantic movement of the early nineteenth century. He was a follower of Schlözer and Karamzin and it was under the influence of the latter that Pogodin decided to become a historian. In his dissertation *O proiskhozhdenii Rusi* (On the origin of Rus, Moscow 1824) he criticized sharply the so-called skeptical school of Kachenovsky and accepted the "Norman" theory of Schlözer and Karamzin. He criticized Karamzin's writings, however, for being so predominantly literary and not sufficiently "philosophical."

Under the influence of Schelling's philosophy, which was then very much in vogue in Russia, Pogodin attempted to work out a philosophical conception of history. Starting from the belief that "every nation develops . . . a particular idea and contributes in a particular way to the realization of its destiny" he sought to determine the principles underlying the guiding forces of Russian history; but lacking philosophical education he arrived only at a crude pseudo-organic scheme, in which nations and states were viewed as analogous to living beings. From this conception Pogodin deduced the impossibility of applying general historical categories to the history of different states; he stressed particularly the differences between the principles underlying the history of western Europe and those basic to the history of Russia. He maintained therefore that Russian history should be studied independently, insisting also that the historian should follow what he called "the mathematical method." Beginning with a careful study of sources the historian should establish the main historical facts and from these arrive at the principles motivating the historical process. Pogodin took his organic metaphors literally and believed that he could find his historical principles "in the origins"—the "birth hour" of Russia. His real effort was therefore devoted to the earliest period of Russian history. He collected a very valuable group of manuscripts, old prints, published texts, monographs; and his *Issledovaniya, zamechaniya i lektsii* (Investigations, notes and lectures, 7 vols., Moscow 1846-54) are still indispensable to the student of Russian history. As to the "principles," Pogodin simply read into early history the leading political and cultural forces of his time—orthodoxy, autocracy and nationalism. Since these were obviously inadequate to account for the historical phenomena, Pogodin fell back upon the direct intervention of Providence and admired its unerring foresight in guiding the destinies of Russia. In 1835 he published a general history of Russia, which was of no scientific value; it was written with the avowed purpose of teaching the Russians "patriotism" and strengthening their pride in the past of their country.

POHLE, LUDWIG (1869-1926), German economist. Pohle was professor of economics first at the Akademie für Handels- und Sozialwissenschaften in Frankfurt and later at the University of Frankfurt. In 1918 he succeeded Karl Bücher to the chair of economics at the University of Leipsic, where he taught for the remainder of his life.

Pohle was a follower of the deductive school in economics and a determined opponent of the historical school as represented by Schmoller, Brentano and others; he opposed likewise the socialism of the chair both as expounded by the historical group and as represented by deductivists like Adolf Wagner and Lexis. He expressed his position on the various methodological and socio-political problems in the *Zeitschrift für Sozialwissenschaft*, which he edited from 1910 to 1921. To this publication he contributed also his very useful annual surveys of the current business and economic situation. In the controversy over the tariff problem which occupied the attention of German economists at the beginning of the century Pohle sided with the protectionists. In his general economic views, however, he was very close to the Swedish economist Gustav Cassel, with whom he collaborated on the latter's *Theoretische Sozialökonomie* (Leipsic 1918).

Pohle's most notable contribution was in the field of business cycle theory. He saw the fundamental cause of the periodical business crises in the ever recurring disproportion between the fairly uniform rate of population growth and the highly irregular rate of production of capital goods which are necessary to provide the additional population with industrial equipment. This disproportion, he held, arises from the fact that under an individualistic competitive economy the two acts involved in the production of capital goods, namely, the act of saving and that of actual investment, are two separate functions performed by independent agents and guided by different considerations. The frequent result is that savings are not transformed into capital goods with sufficient promptness, so that in con-

sequence there result stagnation in the basic industries, unemployment, eventual undersupply of capital goods and much unproductive consumption.

Tugan-Baranowsky und L. Pohle" in *Jahrbuch für Gesetzgebung, Verwaltung und Volkswirtschaft im Deutschen Reich*, vol. xxvii (1903) 679-708.

PÖHLMANN, ROBERT VON (1852-1914), German historian. Pöhlmann was professor of ancient history at the University of Munich. He was the first to delve profoundly into the problem of the social history of the ancient world. The presentation of this problem he credited to Roscher, and the broad historical vision which always characterized his work also derived from Roscher. Familiar with contemporary economic problems, he turned first to the economic policy of the Florentine Renaissance. With his *Die Übervölkerung der antiken Grossstädte* (Leipzig 1884), however, Pöhlmann entered the field in which he was to find and pursue his chief interest.

The compact ancient world seemed to Pöhlmann a particularly important paradigm for the role of economic forces in history, for their transposition into class interests, into capitalistic and socialistic tendencies, and the consequent struggles for power. This idea runs through all his works, a series of scattered papers, most of which were collected in *Aus Altertum und Gegenwart* (2 vols., Munich 1895-1911; vol. i, 2nd ed. 1911); the *Griechische Geschichte* (Munich 1902, 5th ed. 1914); and above all his brilliant standard work, *Geschichte der sozialen Frage und des Sozialismus in der antiken Welt* (2 vols., Munich 1893-1901; 3rd ed. by F. Oertel, 1925). From his study of antiquity he derived his anti-democratic viewpoint. Believing that liberalism with its encouragement of an organic state must inevitably end in surmounting the idea of democracy as embodied in the arithmetical equality of citizens, the democracy of numbers, and must necessarily proceed to socialistic radicalism and finally to the very destruction of the

idea of the state, Pöhlmann was led to reject democracy.

As with most pioneers who open up new fields, Pöhlmann's urge to "discover" led him into error. The surprising parallels with contemporary society which he found in an antiquity no longer classically conceived led him to view it as too similar to his own age. He constructed an ancient social democracy with a program of socializing production and found manifold anticipations, such as those of the *Gotha Program* and the *Communist Manifesto*. One essential premise of Pöhlmann's theory was false—his conception of ancient economics, especially in the pre-Hellenistic age, the period which interested him particularly. The economic structure of this epoch was thoroughly unfavorable to a revolutionary program of socialization and to the idea of a reform in methods of production. Nevertheless, Pöhlmann rendered an indisputable service in recognizing that the strong mass individualist root, including elements of state socialism, also played a leading role in ancient history and in analyzing and explaining the communistic and socialistic theories of the ancient world.

FRIEDRICH OERTEL

Consult: Wilcken, Ulrich, in *Bayerische Akademie der Wissenschaften, Jahrbuch* (1915) 146-50; Kaerst, J., in *Historische Vierteljahrschrift*, vol. xviii (1916-18) 236-38; Oertel, Friedrich, in his edition of Pöhlmann's *Geschichte der sozialen Frage . . .*, vol. ii, p. 511-85.

POISSON, SIMÉON-DENIS (1781-1840), French mathematician. Poisson, after displaying unusual precocity as a student, became full professor at the École Polytechnique in Paris at the age of twenty-five. Of his outstanding contributions to many branches of pure and applied mathematics those in the field of probability are not the least important; certainly they have loomed large in the history of that discipline. The two most notable are the Poisson probability series and the law of small numbers. Bernoulli and Laplace, the latter of whom Poisson claimed as master, had studied extensively repeated trials wherein the probability of an event is constant. Poisson succeeded in generalizing a number of their results and in modifying others to make them applicable to cases in which probability varies from trial to trial. While Laplace is responsible for generalizing Bernoulli's theorem and may therefore be regarded as the originator of the law of large numbers (the term is of Poisson's coinage), Laplace's

transformation makes the law practically inapplicable to situations in which the probability deviates considerably from $\frac{1}{2}$. Using a different transformation, Poisson found a simple approximate formula for dealing with very small probabilities. He showed that the probability of a rare event occurring r times in a large number of trials is proportional to $R^r/r!$ where R stands for the observed frequency. Like Laplace and Cournot, Poisson was interested in Condorcet's problem of calculating the probability of errors in court or jury decisions. He tried to improve upon Laplace, who arrived at some unacceptable conclusions, by modifying the latter's hypotheses and making them more realistic. Later writers have criticized severely the application of probabilities to problems of this type, in which the element of individual judgment plays so large a part. It has not been established, however, that the work of Poisson and his predecessors was entirely fruitless; possibly they did not go far enough in fitting their hypotheses to the complexities of real life.

POKROVSKY, MIKHAIL NIKOLAEVICH (1868-1932), Russian historian. Pokrovsky was born in Moscow and studied under Kluchevsky and Vinogradoff. As a young man he joined the revolutionary movement and in 1905 became a member of the Bolshevik party. As a result of these radical activities Pokrovsky was forced to carry on most of his work in exile until he returned to Russia in 1917.

Pokrovsky is known as the most representative Russian Marxist historian. After freeing himself from his early "democratic illusions" he passed, during the period between 1905 and 1917, from "legal" to revolutionary Marxism. He considered no one a Marxist who did not, in addition to recognizing the economic factor and the class struggle in history, also recognize the inevitable political consequences of Marxism; namely, the socialist revolution and the dictatorship of the proletariat. He demanded

historical perspective of all Marxists and considered the essence of dialectical materialism to consist in viewing all events historically. In his works on philosophy of history and on historical methodology he took issue particularly with Rickert, Max Weber, Dopsch, Plekhanov, Trotsky, Rozhkov and Miliukov. He attacked the "vulgar evolutionist," "bourgeois liberal," antidialectical viewpoints (a view of history without the dialectic method was for him *belles lettres* in the service of bourgeois class interests); he attempted to prove that the ideas of Petrushevsky, Platonov and Tarle were idealistic, petty bourgeois and pseudo-Marxist. In his own camp he turned against the so-called mechanistic conceptions and nationalist deviations from the general line of the Bolshevik party. His works on Marxist ideology, historical method and Russian historiography as well as his treatment of various problems of cultural, social and economic history, constitutional and diplomatic history, military history and military technique of civil war have become the guides for his school. In these works Pokrovsky developed an orthodox Marxist interpretation of Russian history which serves today as the historical justification for the Soviet Union. His rigid, oversimplified schematization, his periodization and his leading idea of the origin of the Moscow state and Moscow absolutism from commercial capitalism, from which he derived the logic and unity of Russian internal history and Russian foreign policy, have provided particular targets for criticism by his opponents.

As vice commissar of public instruction of the Soviet republics Pokrovsky emphasized the class character of science, particularly of the social sciences. It was their task to forge the weapons for the class struggle. He labored successfully to stabilize Marxism-Leninism-Stalinism as the principle of scientific investigation and doctrine and to organize the class struggle on the "scientific," the "general ideological" and particularly the "historical" fronts. The Bolshevik science of the proletarian state must provide the basis for the political demands of the working classes and ally itself with the practical work of socialist reconstruction. Pokrovsky proclaimed the supplanting of individualism in historiography by the new type of historian of the future, the "collective historian," who participates definitely in planned collective effort. The radical transformation of Russian higher education since 1918 is also linked to his name. Among his

achievements are the creation of workers' faculties (*rabfaki*), the Communist Academy and the Institute of Red Professors (for the development of communist scientists) embracing all branches of natural and social sciences, the amalgamation of all the research institutes in social science (Ranion), the reform of the Russian archives, the organization of Russian Marxist historians, the founding of leading social scientific periodicals (*Istoriik marxist*, *Krasny arkhiv*, *Vestnik Kommunisticheskoy Akademii*) and the publication of numerous collections of materials, especially in regard to the history of the Russian revolutionary movement and Russian foreign policy in the modern and most recent period, crowned by the collection of documents, *Mezhdunarodnie otnosheniya v epokhu imperializmu* (3rd ser., vols. i-ii, iv, Moscow 1931-33; tr. into German as *Die Internationalen Beziehungen im Zeitalter des Imperialismus*, ed. by Otto Hoetzsch, Berlin 1931-33).

POLE FAMILY, English merchants and financiers. On the foundation of one of the great fourteenth century fortunes made in the wool trade the Pole family rose not only to the peerage—they were earls and dukes of Suffolk—but to the heritage of the throne. Richard III's nephew and heir was the descendant of Edward III's merchant and financier, William de la Pole (d. 1366). The latter, first mayor of Kingston upon Hull, member of parliaments, baron of the exchequer, mayor of the wool staple in Antwerp, is noteworthy as Edward III's principal English creditor when English financiers were replacing foreigners. In 1337 he headed the syndicate which was the outstanding experiment in Edward's manipulation of the wool trade to secure extraordinary funds for his war with France. Merchants purchased on credit the year's growth of wool, lent the king £200,000 and received as repayment the customs and half the proceeds from the sale of the exported wool. The scheme failed. Edward had recourse again to borrowing, chiefly, until 1345, from William de la Pole. Knighthood, gifts of land and advantageous marriages for Pole's children marked the king's gratitude and gave substantial evidence of the rise of the family.

Succeeding generations turned, less fortunately, to war and politics. Advisers of weak kings or, latterly, rebels, all but one of the Suffolk earls and dukes died in exile, in battle or by execution. Michael (c. 1330-89), William's heir, served in France, was governor to Richard II in his minority, arranged Richard's marriage with Anne of Bohemia and became chancellor and earl of Suffolk. Similarly William (1306-1450), his grandson, fought in France, commanded the army before Orléans and helped arrange the peace of 1444 and the marriage of Henry VI with Margaret of Anjou. He was created duke in 1448. Both sought order at home by strengthening the royal power, and peace with France, even by such territorial concessions as the surrender of Maine and Anjou in 1444. For these policies they bore the brunt of parliamentary and baronial opposition to the crown. Michael was impeached at the instigation of the duke of Gloucester, was convicted of unproved charges and imprisoned. Ultimately he fled to Paris, where he died. William was accused of treason by a Parliament inspired by his private enemy and dissatisfied with the treaty of 1444 and the loss of Normandy through Somerset's incompetence. He appealed to the king, was banished but, while crossing the channel, was

captured by a royal ship and executed under unexplained circumstances.

William's heir, John (1442-91), turned Yorkist and married the sister of Edward IV. His son, John (c. 1464-87), heir to the throne of Richard III, became involved in the Simnel imposture and was killed at the battle of Stoke. His brother and heir, Edmund (c. 1472-1513), was beheaded for suspected complicity with another brother, Richard, who schemed openly with France against Henry. Richard died in battle at Pavia in 1525. With him the direct male line ended.

POLICE. The term police in its early definitions has covered a wide range of functions. It has been employed to describe various aspects of the control of public sanitation; it has had a highly special meaning with respect to the suppression of political offenses; and at times it has been expanded to cover practically all forms of public regulation and domestic order. Now, however, it is used primarily with reference to the maintenance of public order and the protection of persons and property from the commission of unlawful acts. Hence police and constabulary have come to be almost synonymous.

The complex structure of modern society and the necessities of governmental administration sometimes operate to extend police activities quite beyond any strict concept of crime control. Such modern extensions are largely attributable to an increasing emphasis upon prevention in police work. Thus the police sphere is constantly widening and now frequently includes the licensing of various employments and enterprises, such as private watchmen, vehicles plying for hire, the storage and cartage of combustibles and other dangerous substances, the sale or possession of firearms and the operation of many types of public entertainments. In the case of practically all types of licensed callings the police are employed for the preliminary inspection of premises and investigations into the personal characters of licensees, and they are sometimes required to make periodic reports to the licensing authorities concerning the manner in which licensed callings are operated. The police also act to prevent

conditions which threaten the safety or morals of citizens; such activities include traffic regulation, the maintenance of fire lines at the scene of a conflagration and in some instances the exercise of certain limited powers of public censorship. It is also an increasingly common practise for the police to extend emergency relief to the destitute.

These and various related duties less frequently exercised have a certain bearing upon the protective functions of police and sometimes devolve upon them as matters of administrative necessity. When they are numerous they raise difficult problems of management and serve to divert police attention from more fundamental duties. The administrative structures of police forces are predicated upon their activities to a considerable degree, even though most police organization plans may be criticized for failure to recognize the close relationships which exist between certain of the activities. There is also a distinct tendency toward creation of small units and detachments, which are not easily articulated with the work of the police force as a whole. Such units are frequently set up for the regulation or suppression of commercialized vice, for license administration and the like.

The methods employed in securing administrative supervision and control of police forces vary so widely as to defy successful generalization. There are, however, three general categories. Police systems on the continent of Europe and in many other parts of the world are highly centralized. The national government, usually represented by the minister of justice or the minister of the interior, exercises a more or less preponderating influence upon all matters of police direction and management. Even where police districts are coterminous with the subdivisions of local government and are correlated with the latter, the central police authority frequently controls not only the large questions of organization, personnel management and official policies but even, if occasion requires, the smallest details of daily operations. The trend toward centralization still continues, in which respect the Scandinavian countries and Hungary offer recent and striking examples.

A second type of police system is partially decentralized, as, for example, that of England and Wales, which was founded upon local administration and later subjected to a measure of national control. The last few decades have witnessed a further expansion of the supervisory powers exercised by the Home Office, which

makes subventions to the local police forces amounting to one half of the compensation and allowances given to the police personnel. Through His Majesty's Inspectors of Constabulary a check is maintained on local police administration, and the grants by the national government are conditioned upon a favorable report from these Home Office inspectors. Thus far central influence has been applied with reserve and has been confined chiefly to raising the quotas of the police establishments, encouraging the consolidation of the smaller forces and improving various special aspects of local police administration. The control of the Home Office over the London metropolitan police, however, is complete and unqualified.

Finally, there is the system which obtains in the United States, in which all governments—national, state and local—maintain police agencies which are wholly independent of each other. The result is the most complete decentralization of police authority known to the civilized world, accompanied by an extraordinary degree of duplication and conflicting jurisdiction. Cities, villages and special districts, towns and townships, counties, states and the federal government, all maintain police forces charged with general or special duties. The nature of the federal union and the fact that police management has become embedded in the whole scheme of local government are chiefly responsible for this curious situation. The advent of state police forces in many commonwealths may indicate the beginning of a trend toward larger police areas, although there is as yet little evidence of a willingness to destroy even the smaller of the local forces.

Police forces are placed under the immediate supervision of either legislative bodies, administrative boards, commissioners of public safety or single police administrators. The legislative type is found usually only in decentralized systems and consists in placing the general control of local police in the hands of a standing committee of the local council; it is almost universal in Wales and England, where, except in London, the municipal forces operate under a committee of the municipal council and the county constabularies are similarly subordinated to a joint committee of the county council and the justices of the Quarter Sessions. The scheme has met with a considerable degree of success, largely because the local party machines do not ordinarily interfere with police management; the committees themselves are

content to handle only the broad general problems, leaving the chief constable free to work out a detailed and constructive program. In the United States control by municipal councils is steadily becoming less common, because of the scandals, corruption, political interference and inefficiency which have characterized it.

Administrative boards or commissions especially charged with police control have also been tried in the United States but, with a few exceptions, have failed to produce satisfactory results. Where state controlled municipal police forces were created, provision was usually made for board management. In most instances this expedient was a practical necessity. Police boards, both state and local, were constituted as bipartisan, unipartisan or non-partisan bodies; yet whatever their designation, they have seldom risen above partisanship. State controlled but locally supported police are now quite rare, having been destroyed principally by the abuses which arose under board management. Administrative boards on the continent and elsewhere usually act only in an advisory capacity or are confined to the consideration of some irregularly recurrent problem of an especially difficult or technical nature.

The rise of commission government in American cities led to control of the police by a commissioner of public safety, chosen from among the members of the commission council. Such commissioners administer the affairs not only of the police but frequently also of the fire force, of the department of building inspection and sometimes of public charities. While this is a natural and even necessary feature of commission government charters, a similar combination of administrative duties has also occasionally appeared under a few city manager and mayor and council governments. Except for a very few cities the public safety commissioner plan and its variations have proved disappointing and have raised new and difficult problems of practical administration.

A single administrative head directly responsible to civil executive authority represents the most prevalent type of police control. When suitably protected from the intrusion of partisan or other selfish interests it appears to avoid the difficulties more or less inherent in the other systems. This type is virtually universal in highly centralized systems and its adoption is being steadily extended in the United States wherever charter provisions permit.

The selection, training, promotion, discipline and welfare of members of police forces, especially of the rank and file, constitute problems of primary concern to police organizations. Since no reliable tests of police aptitude exist, there has been much experimentation, although no important results have been produced. In continental Europe police recruits are often drawn directly from the army or from conscript lists, while in Great Britain and the United States they are drawn chiefly from the civilian population. Except in Great Britain and the British dominions and possessions, the titles of the official police hierarchy are strongly reminiscent of the military origins of civil police, and in continental Europe and in many colonial possessions a varying degree of military precision and discipline is imposed upon the police. Political affiliation, residence, physique, personal character, formal education and native intelligence are the most common qualifications for membership in police forces in the United States. The test of political affiliation is far less common than it was fifty years ago, although it is still occasionally an influence even with civil service commissions. In Europe political considerations play practically no part in the selection either of patrolmen or of the higher police officials. The more important positions are often filled by applicants from the universities or from the military schools. In the United States the higher posts are generally held by men who have risen from the ranks, while the chief is usually a man of no administrative training or ability, who receives his office as a political reward and whose tenure is usually brief because of the vicissitudes of politics or of statutory limitation of his term. In the larger cities the tenure of the administrative head averages less than two years, and the record of the smaller cities is not materially better. This condition has had a demoralizing effect on police forces in the United States and stands out in sharp contrast to European practise, in which police administration is regarded as a profession and where trained chiefs of police generally hold office as long as they render efficient service or until they are called to more important posts. The fact that the head of a police department in a European city is rarely chosen from among its inhabitants is a factor, although possibly a minor one, in accounting for the absence of local political influence in European police administration.

Special police training, both for recruits and

for supervising officers, is coming to be almost universal, despite the fact that the highly decentralized character of police systems in the United States has somewhat retarded the movement. Police discipline does not constitute a serious problem except in the United States, where tenure of office statutes raise high obstacles to vigorous executive action and where civil service commissions or the judiciary have been granted a wide discretion in hearing or reviewing charges against police officers.

Not many decades ago police were customarily required to work twelve hours a day and received no rest days or vacations. This practise has been quite generally abandoned. The hours of duty now approximate eight per day, except in emergencies. Rest days are apportioned either according to a fixed ratio, usually one day in seven or one in ten, or formal leave is allowed after an extended tour of duty. Wages for patrolmen vary from excessively low pay, which predominates in Europe, to more or less adequate salaries, as, for example, those paid in such cities as New York, Chicago, Detroit and San Francisco, in which the maximum is from \$2500 to \$3000 per year. In some European cities housing provision is made for patrolmen or rent allowances are paid in addition to salaries. Almost universally pensions are granted upon retirement and it is general practise for large police establishments to engage the services of regular police surgeons, who supervise the general health and welfare of the rank and file and act as inspecting officers to prevent malingering among those on sick leave.

Benevolent and protective organizations of the rank and file are especially common in England and the United States. Although in the latter country police authorities have sternly suppressed various attempts of local associations to affiliate with the American Federation of Labor, some of these associations operate in fact as local police unions which employ collective bargaining methods. In England, following the police strike of 1919, Parliament provided for a federation of all English and Welsh county and municipal police which is to be consulted by the government upon all matters affecting conditions of service.

The most common activities of police forces embrace uniformed patrol, criminal investigation and identification, crime prevention, criminal records, departmental records, traffic regulation and the maintenance and operation of plant and equipment, including facilities for

transportation and communication. Systematic uniformed patrols, conducted throughout the day and night, are everywhere recognized as being an essential prerequisite to effective police protection. These patrols are now commonly divided into three daily tours of duty of approximately eight hours each. Their distribution is usually based upon a fixed territory to be covered by each uniformed patrolman, and certain facilities for communication between patrols and police stations are steadily coming into more general use. Patrols are supervised by superior officers who visit them at frequent intervals and are checked by routine signals dispatched by patrolmen from telephone or telegraph boxes.

Two recent English innovations in patrol methods are worthy of note. The decentralized patrol, or "police box" system, first extensively employed in Newcastle upon Tyne, has been widely adopted throughout Great Britain. It prevents the periodic contraction and expansion of the protected area by requiring the police constable to report for duty at a police booth located on his patrol post, at which point orders are transmitted to him and from which he conducts systematic patrols of the surrounding area. Similar in purpose, although less simple in execution, is the patrol system which originated in the Hertfordshire constabulary. This system discards the traditional "beat and relief" plan with defined areas for individual patrol posts and requires that police constables follow a specified itinerary and time schedule which carries them over a considerable territory in the course of a tour of duty. Hence several patrols are constantly at work in any given area, or "sector," although each is independently conducted. Several combinations of alternative routes are provided, and individual patrols are dispatched from a central point at specified intervals throughout the day and night.

Although foot patrols are the most common, the use of bicycles, motorcycles and motor cars is steadily increasing. Equestrian patrol is gradually decreasing, despite the fact that it is still of great value in protecting inaccessible rural districts and extensive park areas. Mounted police have proved invaluable in regulating slow moving traffic and in quelling riots and other street disorders as well as in handling orderly but unwieldy congregations of people. Throughout the United States motor cars of all types are used by police forces for patrol purposes, as a convenience to criminal investigators and super-

vising officers, for the transportation of prisoners and for routine police work generally.

Electrical communication in various forms is coming into widespread use, particularly in the United States. For communication between headquarters and district stations public and private line telephones, telegraph, teletype and the radio telephone and telegraph are employed; between patrolmen on post and district stations the telephone, telegraph and centrally controlled recall signals are used; while broadcasts to patrol cars through the radio telephone, and in a very few instances the radio telegraph, have constituted a recent innovation. In 1933 about one hundred police forces in the United States were operating radio broadcasting stations. Regional police radio service is available in some metropolitan areas and in a few states.

The maintenance of public order sometimes requires that police employ quasi-military methods in suppressing riots, in regulating activities connected with industrial strikes and lockouts, and in preventing or restricting mass demonstrations or politically subversive movements. The performance of these duties under disturbed conditions leads to charges that the police employ undue force and brutality, but the evidence in such cases is of so conflicting a character as to render any general judgment difficult.

Criminal investigations are often turned over to a special unit, which is usually an integral part of the general police force, although in some continental countries major offenses are investigated by an independent branch of the police. Medico-legal science and the allied methods of discovery known as *police scientifique* are more or less extensively employed in all but the English speaking countries. The police forces of the latter continue to rely upon the natural shrewdness of investigators, the examination of witnesses and suspects, and confidential sources of information, such as "stool pigeons" and secret agents. In the United States the use of stool pigeons is a common practise in the enforcement of laws prohibiting alcoholic beverages, narcotics, prostitution and gambling. Criminal investigators and detectives also occasionally protect and otherwise compensate drug addicts and prostitutes who provide them with information concerning crimes and criminals. Police in English speaking countries question the practical use of many so-called "scientific" processes of criminal investigation and maintain that they can be successfully applied

only in unusual instances. Nevertheless, *police scientifique* is making measurable progress even in Great Britain and the United States, particularly in the larger police establishments.

The use of brutal methods as an aid to criminal investigation—the “third degree”—is most frequently charged in the United States, although similar complaints against the police are by no means rare in other countries. While such abuses are sometimes described by persons of doubtful credibility and tend to be grossly exaggerated as to gravity and frequency, they unquestionably exist and are a continuing reproach to the police forces which apply them. It is perhaps significant that the most efficiently managed police forces are least frequently charged with brutality to prisoners in their custody. In England efforts to suppress alleged third degree practises have led to the imposition of severe limits upon the right of the police to interrogate suspected persons, and according to some observers the success of criminal investigations has thereby been impaired. As a further expedient for the elimination of third degree practises it has been proposed in the United States that the police be required to arraign prisoners immediately after arrest.

Police forces, particularly in English speaking countries, are now directing a part of their attention toward the preventive aspects of police work. Since little is definitely known concerning crime causation, the preventive efforts of police, while promising, have thus far been of uncertain practical effect. There is a continuing tendency to turn preventive and protective work with women and juveniles over to a corps of policewomen. In England these officers are usually uniformed, a practise which has been criticized by some English commentators as encouraging the recruiting of the “jail matron” type. In the United States policewomen are seldom in uniform, and some effort is made to recruit them from among social workers. Thus the techniques of the police and of the social worker are combined, and it is hoped that in time there may emerge a new technique of crime prevention.

Criminal identification through the Bertillon anthropometric system is rapidly being replaced by dactyloscopy, or fingertip impressions. The latter method, used in conjunction with photographs of offenders, is coming to be universal in police organizations. Single fingerprint classifications designed to facilitate the identification of fragmentary fingertip impressions found at

the scene of a crime are being developed in Denmark, England and the United States. The criminal *modus operandi* system, which originated in the West Riding Constabulary, Yorkshire, is designed to facilitate investigations by providing a list of suspects based upon the criminal method employed. Its use is general in England and Wales and is increasing in the United States. With the improvement in communication the area in which a criminal may operate has been tremendously expanded. In order to meet this new development great national and state exchanges, or clearing houses, for criminal identification data are coming into general use. The National Division of Identification in the United States Department of Justice at Washington is the largest of these, with over 3,800,000 fingerprint records on file (1933).

Aside from certain administrative and procedural records, which vary widely according to the special requirements of each police force, there is a steady movement toward uniformity of reports concerning crimes committed, arrests made and cases prosecuted and disposed of. National statistics concerning such matters quite invariably originate with local police units, even though the final and complete tabulations are made by central authority. In western Europe, the British Isles and colonial possessions nation wide police and crime statistics are firmly established. In the United States rapid progress has been made along these lines, particularly since 1930, when the United States Department of Justice took over officially the Uniform Crime Reports previously prepared and compiled by the International Association of Chiefs of Police.

With the increasing use of the motor car traffic regulation has become an important feature of police work. It is usually performed by the regular police force, both because of the administrative convenience of this method and because police surveillance of motor cars as instrumentalities of crime is thereby simplified and improved.

The most common type of rural police is the *gendarmerie*, which exists in many parts of the world as a state controlled police force, sometimes being recruited from the ranks of the army. The peculiar nature of the sheriff-constable system, as it originated in England, has, however, profoundly influenced rural police organization in all English speaking countries. In Great Britain the sheriff has been shorn of

his police powers, the parish constable has disappeared and both have been succeeded by highly organized constabularies for each administrative county. These frequently assume sole responsibility for the protection of urban and rural areas alike. In the United States the sheriff-constable system continues to function after a fashion, although in all cases independently of any effective form of central control. It has been widely criticized as a method of law enforcement and seems destined for eventual extinction. County, town or special district constabularies have been superimposed upon the ancient system in a very few special instances.

In a considerable number of states there have also appeared state police forces, which are tending to deprive the sheriff and constable of control over rural police protection. The better state forces are completely equipped as regards transportation and communication, conduct regular and systematic patrols of rural areas, have a record of convictions of about 90 percent in relation to the number of arrests which they make and in several instances have successfully avoided political influence. In some cases state authorities have employed them in suppressing industrial riots or other unlawful assemblages, in the course of which they have acquired a reputation for ruthless efficiency. Hence organized labor has taken a definite stand against the use of state police for the suppression of riots and disorders and has more or less actively opposed the establishment of such centrally controlled police bodies.

Somewhat comparable are the provincial police maintained in the western provinces of Canada. These have been rivals, in a sense, of the Royal Canadian Mounted Police, a national force, and for a time threatened to oust the latter organization from the performance of general police work in the rural portions of the country. Recent developments indicate, however, that the provincial police may in time disappear and that the Canadian Mounted will again assume general responsibility for law enforcement not only in the arctic and subarctic regions, where their position has never been challenged, but in the rural settlements of southern Canada as well.

Quite aside from, and in addition to, the rather strong general tendency toward centralization of police control, there are instances in which central governments maintain special forces to deal with particular problems. The political police maintained in both czarist and

Soviet Russia as well as the wide variety of federal police agencies located in various departments of the United States government partake of this character. The latter are noteworthy because of the unusual complexity which characterizes federal police arrangements in the United States. There are four federal agencies which perform police functions exclusively: the Division of Investigation in the Department of Justice; the Secret Service and the Customs Border Patrol in the Treasury Department; and the Immigration Border Patrol in the Department of Labor. In addition there are five other agencies distributed over the departments of Treasury, Labor and Post Office, which devote much of their time and attention to police functions. These units include the Narcotic Unit, the Customs Special Agency Service and the Coast Guard in the Treasury Department; the Immigration Service in the Department of Labor; and the Division of Inspectors in the Post Office. Despite the fact that most of these nine police units are concerned with the enforcement of particular federal statutes, there is a considerable degree of overlapping in their investigations. Thus the Customs Border Patrol, the Immigration Border Patrol, the Customs Special Agency Service and the Narcotic Unit all deal in some degree with the smuggling of aliens and of liquor, drugs and miscellaneous commodities. Similarly, the Customs Border Patrol, the Customs Special Agency Service, the Coast Guard and the Division of Post Office Inspectors are directly or indirectly concerned with the enforcement of the liquor laws. Because of this overlapping there is a persistent demand that further consolidation of federal police agencies be effected.

The development of a scientific attitude in police work and the obvious advantages of co-operation between police units have led to state, national and international associations of police executives. The Deutsche Kriminalpolizeiliche Kommission and the English Chief Constables' and County Chief Constables' associations are perhaps the most active and prominent of the European organizations. Similar associations of police executives, sheriffs or peace officers have been set up in many states of the United States, of which the most important is the International Association of Chiefs of Police, with a membership drawn chiefly from the United States and Canada. There are some organizations which have an international character and devote much of their activity to improving methods for the

exchange of criminal information. Especially prominent in the latter category is the International Criminal-Police Commission, composed chiefly of the representatives of continental police forces.

POLICE COURTS. See **COURTS**; **JUSTICE OF THE PEACE**; **MUNICIPAL COURTS**.

POLICE POWER is an idiom of apologetics which belongs to the vocabulary of constitutional law. In American government the validity of any regulatory statute may, in "a genuine case in controversy," be tested by judicial review. If the act is sustained, the police power is usually invoked as the sanction; if it is declared null and void, some such phrase as "lack of jurisdiction" or "want of due process" lies at the base of rationalization. Hence the police power is one of two balanced terms which make up a formula of constitutionality. As cause follows cause to judgment, "public benefit" is measured against "private sacrifice," and victory goes with the concept which is weighted with the more compelling values. A repeated use has worn away the metaphorical significance of the term, and police power connotes to those who habitually employ it an objective reality.

The antecedent institution of the police runs back into antiquity. It springs from *πολις* the genitive of a Greek noun, which means "of or pertaining to an organized community." The Romans appropriated the word, Latinized it into *politia*, the condition of the state, and in the golden age of Augustus established a police for the maintenance of law and order. After the decline of the empire and a long period of chaos there was revived in the capitularies of Charlemagne a body of regulations for weights and measures, tolls and markets, the sale of food and cattle and the relief of famine and pestilence. From that time the orbit of control roughly marked out by these particulars has, with intermittent consistency, been called "the police."

In English usage, even from Tudor times, the word police has connoted the way of the state with its subjects. As the feudal establishment crumbled beneath the shock of change, the system of duties called piety gave way to the more elastic demands of polity. In time this useful, generous and time-serving word was resolved into the distinctive terms of policy and police. In Samuel Johnson's *Dictionary* policy has reference to foreign affairs while police defines "the regulation and government of a city or country so far as regards the inhabitants."

In his *Lectures* Adam Smith used the word police to denote a domestic regulation of such matters as taxes, bounties, monopolies and the exclusive privileges of corporations. Blackstone, who was in the nineteenth century to become the Great Commentator, drew up an extended catalogue of "offences against the public health, and the public police or economy." His undifferentiated category includes such miscellaneous items as bigamy, association with gypsies, keeping a disorderly inn, maintaining an unlicensed theater, carrying on an offensive trade, conducting a lottery, eavesdropping and being a scold. Idleness was "a high offense against the public economy"; sumptuary laws were to be leveled against luxury and extravagance; and the public police through "due regulation and domestic order of the Kingdom" was to bind the individuals to "conform their general behaviour to the rules of propriety" and to become "decent, industrious, and inoffensive in their respective stations." In short the police comprehended all regulation necessary to the virtue, peace and wealth of the nation.

As time brought challenge to authority, "power" was the verbal symbol by which a body of usage was translated into doctrinal statement. In the Holy Catholic church each bishop and priest was a vicar of Christ and exercised a power vested in him from on high. In the authoritarian order of feudalism every office and station from emperor to serf had its vested liberties and its established obligations. As parchment came into use, men came to repose a trust in engrossed words as a limitation upon arbitrary action. One who acted for another must not exceed his power of attorney; a minister of state was not to exceed the powers of his office; the crown itself might lawfully employ only the powers granted by the sovereign. As the divine right of kings passed and written constitutions emerged, the activities of government were restricted to powers specifically granted by the people. Finally, as the judiciary came to expound "the higher law," power became a key word without which no constitutional argument could be driven to a restful conclusion.

At last the words were quietly mated, and "the police power" made its unobtrusive entrance into the law reports. As early as 1774 a Declaration of Rights had claimed for each of the colonies "a free and exclusive power of legislation" in "all cases of taxation and internal polity." In 1827 in the famous case of *Brown*

v. Maryland (25 U. S. 419), which concerned the capacity of the state to tax merchandise coming from across its borders, Marshall made the breaking of the "original package" the line between the congressional control over interstate commerce and "the police power" of the state. But the verbal coin of a Federalist chief justice was not given immediate currency. Kent in his *Commentaries* recognized that "the government may, by general regulations, interdict such uses of property" as might "become dangerous to the lives, or health, or peace, or comfort of the citizens." He enumerates specifically "unwholesome trades, slaughter-houses, operations offensive to the senses, the deposit of powder . . . the building with combustible materials, and the burial of the dead"; but as a common lawyer he rests his authority upon the duty of the owner so to use his property as not to injure another and upon the right of the state to abate a nuisance. It is not until the twelfth edition, which appeared in 1873, that the editor, O. W. Holmes, Jr., set it down in a footnote, "This power of the government is now called the police-power." And, if his *Commentaries* alone are to be taken as evidence, Story seems never to have heard the term.

For a time the police power was a concept in search of a content. It had been employed by the great Marshall; it was large, sonorous and compelling, a verbal judicial treasure; it had no certainty of meaning. In 1837 in the case of *Charles River Bridge v. Warren Bridge* (36 U. S. 420) Taney found in the power "to promote the happiness and prosperity of the community" an answer to the contention that a charter from a state was exclusive; and within two decades the police power was being employed by state courts as an answer to the charge that statutes regulating corporations impaired the obligations of contract.

Taney and his associates were not unaware of the problems of a rising business economy. But slavery was filling the air with a clash over states' rights, the practical members of the court were not insensitive to prevailing doctrines, and in the major activity of constitutional exposition rival philosophies found expression. In 1837 in the case of *City of New York v. Miln* (36 U. S. 102) the court decided that a statute designed to exclude paupers and other undesirables was not an encroachment by the state upon interstate commerce. In a concurring opinion Thompson insisted that no legislation could "fall more directly within the police power and

internal regulation of a state." In subsequent cases concerned with the validity of state acts forbidding an owner to recapture his runaway slave within the boundaries of other states, imposing regulation upon the liquor traffic and assessing fees upon immigrants the issue of jurisdiction was fought out. The fortunes of battle varied, sometimes by a close vote and never with a concurrence of the opinions of the justices. In all these cases the challenge is in the name of interstate commerce, and in all of them Barbour, Story or some other justice invokes an equivalent of the police power as a justification of the legislation. But the Marshallian term shares its dialectical eminence with "police regulation," "internal police" and "police powers," and it is not until the 1850's that it is established as a constitutional category. It is, in the language of Baldwin, as against federal authority "a power excepted and reserved to the states" which "remains in them in full and unimpaired sovereignty."

But dialectic does not always reflect actuality. If those who challenged state legislation invoked the sanction of interstate commerce, it was not because they were stanch Federalists. Rather they found the statutes inconvenient and leveled against them the readiest constitutional weapons at hand. In the first half of the century the issue of constitutionality was generally confined to ex post facto laws, especially acts impairing the obligations of contract. But even in this period town ordinances regulating saloons, markets and trades were sometimes attacked as contrary to some clause in the state constitution or as in excess of the authority granted to the municipality. Here the issue lay between the common law doctrine of the freedom of trade, buttressed by statutory or constitutional sanctions, and the propriety of the regulations of police. In 1852, in the case of *Jones v. People* (14 Ill. 196), police power seems first to have been set in opposition to individual rights. In the next year, in the classic opinion of Shaw in *Commonwealth v. Alger* (61 Mass. 53, 85), a statute forbidding the erection of any wharf within certain parts of Boston harbor is upheld as a proper exercise of "the police power." This is the authority "vested in the legislature" to "establish all manner of wholesome and reasonable laws" which are judged to be "for the good and welfare of the commonwealth." As this opinion gained wider currency, the police power definitely became the judicial defense against the charge of an invasion of "the con-

stitutional rights to liberty and to property."

After the passage of the Fourteenth Amendment the development of the doctrines of the "police power" and "freedom of contract" became inseparable. In cause after cause, as social legislation was submitted to judicial review, their rival claims were fought out. In 1873, in the *Slaughter-House Cases* (83 U. S. 36) the police power of Taney and of Shaw prevailed over a novel attempt to read the indefeasible rights of man into the privileges of United States citizenship. In 1876, in the first of the *Granger Cases* (*Munn v. Illinois*, 94 U. S. 113) it won a victory over a crudely formulated doctrine of "due process." In 1886 the corporation was endowed with the rights of personality; and since that time, in the formula of constitutionality, the "police power" has been set in opposition to the deprivation of liberty or property without "due process of law." If the abridgment of individual right loomed larger in the judicial mind, the statute was condemned; if the act seemed to the justices to serve such ends as public safety, public health, public morals or occasionally even an indefinite public welfare, it was approved.

But even such worthy and catholic terms, fitting as they were to a rudimentary social order of agriculture and petty trade, are hardly an adequate expression of the objectives of an industrial society under control. For want of a longer catalogue the courts have had at times to resort to logomachy to sustain statutes protecting the buyer against the unscrupulous seller, shortening the workday, and assuring the payment of wages in coin of the republic. Statutes outlawing billboards have been held valid by an invocation of the law of nuisance or an appeal to public morals. The minimum wage failed of judicial approval because the majority of the Supreme Court could not discover for themselves the nexus between its objectives and the public health. Although precedent has played its part and the judiciary tends to repeat a decision, the court has acknowledged that constitutionality depends upon circumstance. Accordingly, in pricking out the lines of the police power, there is opportunity for judges to be guided by their personal preferences, and the law reports present a battle ground between rival social philosophies. In fact in the continuing volumes of record it is easy to trace the waxing and waning fortunes of the police power.

The idea of a federal police power would have been an anomaly to Marshall, Taney,

Bradley and Field. Even today the term is used only by jurists who are caught off guard or who consciously attempt to give exact names to current realities. But Congress has grafted upon the powers which it possesses over the mails, taxation and interstate commerce a police function. Obscene matter, seditious newspapers and lottery tickets have been denied admission to the mails; oleomargarine has been penalized in favor of butter and narcotic drugs have been outlawed in measures designed "to raise revenue"; hours of work have been regulated, liability for industrial accidents has been imposed upon employers, and the white slave trade has been prohibited in the name of interstate commerce. As a result of a stream of tendency, which as yet has not run its course, the federal government is already possessed of fragments of a power which was once but another name for "the residual sovereignty" of the states.

In the decades just ahead the police power is almost certain to be remade. It was recently invoked in the case of *Hammer v. Dagenhart* [247 U. S. 251 (1918)] to declare invalid a congressional prohibition of child labor and to check at least for a time the trend toward nationalism. So long as the federal system endures it will doubtless continue to be a counter in the jurisdictional combat between the state and the national government. As yet we have not succeeded in domesticating an unruly industrialism; a fault line exists in our culture between business enterprise and the institution of control. As a definite philosophy replaces the opportunism which drives our society toward collectivism, the domain of regulation will be greatly extended. In a drift or a drive toward a state capitalism or a business socialism ways and means will be employed unknown to the police power of the tomes on constitutional law. Such instruments of welfare as industrial codes, a managed currency and a processing tax, creatures as they are of an emergency, are mere forerunners of a comprehensive array of novel regulations. A truce can be effected with a national industrial system only through a complementary system of control. As emergency succeeds emergency in the continuous process called history, an enlarged police is likely to make provision for a revised public welfare; and as it does the idiom police power will probably fade from the apologetic vocabulary of constitutional law.

POLICING, INDUSTRIAL. Wherever collective action by labor is officially discouraged or prohibited, industrial policing manifests itself in espionage, provocation and deliberate brutal suppression not only of strikes or demonstrations but of free assembly and free speech. The early history of the labor movement of every country gives testimony of repeated and widespread police violence and interference with the civil rights of workers.

With the growing strength of labor organizations, the major abuses of industrial policing have tended to disappear. However, even in countries where the labor movement is strong, the occasional use of strike breakers guarded by troops has led to bloody conflicts, as in the

Aadalen valley of Sweden in May, 1931, when five striking pulp wood workers were killed. Mass demonstrations, such as those of the unemployed, may also lead to police brutality, as in London and Geneva during the fall and winter of 1932. And in all European countries the calling of a general strike (*g. v.*) inevitably resulted in an unusual display of policing activities, the regular forces often being supplemented by "citizens' emergency committees" and the governmental military forces.

Since the rise of fascist regimes and the resurgence of military dictatorships, government has once again openly suppressed labor activities. The most virulent forms of suppression of workers' organizations by police appear in colonial and semicolonial countries where forced labor and virtual imprisonment under contract prevail. In revolutionary upheavals the control of the police force becomes a major political issue, as in the struggle between the conservative Lliga Regionalista and the left wing Esquerra in Catalonia in 1932.

Among industrialized countries having a democratic form of government the United States presents in sharpest relief and on the widest scale all the problems involved in the partisan use of police power in industrial relations. The practise, widespread in the United States, of selling governmental police power to private employers is unknown in most other countries and is directly connected with the persistent and organized refusal of the overwhelming majority of American employers to countenance any form of collective bargaining and with their use of professional strike breakers during industrial disputes. The presence of large numbers of strike breakers inevitably creates situations where breach of the peace is difficult to avoid. To meet such situations employers aim to strengthen the police by importing additional forces. These forces are of several types. Sometimes they are hired watchmen and guards, who are usually but not necessarily deputized as officers of the law. In certain states which have state constabularies or in cities with special "industrial squads" these may be used. Finally, the state militia and, in strikes involving interstate commerce, the federal troops may be summoned for industrial duty. Although there are many instances of violence, illegal arrests and prohibition of union activities by regular police, especially where labor organization is weak, the bulk of the illegal acts in industrial disputes are occasioned by the use of private police, state

constabularies and militia, especially the first named group.

Some types of private police exist in the United States as more or less permanent forces. The marshals or chief guards in non-union coal camps and other company towns who have the job of preserving order and stamping out incipient unionism are usually deputized by the sheriff of the county, who is in turn paid by the employers. Thus in Logan county, West Virginia, it was reported in 1923 that the coal operators' association stated that it paid \$7000 monthly to the sheriff for the salaries of deputies. The sheriff retained a commission on each salary so paid.

Pennsylvania authorizes the appointment of a special class of watchmen, with a special uniform, commissioned by the governor but paid by the companies; these have all the authority of regular policemen, including that of arrest in any part of the county in which they operate. Railroad police were authorized in 1865 and coal and iron police in 1866. In 1925 special police were authorized for certain public utilities, and about the same time coal and iron police began to be used extensively for the first time in the bituminous coal fields of western Pennsylvania. In 1928 it was stated that there were 2474 coal and iron police in the bituminous coal fields alone. The unusual brutality shown by some of these police in the coal strike of 1927-28, culminating after the strike in the unprovoked murder of a mine employee, led to the revocation of the commissions of all special police in 1931. But the law providing for their appointment is still on the books.

When industrial disputes occur, it is common for employers to purchase the active cooperation of the regular police, and private police may be specially hired. The "detective agencies" which make a business of providing professional strike breakers to employers also supply professional guards or other private police or detectives. The proportion of guards so hired to professional strike breakers is seldom less than one to five, often as high as one to three and in special instances, as, for example, in truck drivers' strikes, may be one to one.

In non-urban areas such guards are sworn in as deputy sheriffs (in Pennsylvania as special police), and in some disputes the strike breakers also have been commissioned as deputies. Where special conditions have prevented the use of the deputy's commission, guards have become sheriffs' aids or special constables. In urban

areas the use of special police takes a different form legally, since deputy sheriffs are used comparatively seldom. The effect, however, is much the same.

All classes of special police employed in labor disputes are usually recruited from the same low class of people as professional strike breakers. Thus men, untrained for policing, with criminal records and a disdain for the law, are clothed with legal authority. The result is wholesale violation of the civil rights of strikers and brutality, murder and brigandage directed against workers, their families and persons or groups in sympathy with them. These acts of open class warfare on the part of the employers are sometimes conducted on a tremendous scale. In the first three months of the anthracite coal strike of 1902 the employers are said to have spent \$1,800,000 for coal and iron police alone.

The system of clothing with public police power the agents of private employers has been repeatedly condemned by government commissions; the Anthracite Coal Commission of 1903, the United States Commission on Industrial Relations in 1915, the United States Coal Commission of 1923 and the Senate Committee on Education and Labor appointed in 1919 to investigate the steel strike have all denounced the practise. But the weakness of working class organization in those localities where private police are used has resulted in the persistence of the system. The law continues to be administered by private armies, comparable to those of feudal chiefs in the Middle Ages.

Major industrial disputes are likely to lead to the calling out of state troops. In exceptional instances the demand for troops may come from workers or local business men. But typically the demand comes from employers who have found themselves unable, because of the economic and political strength of the workers in the community, to crush a strike by the use of private police.

The custom of quartering militia on company property and even, in some instances, of having the employers pay part of their expenses is prejudicial to the impartiality of troops on strike duty. However, the attitude of the militia in strike situations varies according to the social composition of the troops and their place of origin. Typically the militia is composed of young workers, although the antilabor acts which have been forced on the rank and file by their superiors have brought the militia into such bad repute with organized workers that

some unions have forbidden their members to join the militia. If locally recruited, the troops may fraternize with the strikers. In Colorado, where the state had spent between 1880 and 1904 over \$1,000,000 for the use of its militia in strikes, a special effort was made to secure college graduates as members. During the mine strike of 1914 a company of militia was sent to Ludlow made up almost entirely of college graduates, who asked for relief from duty and were replaced by professional gunmen from West Virginia. These gunmen later burned the strikers' tent colony and caused the death of a score of women and children.

Another form of extralocal police force is the state constabulary. Such a force was established in Pennsylvania in 1905 following the failure of the militia and the coal and iron police to crush the anthracite strike of 1902. Strike policing was the most important but not the only function of the constabulary. From January 1, 1906, to June 1, 1930, one seventh of its time was devoted to strike duty. Between 1917 and 1921 state police forces patterned more or less on the Pennsylvania model were established in New York, Michigan, Tennessee, West Virginia and New Jersey. Since 1921 only three states, Rhode Island, Oregon and Missouri, have established such police forces, while two other states which had such forces abolished them. In states other than those mentioned the state police, where they exist, do not figure in strike situations to any great extent. In Pennsylvania and several other states (not including New York) the governor may order state police to the scene of an industrial dispute in the absence of acts of violence and even over the protest of the local authorities.

Federal troops have occasionally been used in strikes. These troops are usually not quartered on employers or paid by them, but the federal troops which were used in the American Railway Union strike of 1894 were practically controlled by Edwin Walker, a railway attorney who was put in charge by the attorney general at the employers' request.

In some of the larger cities the regular police force is supplemented by special squads assigned to industrial duty. The New York City industrial squad was for a time closely allied with the "strong arm squad" formed about 1914 to deal with gangsters and from 1926 to 1928 was merged with it. The industrial squad was reorganized as the radical squad in 1929. The duties of such special police involve not only

policing of strikes but espionage in so-called radical organizations and the curbing of their public demonstrations.

Strike leaders generally have come to look on an appeal to the law for protection against industrial police as a waste of time and money. Complaints have usually resulted only in perfunctory action against the offenders, and even the highest courts have shown little disposition to assure protection to strikers. Thus the Colorado State Supreme Court in 1904 denied the writ of habeas corpus to Charles H. Moyer, a strike leader who had been arbitrarily held in prison by police at the employers' behest; and the summary exclusion of union organizers by company police from certain areas of the West Virginia coal fields was sanctioned by the United States Supreme Court in *Hitchman Coal and Coke Company v. Mitchell* [245 U.S. 229 (1917)].

Occasionally working class leaders have urged direct resistance to publicly commissioned agents of the employers. The formation of permanent workers' military organizations has been advocated from time to time, as by the German socialists of Chicago in 1875-78, but the idea has never taken hold. Only when the workers have been driven to desperation, as by the Ludlow massacre of 1914 in Colorado and the outrages in Logan county, West Virginia, in 1919-21 have they taken arms in concerted revolt against the abuses of industrial policing. Such uprisings have been quickly put down by federal troops. Workers as the weaker party strategically have little to gain from a resort to arms. In the few instances where the local police have been sympathetic to strikers or where the political influence of labor has been strong, the situation has been somewhat different. Occasionally unions have used the weapons introduced by employers and have bought police neutrality or the protection of gangsters and racketeers. But the workers have usually been outbid by the employers.

If the prevention of violence were the main consideration in policing industrial disputes, the end could be attained in most instances by prohibiting the importation of scabs. Such action on the part of public officials has, however, been held unlawful wherever the question has come before the courts, except in situations where martial law has been declared. In the United States, generally speaking, legislatures, courts and public officials have upheld the employers in the use of methods designed to prevent

unionism, and the tactics of both public and private police have merely carried into action the implications of this attitude.

The United States Commission on Industrial Relations said of the Pennsylvania State Constabulary: "It is an extremely efficient force for crushing strikes. . . . It appears to assume . . . that the strikers are its enemies and the enemies of the State and that a campaign should be waged against them as such." The same holds true for American industrial police forces generally. The conclusion, by the same commission, that "violence seems to increase where the constabulary is brought in" suggests that industrial policing in the United States has augmented the violence for the prevention of which it has nominally been intended.

POLISH CORRIDOR. By the first and second partitions of Poland, in 1772 and 1793 respectively, the Polish palatinates of Pomerania (Pomorze), Poznań (Poznań) and part of Silesia were allocated to Prussia. These territories, historically Polish for three centuries and ethnographically Polish for over eight hundred years, although containing a number of German enclaves, were incorporated into and administered by Prussia down to the end of the World War. In the course of a century and a half of Prussian rule the three areas were inextricably caught up into the German economic and transportation system, the cities of industrialized central and western Germany serving as the principal outlets for the mineral and agricultural products of Prussian Poland. But while they were economically integrated into the fabric of Prussia and the Reich, the three Polish areas resisted political assimilation vigorously. Until the end of the Hohenzollern regime the provinces sent Polish representatives to every Reichstag.

In pursuance of President Wilson's Thirteenth Point, accepted by Germany and the Allies as one of the bases of peace, the Paris Peace Conference undertook the erection of "an independent Polish State," which should "include the territories inhabited by indisputably Polish populations," should "be assured a free and secure access to the sea" and be guaranteed "political and economic independence." In the definition of Poland's western boundaries strategic factors were virtually ignored. Except in Upper Silesia, whose mineral resources were felt to be essential to Poland's national economy, the boundary was determined primarily by reference to German linguistic statistics, which officially favored the Reich, and secondarily by religious considerations, which undoubtedly favored Poland. The net result was a boundary broadly conforming to that of 1772, save to the extent that German colonization, particularly in the northern portion, had made definite inroads on historically Polish territory. This fell short of the Polish claims, which included the whole of Silesia and Danzig. The boundary was basically ethnographic with minor deviations made to avoid undue dislocation of existing communication lines. In defining the northern boundaries of Poland, the Allied Supreme Council, disregarding the recommendations of its experts, rejected the Polish claim to Danzig and, under British pressure, set off the mouths of the Vistula, with a carefully delimited German

hinterland, as the Free City of Danzig, leaving to plebiscites in 1920 the final decision as to the southern boundaries of West and East Prussia. The cumulative effect of these decisions was not to create but to restore a narrow coast line, giving Poland direct access to the Baltic, with auxiliary opportunities for commerce and navigation down the Vistula to Danzig. East Prussia, while it remained a part of the Reich politically, was completely cut off from German territory by the corridor and Danzig. The territories lost by Germany to Poland were first: Upper Silesia, whose economic entity was dismembered when the Council of the League of Nations partitioned the area between Poland and Germany, despite a plebiscite definitely favorable (707,393 to 479,365) to Germany; second, approximately five sixths of the province of Poznań, the loss of which was not seriously contested by Germany on account of its pre-eminently Polish character; third, Pomorze, which constitutes the "corridor." Lastly, Danzig and its environs, whose thoroughly German character has never been contested, became a free city. The first two areas concern the corridor question only indirectly, in so far as their commerce and communications are involved; the latter two are the crux of the corridor problem.

Geographically the voivodeship of Pomorze embraces an area of 6327 square miles; it is situated along both banks of the lower Vistula between 52° 50' to 54° 50' north latitude and 17° 10' to 20° 25' east longitude, with a coast line of approximately 90 miles on the Baltic. Sparsely populated at the time of its cession to Prussia, according to Prussian statistics it had a population on the eve of the World War of approximately 990,000, of which 437,412 were Germans, 448,773 Poles and 104,000 Kashubes, a people closely affiliated ethnographically to the Poles. By 1921, after two years of Polish administration, the population had fallen to 935,643, of which only 196,020 were Germans and 743,225 Poles. A decade later the total population had risen to 1,086,144, of which 109,645 were Germans and 976,499 Poles. These Polish figures, confirmed from German sources, testify to the activity of Poland in fostering internal colonization and in displacing by systematic expulsions, official persecution and differential land expropriation more than 330,000 Germans in the one province alone. In consequence the corridor area is approximately 90 percent Polish and is moving farther in this

direction. Political pressure has resulted in the progressive de-Germanization of the corridor area.

Economically the corridor is of enormous importance to Poland and Germany alike. It is the natural outlet of the Vistula, whose basin forms the backbone of the economic life of ethnographic Poland. But because of Russia's desire in pre-war days to divert outbound Russian traffic to Russian ports and also because of the existence of high tariff barriers between Germany and Russia, Danzig failed to obtain its full share of the commerce of the hinterland. Moreover Prussia overcame the natural advantages of the corridor for north and south water borne traffic by developing a highly organized network of strategic and commercial railways linking East Prussia with Berlin, Poznań and Silesia. The delimitation of the corridor, however justifiable from a political, historical or ethnographic standpoint, cut completely athwart this complex web of economic relations, forcing a far reaching reorganization of traffic and thoroughgoing reorientation of the economic life of the territories allotted to Poland. This was to some extent an inevitable consequence of the creation of any Polish state receiving territory from Prussia; but Poland, in contravention of its pledges in article 89 of the Treaty of Versailles, has intensified the situation by consistent efforts to obstruct traffic between its Prussian territories and German West and East Prussia. According to German figures, 68 railway lines, 144 highways and 722 country roads along the frontiers common to Germany and Poland are today barred to traffic, thereby permanently sundering the warp and woof of the area's previous economic life. In addition a number of bridges across the Vistula have been destroyed. Moreover Poland has been successful in preventing the placing of the Vistula under the international regime provided by the Treaty of Versailles for the Rhine, the Elbe and the Oder and, in default of such an agency of supervision and control, has deliberately allowed the lower reaches of the Vistula to silt up and to flood adjacent German territory which had long ago been laboriously drained and reclaimed. This has been a cause of continuous friction between Germany and Poland.

Since 1920 Poland has built several important strategic and commercial north-south railways to connect Pomorze with Poznań and Silesia. Thus the Katowice-Bydgoszcz-Gdynia line was put through partially to compensate for the

deficiency of north-south roads under the Russian regime but mainly to free Poland from economic dependence on the German railways and to maintain a "secure" access to the sea. The creation of the imposing seaport and naval base at Gdynia since 1924 testifies further to the Polish determination to hold fast at all costs to Pomorze but is in itself a confession, widely shared by the inhabitants at Danzig, of the impermanence of the status of the Free City and of Poland's endeavor eventually to dispense with the use of the port of Danzig either in peace or in war. Thus stimulated and manipulated, commerce has broken the old, pre-war trammels and established for itself a new nexus of economic relationships.

The German case against the corridor rests upon an interpretation of the Thirteenth Point widely at variance with that of the Peace Conference. It denies the necessity of creating a Polish state so large as to involve disannexation of the areas once annexed by Prussia; it challenges, particularly as regards Pomorze, the "indisputably Polish" character of the population, basing its assumption on an essential difference between Kashubes and Poles, a view unsupported by ethnological, philological or historical evidence; it questions whether "free and secure access to the sea" in reality involves direct frontage by Poland on the Baltic. "Free" access is regarded as involving merely free zones for commerce at the mouth of the Vistula and in German Baltic ports, "secure" access as internationally regulated navigation of the Vistula. Germany objects also to the status of East Prussia, which although politically a part of the Reich can be reached from the rest of Germany only through Polish territory. The Germans claim further that transportation and communication between East Prussia and the rest of the Reich are unnecessarily obstructed by Poland, to the consequent disadvantage of East Prussian economy. Finally, German propaganda, taking a broad view of the corridor, holds that assurance of Polish "economic independence" does not necessitate the partition of Upper Silesia, especially in the light of the results of the plebiscite. Thus the principal grounds of German objection are economic, argued on the superiority of the economic nexus of 1914 to the claims of historic and ethnographic nationality. This position attributes most of the economic woes of eastern Germany to the "partition" of Versailles rather than to the general economic dislocation of Europe and the virtual loss of the Russian

market, factors which likewise operate to Poland's disadvantage.

On the Polish side the case for the retention of the corridor rests upon foundations of history and ethnography plus a series of accomplished facts—the denationalization or expulsion of Germans, the economic enfeeblement of East Prussia and the systematic disruption of traditional and established means of intercommunication. The corridor is viewed as a birth-right and is conceived to be vital to Poland's economic existence, to its prestige as a coming great power. Where tenuous bases for acquiring possession existed in 1919, they have been buttressed for the past fourteen years by definite administrative measures intended to subordinate, if not completely to extirpate, German influences.

The effect on international relations has been unfortunate, as Polish policy was posited from the beginning on a continuing and inevitable struggle with Germany, economically, politically, culturally. Germany and particularly East Prussia took the loss of the corridor with a bitterness which subsequent events have turned to an uncompromising truculence and a refusal to accept with finality Poland's series of accomplished facts. This has made the corridor possibly the most dangerous tension zone in contemporary Europe. Various solutions of the problem have been propounded, ranging from the complete annexation of Danzig and East Prussia to Poland, through the creation of a small, neutralized buffer state embracing both Danzig and the corridor area, to integral retrocession of both Pomerania and Danzig to Germany. None of these schemes touches two cardinal features of the corridor problem: first, its aspect as basically a matter of communications, and, second, the flagrant violation, at Danzig in its present status, of the principle of nationality. The retrocession of the Free City to Germany, with a certain number of minor frontier rectifications tending somewhat to narrow the corridor; the reorganization of all trans-corridor Germany into a single administrative unit; the demilitarization, after the manner of the Rhineland, of a 50-kilometer zone on either side of the corridor; the creation of a powerful international commission supervising both rail and river traffic in the corridor and Vistula valley—all these measures would tend to remove the basic political and economic grievances of Germany without imperiling Poland and to provide a solution postulated on

the establishment of peace and normality rather than on the perpetuation of an irreconcilable conflict.

POLITICAL OBEDIENCE. See OBEDIENCE, POLITICAL.

POLITICAL OFFENDERS. Political offenses are as old as political activity and flow directly from the struggle for power inherent in the state. They include such acts as conspiracy, rebellion, sedition, treason, lese majesty, assassination, military desertion and mutiny; they may involve not only acts against the government and its officials but culpable acts or derelictions on the part of the officials themselves, such as corruption, extortion or the abuse of authority, which are deemed to endanger the

existing fabric of the state; and they often deviate from the strictly political realm so that they threaten the stability of the larger economic and social order. They form part of the domain of the criminal law but are distinguished from non-political criminal offenses by the fact that the state intervenes not merely to assert the social interest when the person or property of an individual has been attacked, but directly as itself the aggrieved party. Political offenses reach thus to the roots of state power. It is of their essence that they have not merely raised legal issues or stirred up conflicting claims but have been in position to affect the structure or stability of the existing regime.

The rather untrustworthy records which remain of political crime and punishment in the early absolute monarchies of the East—Egypt, the Tigris-Euphrates states, Persia, India, China and Japan—emphasize the despotism of the monarch, the severity with which he punished any act that threatened his power or impaired his dignity, and the divine sanctions that attached to his authority. A wholly different attitude is found in the Greek city-states of the democratic era. The underlying conception was that political offenses were directed not at the head of a state but at its basic framework. Their fear of tyranny made the Greeks unusually sensitive to attempts to overthrow the democratic form of the state. Their greatest fears on this score were stirred not so much by open treason or by direct use of force against the state, instances of which were relatively infrequent, but by the behavior in office of the magistrates and officials. Public office in the Greek *polis* was jealously guarded, and officials might at any time be accused by a citizen of corruption, embezzlement or abuse of authority. To make such accusation, like the vague charge of "injustice" leveled against Pericles, was, in the contest of factional struggle, as much a part of political strategy as of civic zeal and lent itself to demagogic possibilities.

It remained for the Romans to give the law of political offenders a certain conceptual firmness and institutional form. The concept of *perduellio*, or open treason against the state with an obviously hostile intent, was suited to a small city-state surrounded by enemies. But during the agrarian conflict at the time of the Gracchi it began to be evident that danger to the state might lie in the more insidious forms of class conflict or official aggrandizement; and as the empire grew and became primarily an

administrative structure, with a shifting constitutional system and a continuing struggle for power at Rome, *perduellio* was increasingly pushed into the background by *majestas*, or the violation of the dignity and stability of the state. The concept of *majestas* was built up by a series of legislative enactments extending from the second century B.C. to the Claudian emperors. It had its roots in the attempt to bolster the constitution of the plebs against the senatorial encroachments; it received an impetus when Sulla, among his judicial reforms, established a separate *quaestio*, or court, to deal with political offenses; and it suffered a crucial change of character with the advent of the principate, when the protection which had formerly been sought for the state and its magistrates was transferred to the person and power of the emperor. Attempts to overthrow the constitution had in republican Rome not been in themselves *perduellio*, although the means employed might have been; but attempts to restore the old monarchy were expressly forbidden. With the coming of the dictatorship and the principate the legal situation in this respect remained unchanged, since Augustus was very careful not to give legal perpetuity to the monarchy. Counter-revolutionary attempts to restore the republic, like that of Clodius Macer in Africa, or attempts to usurp the throne, were however dealt with *de facto*, and their suppression was given legal stamp by investing the person of the emperor rather than his office with *majestas*. The process of transferring the whole focus of the Roman law of political offenses from offenses against the state to offenses against the emperor was given impetus under the Julian emperors when jurisdiction over important political offenses was transferred from the regular courts to the Senate, and completed under the Claudian emperors when jurisdiction as well as actual power over political offenses was increasingly taken over by the emperor. In the later empire the *crimen majestatis* reached almost whimsical lengths in the prosecution and punishment not only of acts but even of words and thoughts directed against the emperor. But these extremes should not be allowed to obscure the essential function that the Roman law of political offenders performed in compassing a degree of stability for the empire in the face of attack from without, strife from within and the peculiar cumbersomeness of a huge administrative structure.

The Roman legal conception of political of-

fenders left a permanent mark upon later European history. In the Eastern Empire the severe suppression of political opposition and the tabus surrounding the head of the state persisted until the end. In the western world the mediaeval canon law was practically a paraphrase of the *Lex quisquis* of Arcadius and Honorius. But the secular law of political offenders in the Middle Ages was given shape primarily by a fusion of the Roman conception with Germanic tribal custom and the ideology of the feudal system. The late Roman notion of the sanctity of the person of the emperor reenforced the Germanic view of treason not as an offense against the state but as *Treubruch*—a violation of the allegiance which each member of the fighting group owed to his leader; and the fealty of vassal to lord gave a peculiar feudal stamp to the whole conception. Treason was a breach of faith, and betrayal of one's lord the blackest of crimes, a conviction strikingly illustrated in Dante's *Inferno*, where Brutus and Cassius are placed in the same circle of infamy with Judas Iscariot. Anything that touched the lord's person or bore his image—his wife and daughter, his seal, his coin—was enveloped by *majestas*. Punishments were severe. In London alone in 1278 about 280 Jewish money clippers were hanged, while major offenders like David of Wales and William Wallace were hanged, drawn, beheaded and quartered. The mediaeval consciousness with respect to the law of political offenders was summed up legislatively in the Statute of Edward III in 1351 (25 Edw. III, stat. 5, c. 2). By defining high treason and limiting it to seven categories of acts, the statute sought to define the boundaries between treason and felony. To a feudal system this was of considerable moment, since the king claimed for himself the land of offenders convicted of treason while the nobles had secured in Magna Carta a definite provision that in the case of felonies the land was to revert to the lord. But in the very process of expressing the preconceptions of a feudal society the statute marks also the crumbling of that society. One of the categories set down as treason is the levying of war against the king, a conception, as Maitland points out, essentially non-feudal, for in the feudal notion a vassal, if the lord refused him justice, could consider the bond of fealty broken and could levy war against him.

The creation of the national state shifted completely the significance of political offenses. A tripartite struggle between king, nobility and

clergy had as its first result throughout western Europe the victory of the absolute monarchy and the centralized state. For the history of political offenses this meant a transition stage between the feudal and the modern conceptions. Treason was no longer merely a breach of faith with one's lord; and it was not yet a crime against the fundamental institutions of the state. It became that when the absolute monarchy was converted into the constitutional monarchy. In England the crucial century in this process was the seventeenth. At the point of its greatest intensity, under James I and Charles I, the constitutional struggle revolved around these two competing conceptions of political offenses. Parliamentary immunities, ship money and the Star Chamber were all phases of the attempt of the absolute monarchy to strike back at every thrust against it and the attempt of the parliamentary party to set the fundamental law above the king's person or power as a criterion of political offenses. The culmination of this struggle came with the execution of Charles I: the parliamentary party was careful to preserve the legal forms and to behead Charles in his own name as a traitor to the fundamental political institutions of the state. In France too an important phase of the constitutional struggle was the difficulty of setting limits to the king's jurisdiction in trying his enemies and to his use of extraordinary commissions. Throughout the sixteenth century the French kings were compelled to issue ordinances defining political crime and revoking the commissions; but Richelieu and Louis XIV had no scruples about disregarding them on the ground of *raison d'état*. The victory of the constitutional state came earlier in England than anywhere else. France under the *ancien régime* furnished the eighteenth century pattern for Europe in the treatment of political offenders: legal concepts sufficiently vague to allow the king despotic power, *lettres de cachet* for arbitrary arrest, torture in extracting confessions, extraordinary commissions and special procedural rules for the trials, cruel punishments and inhuman prison conditions.

It was out of the French Revolution that there emerged the modern conception of political offenses as offenses against a single state only. When the French libertarians came into power they wrote into the constitution of 1793 (art. 120) a manifesto that the French people would grant asylum to foreigners banished in the cause of liberty but would refuse it to

tyrants. In the United States Jefferson made a similar declaration, and that the sentiment was not restricted to the radicals may be seen from de Bonald's defense of asylum for political offenders in his *Législation primitive* (1802). In their own political practise, however, the French revolutionists were thoroughly realistic in their treatment of all forms of treason or opposition, loyalism or too extreme republicanism. The Revolutionary Tribunal of Paris (1793-95) and the revolutionary *sections* of Marseille (1792-93) were two of the high courts of justice for political offenses whose judicial procedures were divided by only a thin line from the more summary terroristic acts. But the rhetoric of the French revolutionary attitude toward political offenders did not die with the failure of the revolution. Canning was carrying on the tradition when in 1825 he refused to surrender to Spain political offenders who had sought refuge on English soil. It remained for Belgium, however, to take the decisive step in 1834 by its extradition treaty with France, which became a model for others. The treaty contained a provision that political offenders were to be excluded from the obligations of extradition. During the remainder of the century this provision was adopted by all civilized nations.

The liberal constitutional state, which had been created in England by the civil wars and in France by the revolution, contained in its attitude toward political offenders a fundamental paradox. On the one hand, it was sympathetic toward political offenders and refugees from "tyrannical" governments, such as Garibaldi, Mazzini, Schurz and Kossuth; on the other hand, it continued to suppress with severity all threats against its own basic structure. The commercial and propertied classes, having consolidated their power and disposed of their feudal and aristocratic enemies, could afford to be humanitarian toward similar struggles in Germany, Italy, Spain and Russia; but this did not prevent them from using the government and the legal institutions as instruments for maintaining and strengthening their own power. Almost in the same decade that Palmerston compelled Portugal to grant its political offenders amnesty (1847) and Gladstone was leading a newspaper exposé of the treatment of 20,000 political prisoners in Naples (1851) the Young Ireland state trials were held at Clonmel (1848) and the prisoners were transported to Tasmania.

Out of the mid-nineteenth century came a series of movements which, by producing a new

type of political offender, undercut the ideology of the old and challenged the dual role which the middle class liberal state had assumed toward political offenders. The communist participation in both the French and German revolutions of 1848, the rise of Blanquism and of secret associations, such as the *Société des Saisons*, the Paris Commune of 1870, the spread of nihilism and the "propaganda of the deed" in Russia and of anarchism throughout the world threw the liberals into confusion. These were not merely offenders against a particular state: they were revolutionists who threatened all states. Louise Michel and Johann Most, compared with Charlotte Corday and Mazzini, seemed to belong to an entirely different genus. With almost complete unanimity the civilized nations sought to suppress this new type of political offender. Secret organizations of political police were formed; laws were passed for suppressing communist and anarchist groups and for controlling the manufacture of dynamite and bombs. But the significant fact was the movement to exclude this new political offender from the asylum which had formerly been granted freely and to make him subject to extradition. International jurists were hard pressed to explain this change of front; distinctions were drawn between offenses against a particular government and offenses against the very fabric of society. But whatever the rationalization, the democratic liberal state here revealed that it was essentially a capitalist state, and that its primary concern was to preserve the institution of private property and the capitalist organization of society.

What was happening was that the focus of political offenses was shifting from the political to the economic sphere, where the real axis of power was located. The United States, the most highly developed of all the capitalist states, exemplified this most completely. American liberalism had protested against the methods of crushing political opposition employed by the Latin-American republics, had sought to rescue Irish state prisoners, had grown indignant at the horrors of the system of exile for Russian political prisoners in Siberia, had even spurred on a war with Spain because of the Cuban patriots who were lying in the dungeons of Cabañas and Morro Castle. But this liberalism could have no effect in the sphere of economic struggle. In the Haymarket trials and in the cases of Haywood, Debs, Mooney and Sacco and Vanzetti, whatever the guilt or innocence

on the specific charges, the real crime was opposition to the dominant economic interest around which the state was organized. The criminal syndicalism laws of some of the American states, the suppression of civil liberties, the use of militia to break strikes and of deportations and frame ups to eliminate too radical labor leaders, were all inevitable methods for fighting movements in which the real political offenders committed no political acts but sought through economic action to build up a revolutionary consciousness.

In the revolutions and counter-revolutions of Europe since the World War and in the struggles between communism and fascism the underlying clash of economic conceptions flared into open political war. The organized ferreting out of political offenders and the purging of all political opposition became the accepted objective on both sides, and the line between terrorism and the judicial process a shadowy one. The "Red terrors" in Hungary, Finland and Poland were matched by the "White terrors" that succeeded them. The White terror in Finland took a large scale judicial form: official statistics of the counter-revolution of 1918 show 80,000 arrests, 75,000 trials and about 70,000 convictions. The number of political prisoners in Poland in 1926 was estimated at 6000. In postrevolutionary Germany assassinations were carried through with businesslike thoroughness by organized secret societies, while the state seemed powerless to punish them. There was a tremendous disparity between the treatment accorded to political offenders from the right and the left parties, largely because the republic had committed the blunder of allowing the judiciary to be carried over from the monarchist regime. The result was a reign of terror in which republican and communist leaders like Rathenau, Eisner, Liebknecht and Rosa Luxemburg were assassinated while only a half hearted attempt was made to follow up their killers. The building of the Fascist movement in Italy and National Socialism in Germany were characterized by a similar weakness on the part of the government in prosecuting political offenders. It is, however, only under the regime of the completed dictatorship, whether fascist or proletarian, that the treatment of political offenders becomes an integral part of the state. As soon as the fascist or communist movements attained a de facto success their opponents became automatically political offenders. To stamp out the political opposition became the

first task of the new regime as a necessary measure of continued existence. Concentration camps, inaccessible prisons for political offenders, a ruthless political police, swift and secret execution or highly publicized trials which were virtually national spectacles, as in the Russian sabotage trials or the German Reichstag trial, became part of government policy. The essential status of the political offender under a dictatorship emerged with great clarity—that every political opponent is potentially a political offender and is to be treated as if he were already one.

Political offenses have been the despair of jurists because of their relativist character. By their very nature their status depends upon the nature of the existing regime, and by definition political attempts cease to be crimes as soon as they have succeeded in overthrowing the regime. Ludwig Börne asked whether anything could be considered a crime which if successful is crowned with laurel and if unsuccessful with thorns. How topsy-turvy the varying content of the concept can be is illustrated by the fact that the Soviet penal code declares those acts to be political offenses—anticommunist terrorism, affiliation with bourgeois organizations, counter-revolutionary sabotage—which are the exact reverse of the offenses similarly punishable in Germany or Italy. The relativism of political offenses does not, however, differ in essence, although it differs in degree, from the relativism of all bodies of legal rules. But because political offenders have operated directly in the realm of political power rather than in that of legal claims and injuries, they have borne the brunt of every manifestation of contemporary savagery, ranging from the mediaeval torture chamber to the third degree refinements practised upon political prisoners in the modern class struggle.

POLITICAL PARTIES. See PARTIES, POLITICAL.

POLITICAL POLICE. Under autocratic governments in all times special agents of the police or of the army have functioned to detect and often to punish illegal political opposition. In many democratic countries too such agents have

functioned but with far more limited authority. Their powers have ranged from simple investigation for the civil authorities to the all powerful "state within a state," the Okhrana of czarist Russia. In some countries the systems of political police are a nameless branch of the police or the army whose existence is not publicly admitted; in others they operate openly, many of their agents wearing special uniforms, as do a large proportion of the Soviet G. P. U. (State Political Administration). Even in such cases, however, the inherent nature of their activity, the detection of illegal political opposition, puts their essential business in the hands of plain clothes men, whose identity must be concealed.

While some agents of this sort have always existed under dictatorial governments, it was not until modern times that the function of the "preservation of the state" was entrusted to a group formally organized as political police. Some of the Roman emperors, mediaeval monarchs and lords, mediaeval popes and oriental potentates had their political spies, their informers, their administrative system of swift execution or exile for political offenses, often without formal trial. So too did the Inquisition in France and Spain and the governments of the Italian city-states. In the French Revolution the intrigues of the opposing revolutionary factions and the constant danger of counter-revolution gave ample scope for the operations of secret police agents, and the Reign of Terror received much of its stamp from their activities. Joseph Fouché, Napoleon's minister of police, was one of the first to organize an efficient network of espionage. In the Congress of Vienna the delegates were continually under the surveillance of Metternich's spies and secret police agents, who intercepted letters and kept him informed of everything that might be useful to him.

The most perfect of all systems of political police has been the Russian. Its continuity has survived the revolution; its pattern and function under the czars have remained fixed under the Soviets. The first special department of political police which was organized with thoroughness was the Okhrana (Department of Public Safety) created in 1825 by Nicholas I, bringing into formal organization a government service which had been started by Peter the Great. From the beginning it exercised enormous power; it investigated, accused, arrested, prosecuted, tried and punished with responsibility only to the

czar and with the right of appeal also only to him. The punishments it imposed were exile, prison or death. It spread its network over the whole of Russia, aiming at the suppression of all opposition to the czar's will, whether of national autonomists, advocates of parliamentary government, disloyal members of the nobility, peasant movements or workers' revolutionary organizations. It became a hated and feared institution, and its name a byword for tyranny the world over.

When the Soviet state consolidated its power after the revolution, essentially the same framework of political police was carried over to deal with opposition groups. An extraordinary commission (Cheka) was organized to deal with counter-revolutionary plots, with the remnants of loyalty for the old regime and with disaffection and corruption within the Communist party itself. It was the Cheka which was the principal agency of the period of terrorism. Its efficiency was greater than that of the Okhrana partly because of the revolutionary drive behind its work and partly because of the knowledge of underground activities and subversive movements which the new holders of power had gained before the revolution. The very men who had been exiled or imprisoned by the Okhrana now wielded a similar power. Even the same places of exile in Siberia were retained for the enemies of the new regime. The death penalty, abolished by Soviet law for all criminal offenses save robbery by arms, was kept for all political offenses and was administered secretly by the Cheka without public trial or notice. After the counter-revolution was put down and Russia was freed of White armies and invading forces, the Cheka, which had always been conceived of as an emergency body, was abolished and a new and more permanent system of political police was organized as the G. P. U. Unlike the Okhrana, which had been a state within a state, the G. P. U. is a department of the Soviet government; its powers are controlled by the political heads of the Soviet regime, and its activities are much less independent. It consisted in 1927 of about one hundred thousand uniformed men and several thousand secret service men—efficient, disciplined, carrying on the multitude of tasks entrusted to a general state police in addition to the special function of controlling political opposition. The will of the government is quickly reflected in its policies and activities. At railroad stations, on the border, in cities and villages, the G. P. U. is

everywhere in evidence as the arm of the government in maintaining order. But its function of controlling political opposition is invisible. Arrests are made usually late at night. Trials take place in secret. The press rarely carries word of its orders sending thousands to exile or to prison. Only when a public trial is deemed desirable, as in the case of the sabotage trial of 1930 or that of the British engineers in 1933, is the world informed of some of its operations. Of all departments of the Soviet government the G. P. U. is generally considered the best organized and the most efficient.

But while the term political police is commonly associated with the police system of Russia under either the czar or the Soviets, it is today far more widely applicable to a host of governmental bureaus under the dictatorships which have multiplied so greatly since the World War, notably in Italy, Poland, Germany, Turkey, Persia, Venezuela, Cuba and Japan. They exist even in many democratic countries, although there they are less influential. And in time of war all countries, whether dictatorial or democratic, create special political police agencies to deal with opposition to the war.

The universal function of all these political police, whatever their name and whatever the country, is to keep track of all illegal political opposition. The Russian Revolution and the world wide Communist movement dedicated to the overthrow of capitalist governments have resulted in the outlawing of Communist parties in a score of countries—a much greater extension of illegality of political opposition than ever before. The total number of political prisoners held in prisons or concentration camps throughout the world today far exceeds any previous estimate. In the colonial regions of the British, French and Dutch empires native political movements for independence, usually illegal, are commonly combated by a plain clothes section of the police or military. This is usually composed of "loyal" natives, operating under officials from the home government and possessing special powers like those of a political police.

While in the United States no separate body of national political police has ever been organized, various federal and local departments have on occasion assumed such functions. In the Department of Justice under Attorney General A. Mitchell Palmer during and just after the World War the Bureau of Investigation took on the character of political police in dealing with pacifists and radicals; this role was continued

and expanded under Palmer's successor, Harry M. Daugherty, who appointed as head of the bureau the internationally known detective, William J. Burns. The Department of Justice was widely criticized for its excesses in carrying out these activities, and its political police function was abolished by Attorney General Harlan F. Stone. The Department of Labor under the administration of Secretary W. N. Doak had a special corps of secret service agents to ferret out political radicals among aliens. In many cities the police departments have organized "bomb squads," "radical squads" or "Red squads," all for the purpose of investigating radical political and industrial activities among both citizens and aliens.

Before the war, investigation was the sole function of the political police in all countries except czarist Russia, where they had also the power to punish. Since the war, however, political police under many dictatorships have exercised powers similar to those of the Okhrana, although usually they lack authority to impose the death penalty. In countries where the political police have no power to punish they prepare cases for the civil courts or for the special tribunals handling political cases, and on rare occasions for the military courts. In some countries, conspicuously in India and under the South American dictatorships, the "preventive arrest" system prevails, empowering the political police during a crisis to arrest and imprison for an indefinite period without trial.

In all except Anglo-Saxon countries the police are under the control of the central government, and the creation of a nation wide section of political police is a relatively simple matter of organization. In only one Anglo-Saxon country does a nation wide police exist—the Royal Canadian Mounted Police, which has developed special agents to act as political police in plain clothes, serving as spies and agents provocateurs among radicals. Under personal dictatorships the political police are directly controlled by the dictator himself; under others, by the directing group of the government. In more or less democratic countries the political police are under the minister of the interior as in the case of France (*Sûreté Générale*) and Rumania (*Siguranta*). So also are they in Poland (*Defensywa*) and some other dictatorships retaining parliamentary façades.

The men chosen to perform this difficult function of tracking down political opposition are generally above the usual level of police

mentality. Some are selected from among the regular police or army officers; many are former members of the very organizations they are set to spy upon. Some have legal training; others are professional men recruited from the party in power for service requiring exceptional skill, devotion and loyalty. Everywhere the political police follow the same methods: they familiarize themselves with the purposes and activities of the opposition, spy upon the known leaders, discover the secret meeting places and printing presses and obtain proof of illegal acts. Many of them join the organizations they seek to destroy, playing not only the role of spy and stool pigeon but also that of agent provocateur. By inciting the very political offenses they are set to detect they make their task easier and at the same time tend to demoralize the opposition. The presence of police spies masquerading as party members is inevitably demoralizing in that it rouses distrust and suspicion. It has resulted even in accusations within the revolutionary movement against well known leaders, the most notable instance being the charge of police spy made by Marx against Bakunin.

Sometimes the political police have provoked or committed crimes not to facilitate prosecutions or to demoralize the opposition but to make a showing of the need for their services and thus to wrest from a hesitant government increased funds and larger powers. These were the tactics of the Russian Okhrana under certain czars, who were thus kept in a state of constant apprehension. Several assassinations of high officials in Russia, as in the case of Stolypin and of von Plehve, were later proved to have been the work of police agents. Somewhat similar were the tactics of the Bureau of Investigation in the United States under Attorneys General Palmer and Daugherty. By alarming the public with false tales of "Red plots," by exaggerating the size of the radical movement and by themselves committing actual crimes of violence attributed to radicals (a charge to be inferred but not proved in any specific case), agents of the bureau kept the country conscious of their services. In the United States these tactics are not restricted to the political police; the labor spy, hired by employers to expose trade unionists and radicals among employees or to win a position of control in labor unions, follows similar methods.

The political police are usually not alone in their functions. A vast army of volunteer spies and informers supplies them with tips. This army is drawn from the more active elements in

the government party, from the bureaucratic servants of a dictator and from the beneficiaries of the regime. The police invite such cooperation, and in many countries it is a criminal offense to fail to report knowledge of illegal political activities. In the United States during the World War a national organization of imposing proportions, the American Protective League, was formed for the specific purpose of reporting to the Department of Justice all forms of "disloyalty."

No class of offenders suffers more severely at the hand of governments than do political prisoners, against whom the hate and fear of the governing party is directed. Even in the few countries where the death penalty has been abolished for crimes, as in Italy and Russia, it is still retained for political offenders. Although under some regimes they presumably enjoy a privileged status among prisoners, they are often the victims of brutalities and torture by political police, either for vengeance or in efforts to extract confessions or recantations. In countries where the third degree is rare against common criminals it is commonly used in the case of political prisoners.

The effectiveness of the use of political police as an instrument for political power is questionable or is purchased at too great a cost. No professed democracy can long tolerate a powerful political police and still retain democratic institutions. In dictatorial governments it has been a necessary instrument for the prohibition of political and civil liberty. In some dictatorships, as in Italy, Turkey and Germany, the opposition has been practically destroyed by a program of suppression of all banned party organizations and stringent censorship over all forms of communication—a program in which the political police have played their part. Mussolini in Fascist Italy and Kemal Pasha in Turkey liquidated all internal organized opposition in a few years; Hitler accomplished the same task in a few months. But the methods used in all these cases extended far beyond the employment of a political police and were applied with efficiency and ruthlessness never before equaled.

As a means of preserving the "safety of the state," meaning the party or class in power, a political police may be regarded as effective if the opposition is not too widespread and powerful. The underground revolutionary movements in czarist Russia were too strongly entrenched to be destroyed even by the tactics of the Okhrana. Where the opposition is open and widespread,

as in India, demoralization is equally impossible because the rebels court prosecution by their program of civil disobedience and non-violent resistance. The question whether the governing economic class is still able to organize production and distribution is also important. Against a powerful political opposition or in the face of a collapse of the governing economic class, the political police can at best be effective only in retarding the rise of the opposition to power.

POLITICAL REFUGEES. *See* REFUGEES.

POLITICAL SCIENCE

CONTENT AND METHOD. Since classical antiquity there has been handed down an extensive body of theory and knowledge which is today subsumed under the category of political science. It would be impossible, however, to formulate any precise definition of either the content or the method of this peculiarly comprehensive discipline. For in the designation political science neither the concept political nor the concept science has any fixed connotation; in other words, the discipline is lacking in either a clearly delimited set of problems or a definitely prescribed methodology.

The manifold constructs of political science and the controversy over its true content and method are not essentially different today from what they were in Hellenistic antiquity. The Greeks, whose field of immediate observation was limited to the city-state (*polis*), used the term *politika* to designate the totality of state phenomena; state institutions as well as state activities. The necessity for a separate and distinct body of theory to deal with these *politika* was not felt until the responsibilities of political

activity began to be shared by those sections of the population which did not belong to the inner group of adepts governing in accordance with traditional techniques of statecraft. In the ancient Orient therefore a separate body of political science never made its appearance, and in Greece its emergence was intimately bound up with the beginnings of the democratic movement in Athens and the Sicilian city-states. The first expounders of political theory in Athens were the sophists, notably Protagoras and Gorgias, who in their teaching identified the art of politics with a kind of personal way of life. Interested primarily in training their pupils for an active political career, they did little more than elaborate on the most appropriate course of action to be pursued by the youthful aspirant to power. The foundation of this training was a comprehensive course of education embracing such diverse fields as mathematics, medicine, botany, zoology and astronomy as well as economics, pedagogy, ethnology and the science of war. Inasmuch as the chief prerequisite in a successful political leader was the capacity to sway the masses by means of his oratorical prowess, primary attention was devoted to developing proficiency in the art of rhetoric. Instead of training the pupil for a particular task or office, the sophists, in the words of Plato's Protagoras, sought to teach "how one can act and speak with the greatest influence in affairs of state." The aim of all scientific training was *arete*, a concept wherein "good" was identified with "clever" and "bad" with "stupid." The course of training whereby the citizen could make himself more useful in the service of the state was given a broader ethical foundation by Socrates, who conceived education less as a guide to civic advancement than as an inculcation of ethical norms relating to the state, the highest of which stipulated the unconditional submission of the individual citizen. In sketching the outlines of an ideal *polis* Socrates formulated a moral philosophy of the state which has colored the thinking of countless subsequent political theorists.

Since the Greek *polis* was an association at once religious and political, it was natural that political and ethical problems should remain closely related. Plato, a political moralist, metaphysician and historical philosopher of the state, devoted his chief work, the *Republic*, to the question of the morally best state, although in his *Laws*, wherein is sketched a less visionary state more closely approaching reality, he pre-

sented a more empirical approach to the political world. The type of political science most closely approximating that of the present day is to be found in Aristotle, who took a long stride away from logical and metaphysical speculation in the direction of empiricism. He still assumed that the ultimate aim of political science was to delineate the ideal state, but this aim was to be realized only by bringing together, in the sphere of politics as well as in the natural sciences, a comprehensive body of factual material which would serve to integrate that which should be with that which is. In the course of his investigations he presented an exhaustive and precise description and criticism of the historical state constitutions of the Athenians, the Spartans, the Cretans and Phoenicians; and in his more than one hundred such summaries he may be said to have laid the foundations of a historical, descriptive science of politics. At the same time he was not unfamiliar with the sociological explanation of political phenomena as an outgrowth of broader social changes; thus, for example, he correlated the innovations in the organization of the Athenian state with the political and social struggles between the nobles and the non-nobles, the rich and the poor. Moreover, inasmuch as his criticism of constitutions dealt at length with the relatively permanent regulative norms of the state, he may be said to have appreciated the place of a science of law in a comprehensive political science.

Thus already in Greek antiquity there developed a political science which revealed, in content as well as in method, marked diversity and range. Depending on the particular approach of the investigator this speculation was in the nature of a guide to political power, a course of civic training, a moral philosophy, a historical metaphysics, a sociology or some other type of special discipline. These same aspects of political thought are to be found at the present day, although the much wider intellectual and historical range of the modern consciousness is reflected in a considerably greater differentiation and specialization of types. Only one ingredient of modern political science was unfamiliar to the Greeks; namely, the juristic-dogmatic theory of the state. In spite of Aristotle's significant researches in comparative and historical law a general dogmatic theory of state law remained unfamiliar to the Greeks. Basically it was unknown even to the Romans and was peculiarly the creation of the later Middle Ages of western Europe.

At the present day there is evident a certain delimitation as regards the content of political science, but its methodology has manifested the greatest diversity. Political knowledge cannot be said to acquire the status of a definite field of science until political activity is recognized as an independent sphere. Where such activity is regarded as merely a reflection of the religious-metaphysical, naturalistic-economic or some other sphere, political science, in the absence of a specific field of inquiry of its own, can exist at best only as a branch of theology, economics or some broader discipline. This is as true for the Augustinian conception of the state as for the economic interpretation of history formulated by Marx and Engels.

The shifting of the field of political science is determined far less by the subjective interests and viewpoint of the particular investigator than by the concrete historical and sociological problems and issues which exist in political life itself. Preoccupation with certain problems is to be explained therefore not by the fact that the individual thinker wilfully imposes his own subjective questionings on political reality but rather by the fact that in this political reality, experienced by the investigator, there has emerged some objective issue which requires clarification. At present the field of political science is restricted, because interest during the past hundred years or so has centered in the main upon the question of empiric political reality and to a much lesser degree upon the question as to what the state should be. Since the Renaissance in fact political science has been impelled by the dominant intellectual trends to free itself from the older type of philosophy which in its description and explanation of political phenomena assumed direct intervention on the part of superhuman, particularly divine, forces. Hence it has had to proceed from the presupposition that the forces governing the political world are immanent; even though the individual thinker may in his private life be an adherent of a transcendental religion and accept the divine will as the *causa remota* from which springs all political activity. Therefore logical and ethical speculation has also been excluded from the field of political science as unscientific.

A further and closely related restriction of the field of inquiry of political science arises from the fact that the discipline no longer makes an effort to deal with everything that concerns the state. Although the political sphere helps determine and is in turn determined by the totality

of human existence, the political in such a wide sense is not a manageable field of empirical observation. As a result the political scientist is prone to limit himself to examining, in descriptive terms, those political activities and institutional forms of activity which presuppose independently exercised power not definitely predetermined by rigid and normative rules of law. The mere application of existing rules of law or, in other words, state activity which creates nothing new, which offers no creative direction of the affairs of state in the sense that it might eventuate in a basic transformation of the distribution of power within the state, is of minor interest to the political scientist. Such activity and the institutions through which it is expressed are not, to be sure, of necessity unpolitical, but as a rule they do not come within the province of political science. Accordingly the modern discipline may be said to be concerned primarily with the problems of government and of legislation, never or only under very particular conditions with those of administration and interpretation of law; except of course where the courts and the organs of administration, by reason of their independent decisions, are in a position to alter basically the political distribution of power, as in the case of the United States Supreme Court, or where the activity of the courts or of the administration constitutes a significant restriction upon or advancement of government and legislation, as, for example, in the integrated dictatorships.

Present day political science revolves primarily around the problem of the attainment, consolidation and distribution of political power, whether in an actually existing state or in a hypothetical state, constructed more or less systematically by a process of abstracting the common elements to be found in a number of concrete states. Among the many other elements constituting modern political science the following may be mentioned: correlation of the processes whereby power is institutionalized with geographic and climatic conditions, racial peculiarities and other natural forces, with the economic, military, moral, religious, national and other characteristics of the population and with the legal system of the state; description and analysis of the most important types of controls, of the organization and action of the significant political associations within the state, especially parties; evaluation of the role played by political ideas in the origins and evolution of political associations; analysis of the relationship

of the organized political powers to the outstanding social forces—particularly, at the present day, to the social classes, but also to the church, to public opinion, to the press as well as to the dominant economic forces, such as associations of financial, industrial and agrarian capitalists and workers; finally, the survey of the state in its relations to international powers and other states, whether in a federal or in an international context. The fact that in modern political science the problems of domestic politics have tended greatly to overshadow the problems of international politics is to be accounted for on the one hand by the much greater difficulty of reducing the processes of foreign affairs to systematic analysis and on the other by the lack of understanding of international relations which has characterized the recent period. Questions of law fall within the province of political science only in so far as law, as written or unwritten social authority, legitimizes, buttresses or restricts political power and actually regulates the relationships of the organs of the state among themselves, in dealings both with native citizens and with foreign states. Thus only the politico-sociological theory of law is a part of political science, and not dogmatic jurisprudence.

Alongside political science there has grown up in all countries, but particularly in Germany, a closely related but distinct discipline known usually as a general theory of the state (*Allgemeine Staatslehre* or *Staatstheorie*). The line of demarcation between the two disciplines is not clear, because in neither case are the terminology and scope constant. The problem is comparatively simple if "theory of the state" be understood as merely a dogmatic treatment of the general positive concepts of public law; but this is feasible only if the theory of the state leaves out of account the actual state and identifies it with the legal order (Kelsen, *Staatslehre*, 1925). In all other cases the dividing line between political science and theory of the state fluctuates. Under the influence of natural law philosophy it was customary until very recently to couple theory of the state and political philosophy and set them off more or less as one against empirical political science. But since theory of the state has also come to employ an empirical methodology, this antithesis has lost its meaning.

The commonly accepted distinction at the present time is that which defines political science as a practical science that attempts to

evaluate and theory of the state as a theoretical science indifferent to values. This view proceeds from the unwarranted assumption that a hard and fast line can be drawn between theory and practise and correspondingly between judgments which relate to political reality and those which deal with political norms. In so far as this dichotomy implies merely a difference of emphasis upon the actually existent and the normative it is justifiable. It finds support in Aristotle's characterization of the statesman, θεωρητικός τῶν ὄντων, πρακτικὸς τῶν θεόντων. This is not, however, a distinction between political science and theory of the state but, in a more general sense, a distinction between political theory and political practise. As a matter of fact theory of the state is a practical science, indifferent neither to values nor to political activity; and similarly political science so far as it is a science at all cannot exclude theory.

Being and becoming are as indissolubly linked in all social sciences as are theory and practise. Yet the autonomy of theoretical political science must not be questioned. The practical statesman is interested in theory and knowledge only in so far as they can be immediately applied as weapons in the struggle for political power. For this reason he directs his appeal primarily to human emotions and human wills. The political theorist on the other hand is interested in an idea for its own intrinsic value, and not like the practical statesman for its utility in political conflict or for its propagandistic influence on human activity. For the thinker in the field of political science no less than elsewhere knowledge should be not an instrument of political domination but an intellectual construct endowed with significance; retaining its independent validity despite the changing configurations of the actual political arena. The aspirations for power of the political thinker have to be subordinated to his aspirations for knowledge, and for this reason he must appeal primarily to man's capacity for intellectual judgment rather than to his more or less ethical and emotional capacity for enthusiasm. The goal of the practical statesman is a coordination and integration of day to day political activity; that of the political theorist, a coordination and integration of political knowledge. But this distinction between theory and practise has as much bearing on theory of the state as on political science, even though the more concrete concepts of the latter may be closer to the practical sphere.

A more useful distinction between the two

disciplines is to be found in the thesis which holds that theory of the state deals with the static phases of the state and political science with the dynamic. It is indeed true that the primary aim of theory of the state is the description and explanation of the institutions of the state whereas the aim of political science is the analysis of political action. But this dichotomy cannot be taken as absolute, because the state, like all other forms of political activity, exists as an institution only in so far as it is renewed through continuous human action. A deeper justification for the stronger emphasis on the static elements in theory of the state, as contrasted with the dynamic elements in political science, lies in the fact that the chief function of the former consists in clarifying the basic concepts of the latter. In this sense theory of the state may be designated as the general conceptual side of political science. Thus it may be understood why political science is more likely to be concrete and in close contact with life, while theory of the state is conceptually more incisive and clearer in its methodology.

In general, however, it may be said that methodological dichotomies of this kind cast much less light on the essential distinction between the two disciplines than does the fact that political science has as a rule attracted the historical and sociological type of mind and theory of the state, the juristic. In Germany at least the divergence of the two disciplines may be correlated with the gradual dwindling of popular interest in actual political questions during the second half of the nineteenth century; whereas the outstanding works of political science, notably those of Dahlmann and Waitz, reflect the widespread political activity of pre-imperial Germany, the juristic abstractions of the later nineteenth century theorists reflect the political desuetude of an indifferent bourgeoisie.

Political science, without a theory of the state either expressly or implicitly assumed, is basically unthinkable. If political science aspires to scientific validity it must endeavor to employ the terms state, law, state power, constitution, sovereignty, territory, people and the like as clear and unequivocal concepts. But just as a theory of the state is indispensable for political science, so political philosophy is a prerequisite of both. Without a philosophical organon which is capable, at least implicitly, of correlating the state with the larger context of the universe, there can be no real political science. Even that school which prides itself on being a purely empiric, antimetaphysical science of the practical is still

unable to cut away from philosophical and metaphysical postulates. In so far as it devotes itself to certain inescapable and fundamental questions, it must deal—epistemological considerations apart—with such problems as whether man is predominantly good or bad, whether in his political behavior he acts according to reason or to instinct and whether there is a rational purpose in history and a progressive development of mankind. Those very forms of political science which seek with the greatest earnestness to free themselves from the trammels of philosophy are inevitably led back to the realm of metaphysics when they pose the question as to the real determinant in political processes and answer it in naturalistic and materialistic terms. For political science is metaphysical not only when, as in the Middle Ages, it introduces supernatural forces to explain political events; it is equally metaphysical when it introduces subhuman causes as the ultimate motivating forces of the political world and interprets political processes as pure epiphenomena. Strictly speaking, the scope of empiric political science is limited to examining a manifold of potentially determining forces. As soon as this manifold is abstracted away and one single determining force, whether ideal or material, is postulated as the sole determinant of all others, the realm of verifiable experience is left far behind.

Such metaphysical postulates crop up repeatedly in the characteristic theses of political anthropology and political geography, inasmuch as both isolate a single factor as the mainspring of all political development; in the former this factor is racial descent and in the latter, territorial environment. The historical materialism of Marx and Engels is equally tainted with metaphysics in so far as it seeks to trace all political development to underlying economic and technical changes. The search for the ultimate unity is beyond doubt the ideal of science, but an ideal which on the face of it can be only an approximation and which can never actually be established by means of empiricism. Wherever political science therefore raises the question as to the *ens realissimum*, the immovable mover of the political process, it crosses into the realm of theology and becomes the surrogate of monotheistic religion. Modern political science may therefore be said to be distinguished from the older political philosophy, not by reason of the fact that it is free from philosophical and metaphysical postulates but rather because it strives

to develop its postulates in empirical terms and to proceed to its conclusions without the help of logical and metaphysical intermediation.

While repeated attempts have been made to delimit the scope and content of political science in the modern period, its methodology has undergone extensive refinement and subdivision. In surveying the heterogeneous methodologies to be found at the present day it may be profitable to exclude one particular type of literary production which can make little claim to scientific precision; namely, the treatise which offers useful guidance and instruction to the active participant in politics and which professes to advise him as to how he should conduct himself in a concrete political situation. Practical politics, however, which has been rightly called an art, is not communicable and can be neither learned nor imparted, being rather an inborn aptitude not easily reducible to rationalized precepts. The course to be taken in a given political situation cannot be anticipated in advance but arises from a certain tact, which in all cases must work with unpredictable sets of facts, weighing many impalpable factors and balancing intangible alternatives. A science of art, in the political sphere as well as elsewhere, is therefore an anomaly. But just as there are schools of the cultural arts so it might be possible to excogitate a plausible theory of political art, provided that at the outset it abandoned all pretense at offering practical guidance for specific situations and dilemmas. It would of necessity be limited to the formulation in theoretical terms of the comparatively permanent principles which are, or should be, normal in the conduct of public affairs, from the point of view both of the leader and of his agents and supporters. The classic example in the modern period of this type of political writing is to be found in Machiavelli's *Prince*; and analogous instances are also to be found in the numerous pamphlets of the seventeenth and eighteenth centuries which present advice to the prince and to the citizen.

Present day political science of course concerns itself almost exclusively with the description and explanation of political institutions and actions and is only very mildly interested in instructions as to the proper course of political action. It has no faith in universally valid principles in politics, except as they are of a purely technical nature. The terrifying consequences of religious dogmatism in the political sphere were impressed on the western mind by the frightful wars of religion which followed the

Reformation. Since then the increasingly powerful current of secular thought, which began with the Renaissance, has sought to interpret the political world in purely immanent terms; that is, to explain and justify it in terms of the needs engendered by the contacts of men in the course of their common existence in society and arising from the nature of man himself. Yet this methodological formula, despite its apparent simplicity, becomes riddled with complexities and uncertainties once the attempt is made to carry it through in practice. The method and at the same time the entire character of political science are determined by its initial presuppositions as to the fundamental nature of man: whether, with the humanistic school of dualists, this nature is venerated as the child of reason and rational laws or whether, with the naturalists and monists, man is regarded as "the most perfect of animals," dominated by blind instincts and passions. But even humanistically oriented political science of the present day has shown a tendency, since the collapse of natural law rationalism, to regard the erection of norms and principles for the guidance of political activity as impracticable and therefore superfluous. Since all prescriptions as to what should be are regarded as conditioned by historico-sociological factors, political science, particularly in its more naturalistic quarters, seeks on methodological grounds to avoid any idealistic formulations and to limit itself to a causal descriptive presentation of the political existent.

The rapid development of the natural sciences since the time of Kepler and Galileo has resulted in an ever spreading disposition to apply the methods of natural science to political science and thus to obtain a greater objectivity and at the same time a clearer understanding of political attitudes and behavior. As a matter of fact, however, there is no single method for natural science, while the facilities of most natural science disciplines for verifying their hypotheses by actual experiment are forever precluded by the very nature of political science. As a rule therefore those who advocate the transfer of natural science methodology to the political field have singled out one particular science as worthy of imitation—the choice being determined in the main by the particular predisposition or training of the investigator. Neurath, for example, in his *Empirische Soziologie* (Vienna 1931) presents a socialistic conception of society based on physics, and Hertwig in his *Der Staat als Organismus* (Jena 1922) draws

upon the science of biology to refute such a thesis; and in both cases claims were made to rigid, natural scientific objectivity. Since Mandeville's *Fable of the Bees* (1714) one of the favorite devices for the explanation, interpretation and criticism of the political activities of men has been by way of comparison with the activities of animal societies. It was believed that the controversy as to whether norms were established by divine will or human volition could be escaped if a retreat was made to the security of natural laws prevailing in the subhuman world and if man set up as a model for himself the bee-state, the ant-state or the cell-state. The controversy which has raged since the seventeenth century between monists and dualists as to whether the nature of man is simply a segment of organic and even inorganic nature or whether man is cut off from the animals by an unbridgeable gulf still disturbs the methodology of present day political science. Therefore it may be said that the character of political science in all of its parts is determined by its basic presuppositions regarding man.

The natural sciences are likewise invoked by those investigators who seek to explain political behavior as the result of subconscious or unconscious human drives and instincts, either of psychological mass contagion, as postulated by Le Bon, or of the imitative faculty, as analyzed by Tarde. Freud in similar correlations has interpreted political associations as psychological mass groupings, bound to the leader by the force of the libido and constituting essentially a process of reversion to the primitive horde. The greater part of those theories which seek to explain political events more or less exclusively by racial or geographic determinants likewise fall into the category of naturalistically oriented political science. Thus the theory of race, which in Germany was first carried over into the field of political science by Gumpłowicz in his *Der Rassenkampf* (Innsbruck 1883), traces the origins of the state to a struggle for domination between races. In the various other racial theories which stem from Gobineau's *Essai sur l'inégalité des races humaines* (4 vols., Paris 1853–55), and which in the form popularized by H. Stewart Chamberlain became in 1933 the official doctrine of the National Socialist government in Germany, the concept of race was exploited not so much to clarify the origins of the state as to reveal the dominant force propelling all subsequent historical and political developments. In its extreme, and essentially literary rather than

scientific, guise this theory maintains that all political evolution is determined ultimately by inherited racial characteristics. The aptitude for the founding and leadership of states, not to mention all other political virtues, is limited strictly to a single race, almost always the Nordic. To the activities of this superrace mankind is indebted for the erection and governance of all the really important states of the earth and for all the major transformations and currents of political history. The supporters of the racial theory, not content that it should serve merely its evocative function as a latter day myth, have buttressed it with a welter of professedly scientific data, which they hold comprise all that need be known of political science.

Much less pretentious as a rule are the claims of political geography, the roots of which may be traced back to William Temple, Montesquieu and Herder but which in its present form derives from Ratzel's *Politische Geographie* (Munich 1897); since the World War this type of interpretation has been popularized by Kjellén in his *Der Staat als Lebensform* (Berlin 1924). As a rule the various exponents of this theory carefully avoid explaining all of political science in terms of geography and, instead of presupposing that the geographic factor is the sole determinant of all political development, limit themselves to showing its significance in the conduct of foreign affairs.

The antithesis of naturalistically oriented political science is the type of political science which is based on the mental and moral sciences (*Geisteswissenschaften*). This constitutes the methodological ideal of many German thinkers, who have sought thereby to transform political history from a series of causal events into a syllogism of concepts; from a cause and effect relationship into a complex of ideational meanings. According to this idealistic method the battle of Waterloo is not the efficient cause of the downfall of the Napoleonic empire. Spann in his *Kategorienlehre* (Berlin 1924) asserts that cause in historical events is to be understood merely as the "basis for an integrated political or other type of activity, possessed of meaning, or, in other words, a conceptual basis rather than a real basis." Since the time of Dilthey there has existed a special category of the moral scientific method known as understanding (*Verstehen*), according to which the function of explaining has been excluded from all social and historical sciences and limited exclusively to the natural sciences. The disciples of Dilthey not only ruled

out from political science a causality, which is legitimate in the natural sciences, where it expresses purely quantitative interrelationships, but went so far as to deny the possibility of a causal explanation of political events themselves. If this method is consistently followed out, it has little to contribute to present day inquiry into the history of political ideas and even less to the description and criticism of actual political events. In fact this method has to answer for that pseudo-scientific type of intellectual history which traces "the development" of every political concept in supposedly unchanging form from Babylonian times down to the present, without paying the slightest attention to the interrelationship of this concept with actual political events. Such a history of political ideas and still more a political science which makes use of such a methodology are the last reverberations of Hegel's "self-unfolding of the Spirit," which, as F. J. Stahl once observed, like the post horn of Baron Munchausen, blew itself.

If political science is to avoid the danger of overabstraction and indifference to the realities of the political world, it must comprehend and interpret political activities, institutions and doctrines as political realities; in short, it must rely on a realistic scientific method. The political reality in which it must ground itself is neither superhuman nor subhuman but always and under all conditions the activity of man. Politics is political history in the making, and history an interweaving of cause and effect, directed by man and at the same time directing him. In the concept of political reality two factors, the subjective activity of man and the objective processes by which it is conditioned, are intimately bound together. In order to be brought into the sphere of political reality all superhuman as well as all subhuman forces require the mediation of man. These superpersonal complexes should be treated not as independent factors in political reality but only as forces stimulating, conditioning, restricting or advancing the one and only political reality, the activity of man. This activity of man is, at least as far as human comprehension goes, distinguished from all processes in nature in that its end-products may be understood and explained as actual creations possessed of meaning; in other words, as culture. The entire political world presents itself to man only as a concrete work, forged by man and imbued with meaning and significance to man; thus and thus only may it offer itself to human perception.

It follows that such concepts as state, law, politics and all other elements of political science possess significance only for the human understanding. The so-called queen in the society of bees offers little enlightenment as to the conduct of the state by men. The fact that this designation is given to one of the bees indicates nothing more than that the human mind proceeding from its own category, "monarchical state," is indulging in a very vague type of analogy. Here as in all other cases the analogist proceeds not from the animal to man but from man to the animal. Nor does the fact that political science cannot dispense with the search for the inner meaning necessarily imply the abandonment of the purely causal, explicative method. For in all political reality there is a caused and causing activity on the one hand and a significance of content on the other: an action and a meaning inextricably bound together. Politics, like economics or any other practical sphere of culture, is not disembodied idea but the idealized concrete. Therefore political science can never remain satisfied with the idealistic *Verstehen*, as interpreted by the leaders of the *Geisteswissenschaft* school. Instead it must strive to resolve into a single integrated complex the causal and the concrete. It must recognize the battle of Waterloo as the efficient cause for the subsequent conduct of Napoleon, but in so doing it must draw a careful distinction between physical causation and historico-political causation. The loss of the battle did not determine the exact course of Napoleon's subsequent action; whether, for example, he would flee abroad, merely relinquish the crown or commit suicide. For in the political event as distinguished from the physical event the cause invariably creates a new complex of potentialities.

HISTORY. The thought of antiquity exerted a profound influence on the political concepts of the Middle Ages. In one important point, however, Christianity served to paralyze the ancient conception of the state. For classical antiquity the state was an association at once political and religious; while monotheistic Christianity with its emphasis on the value of the individual rejected the idea of the state as a totalitarian and even ecclesiastical association and conceded only a state of limited functions at least within the religious sphere. It was not unnatural therefore that political thought during the Middle Ages should have revolved around the question as to the relationship between the spiritual power, as

represented by the pope, and the temporal power, as represented by the Holy Roman emperor. In early Christianity the religious elements had so completely overshadowed all others that there was virtually no body of genuine political thought. Augustine, indifferent on the whole to the question of the state in its political context, interpreted *civitas*, whether in the hereafter or the here, as a general spiritual form of life. It was not until the controversy between Gregory VII and the Germanic emperors that political struggles and issues began to find articulation in the realm of theory. The defense of the temporal power as well as of the spiritual was the work of theologians who relied exclusively on theological arguments; and from both camps appeals were directed to Christian natural law, which was conceived as emanating from the divine will. The content of this natural law was drawn in the main from the earlier political and legal theorizings of Hebrew, Hellenistic and Roman antiquity as well as from Germanic sources. The crux of the controversy involved the question as to whether the emperor as well as the pope derived his power directly from God and whether, if the emperor derived his power from his human subjects, it was of necessity sinful in its origin; in other words, whether the emperor was subordinate to the pope or whether in his prerogatives and prestige an equal. Manegold of Lautenbach derived the power of the temporal ruler from the people and concludes from his premise of the *potestas populi* that it was the duty of the people to overthrow the tyrant, a duty which became the greater *quanto hominum a natura distat porcorum*. John of Salisbury in championing the thesis of the supremacy of the spiritual power over the temporal was deeply influenced by the example of the Jewish state.

The later Middle Ages witnessed a growing tendency toward the secularization of political thought, attributable in large part to increasing familiarity with the empirical writings of Aristotle. Whereas the derivation of the power of the emperor from the people had hitherto been used as damaging evidence against his title, the same argument began to be invoked in the fourteenth century to substantiate the claims of the emperor to freedom from papal interference—claims which were still further strengthened by the revival of Roman law under the leadership of Bartolus and Baldus. Political writings during this period were devoted in the main to two problems: first, the question as to whether

the pope had the right to instal and depose the Holy Roman emperor, a right which John XXII had claimed for himself in the year 1317; and, second, the closely related question as to whether the emperor was entitled to dominion over all the princes of Christendom, a problem which had become acute in the course of the controversy between Boniface VIII and Philip the Fair of France. Henceforth the postulate that temporal power derived from the people was used also to justify the independence of the regional princes from the emperor.

The dissolution of the mediaeval imperial unity into a multitude of independent national and territorial states constitutes the predominant characteristic of European power relationships in the modern period. The political writings of the Middle Ages, which had appealed exclusively to religious norms, throw comparatively little light on the concrete political relationships obtaining during the period. With the Renaissance, however, there may be traced, in the field of politics as in others, a rapid development of empirical thought. The strivings of the territorial princes, directed against emperor and church abroad as well as against the power of the feudal estates at home, with a view to attaining absolute authority inside their borders, laid the foundations of the modern sovereign state. Although the aggrandizement of the power of the prince was still justified in large measure on religious and ethical grounds, there grew up alongside an increasingly self-sufficient body of secular political thought. Above all, natural law freed itself from theology and became recognized less as a divine command than as an inner necessity of reason. As early as the beginning of the sixteenth century the German theorist Gabriel Biel advanced the revolutionary thesis that a natural law recognizable by the human reason would still exist even if there were no God or if the godhead were unreasoning and unjust. Machiavelli, bequeathing to a receptive world his realistic *ratio status* formulae, brushed aside without compunction all normative ethical limitations on the power of the prince. While Bodin still acknowledged *jus divinum et naturale* as *suprema potestas*, he denied to positive law any title to restrict the sovereignty of the prince.

The question as to the relationship between the spiritual and temporal power receded into the background and the problem, in the form which has ever since dominated political thought, came to center around the struggle for power between ruler and people. At first, to be

sure, the contest over the question of popular as against princely sovereignty was still suffused with the deeply religious afterglow of the Reformation. As a corollary of his political sovereignty the prince claimed the right to control the beliefs of his subjects. By way of rebuttal the monarchomachs, Catholic as well as reformed, contended for freedom of belief and in substantiation of this contention developed and elaborated the traditional theories of popular sovereignty. In the fight which ensued the weapons of both factions continued to be forged from Hebrew, Greco-Roman, Christian and Germanic legal concepts. The Protestant publicists appealed to the example of the Hebrew prophets, to the covenant of God with the chosen people and to that of David with the Israelites at Hebron. Subordination of the ruler to the dictates of positive law was based on the Aristotelian statement *lex facit regem*—a statement which Aristotle himself had understood merely as a moral postulate. The mediaeval theory of a *populus major principe* was advanced as substantiation of the principle that the prince ruled not by his own right but only as representative of the people. Germanic feudal law as well as the German electoral contracts (*Wahlkapitulationen*) furnished precedents according to which the ruler was obligated to recognize certain fundamental rights of his subjects.

The theory of the social contract with its immanent rather than transcendental implications became for both factions the primary point of reference. The idea of the contractual origin of political authority may be found, to be sure, as early as the age of Gregory VII; but during the entire Middle Ages this contract was conceived of as extending only to the process of constituting a new ruler. It was not until Richard Hooker that the contract theory was employed to show the democratic origins of the state itself. As a counter argument the champions of princely sovereignty appealed to the New Testament statement *non est enim potestas nisi a Deo*; while the monarchomachs, although they were not able to brush aside this text, sought to blunt its authoritarian edge by advancing the formula *electio Deo, constitutio populo tribuitur* (Junius Brutus). From this same statement, however, Barclay contended that the ruler who had been elected by God, even though he had been constituted by the people, could never be deposed by the people but could be punished only by God. By way of further refinement the Calvinist Althusius pointed out that the authority of the

people to constitute the ruler emanated directly from God, while the appointment of the ruler could be traced back only indirectly to God's will.

With this type of argument, in which both sides relied on the same immutable set of authorities, there was but little hope for a clear cut solution. As long as the controversy remained on a theological plane, the champions of princely sovereignty were forced logically to the position, as taken, for example, by Bossuet, Fénelon and Salmasius in France and by Filmer in England, that the people had no part whatsoever in constituting the ruler. The more radical champions of princely sovereignty, however, with Hobbes at their head, set out to justify the power of the ruler and of the state without recourse to religious or ethical sanctions of any kind. Hobbes, the real founder of modern political science, although an uncompromising champion of princely absolutism, found no place for the theory of the divinely ordained ruler. To be sure, the Biblical tradition was still so strong that even he filled chapter eleven of his *De cive* with citations from the Scriptures; but these examples from the Bible in support of the unlimited power of the ruler are of decidedly secondary significance, serving more in the nature of embellishments. For in his most characteristic reasoning Hobbes, cutting away from all transcendental premises, sought to derive the ultimate authority of the ruler solely from the inner nature and purpose of the state itself. He conceived this inner nature as expressing itself immanently in the performance of that function which accorded with its ultimate aim. In the case of the state this function was conceived by Hobbes as a predominantly social one, consisting in the guaranty of *pax et defensio communis* to the citizens who comprise the state. In spite of his absolutistic leanings he clung fast to the statement, *civitas enim non sui sed civium causa instituta est*. The social function of the state served also as the starting point of practically all of Hobbes' statements concerning natural law, in which his conclusions as to the aim of the state repudiated consistently the formal-logical in favor of the socio-political. In his further and perhaps less convincing efforts to substantiate the absolute right of the ruler Hobbes presupposed two contracts: a social contract, in which every individual contracted with each of his fellows to submit to the same ruler; and a second contract, in which every individual alienated to the ruler the right of self-determination that had

been his prerogative in the state of nature. As a result of Hobbes' theory of the contract the state became for the first time an immanent process, realizing its aim through the function performed by its agencies and institutions within the social totality. The enduring significance of this contract theory, which made no pretensions to explaining the historical origin of the state in empirical terms, lies in the fact that it explicitly recognized for the first time that the absolute power of the state must be justified in terms of the essential nature of the state itself. The epoch making element in his theory was above all else his method, which in accordance with the presuppositions of the contemporary natural sciences sought to explain and justify that which exists in terms of its own inherent forces.

Two major types of political thought, each contributing to the formation of modern political science, may be isolated in the literature of the seventeenth and eighteenth centuries. On the one hand, it is readily understandable that there were writings which presented a direct empirical description and causal explanation of the political concrete. At the same time there was, for less obvious reasons, a second type, which sought in conformity with the current doctrines of natural law to proceed beyond the causal to a rationalization in normative terms of traditional political institutions and thereby served to enrich immeasurably the more empirical body of observations; despite the fact that the exponents of natural law tended to vacillate between the rational-normative and the historico-causal—as, for example, when the widely influential theory of Locke, although intimately related with the Hobbesian theory of the social function of the state, sought to explain the actual historical origins of the state through a contract.

In the attempt to interpret political institutions as expressions of the wills of single individuals there lurked the danger of a one-sided rationalism and individualism; even in present day political science the unfortunate effects of this overemphasis are still perceptible, especially in the frequently advanced fallacy that the objective, social function of the state or of other political institutions must be in accord with the will and intent of the individual citizen. The portrayal of the entire political world as the deliberate, volitional work of man constituted a serious error on the part of the natural law schools of the Enlightenment; and yet at the same time it is equally true that the concept did

represent a significant stage in preparing the way for modern political science. For thanks to such a concept there had since the Renaissance been a steady swing toward the humanistic premise that political institutions as a whole were to be understood, explained and justified only as the creations of human beings. The fact that the eighteenth century exponents of natural law, by breaking away from the vague, unprecise concept of "the people" as advanced throughout the Middle Ages and even by the monarchomachs, as well as from the family associations postulated by Bodin and Althusius, substituted in their stead a more exact analysis, did not, as has frequently been charged by the romantic schools and their successors, constitute a regrettable lapse but rather a fundamental advance in methodological precision. A really serious error, however, was involved in the process of abstraction which conceived the mold of the state, the *homo politicus*, as a being, arbitrarily acting apart from the concrete realities of nature and society, divorced from environment, family, nation, class and tradition. Since society and history, with their intricate ramifications and interweavings, were basically misunderstood by the schools of natural law from Locke to Rousseau and from Pufendorf to Kant, characteristics were imputed to natural man, as conscious forger of the state, which properly belong only to men who live in society and who have been formed by society and the innumerable historical forces playing upon it.

Before the political world could be understood as the work, not necessarily rational, of socially and historically conditioned groups of men, a comprehensive historical, psychological and sociological empiricism had to be developed. Since an insight of this kind into the realistic phenomena of human life was in a sense one of the primary aims of all sciences from the sixteenth to the nineteenth century, the methods of science and its contributions to the understanding of political processes were seized upon by the exponents of that second type of political thought which was concerned not so much with the ideal norms of natural law as with the actual mechanisms and institutions of governmental control. The development of this more realistically oriented type of investigation may be traced from Machiavelli through Bacon and Bodin to Montesquieu, who represents its climax in the eighteenth century. In his famous *Esprit des lois* Montesquieu, while supporting the demands of Locke for a constitutional state,

recognized that the institutions of this state like all institutions were conditioned by the geographic and climatic peculiarities of the country in question or by the mores, the temperament, the economic system and the religion of the population. Substantiated by a wealth of detailed material of a social and historical nature, the work of Montesquieu represents the first systematic and comprehensive attempt to explain the state and political activity in terms of the totality of the concrete natural and social environment. At the same time in England David Hume, explicitly excluding from political speculation any semblance of religious and ethical dogmatism, denied to any political ideal absolute and universal validity, insisting that all such formulations were determined by the political situation in a particular state.

For a long period the two methods, the rational-normative and the historico-sociological, existed side by side in political science; and even to the present day a combination of the two may be met with, particularly in the writings of French and English speaking politicians. Since the beginning of the nineteenth century, however, the historico-sociological approach has on the whole gradually predominated and natural law formulae have been presented as a rule only in a sociological disguise. The triumph of the empirical positivistic methodology was forwarded by transformations in the political and intellectual world. In the realm of practical politics natural law rationalism had become a threat to authoritarian groups, even where the tendency of the publicists was predominantly conservative. Hobbes' theory of state function as the test of state law, no less than Kant's conception of the social contract as a point of reference whereby to evaluate existing state controls, inevitably stimulated criticism of the existing political authority. But when the French Revolution with its demands for freedom and equality for all and its cult of the goddess of reason had become transformed into a reign of terror at home and into a Napoleonic imperialism abroad, the world was convulsed, terrified and at the same time disillusioned. In the process a new body of political thought was brought into being, which directed the attention of not only counter-revolutionary but also revolutionary thinkers to the very complicated social and historical conditioning of political action. The old clash between sovereignty of ruler and sovereignty of people still occupied the center of the forum, but it became subjected to a new type of

analysis. Since doctrinaire political speculation had brought only disillusionment, political philosophy began to concentrate upon the question of the relation of reason to society on the one hand and to history on the other.

For the more empirical type of political science the crucial problem consisted in determining the process whereby political policies and programs were evoked through a given set of political conditions and how under given social and historical conditions these policies and programs could be carried into practice. Hegel's political philosophy, which for all its idealistic metaphysics had an extraordinarily clear insight into political reality, exercised a powerful influence on conservative as well as on revolutionary thought. His maxim, "Whatever is rational, is; and whatever is, is rational," was accepted by nationalists and Marxists alike. Political doctrines and institutions which laid claim to universal validity came to be regarded with distrust and by the political left no less than by the political right were explained, if not explained away, by reference to the matrix of social, historical forces in which they had gestated. In 1835 two works appeared which still serve as classic representations of the new type of political science. The title of Dahlmann's *Die Politik, auf den Grund und das Maass der gegebenen Zustände zurückgeführt* (Göttingen 1835) epitomized the new methodological approach, which de Tocqueville's *De la démocratie en Amérique* (4 vols., Paris 1835-40; tr. by H. Reeve, new ed. by F. Bowen, 2 vols, New York 1898) by analyzing the demands for equality and its concrete prerequisites in America carried out. Political science was finally dominated by the empirical and positivistic schools, which repudiated all metaphysics and philosophy and which sought to derive what should be from what is and to deduce political ideals from an analysis of the data of experience. Both historical materialists and idealists came to exclude from the realm of the concrete and the real any guiding or rational idea: from the political tensions of the present they set out to isolate the dominant trends of the future and were not disposed to cavil at any trend whatsoever, provided that it gave evidence of power to persist.

But despite the striving for methodical agreement and the general appeal to the positive facts of historico-sociological empiricism, modern political science has failed signally to achieve its hoped for freedom from apriorism and subjectivism. In its descriptive as well as in its

critical phases it reveals an unprecedentedly heterogeneous body of opinions. Not only its premises regarding the future but its descriptions of the immediate political concrete display the utmost variation, according as facts are selected by reason of their significance for the present or of their import for the future. While it is universally conceded that the political present is essentially a perpetual process of becoming, governed by social and historical forces, there is the greatest confusion of opinion as to whether the ultimate, uncontingent agent in this process of becoming is the state, the nation, the class, the race, the genius, the masses, the natural environment or the economic system.

Thus, for example, the various currents of romantic speculation in Germany rejected completely the rationalism and atomism of natural law political philosophy and made their common fundamental conception of historical unfolding an irrational and therefore undebatable article of faith. Scientific analysis is automatically precluded if with the historical school it be maintained that all political unfolding is ultimately to be explained as the work, unconscious and organic, of an essentially irrational folk spirit. As was the case in the mediaeval conception of the state, the starting point of this theory was a vague conception of the people and any attempt at empiric analysis of this folk spirit was profoundly despised as rationalistic atomism. A similar methodological premise was to be found in those theories which regarded the state as its own self-justification and which branded as rationalistic utilitarianism any further questioning as to the exact nature of its aim and objective.

FUNCTION. In so far as it is a science, political science can be said to have a function only if it be assumed that it is capable of providing a correct and authentic description, explanation and criticism of political phenomena. Without this assumption of course a pronouncement concerning any political processes at all may still serve a practical function in the struggle for political power as a weapon in the attainment or maintenance of hegemony. But a theoretical function cannot be ascribed to it. The fact that a particular pronouncement about political happenings may be utilized as an instrument in the practical struggle for political power must in nowise preclude the possibility that it may have in addition an authentic theoretical validity which carries weight. But when is a descriptive,

explanatory and critical pronouncement by the political scientist to be regarded as valid and binding? As already explained, every description and explanation of political reality is determined by the criteria governing the choice of the significant and correct facts for the description and explanation of the phenomena involved. So that every description and explanation assumes at the outset definite critical standards. But where does political science find the criteria for determining the validity and authoritativeness of its pronouncements?

To the naïve type of mind the answer to this most fundamental of all questions is simple. Its naïve dogmatism arms it with the belief that the views and convictions which it holds and which are appropriate to the immediate environment are universally valid. As soon, however, as this naïve mind is broadened through contact with the experiences and convictions of other groups and periods and is stimulated to make a critical comparison of these alien criteria with its own, it begins to draw a distinction between objective knowledge and subjective will, between idea and interest. Once the critical consciousness has rendered naïve dogmatism impossible, only two alternatives remain. The critical consciousness may assume as criteria ideas which all the competing factions will accept as just and binding. It makes no difference whether or not the idea on which all are agreed transcends history and society. If it is acceded to only by the groups struggling at a particular time and a particular place, political science already is possessed of the significant function of establishing valid and binding truths for this group. Whether or not it is possible to detect criteria of the type which are binding upon periods, classes, parties or peoples depends upon whether or not it is possible to detect in the political event which is an outgrowth of the group struggle a significance that all the competing factions would accept. But when political science cannot assume such a significance and for this reason possesses for the authoritativeness and validity of its pronouncements no criteria which are acceptable to all the rival groups, it cannot be said to be a science at all. Under such conditions there exists in practical politics only naked power and the type of party knowledge which goes with it. But a theoretical political science has entirely lost its function.

In the Middle Ages political thought, like all other branches of knowledge, was determined by religious dogma and, as *ancilla theologiae*, was

in bondage to the generally binding criteria of revealed religion. Thus the political consciousness believed that it was serving views and norms which transcended all contradictions and were concurred in by all conflicting groups. The transcendental sacred history of Christianity and the natural law faith in the perfectibility of the human race allowed it to pronounce universally valid judgments and to explain political reality as a unity possessed of meaning. Those ideas which were assumed in revealed religion as well as those in rationalistic systems of natural law were not open to question or controversy and were regarded as being in accordance with the interest of each and every group. For this reason each party could appeal to the same Biblical or natural law authority, and the function of all political thought consisted in showing that this or that political objective or exercise of political power was consonant with those authorities.

The sociologico-historical thought of the nineteenth century ultimately destroyed this dogmatic naïveté. The persuasive power of such theological arguments as were customarily advanced in the struggles for political power from the Middle Ages to the eighteenth century no longer survives even among the ecclesiastically minded. The faith of rationalistic natural law in a universally valid *ordre naturel* has been shattered and finally annihilated, since the actual content of the professedly absolute natural law came to be understood as the expression of historically and politically conditioned interests of certain social groups, especially of the bourgeoisie, which in the seventeenth and eighteenth centuries was gathering economic and political strength. Today the sociological and historical conditioning of our political knowledge and norms has become a matter of general acknowledgment. The discipline which is known in Germany as *Wissenssoziologie* is so intent upon demonstrating the complete dependence of all political views upon the interests of the church, of the crown, of the nobility, of the bourgeoisie or of the proletariat that not only is this conditioning of our thought no longer doubted but the very existence of political science itself is called into question.

Critical political science destroyed the self-conscious naïveté of its predecessor, which free from the restrictions of a sociologico-historical consciousness placed its intellect in the service of political group interests. The criticism of dogmatism, however, has basically altered the function of political science. Hitherto it had

understood its task as that of establishing norms and forms common to all political arrangements and strivings. The crossbeams of Fichte's philosophy of the state were still the "destiny" of the entire race of mankind and the "equality of all who bear the human countenance." In the nineteenth century this type of thinking—to use a well known phrase of Napoleon's—came to be regarded as the business of the "ideologues," whose pronouncements were dubbed by the so-called political realists "ideologies." Critical political science directed its attention much less to the common element than to the individual varieties of political criteria and constructs; it sought to describe the socio-historical differences in their manifoldness and to explain them in terms of their causes and consequences. At the same time the historical and rational faith of past epochs persisted so strongly during the nineteenth century, particularly in the Romanic and Anglo-Saxon countries, that this historico-sociological relativization of thought was not able to undermine the meaning and function of political science. There was still a faith in an autonomy of the mind which was capable of preserving its independence over and above the fluctuating alignment of interests at different periods and under varying social conditions. Ranke, for example, still believed in the possibility of a science of history, which should content itself with describing "how it has been." Political science was still accorded the function of preserving as objective and impartial an attitude as possible in the face of all political tendencies, of describing them in terms of their dependence on the various natural and cultural conditions and of striving for a mediation, if not a reconciliation, of the conflicting forces on intellectual grounds. It was still believed in the majority of quarters that there was a common ground of discussion for all the rival interests and that the mind must succeed, on the basis of this common meeting ground, in discovering a general *status vivendi*, in which all factions might concur politically.

Toward the end of the nineteenth century, however, there began a self-relativization of the consciousness in terms of the socio-vital being, the consequences of which must lead to the self-destruction of political science. The faith of past epochs in science tended to make political theory absolute as against political practise; today there is a much more dangerous tendency to deny outright the autonomy of political science and consequently to question the possibility of a

political science at all. By insisting in extreme terms on the dependence of all forms of thought on historical, sociological and polemical factors it has introduced a real danger not only for political theory but also for political practise—a danger which becomes apparent if the natural consequences of such a line of reasoning are thought of in present day terms. In the nineteenth century as a rule it was assumed in one type of approach that thought was conditioned by historical factors and in another type that thought was conditioned by sociological factors; and even where the two approaches were followed by the same thinker, room was still left for a position which transcended history and society. Although Hegel, in formulating the classic statement of the process whereby historical forces condition the thinking of a given period, had presupposed that the existence of man in a given historical context is the only true reality, his philosophical premises left no doubt that time, the conditioning agent, was itself the creature of thought. Even Marx, who carried the relativization of thought a step further by stressing the economic and class foundations of the ideological superstructure, was so saturated in the postulates of older systems of political philosophy as to a meaning and purpose in history that he preserved a carefully drawn distinction between truth and illusion.

In the twentieth century, however, particularly under the influence of the philosophy of Nietzsche and Bergson, the radical relativization of thought in terms of "life" has introduced a really serious danger. According to George Sorel and Vilfredo Pareto every pronouncement of political science is merely the sublimation of a highly individualized, thoroughly irrational life situation; every item of knowledge in the political sphere, merely the derivative of a moment of time in the socio-historical and personal sense, above which thought is incapable of rising to any unified point of view. If such interpretations are correct, political science has completed its own self-destruction and has finally done away with itself as a science. For with such a complete annihilation of the mind it would have to be recognized that political science is no longer in a position either to influence political practise or to understand it. In the nineteenth century each faction attempted, by disclosing the strictly political function which the ideas of the opposition performed, to destroy their political influence but at the same time to claim that its own ideas alone were objectively

true. But as soon as all human consciousness is regarded as nothing more than a function of the socio-vital reality, as pure reflection, fiction or ideology, and mind in any form as nothing else than a weapon in the struggle for political power, this view must lead to the self-destruction of even one's own political position, and one's own standards must finally be stripped of their pseudo-objectivity.

Both in theory and practise the attempt is made to avoid the logical consequences of such a point of view by removing this or that socio-historical phenomenon from the workings of the law of radical relativization and by elevating it to a status of absolute criterion and constant, by reference to which historico-sociological phenomena are interpreted as pure derivatives. The present day tendency to attribute to certain time-space phenomena an absolute value is the equivalent of the earlier historicizing and sociologizing of all absolute content. With the aid of this type of metaphysics, which hails any fact of experience whatsoever as the only real element and rejects everything else as ideological, all radical movements of the present day contest their political sciences. In this category belong the apotheosis of the state or the nation, the tendency to make race or class absolute and the conception that the one and only motive power of all political happenings is the economic system, the will to power or this or that libido.

For the time being at least political practise could be satisfied with this solution of the problem. It could declare itself in agreement with the view that all political knowledge is possible only as party knowledge and that the value of this knowledge is determined solely and exclusively by its actual propaganda value; that is, according to its utility as "a knowledge of domination" for ruling the masses. Vilfredo Pareto, the so-called father of Fascism, gave this bourgeois neo-Machiavellianism its most incisive and influential formulation, when he interpreted all consciousness as conditioned by the "residue"; that is, by the total individual-irrational condition of the participant. For Pareto all political knowledge from Plato to Marx is only bad metaphysics, all these ideologies are nothing else than weapons in the *bellum omnium contra omnes*. The ideological coverings of the irrational political will are of course fictions, which are necessary for the domestication of the beast that is man. Accordingly the dominant élite of the moment must make use of them, in order to be able to come to the fore and establish itself in the

forever identical—and in itself meaningless—fight of the élites for power. But if all political consciousness is only the expression of a most highly individual situation, if between generations and classes, between parties and nations, there is no meaningful unity, then in theoretical and practical politics there is no *status vivendi* which can mediate in intellectual terms between them, no basis of discussion, no rational-moral intercourse; but only an activity which by means of power suppresses the opponent or exterminates him. The apotheosis of unrelieved political power, which corresponds to this disillusionment, is indicated in Sorel's *Réflexions sur la violence* (Paris 1906-07), which was popularized in Germany by Oswald Spengler. In the second volume of his *Decline of the West* Spengler presents war as the primitive politics of all forms of life: "The war, not of principles but of men, not of ideals but of races over the exercise of power, is the first and last." Finally, Carl Schmitt formulated this theory for German fascism and singled out the conflict between friend and enemy as the basic category of the political process. The emphasis in this formulation was exclusively on the concept of the enemy, that which "in its mode of existence is something outside and alien," and which in case of conflict must be annihilated.

Although the active political leader may welcome a view which reduces thought to the level of propaganda, the acceptance of such a premise foredooms inevitably all future culture, political and otherwise. It would therefore seem appropriate to inquire briefly whether this implied self-immolation of political science can be justified on intellectual or historical grounds. If it be conceded that all human thought is but a series of expressions of transient individual or group interests, determined by an ephemeral set of historical and social conditions, it follows that the sole function of political science, if under such an assumption it could be dignified with such a name, would consist in investing the prevailing mechanisms and agencies of political control, whatever form they might take, with the appropriate ideological trappings. If the mind is ceaselessly enmeshed in opportunistic struggle for political power and in these struggles shows no capacity for independent self-expression, anarchy in the realms of both theory and practise becomes rampant as the last barrier falls before the triumphant party leader.

In order to reendow its pronouncements with a universally binding authority political science

must succeed once again in isolating from the flux of historical and social evolution an unequivocal set of fixed constants. In approaching this fundamental problem from the realm of the arts Marx declared that the "difficulty is not in grasping the idea that Greek art and epos are bound up with certain forms of social development. It rather lies in understanding why they still constitute with us a source of aesthetic enjoyment and in certain respects prevail as the standard and model beyond attainment." Nor is this independent existence of spiritual forces confined by any means to the realm of the arts. The modern pragmatist and relativist would encounter equal difficulty in explaining how it happens that the theoretical formulations of an Aristotle, a Hobbes or a Marx still carry weight with present day thinkers in the most varied political situations. Activistic irrationalism, in seeking to strip political thought of its mask of self-illusion, has failed to reveal why, amid the multiplicity of political pronouncements at a given period, only certain fragments and not others have borne witness through the years and centuries to their enduring truth and authority.

The incontestable fact that political science has invariably performed the incidental function of buttressing or undermining an intrenched group or class cannot be cited to show that this is its only function. The fact that the political theory of the Huguenot lawyer Bodin served to bolster the absolute monarchy in sixteenth century France must in no sense be construed as invalidating the more significant contribution which he made in elucidating certain enduring truths of political life. This broader intellectual sympathy, which still continues to attract the modern theorist to the work of Bodin, is evidence that history is something more than an agglomeration of momentary situations and that in the political process there are indeed certain unchanging constants, which elude the practical reason of the historicizing and sociologizing relativist.

The most significant of these constants, the nature of man, is to be conceived not in the manner of the rational natural law schools as prior to history and society, but as the product of history and society. Prehistory may deal with remote human and subhuman forms, but political history must without exception limit itself to the human being, who in contrast to the animal sets out, in the light of his understanding and aspirations, to transform the surrounding world. Accordingly political science, like all

historical, sociological thought, must take as its starting point human behavior, which, as pointed out by Marx, "is not to be encountered except among men." "A spider," writes Marx in *Das Kapital*, "conducts operations that resemble those of a weaver, and a bee puts to shame many an architect in the construction of her cells. But what distinguishes the worst architect from the best of bees is this, that the architect raises his structure in imagination before he erects it in reality. At the end of every labor-process we get a result that already existed in the imagination of the laborer at its commencement. He not only effects the change of form in the material on which he works, but he also realizes a purpose of his own that gives the law to his *modus operandi*, and to which he must subordinate his will."

The consciousness which purposefully transforms the environment according to ideal laws is in the nature of things confined to man. From the point of view of natural history this being, capable of remolding the given world of reality, may be a variable, but for all cultural history it must remain a constant. Even the complex of natural and cultural objects, upon which the mind of man works and which determine his activity according to a fixed law, reveals, although with the widest variation, that historical and sociological immutability which is a prerequisite of all culture: those countless natural and cultural factors which have made their imprint on human existence and thought and which form the shifting basis of man's actual social and historical work. Depending on the extent of abstraction it is possible to premise a larger or smaller number of constant factors—anthropological, geographic and climatic, national, social and technico-economic—which in spite of all class differentiation exert an equal influence on all the political groups that are submitted to the same environmental influences, and which in many cases remain unchanged over practically endless periods of time. The fact that Russia has not possessed enough ice free harbors and that it has never been influenced by the Renaissance movement of western Europe has been instrumental in determining the political policy of the czars no less than of the Bolsheviks. In all natural and cultural history that which has been caused becomes in its turn a causative factor. Man is the product and at the same time the molder of his history, a comparatively constant element, which evolves through living. That which has been brought into being through the

historical process is not merely a disembodied element of the past which stands outside the observer of history as something alien. While all thought is necessarily a reflection of a particular intellectual and social climate, it may, consciously or unconsciously, free itself from the immediate set of conditioning forces and acquire validity for basically different situations. So that, wherever the essential features of a political system have found adequate intellectual expression and where social continuity has been unbroken, political opinion becomes elevated to the plane of real political understanding which may preserve its inner validity in the midst of all political transformations and shifts of power.

The inane observation of Spengler, that in "actual" history Archimedes with all his scientific discoveries has probably had less influence than that soldier who slew him in the storming of Syracuse, is particularly well fitted to hasten the break up of western culture. But even if this collapse of our culture were actually to take place, Archimedes would still bulk incomparably larger in the heritage of the west than his slayer. It is in this sense that political science has the significant function of working toward an accurate and authoritative description, explanation and criticism of political phenomena.

POLITICS. The lexicographers usually define politics as "the science and art of government." The term covers the entire field of political life and behavior. It embraces the relations between the state and the individual and in this sense is practically synonymous with political

philosophy. It comprehends "the forces at work which form the anatomy and determine the physiology of states." It includes relations between the state and its political subdivisions and between states and other states. Thus politics can be domestic, national, federal, municipal, imperial or foreign. The relationships thus comprehended and the regulations which they necessitate are intergovernmental. William Penn said: "Governments like clocks, go from the motion men give them; and as governments are made and moved by men, so by them they are ruined too. Wherefore, governments rather depend upon men than men upon governments."

It is with due regard for William Penn's emphasis that the term politics is ordinarily used. In American academic parlance, the term is synonymous with government, political science or even public law. There are university departments thus variously named with no resulting differences in the character of the subjects which are treated. If Penn's emphasis were adhered to, politics would stress political action and practise; the tactics and strategy of the practitioner of politics; and the conduct of political affairs or business: with politics being carefully distinguished from administration, for politics is the excogitation of policy and administration is the execution of policy.

As applied to the living of political lives and the attainment of political goals, politics frequently has unpleasant connotations. It comprehends scheming and planning different from the scheming and planning, say, within corporate enterprises. In associations where personal relationships are important—trade unions, universities, churches—politics is frequently to be found. The use of the term to describe such personal or group action implies a milieu hospitable to scheming and manipulation and invites action and speech less intellectually honest and high minded than are common in purely personal relationships. The degree of the lowering as viewed in the light of the objects to be obtained determines the nature of judgments which may be passed on such actions.

The vast extensions of suffrage and the spread of democracy have worked a complete metamorphosis of political methods and tactics. Politics nowadays is quite different from politics in the days of the Hanoverians. Then politicians could be successful if they curried favor with royal mistresses. Now they must curry favor with parties and electorates. As Bernard Shaw has put it, "The politician who once had to

learn how to flatter kings has now to learn how to fascinate, amuse, coax, humbug, frighten or otherwise strike the fancy of the electorate." That is somewhat cynically put but is profoundly true. If the fancy of the electorate can be struck, if it has confidence in a leader, then the electorate rallies to his support.

Dictators may inveigh against parliamentary government as *un gouvernement qui parle*, but in order to keep popular support they frequently deem it necessary to rattle the saber or wave the flag in a fashion more extreme and grandiose than would be ventured by any parliamentary prime minister. In a dictatorship a dictator does not bar demagoguery. He simply monopolizes it. His political eminence may be possible because of the despair of his people, as in the case of Hitler. It may seem unassailable because from its heights the dictator appears partly a legendary, partly a homely figure, as in the case of Mussolini. From recent political history as many illustrations as there are prominent politicians can be adduced to suggest, albeit vaguely, how success is attained and retained and how failure is risked and suffered.

In recent years the claim has been more and more frequently made that political discussion is futile; that the technical character of the problems to be dealt with, the increasing power of party organizations and the preoccupation of the people with their business interests and the enjoyment of their leisure have combined to rob politics of its interest. This is true only when the politicians themselves are uninteresting and lack courage. They can inject vigor into democracy, but they must remember that it is better to fight and risk losing than not to fight and thus to seem to escape defeat. Only in the former case will the people stand by them.

Moreover one striking lesson of recent elections both in Europe and in the United States is that millions of voters recognize no binding party allegiance. They are ready to turn against parties and candidates they have supported. The successful candidates who benefit thereby should be aware that party organization and loyalty will not save them from being driven from office at the next election if a sufficient percentage of the electorate, temporarily under their banner, becomes critical and resentful.

Newly elected presidents of the United States find it difficult not to begin at once to think of reelection for a second term. Many of their appointments seem to be determined upon, their policies to be shaped, with reelection in mind

The best means to reelection is frequently not to think about reelection. The dictum is particularly sound in respect of a politician who is placed in office by a tremendous afflux of support from people who may later desire to punish failure. Such support amassed in one campaign cannot be retained by use of the appointing power, by building up local organizations or by framing a legislative program which, in seeking to avoid acute dissatisfaction to any interest, ends by failing to merit the general approval of any interest and if it does not prevent, at least retards, intelligent action.

There is throughout the world a growing agreement that many troubles have been due in considerable measure to lack of courage in statesmen. Too often they have known in their hearts what should be done but have failed to confess their beliefs publicly and have hesitated to press for their acceptance. Too often they have been content to be the prisoners of their parliaments and peoples. But the conviction is spreading that such lack of courage does not pay. There are increasing signs that the taking of risks in the name of intelligence is the road not alone to the favorable verdict of history but also to the continued approval of parliaments and electorates. This truth should be pondered especially by statesmen who are put into office by millions who have sloughed off party ties. These statesmen have emerged from among their colleagues as the strong men demanded by the exigencies of the moment. It is within their power to shape the program and set up of the political parties they lead; sometimes, without any party support, their positions are sufficiently commanding to enable them to guide their nations.

What has been said contradicts in considerable measure certain dicta which have long been current and which have been blindly relied upon by politicians. Candor is said to be dangerous. Manipulation and compromise are to be preferred to leadership. The use of patronage, attentiveness of national leaders to the building up of local party organizations and reliance on such support rather than on general approval of a courageous legislative or administrative program; the outsmarting of the opposition, sometimes by presenting an issue which will divide it and sometimes by presenting an issue which makes its opposition difficult; the throwing out of successive sop to regions in a country or the placation of a series of factions or groups, all these methods of "politics" have caused the formulation of political maxims, the truth of which

has been taken for granted until some politician acted in a contrary fashion. But even then the maxims were not deemed false. The fact was simply the exception to the general rule.

There is, unhappily, no modern manual of political tactics. Such a manual could be only tentative. It would have to deal not only with the art of cajoling electorates but also with the art of government, for the successful practitioner of the latter art is greatly advantaged in the former. Continental writers before the advent of democracy attempted such manuals. Machiavelli, Guicciardini and others told the statesmen how to act. In comparison the modern continental literature is trivial. Perhaps the least trivial is the somewhat cynical but frequently wise brochure of Louis Barthou, *La politique*. In England Graham Wallas has been the only successor to Sir Henry Taylor. There are American manuals on the methods which have been proved successful by municipal bosses, but there is little or nothing on the practise of less parochial politics.

The complexity of governmental tasks already referred to makes it inevitable that politicians will rely to a greater and greater extent on experts. One may paraphrase Byron's *English Bards and Scotch Reviewers* and say that a man must serve his time to any trade save politics, but that politicians are ready made. So long as the business of government was simple, amateurs in office were competent to do what was required of them. But now experts are playing a more and more important role, not in determining the proper methods of cajoling or humbugging electorates, but in suggesting how the politicians should use their offices. "It is the business of the politicians," said a well known English statesman, "to prevent the civil servants from acting so there will be a revolution." The ideas of intelligent people always race along ahead of party programs. The thoughts of parties and politicians lag behind events but so serious are the demands which modern government makes on intelligence and expertise that the gap is likely to be greatly narrowed. "Politics," wrote Gladstone in the year of his retirement (1894), "are like a labyrinth, from the inner intricacies of which it is even more difficult to find the way of escape, than it was to find the way into them." The intricacies need charts, which at first will be rough but which can be perfected. These charts can be made by only courageous guides

POLL TAX. The distinguishing feature of a true poll tax is that every person subject to it pays the same amount regardless of his income, property, other taxes payable or services received from the state. Exemption from the tax is usually based on age and sex, although political and social standing have sometimes been important factors. Occasionally the family rather than the individual is the unit of assessment. The rate is usually low, amounting in the United States to from \$1 to \$5 a year per person. At times it has been permissible to commute the tax by a few days' work on the roads.

The poll tax is not a major source of revenue in any part of the world today and even as a minor source is found in few places outside some American states, Canadian provinces, Swiss cantons, Balkan countries and European colonies. Sweden's long established national poll tax produced only 0.1 percent of the state's total revenue in 1926-27. In the United States the poll tax is levied or required to be levied by the constitutions of thirteen states, nine of which also permit the levy of such a tax by local authorities; while the constitutions of thirty other states authorize the imposition of such a tax by state or local governments. The revenue usually flows to local units, particularly the counties and municipalities, although in a few states highway and school districts are allowed to impose a poll tax. In eight states part or all of the revenue goes to the state government. While the tax money is ordinarily earmarked by law for streets and

roads, often, especially if the constitutional provision is mandatory, it is destined for schools. The federal government levies a head tax of \$8 upon every immigrant entering the United States.

The poll tax has at various times been a special levy upon the conquered, as, for example, the poll tax in ancient Greece, regarded as a badge of slavery; the Roman tax levied on colonials; the Mongol tax collected from Russians; the poll tax levied by the Islam rulers on unbelievers; and the modern colonial poll taxes levied on natives in many European possessions. Its use in such circumstances may be explained either by the undeveloped economic state of the taxpayer or by the natural lack of concern for justice in the distribution of the tax burden.

The poll tax has been noted for its non-fiscal uses. Twelve of the states of the United States, most of them southern, make payment of the poll tax a prerequisite to the exercise of suffrage, a provision which has often been used either to disqualify the Negro or to control his vote. The "hut tax"—virtually a family tax—as used in some parts of Africa exempted those natives who settled and worked steadily in one place for more than six months.

In an attempt to establish a more equitable system of taxation governments have often graduated the poll tax. The flat rate tax first levied in England in 1377 was in 1379 graduated according to rank; the tax appeared at intervals up through 1698. The *capitation*, established in France in 1695 and radically altered in 1701, divided taxpayers into twenty-two classes, the tax ranging from 20 sous to 2000 livres. The Russian poll tax, established by Peter the Great in 1718, divided taxpayers into three groups; and before it was abolished in 1886 it had been much modified by the introduction of property elements. The simple Prussian poll tax of 1811 was succeeded in 1820 by the *Klassensteuer*, which divided taxpayers into four groups and distinguished three classes within each group. An elaborately graded tax of this type must be regarded as an income or fortunes tax rather than as a poll tax.

Lately a reverse movement has set in, and some of the states of the United States have adopted or considered a flat tax on all adults except specified groups of dependents as a complement to the personal income tax, thus developing "tax consciousness" and checking evasion of the income tax (hence the term filing fee, connoting the filing of a return showing total

personal income). Delaware imposed a \$3 tax of this type from 1921 to 1927, its repeal apparently being an attempt to gain political favor, as the tax administrators have declared themselves in favor of its retention. Utah is now attempting to administer a similar tax.

Full collection of a poll tax is usually very difficult. Some of the laws in the United States provide for payment by debtors of the person assessed, such payment to be allowed as set off against the debt, or by employers and for attachment of property or imprisonment. In many states of the United States it seems that only those who pay other taxes—especially the property tax—are effectively reached by the poll tax. The burden of the tax probably rests on the person taxed, unless—as is rarely the case—the amount involved is so large that an increase in wages can be forced and the tax thus shifted to the employer. When poll taxes are levied as a prerequisite to the exercise of suffrage, political party funds may supply the money and thus bear the burden of the tax.

POLLS. See ELECTIONS.

POLYBIUS (c. 200-c. 120 B.C.), Hellenistic historian. Polybius was the son of a statesman of note in the Achæan League. He had some experience of political and military life in Greece, was one of the thousand leading Achæans surrendered to the demand of the Roman government in 167 B.C. and was interned for sixteen years in Italy. The friendship of the Scipio family secured him a domicile in Rome; and there he lived in intimacy with the group who shaped the intellectual life of the Romans—Scipio, Laelius, Terence, the stoic Panaetius. The famous elder Cato himself was responsible for his release, after which he saw much of the world. He records a visit to Alexandria, he was with Scipio at the fall of Carthage (146 B.C.) and in the same year he was present at the sack of Corinth. Sent by Scipio, he did some exploring

down the Atlantic coast of Africa. The Romans later employed him to draft arrangements for the government of the Peloponnesus.

Polybius' view of history was what he called a "pragmatic" one. He was interested in ascertaining the true historical facts in order that they might serve as a guide to the practical administration of affairs. His *History*, originally in forty books, of which six survive almost intact with large extracts from the rest, thus deals with the central question, proposed in his prelude; How came Rome within a space of fifty-three years to dominate the Mediterranean? The Greeks, wrote Gibbon, "imputed the triumphs of Rome, not to the merit but to the fortune of the republic. . . . A wiser Greek, who has composed, with a philosophic spirit, the remarkable history of his own time, deprived his countrymen of this vain and delusive comfort by opening to their view the deep foundations of the greatness of Rome." In his sixth book he sets out the political and military principles and methods of the Roman state, the best presentment that has survived. He accepts the older Greek division of the forms of government into monarchy, aristocracy and democracy and interprets the changes in governmental institutions as the cyclical succession of each of these forms to another. Stability can be assured only by the establishment of a mixed form of government including the essential features of each of these forms. The stability of the Roman state he attributed to the fact that such a mixed form was present in Rome in the institutions of the consuls, the Senate and the popular assemblies, representing respectively the monarchic, aristocratic and democratic principles.

Polybius has been reproached both as hostile and as subservient to the Romans, but he deserves neither reproach. A singular fairness, based on experience of both Greek and Roman; a long intimacy with political leaders, East and West; military service; land and sea travel; a Thucydidean concern for absolute truth; a shrewd judgment of men and movements; an eye for the great character, the great scene, the great event; and a strong distaste for rhetoric in all its branches, such features set him among the greatest historians of antiquity. His picture of Hannibal is unmatched. The ancient Greeks found his style an obstacle to reading him, but he towers above all the other historians of Rome. We owe to him the best of modern knowledge of the Achæan League; and nothing compensates for the loss of his books on the affairs of the

Macedonian dynasties in Syria and Egypt. His attitude to literature and philosophy, his discussions of the historian's ideals, and the movement of his judgment on the part played by fortune in human affairs are no less important in illustrating the strongest intellectual life of his age.

POMBAL, MARQUEZ DE, SEBASTIÃO JOSÉ DE CARVALHO E MELLO (1699-1782), Portuguese statesman. As minister of Portugal throughout the reign of Joseph I (1750-77) Pombal became perhaps the most famous of those statesmen who served the various "enlightened despots" of the eighteenth century. Consolidation of the royal absolutism, anticlericalism, promotion of the national wealth and encouragement of cultural improvement were all combined in the program which Pombal conceived and executed with a display of energy equaled only by his cruelty. He banished intractable officials, after the attempted regicide of 1758 subjected some of the first nobles of the realm to barbarous torture, subordinated the Inquisition to the monarch, transferred its privilege of censorship outright, reduced the ecclesiastical jurisdiction and conducted a world wide pamphlet propaganda against the Jesuits. Not satisfied with expelling the order from all Portuguese territories in 1759, he subsequently joined forces with Aranda and Choiseul and took a leading part in its final extinction. By reorganizing the army and navy and fortifying the frontiers he was able to uphold the complete dependence of Portugal against Spain in the war which broke out in 1762 over Portugal's refusal to enter the Bourbon Family Compact. Among the various aspects of his program none better illustrates his quality as a statesman than his manoeuvres to liberate Portuguese commerce and economic enterprise from the hold which England had gained by the Treaty of Methuen of 1703.

Pombal's internal policy included the promo-

tion of such industries as silk in Lisbon, woollens in Covilhã, linen in Guimarães, glass in Marinha Grande and fisheries in the district of Algarve. Firmly persuaded of the advantages of great monopolistic corporations, he organized for the Brazilian trade two chartered companies, one to operate in Grão Pará and Maranhão, the other in Pernambuco and Parahyba. His foundation of a wine monopoly in the upper Douro was the occasion of a serious popular uprising in Oporto, which evoked from Pombal brutal reprisals. He took measures to revive agriculture and to protect the rural tenantry. In order to prevent the accumulation of wealth in the hands of ecclesiastical corporations as well as to guard against excessive parceling of the land he revised the laws governing property. Following the earthquake of 1755 he rebuilt Lisbon on a geometrical plan, making this unstable terrain safer and more sumptuous. In 1772, on the basis of data prepared by a committee, he issued his famous decree on the reorganization of public instruction; as a result of this and other measures taken by Pombal, all branches of teaching were improved but especially the University of Coimbra, into which he introduced several new chairs in the sciences. His abolition of slavery and of the distinction between "new" and "old" Christians testifies to his accord with the humanitarian spirit of the eighteenth century.

After the death of Joseph I, Pombal was dismissed and banished. His adversaries succeeded in rehabilitating his victims as well as in destroying a great part of his work. The memory of his cruelties and the protests of the clerical party have continued to divide Portuguese opinion regarding the greatest of the nation's statesmen.

POMERANUS. *See* BUGENHAGEN, JOHANNES.

POMEROY, JOHN NORTON (1828-85), American jurist. Pomeroy was born at Rochester, New York, where he taught school as a young man. After studying law, he was appointed to a professorship at New York Uni-

versity which he held with great success for many years. In later life, after a period of ill health, he accepted a professorship at the University of California.

Today Pomeroy is best known to the practising lawyer by his *Equity Jurisprudence*, an encyclopaedic treatment of the more generalized concepts of Anglo-American equity. It is difficult to appraise this work. No book has been more frequently cited and quoted by the courts in the last half century, but that is not convincing evidence of formative influence upon the course of decision. Such a compendium of abstractions will usually be apposite to either side of a case. It must also be observed that Pomeroy's statement of doctrine was original in form rather than in substance, for there were not many points where he quarreled with current views. Finally, this was not a pioneer text in the equity field, for Story had covered the subject in much the same way. It cannot then be said that this book profoundly influenced the development of equity.

From the historical point of view, Pomeroy's most significant work was his study of "code" procedure, first published under the imposing title, *Remedies and Remedial Rights by the Civil Action According to the Reformed American Procedure*, but known in later editions as *Code Remedies*. This was the first comprehensive treatment of the statutory procedural system devised by David Dudley Field, first adopted in New York in 1848, and now in force in modified forms in most states of the United States. The code was intended to abrogate the cumbersome common law system, but reactionary interpretation by the courts threatened to nullify the statute. This tendency was halted by Pomeroy's book, which not only presented vigorous arguments upon specific points but, going to the root of the matter, created in bench and bar a more sympathetic attitude toward the new system. If it now seems too conservative, it must be remembered that when it was written the code had already suffered thirty years of hostile interpretation. An attempt at that time to reinstate in its entirety the radical theory which underlay the legislation would probably have antagonized the legal profession and so have failed entirely. Pomeroy accomplished conspicuous reform by appearing to be not so much a reformer as a superior technician.

POOR LAWS. Poor law legislation may be said to have had its origin in the breaking up of feudalism. With the disappearance of the latter system, under which the obligation of the serf to work on the manor implied his right to maintenance, the responsibility both for preventing and for relieving destitution devolved upon the community. In continental Europe, where the church was powerful, poor relief was until very recent times almost wholly in the hands of ecclesiastical authorities. In England and Scotland the Reformation and the dissolution of the monasteries led to the assumption of this responsibility by the state. The first steps in the development of a national system of poor relief were for the most part negative and prohibitory: the repression of begging and vagrancy, the regulation of individual almsgiving and the restriction of the movement of laborers from one parish to another. The English act of 1531 licensed the aged and impotent poor to ask for alms. The attempt to localize relief and prevent vagrancy found expression in the Scottish law of 1535 which forbade begging outside the parish of birth, and in the English act of 1536 which prohibited begging altogether and provided for local aid by the organized collection and distribution of alms, the apprenticing of children and the division of the able bodied into the willing, who were to be given work, and the unwilling, upon whom punishment was to be inflicted. The provision of aid was hampered by the absence of compulsory taxation, the act depending on the Sunday exhortations of the clergy and the collections of town authorities and parish church wardens. It was not until 1572 (14 Eliz., c. 5) that a law was passed providing for the appointment of collectors and overseers with power to compel the payment of poor relief to parish

officials. This legislation laid the foundation for the Elizabethan poor relief act of 1601, which definitely recognized the responsibility of the state for its dependent classes by the provision that each parish levy a rate, or tax, for such relief to be collected by overseers of the poor appointed by justices of the peace. The act of 1601 attempted also to classify dependents and to provide specific treatment suitable to the needs of each group—work for the able bodied poor, almshouse care for the infirm and apprenticeship for children.

Relief under the poor law, however, was greatly influenced by the background of repression carried over from earlier times and with the increase of pauperism found expression in the Act of Settlement [13 & 14 Chas. II, c. 12 (1662)] forbidding migration and in numerous vagrancy acts. An attempt to supply work for the able bodied poor was made in 1722 through Knatchbull's Act (9 Geo. I, c. 7), which provided for the building of workhouses by single parishes or unions of parishes in which able bodied paupers were to be employed and the aged poor, children and pauper sick were to be cared for. This act accomplished one of its objects, that of economy, but serious administrative problems arose from the grouping of all classes of poor within a single institution. An effort was made in 1782 to remedy these difficulties by the passage of Gilbert's Act (22 Geo. III, c. 83), through which outdoor relief for the able bodied poor became obligatory. The economic and social disorganization attendant upon the industrial revolution and the consequent increase of poverty among the laboring classes emphasized the need for additional measures to cope with the problem. By the close of the century a regular system of relief in aid of wages had developed largely as a result of the Speenhamland system of 1795, under the terms of which all laborers whose wages fell below a certain level were granted an allowance from the public treasury. The effect of this act was to demoralize both employer and employed. Thousands were pauperized and the nation's expenditures for poor relief increased tremendously.

Widespread dissatisfaction with existing laws and their maladministration led in 1832 to the appointment of a royal commission to inquire into the whole problem of poor relief and to offer recommendations for reform. The result of this inquiry was the poor law amendment of 1834 (4 & 5 Will. IV, c. 76), which repealed most of the existing legislation on poor relief including

Gilbert's Act. Beatrice and Sidney Webb summarized the principles laid down by the act of 1834 under three heads: first, the principle of national uniformity—that is, the identity of treatment of each class of destitute persons throughout the kingdom; second, the principle of less eligibility, which required that the condition of the pauper be less desirable economically than that of the humblest independent laborer; third, the principle of the workhouse system—that is, the substitution of indoor for outdoor relief. In addition the new law provided for the establishment of a central authority consisting of three poor law commissioners with power to control the entire administration and to regulate the work of the local officials in minute detail. This was accomplished by the abolition of the parochial system of relief and its replacement by poor law unions or groups of parishes each of which elected a board of guardians. Thanks to the able administration of the first commissioners, among whom was Sir George Nicholls, the cost of poor relief was reduced by the strict application of the principles that relief should be given only to the able bodied poor in a well regulated workhouse under conditions inferior to those of the humblest laborer outside. Many of the old restrictive measures were set aside and *laissez faire* became the keynote of poor law administration. The rise of a new class of industrialists whose philosophy was dominantly individualistic and opposed to governmental interference changed the entire spirit of the poor laws.

For nearly a century the reforms of 1834, only slightly amended by subsequent legislation, remained the core of English poor law policy. The opening of the twentieth century, however, witnessed a new attitude toward poor relief. The failure of the system in dealing with unemployment and pauperism produced by the constantly changing conditions of the industrial world was acknowledged and an increasing effort was made to attack the problem at its inception by the prevention of destitution. Factory acts, social insurance, public health work and other preventive measures were initiated which served to lighten the burden of poor relief and to alter its methods. These tendencies were clearly reflected in the recommendations of the Poor Law Commission of 1905-09. A majority and a minority report were rendered, both of which agreed in condemning the workhouse and in recommending the abolition of the boards of guardians and the poor law unions. The majority

report advocated the abandonment of the "deterrent" philosophy of the principles of 1834 and the establishment of a new curative and preventive aid through a more humanized administration of the poor law system. It favored relief of the various classes of the destitute in specialized institutions and a more adequate provision for outdoor relief. It recommended also that a single authority be set up to handle all matters pertaining to "public assistance," the term suggested as a substitute for "poor laws."

The minority report urged the complete abolition of the poor law and the substitution in its stead of a system of social insurance, pointing out the failure of the existing system and maintaining that it is the duty of the state to prevent rather than palliate destitution. The report advocated that the duties of the guardians be transferred to the county authorities with an appropriate distribution among the four existing committees of the county council. It recommended that the education committee become responsible for the entire care of children of school age; that the health committee care for the sick and the permanently disabled; that the asylums committee take charge of the insane and all classes of mental defectives; and that the pensions committee supervise the aged receiving pensions. The minority report suggested further that the national authority for unemployment might, by the right sort of effort, deter men from becoming unemployed by making labor more continuous through the equalization of supply and demand and the regularization of seasonal employment.

Although no immediate legislation based upon these recommendations was enacted, the whole problem of poor relief was directly influenced by the work of the commission. Agitation for the reform of the poor law continued during the years after the World War, when the situation was greatly aggravated by the increase of unemployment. In 1919 Parliament created a Ministry of Health combining the various duties and functions pertaining to public health and welfare with general supervision over the poor law. The poor law acts of 1927 (17 & 18 Geo. V, c. 14) and 1930 (20 Geo. V, c. 17) represent additional efforts to consolidate several centuries of poor laws and to form a fairly complete code embodying the distinctive features of English policy with regard to the relief of destitution. Growing recognition of the close relation between unemployment and destitution led to subsequent modification of the National Insurance Act

passed in 1911. In its present form it provides for two kinds of benefits: first, the standard, or insurance, benefit, under which an applicant receives aid from a fund to which he himself has contributed during his previous period of employment; second, the transitional benefit, whereby an applicant who is still unemployed at the end of twenty-six weeks is shifted from the first class of benefit to the second, or transitional, class. In order to qualify for the transitional benefit he must pass a "means" test by which the public assistance authorities determine his eligibility for aid and the amount needed. Here it is no longer a question of mutual insurance but of public relief, a fact which in no way vitiates the principle of public responsibility for dependency inherent in English law, whether it be caused by unemployment, sickness, old age or other individual incapacity.

A comprehensive Local Government Act of 1929 (19 Geo. V, c. 17), initiated principally with a view to readjusting the burden of local rates, abolished the boards of guardians and handed over their work to the local authorities, placing the full responsibility for poor law administration upon the county councils and the county borough councils. These councils are now charged with the administration of poor relief and are required to appoint public assistance committees, who in turn appoint local committees to deal with individual cases. The most far reaching and significant provision of the act was that empowering the Ministry of Health eventually to "break up the poor law" by removing certain classes of persons from its jurisdiction. The Local Government Act of 1929 indicates the remarkable changes that have taken place in the principles of relief since the beginning of the present century. It represents not only a better technique of administration but a reform in social policy, an effort to eliminate the need for poor relief by meeting the problem at its origin instead of after the effects of destitution are felt.

In the United States because of the absence of federal provision for poor relief varying types of legislation exist in the different states, most of which stem from the Elizabethan poor law of 1601. During the colonial period relief was given to the needy largely in their own homes. Auctioning off the care of the poor as individuals or in groups and the indenture of both children and adults were common practises also. Later the establishment of the almshouse resulted in a system of poor relief which was predominantly

institutional in character. The latter part of the nineteenth century, however, was marked by a more scientific approach to the problem of dependency, an approach which demanded segregation of different classes of dependents and specialized treatment with a view to their ultimate rehabilitation. The result of this attitude was the passage of laws prohibiting the care of children in almshouses and requiring the removal of the insane and feeble-minded to separate hospitals and asylums.

Poor law administration differs widely in the various states. In New England the township is the unit of administration, while in the other states the county system prevails. Under the latter, administration is in the hands either of the county court, of specially elected county officers or, more commonly, of a board of county commissioners or supervisors. In the large cities relief is usually administered by overseers or salaried officers appointed by the mayor or town council or elected by the citizens. An express recognition of the individual claim to relief appears in the legislation of certain states; for example, Connecticut and New York. Supervision over poor relief is exercised in many states through the state board of charities and in New York and New Jersey through the officially recognized State Charities Aid Association. Out relief, absolutely prohibited in only a very few areas, is generally much restricted both in amount and in the class of cases eligible for it. In some states, however, the numbers receiving out relief exceed those in institutions. A labor test for the able bodied is common and vagrants are penalized. The establishment of charity hospitals supported by the states, in addition to those sponsored by churches and philanthropic agencies, has gone far in providing medical relief for the poor. Within recent years several states have adopted old age and mothers' pensions and there is a growing popular demand for health insurance. Since 1929 the crisis brought about by unemployment and the mounting cost of family relief by both public and private agencies throughout the country have added impetus to the movement for unemployment insurance on a national basis as well as by the states.

In continental Europe, where the church had always been the chief agency of poor relief, the growing acceptance of the idea of state responsibility for the care of the poor led during the nineteenth century to measures designed to give public aid where private charity was insufficient.

This movement is exemplified by the creation of the Caisse Nationale des Retraits pour la Vieillesse in France, the rise of the Elberfeld system of poor relief in Germany, the establishment of a certain amount of state supervision over charitable corporations in Italy, the organization of public poor relief in Norway and the enactment of a general poor law in Sweden.

In France the poor law is administered through the local relief offices, known as *bureaux de bienfaisance*, which provide assistance at the domicile and other relief whether in the form of coupons for food, fuel, clothing, or in money, as rent or repatriation allowances. A general right to relief from the state is not recognized, except with regard to children and mentally deranged persons. An old age pension law of 1910, amended in 1912 (modified in part by the present system of national insurance), provides for all wage earners' old age pensions, toward which both employers and workers contribute. The expense of relief is met by local and general taxation, supplemented by the proceeds of certain taxes on amusements specially allocated to this purpose, income from endowments, gifts and charitable bequests.

In Germany special attention has been given to the prevention of the necessity for poor relief by the adoption of widespread social insurance, most of which is compulsory in the case of the working classes. The sick, the infirm, the aged and the unemployed are thus cared for, so that the burden on the poor law system is lightened. The relief of the poor is governed by the law of 1924, under which aid is granted by district unions or by provincial and state unions. In the first are united the larger and smaller municipalities, in the second the provincial or state authorities. Relief is given at the place of residence of the recipient and is administered largely through the Elberfeld system, the fundamental principles of which are a thorough examination of each individual dependent, continued careful guardianship during the period of dependence and constant effort to help him regain economic independence.

In Italy although a general right to public relief is not expressly recognized by law, local authorities are required to aid children, the sick and persons who are unable to work, if a local charity cannot be required under its constitution to do so. In Austria poor relief is administered chiefly through the communes under the direction of priests. Such relief is based upon the law of 1863, although no claims of the poor to

any special kind of provision are acknowledged, and poor relief is granted only when no other kind of aid is obtainable. In addition to providing poorhouses and out relief certain provinces follow the practise of quartering paupers on householders in fixed succession. Poor relief in Belgium is administered by *bureaux de bienfaisance*, which exist in every commune. Poorhouses with compulsory labor are maintained and habitual vagrants are committed to the penal colonies for a term of years. In Holland poor relief is granted only when aid is not forthcoming from churches or private charities. Mendicity and vagabondage are treated as offenses and a system of pauper or labor colonies is maintained. In Norway and Sweden poor relief is administered largely through the established church. In Soviet Russia, despite the efforts to eradicate poverty through a more equitable distribution of wealth and the widespread provision of social insurance, some forms of poor relief still persist. There are rural relief committees with power to raise a rate to which the state does not contribute, although to some extent the state controls the administration of it.

The declining significance of poor laws in the light of modern developments in social insurance and community welfare has become apparent in all capitalistic countries especially since the World War. Even in countries, such as the United States, where out relief mounted sharply as a result of the economic depression beginning in 1929, there has been an unmistakable trend toward the development of a system of community service in which the mere relief of destitution is replaced by a policy of preventive and curative treatment. This changed attitude toward poor laws is best exemplified of course in England. Some idea of the extent to which poor relief has been superseded by other forms of public assistance may be gained from a comparison of existing conditions with those of a century ago. According to Sidney and Beatrice Webb the government at present collectively contributes toward the maintenance of its poorer citizens in commodities and social services more than twelve times as much per head of population as it did during the early nineteenth century. It is noteworthy, however, that less than one eighth of the enlarged contribution is made by poor law authorities, while over seven eighths is administered through other channels, including education, public health and the various forms of social insurance. This expansion of

public assistance outside the poor law has been greatly accelerated within the past two decades. With the adoption of old age pensions, health and unemployment insurance, maternity and child welfare services and the national housing subsidies the annual expenditure today is approximately five times what it was in 1908. It is clear that poor relief and the laws under which it is administered will continue to be of diminishing importance in modern social policy, which is based on a recognition of the individual's lack of responsibility for destitution and of the fact that it is the duty of the state to eradicate the conditions conducive to such destitution.

POORHOUSE. *See* ALMSHOUSE.

POPLAWSKI, ANTONI (1739–89), Polish economist and educator. Popławski was born in the province of Cracow, where he entered the Piarist order. He was engaged in educational work as professor of rhetoric and public law in Cracow and in Warsaw and from 1780 was rector and professor at the pedagogical seminar of the Cracow Academy.

Popławski was one of the leading representatives of the physiocratic school in Poland. In his general views he followed closely those of Abbé Baudeau. He adhered to the principles of natural law and regarded happiness as the goal of man's effort; he believed, however, that in the pursuit of that goal the interests of the individual should be brought in harmony with those of society as a whole. Similar considerations dominated his views in international law: every nation, great or small, enjoys full sovereign rights, but in the pursuit of its rights each nation must respect the sovereignty of the other nations. Popławski drew attention to the economic deterioration of the peasantry in Poland and urged the emancipation of serfs and a more equitable system of taxation based on the earnings of land rather than on its area. He contended that the amelioration of the peasant's lot would also bring about an increase in population, a very important consideration in a country which appeared depopulated in comparison with Prussia and Russia, its unfriendly neighbors. Unlike the other physiocrats he laid little emphasis on the distinction between productive and non-productive classes.

As educator Popławski displayed great erudition and familiarity with the teaching methods current in the western countries, where he lived for three years. He regarded the cultivation of civic consciousness as the most important aim of education, but also stressed the value of physical and moral education and of training the mind by encouraging independent thinking rather than by merely imparting information. His educational projects formed the basis for the famous program of elementary, secondary and higher education initiated by the Commission on National Education in the years 1772 to 1776.

ökonomie im Alten Polen (Berlin 1925) p. 106–09; *Pierwiotkowe praepisy pedagogiczne Komisji Edukacji Narodowej z lat 1772–1776* (Elementary pedagogic rules of the Commission on National Education of the years 1772–1776), ed. by Zygmunt Kukulski (Lublin 1923) p. lxxv–lxxxii; Daszyńska-Golińska, Zofja, *Ekonomia społeczna* (Social economy), 2 vols. (Warsaw 1906–07) vol. i, p. 67–77.

POPOV, KIRIL (1870–1927), Bulgarian statistician and economist. Popov was for many years director of the statistical bureau of Bulgaria and a member of the International Institute of Statistics. Under his leadership the statistical work of the bureau was placed on a level comparable to that of the leading countries. He was actively identified with the labor movement, was responsible for the enactment of numerous measures of social legislation and for years headed the cooperative movement in his country. The high hopes he placed in cooperative organization as the solution of the economic problems of Bulgaria are clearly evidenced in *La Bulgarie coopérative* (Sofia 1924) and in numerous studies which appeared in publications of the National Committee of Cooperation and the Bulgarian Economic Society. He favored a protective tariff on imports.

Popov's numerous studies bearing on the economic problems of his country include *Stopanska Bulgariya prez 1911 g.* (Bulgarska Akademiya na Naukite, Sbornik, vol. viii, 1916, partly tr. by V. Robeff as *La Bulgarie économique, 1879–1911*, Sofia 1920), an encyclopaedic descriptive account of the economics of Bulgaria; "Selo Kasi-lak" (written in collaboration with P. Penchev in *Sbornik za narodni umotvoreniya, nauka i knizhnina*, vol. xxiv, 1908, pt. ii; tr. as *Le village de Kassi-Lak*, Sofia 1909); and "Résultats des mensurations anthropométriques des conscrits en Bulgarie" (in Institut International de Statistique, *Bulletin*, vol. xxii, bk. ii, Rome 1926, p. 383–420). In "La prédominance des naissances masculines d'après les données de la statistique du royaume de Bulgarie" (in *Metron*, vol. vi, no. 1, 1926, p. 42–55) Popov and his collaborator, Gaetano Pietra, confirmed the fact that birth statistics of Bulgaria like those of all other countries show a preponderance of males and revealed further that the probability of sex of the child does not vary in accordance with the age of the parents and that sex distribution is purely a matter of chance.

tique, *Bulletin*, vol. xxiii, bk. i (Cairo 1928) p. 337-40; Mishaikov, D., in *Bulgarska Akademiya na Naukite, Lietopis* (Annals), vol. x (1926-27) 79-82.

POPULAR ASSEMBLIES are assemblies of all the citizens in a community for the purpose of performing certain political functions directly and in person. The term is thus not synonymous with true or complete democracy. Some of the most characteristic popular assemblies, such as the Ecclesia of Athens and the comitiae of Rome, were limited to citizens who at times represented only a minority of the inhabitants. The functions performed by a popular assembly include some or all of the following: the enactment of legislation, the administration of justice and of governmental affairs, the election of officials and of representatives to some superior assembly. Voting might be by secret ballot, by show of hands or by acclamation, but no person could vote unless he were present.

Examples of such assemblies can be found in widely scattered areas and periods. Traces of some form of popular assembly have been discovered among the primitive peoples of the West, as, for example, among the German tribes described by Tacitus (*Germania*, c. 11-13) and among the Celtic tribes in the British Isles. The communal assembly was a feature of the village community (*q.v.*) in Russia, India and probably also China. Anthropologists have reported village assemblies, with functions limited by the customary nature of primitive life, among some African tribes; and it is probable that among the predominantly more democratic American Indian tribes the full council of warriors played an important part. The English township of the ninth century and its more important successor, the parish, functioned through popular assemblies; but as the civil functions of the parish increased, the place of the open vestry in its government was gradually usurped by the select or close vestry. The *cabildo abierto* (open council) which was occasionally assembled in Spanish American municipalities in the seventeenth and eighteenth centuries possessed little legal authority, although it seems to have been of some practical political importance at certain times, especially during the revolutionary activity of the first decade of the nineteenth century. The present Japanese local government law, enacted in 1888, provides that small towns or villages may, with the consent of the governor, substitute for the elective local assembly a general meeting of all the voters. In the Union of Soviet Socialist Republics members of the lowest soviet

in the hierarchy of soviets are chosen in the main by assemblies of certain functional groups—the workers in a factory or the peasants of a particular locality.

Most important of the popular assemblies in the past were those of the ancient city-states of Greece and Rome (*see* LEGISLATIVE ASSEMBLIES). The Ecclesia, the general assembly of all Athenian citizens eighteen years of age and over, dates at least from the time of Draco (621 B.C.) and continued to be the dominant organ of government down to 146 B.C., when Athens became a *civitas libera* under the protection of Rome. The assembly had power to enact legislation and to pass resolutions determining policy even regarding negotiations with foreign powers, war and peace, direction of the army and navy and administration. It was checked, however, by two important institutions: the Boule, or elective council of five hundred, to whose approval all proposals had to be submitted before they could be acted upon by the Ecclesia, and the law court, or judicial body, chosen by lot each year, which among other powers possessed that of determining whether measures passed by the assembly exceeded the legal limits of the assembly's power and were therefore null and void. Such legal limits were laid down, for example, in the constitutions of Draco, Solon and Cleisthenes. After the Peloponnesian War, however, the court often became the tool of demagogues and little account was taken of constitutional principles. The Ecclesia itself was apparently never attended by more than a minority of the citizens; after the beginning of the fourth century B.C. a small fee, given only to those who came early and remained through the day's proceedings, was instituted in order to stimulate attendance.

In ancient Italy the popular assembly was apparently a characteristic feature of early village government, along with a council of elders or senate and some form of executive. In Rome the *populus romanus* during historic times acted through the various comitiae, which were based upon subdivisions according to curia, century or tribe. The practical effect of the system of voting by subunits was to give control to the aristocratic and rural section of the citizenry. The power of the popular assembly varied at different times; by the end of the first century A.D. it had practically disappeared.

The history of popular assemblies in Switzerland and New England illustrates both the possibilities and the limitations of this form of

government. Direct democracy has been applied more extensively and for a longer period in the Swiss cantons and communes than in any other modern state. The *Landsgemeinde*, exercising through popular assembly the sovereign self-governing functions of the canton, existed in Uri as early as 1234. The largest number of cantons governed in this way was eleven, in the seventeenth century. But by the beginning of the nineteenth century the number had been reduced to eight, and in 1848 Schwyz and Zug adopted the representative system. In Schwyz this step was made necessary because increasing population had rendered the assembly turbulent and unruly, if not actually corrupt. Uri abolished its popular assembly in 1928, following a three-year struggle over cantonal representation in the Council of States. The contest brought record attendances but revealed the defects of the open system of voting, which permitted the effective utilization of powerful political pressures. The *Landsgemeinde* was also attacked by the Socialists on the ground that most workers could not leave their work for the required time. Others claimed that the size of the canton made an assembly of all its citizens inconvenient for many, a charge which is to some degree substantiated by the fact that the percentage of attendance at the various *Landsgemeinden* seems roughly to vary inversely with the size of the canton. The *Landsgemeinde* still functions vigorously in the canton of Glarus and the half cantons of Obwalden and Nidwalden and of Appenzell-Innerrhoden and Appenzell-Ausserrhoden. Homogeneous population, common and simple interests, respect for custom and tradition and willingness to follow leadership are the chief factors which make possible the continuation of the system in these places.

The annual meetings of the *Landsgemeinden* are held usually in the open air on the last Sunday in April or the first in May. Supplementary meetings may be called at the request of a certain number of voters. Each *Landsgemeinde* has an advisory council which prepares the business for the annual meeting; without such an institution no popular assembly could long exist except in the most primitive rural community. Except in Appenzell-Ausserrhoden, which requires the signature of 65 voters, a single voter may initiate ordinary legislation; in all but one *Landsgemeinde*, however, the proposed measures must be submitted to the advisory council at a fixed date prior to the annual meeting. Freedom of debate is generally permitted, but only in Glarus

(formerly also in Uri) may amendments and additions be made at the meeting to proposals submitted by the advisory council.

More widespread and applying to a larger number of people, although perhaps not so well known, are the Swiss town meetings, by which all but the larger communes regulate their political affairs. These town meetings, similar to the *Landsgemeinden* except for the limitation in the scope and area of their functioning, possess important powers regarding finance, local regulations and local administration. The percentage of attendance at these town meetings is generally larger than at the *Landsgemeinden*, largely because of the greater convenience of the former.

Perhaps the most important survival of the direct popular assembly is the New England town meeting, which is the dominant organ of local government in a territory considerably larger than the whole of Switzerland. There has been a great deal of controversy regarding the origin of the New England town meeting. It has been considered by some, notably Herbert Baxter Adams, as a conscious imitation of the popular government of the Anglo-Saxon and earlier Teutonic tribes. Channing saw in it a survival of the English parish government. Charles Francis Adams traced its origin to a conscious imitation of the corporate functioning of the Massachusetts Bay Company. Others regarded it as an imitation of guild organization, church organization or the Swiss *Landsgemeinde*. Each theory has apparently been rejected in whole or in part, but it is difficult to disagree with Channing's conclusion that New England towns "grew by the exercise of English common sense, combined with the circumstances of the place."

The town meeting seems to have been utilized by the New England towns from the beginning. Originally meetings were held weekly, then monthly; but as the community grew the intervals between meetings were further lengthened and it became desirable to set up a group of persons, known as selectmen, to operate in the intervals. The powers of the selectmen were at first indefinite but they gradually came to possess an important group of administrative functions. There were also other specifically administrative officials chosen by the town meeting. Originally the right to vote at town meetings was limited to freemen, while the inhabitants as a whole, although they might attend all meetings, could vote only on certain occasions. The broadening of the suffrage ultimately eliminated this distinction.

Customs and practises of the towns were put into legal form from time to time by the general courts of the colonies. For example, a Massachusetts law of 1692 provided that town meetings be held annually in the month of March, that warrants be issued by the selectmen, and that meetings be warned by constables or such others as the selectmen might appoint. The election of local officers was to be by a majority of the qualified inhabitants assembled, and the officers to be chosen were fully enumerated. Another Massachusetts law enacted in 1715 required the selection of moderators for town meetings, with power to impose fines for speaking without permission; it authorized ten or more freeholders to compel the insertion of articles in the warrant and made it illegal to vote on or determine any matter not inserted in the warrant.

The earlier ideals and traditions, which saw in the town a "pure democracy" capable of providing a high state of public welfare for its inhabitants, are becoming more and more endangered by the unwillingness of such democracies to modify the machinery of government in response to the requirements of a changed society. The town meeting is growing increasingly more unwieldy and ineffective as a policy making body. The administrative organization, which functioned smoothly and adequately in the simple, rural era, fails to give the skilled supervision and management essential for success in a socialized and industrialized society. There is scarcely a town in New England with over 5000 inhabitants which has not during the past two or three decades debated the question of reform or abolition of the town meeting.

Modifications of the simple town meeting system in New England fall mainly under three headings. An advisory finance committee was the first device created to remedy the increasing weakness of the town meeting in administering financial matters. Practically all towns in New England with a population of over 5000 have created such committees; in Massachusetts state law requires the provision of advisory committees for every town with a valuation for state tax purposes of more than \$1,000,000. A rather extensive investigation indicates that the influence of the committees is steadily increasing and is becoming a decisive constructive factor in town affairs.

The second reform was the limited town meeting, which was inaugurated in Brookline, Massachusetts, in 1915. Under this system the

town is divided into districts, each of which elects by popular vote "town meeting members," usually between 30 and 40 in number; the town meeting members from the several districts, together with certain designated officials, comprise the town meeting. Usually the ex officio members of the town meeting include the selectmen and the heads of the several departments and bureaus. Thus constituted the town meeting exercises practically all the powers which had been vested in the unlimited town meeting. Any voter may speak at any meeting, but the right to vote is reserved to the duly qualified members. The limited town meeting is thus no longer a popular assembly but rather a large representative town council.

The third type of modification has resulted from the growing opinion that the town meeting can survive only where adequate administrative machinery is created. Among the several administrative reforms now being experimented with the most noteworthy is the town manager plan, which is operating in at least sixteen New England towns. Under this system the manager is chosen by the selectmen, themselves chosen by the open town meeting, and holds office at their pleasure. The plan thus represents an adaptation of the commission manager system to the town meeting system.

POPULAR SOVEREIGNTY. The move for independence on the part of the American colonies transformed each colony into a state and evoked a central authority to replace that of the British crown. The process, having a republican character, invited an antimonarchical, anti-authoritarian philosophy. This philosophy was supplied chiefly by Thomas Jefferson, who was more deeply versed than any of his contemporaries in the democratic and libertarian ideology of eighteenth century Europe (see **SOVEREIGNTY**). The doctrine became official that the will of the people is the only true source of governmental power.

The will of the people, however, was an ambiguous concept under the system of federalism set up in the United States. In each of the states there was a people by whom or in whose behalf a constitution was made and laws were enacted. These states were joined in a union federal in character, and the problem of control of the distribution of powers as between the central authority and the several states gave rise to the question whether a unitary people of the United States existed. John C. Calhoun, when vindicating nullification of the tariff by South Carolina in 1832, attributed sovereignty to the peoples of the several states but denied it to the union, while Daniel Webster affirmed sweepingly that the American republic was unitary in origin and that its people was properly sovereign without hindrance from the states. This dispute was tempered but not settled by compromise upon the tariff.

The United States, whether plural or singular in historic and current concept, had meanwhile acquired a domain lying outside the several

states. Into sundry parts of this domain migrants went from the states, with or without the prior sanction of law. In the region north of the Ohio River the Ordinance of 1787 prohibited Negro slavery; but south of this boundary there was no such prohibition and slaveholding became legal and customary. The more serious implications of this situation were not fully realized until the course of politics produced a contest for power between the north and the south, turning attention to the question of the future alignment of these "territories," once they had been admitted to statehood, on the increasingly crucial question of slavery.⁴ A crisis upon this question was adjusted in 1820 by the Missouri Compromise, which excluded slavery from the remaining area north of 36° 30'; another was precipitated in 1846 by the Wilmot Proviso, which proposed an exclusion of slavery from the region in process of acquisition from Mexico. The Democratic and Whig parties were thrown into confusion, and the union itself was imperiled. As a way out Lewis Cass asserted in 1847 that in each territory, as in a state, the will of the community was properly paramount and that Congress ought to sanction the local decision in due time by admitting the territory to statehood with or without Negro slavery as its constitution might specify. Stephen A. Douglas was a prominent recruit to this doctrine. In California no territorial organization was awaited. Delegates of the people, upon presidential suggestion but without an enabling act from Congress, framed a constitution prohibiting slavery and applied for admission to statehood. In the Compromise of 1850 California was admitted with its constitution, and the remainder of the Mexican acquisition was organized as the territories of New Mexico and Utah, with the specification, phrased by Douglas, that when admitted as states these territories should be received into the union with or without slavery as their constitutions might prescribe at the time of admission. With these remote and arid regions there was little further concern.

The culmination of popular sovereignty as a doctrine and an issue came during and after 1854, centering about the problem of Kansas and Nebraska, portions of the zone in which slavery had been prohibited by the Missouri Compromise. As chairman of the Senate Committee on Territories Douglas, a warm advocate of expansion and particularly anxious to promote a railroad to the Pacific in the latitude of Chicago, had endeavored for some years to procure

legislation opening the Nebraska region to settlement. But New Englanders in Congress were unfriendly to the westward movement in general, and the southerners, desiring an equipoise between the sections, would not facilitate migration into districts dedicated to the northern regime. As a device to break this obstructive alliance Douglas refurbished the Cass doctrine. The legislation of 1850, he caused his committee to say, had established a great principle valuable for all time. The perils of agitation would best be avoided by withdrawing the question of slavery from the halls of Congress and the political arena and committing it to the arbitrament of those immediately interested and alone responsible for its consequences. Douglas' bill to organize Nebraska and Kansas with a slavery clause copied from the legislation of 1850 was amended upon southern initiative to cancel the prohibition of 1820. It was then enacted despite vehement opposition by many northerners and milder disapproval by some southerners.

Douglas truly said, as Webster had held in 1850, that the question was wholly hypothetical, since geographical conditions would exclude slavery from all the regions concerned. The soundness of this observation was more than offset, however, by his egregious error in thinking that the matter was of more interest to the people of the respective territories than to the public of the United States. The vigorous rise of the New England Emigrant Aid Company and of the Republican party soon exposed this fallacy. Grave disorders in Kansas led to repercussions at Washington and the position of Douglas was attacked from both sides. In trying to clear up ambiguities he chose horns in successive dilemmas of detail without finding surcease. He sought, for example, to dissociate himself from the "squatter sovereignty" epithet, which he applied to the assumption of power by settlers in a region before its organization as a territory. In reply Judah P. Benjamin praised such activity by pioneers and argued that when Congress, as the trustee of all the states, assumed control by erecting a territorial administration, the occasion for spontaneous action was not enlarged but diminished.

The principal attacks came from Abraham Lincoln on the stump in Illinois and Jefferson Davis on the floor of the Senate. In 1860 the Republican party denied that slavery could be constitutional in any territory, and the Democratic party was split between those who supported the doctrine and the presidential candi-

dacy of Douglas and those who denied that either Congress or a local legislature could constitutionally exclude slavery from any territory. The Civil War ended not only the Douglas phase of the dispute over popular sovereignty but the Calhoun phase also.

In recent decades popular sovereignty has in the main become, as in Webster's thought, a basis of sanction for whatever the nation may wish to do or whatever a politician may wish to persuade the people to approve. The doctrine, composed of the stuff of democracy, is an opportunist's mask with adjustable features.

POPULATION

HISTORY AND STATISTICS. If by knowing the population of a country it is meant that the reported population can safely be said neither to exceed nor to lag behind the actual number of inhabitants by more than 10 percent, it might be said that the present population is known for all countries of Europe, North America and Oceania, for many countries of South and Central America and for some countries of Asia and of Africa. The countries for which, by this standard, the population is not known comprise at present probably one third or one fourth of the world's population. In 1900 the *terra incognita* was not much larger, but it comprised at least 80 percent a century ago. Notwithstanding the inadequacy of the statistical data several notable attempts have been made to estimate for the last two or three centuries the trend of the world's population. Table I presents the most recent of such attempts, made by Walter F. Willcox. An examination of the methods by which these figures were arrived at would suggest that, with the exception of the figures of Europe for 1800, 1850 and 1900, of North America for 1850 and 1900 and of Oceania for 1900, the estimates do not comply with the standard given above.

This conclusion is illustrated by an analysis of the European figures for 1750 and 1650

TABLE I

ESTIMATED POPULATION OF THE EARTH BY CONTINENTS, 1650-1900*
(In 1,000,000)

	1650	1750	1800	1850	1900
Europe	100	140	187	266	401
Asia	250	406	522	671	859
Africa	100	100	100	100	141
North America	7	6.3	15.4	39	106
South America	6	6.1	9.2	20	38
Oceania	2	2	2	2	6
Total	465	660	836	1098	1551

* The figures for Europe 1650, 1800, 1850 and 1900, Asia 1000, Africa 1650, North and South America 1850 and Oceania 1800 were taken (a few with slight modifications) by Willcox from other authorities. The figures for Asia 1650, 1750 and 1850, North America 1650, 1750 and 1800 and South America 1650 were arrived at by estimates made by Willcox of the various sections of those continents. The figures for Africa and Oceania were considered identical in 1650, 1750, 1800 and 1850. The figures for Europe 1750 and Asia 1800 were computed by Willcox by extrapolation or interpolation. The figures for South America 1750 and 1800 were arrived at by estimating the percentage relation of its population to that of North America. Source: National Bureau of Economic Research, *International Migrations*, ed. by W. F. Willcox, 2 vols. (New York 1929-31) vol. II, p. 78.

and those of Asia for 1650, 1750 and 1850. The 1750 European estimate is by Willcox on the assumption that: "The rate of increase in Europe, 1750-1800, may be supposed to have been to the rate 1800-1850 as the latter was to the rate 1850-1900. This assumption points to an increase of 35 percent in the population of Europe, 1750 to 1800, and so a population in 1750 of about 140 million." His argument in estimating the population for 1650 is as follows: Riccioli in 1661 and King in 1696 both estimated the population of Europe for the time in which they were writing at 100,000,000; the fact that their figures agree for Europe and Africa tends slightly to confirm their results; Beloch in 1900 gave 100,000,000 for 1600; "because of the great losses of life between 1600 and 1650 . . . the population of Europe was not much greater in 1661 than in 1600 and therefore the difference in date between the estimates of Beloch and of Riccioli is unimportant." But the differences in Riccioli's and King's estimates for individual countries are so enormous—for example, for France Riccioli's is 19,000,000 to 20,000,000 and King's 14,000,000; for Great Britain and Ireland Riccioli's is 4,000,000 and King's 7,000,000—that the identity of the totals should be considered rather as a coincidence. Similar conclusions should perhaps be drawn concerning the identity of Beloch's and Riccioli's estimates; for Germany, for example, Beloch gives 20,000,000 before the Thirty Years' War (1618-48) and Riccioli gives the same number after that war.

The population of Asia (in millions) for 1650

to 1850 is given by Willcox (p. 53-74) as follows.

	1650	1750	1800	1850
China	70	158		342
Japan	23	31.8		32.5
India	100	144		205
Other Asiatic countries	57	72		91
Total	250	406	522	671

The figure for China in 1650 takes into consideration nine estimates of the population of China in the seventeenth century varying between 21,000,000 and 200,000,000; the two extreme estimates are discarded and "the average of the other seven, about 70 million, may be adopted as the best approximation to the population of China in 1650." By taking the estimate of E. H. Parker (1899) that the average Chinese household was 6 persons in 1712 and his own of 5 persons in 1910, by assuming that between 1850 and 1930 the population of China was stationary and by distributing the increase between 1712 and 1910 over the years between 1712 and 1850 at a uniform annual rate, Willcox arrives at 158,000,000 for 1750 and at 342,000,000 for 1850. For Japan Willcox uses mainly evidence offered by Droppers and Yanagisawa. For India in 1650 he uses recent estimates of the population at the beginning of the seventeenth century based "upon evidence drawn mainly from the reported size of armies and the extent and character of agriculture"; although these estimates of 100,000,000 have been challenged as too high for the year 1600, for "half a century later they are not excessive." The first census, taken in 1871, showed a population of 239,000,000. "Assuming that the rate of its increase 1851-71 was equal to the average of the rates of increase 1871-91 and 1881-1901," the population in 1850 was 205,000,000. And "assuming a uniform rate of increase" between 1650 and 1850 "the population in A.D. 1750 was about 144,000,000." Therefore "if the three countries included in 1650 as they do now about three-fourths (76 per cent) of the population of Asia, then in the middle of the seventeenth century it supported about 250 million people." For 1850 Willcox estimates, by revising Dieterici, 91,000,000 for the rest of Asia. "If the rest of Asia included in 1650 about 57 million and in 1850 . . . about 91 million then in 1750 it had probably about 72 million. . . . If the population of Asia in 1750 was about 406 million and in 1850 about 671 million, in 1800 it was probably not far from 522 million, the mean of the other two."

In commenting on his table of the earth's population Willcox (vol. ii, p. 80) says: "... if the foregoing results are accepted, the century before 1750 was characterized by a growth in the relative size of Asia's population at the expense of every other continent. In that century the population of the Americas dwindled, that of Africa and Oceania was stationary, and while the population of Europe increased, it did so at a rate not much more than half that of Asia. Since 1750, on the contrary, Europe's rate of growth has been more than twice that of Asia."

Willcox' estimates are based on the best available evidence and some of his results may never be disproved. It is possible that the population of Europe and of America has developed since 1650 as he has indicated, that the population of Africa amounted to 100,000,000 in 1650 and did not essentially change before 1850, that Oceania had 2,000,000 inhabitants in 1650 and that the influx of Europeans after 1770 was counterbalanced by an extermination of natives up to 1850. It is possible that since 1750 Europe's rate of growth has been more than twice that of Asia. It is finally possible that Asia (excluding China) increased its numbers from 1650 to 1850 by 83 percent. But it seems absolutely impossible that China's population in that period should have quintupled; that is to say, should have increased about as fast as the Caucasian race in the last two hundred years. The population of China is still unknown. In 1928 Willcox estimated its population for 1910 at 294,000,000 but raised this estimate two years later to 342,000,000 and assumed that the population remained stationary at 342,000,000 from 1850 to 1930; the International Institute of Statistics, however, which in 1925 had estimated the population for 1910 at 321,000,000 and in 1922 the population for 1920 at 428,000,000, estimated in 1929 the population for 1920 at 433,000,000 and for 1928 at 462,000,000 and in 1931 the population for 1920 at 414,000,000 and for 1929 and 1930 at 445,000,000. Willcox' opinion that the population of China has not increased since 1910 is so plausible that the increase estimates of the International Institute of Statistics should be discarded as absolutely erroneous. But the estimate of 445,000,000 for 1929 by Warren H. Chen, accepted by that institute, is practically identical with the estimates of 440,000,000 to 458,000,000 published in 1927-29 by the International Institute of Agriculture (*International Yearbook of Agricultural Statistics* for 1928-29, 1929-30 and 1930-

31, Rome 1929-31, p. 8), the League of Nations and the French Bureau of Longitudes (*Annuaire 1927*, Paris 1927, p. 492), while O. L. Hübner's tables (*Hübners geographisch-statistische Tabellen aller Länder der Erde*, vol. lxvi, 1920, p. 7, and vol. lxxi, 1932, p. 164), which in 1920 gave the 1911 population at 330,000,000, in 1932 set the 1926 population at 487,000,000. It therefore must be accepted as possible that China's population may actually exceed these 342,000,000 by a third or more, while it is also possible that it may be even smaller than 342,000,000.

In view of this uncertainty even for modern times the estimates for earlier dates must be considered with particular skepticism. Willcox himself, who in his foregoing estimate of the earth's population entered for all China 70,000,000 in 1650, 158,000,000 in 1750 and 342,000,000 in 1850, gave for China proper at the same dates, in a paper read in 1930 before the International Institute of Statistics in Tokyo, 70,000,000, 181,000,000 and 323,000,000 (the latter figure corresponding to the 342,000,000 for all China). This would mean an increase of 78 percent from 1750 to 1850 instead of 116 percent. On the other hand, the increase of 126 percent from 1650 to 1750 would be raised to 159 percent. This would mean an average annual increase of nearly one percent for a century, and such an increase in a densely settled country would presuppose an agricultural or industrial revolution such as has not been reported from China. As to the assumption that, because of the many natural and political calamities from which the country suffered, the population did not increase between 1850 and 1910, it seems unlikely that after 1850 those factors should have entirely stopped the increase which apparently was so large before 1850.

If 181,000,000 is accepted for China proper in 1750 and 323,000,000 for China proper in 1910—and the corresponding figure of 342,000,000 for all China in 1910—it could be deduced that the population of all China was probably not less than 120,000,000 in 1650, about 192,000,000 in 1750 and not more than 300,000,000 in 1850. The totals for Asia would then read: for 1650 at least 318,000,000; for 1750 about 451,000,000; for 1800 about 533,000,000; and for 1850 at most 629,000,000. If these figures are accepted the rate of increase from 1650 to 1750 would have been about the same for Asia as for Europe.

The present status of knowledge of the actual population trends may be summarized as fol-

Population

lows: Practically nothing is known of the trend of the total population of Europe prior to the eighteenth century; there is no reason to assume that the population in 1700 was any larger than in 1600 or that the population in 1600 was much larger than in 1300. Although there is no doubt that the total population of Europe increased in the course of the eighteenth century, the size of the increase is not known. It amounted apparently to about 25 percent in France, to about 50 percent in England and Wales and to about 60 percent in Sweden (see Table II). It was probably much larger in Russia, where the population of the territory constituting the empire of Peter the Great is reported to have doubled between 1724 and 1796. From 1770 to 1800 the combined population of England, Denmark, Norway, Sweden, Finland, France, Spain and Italy rose from 61,000,000 to 69,800,000, or by one seventh. In the original territory of Russia the population increased simultaneously from about 20,000,000 to about 30,000,000, or by about one half. If it is assumed that for three fourths of the population of Europe the increase from 1770 to 1800 was one seventh and for one fourth it was 50 percent, and if it is assumed that the total population of Europe was 185,750,000 in 1800, the population in 1770 would have aggregated 152,500,000 and the yearly increase

for 1770-1800 amounted to about $\frac{2}{3}$ percent.

TABLE III

POPULATION OF EUROPE IN THE NINETEENTH CENTURY

YEAR	POPULATION (IN 1000)	ANNUAL INCREASE PER 1000
1800	187,693	
1810	198,388	5.6

Source: For 1800 and 1900: Sweden, Statistiska Centralbyrån, *Aperçus statistiques internationaux*, vol. xi, ed. by G. Sundharg (Stockholm 1908) p. 24-25, but some figures revised. For 1912, 1919 and 1920: estimates of figures taken from official sources of the individual countries. For 1930: League of Nations, *Statistical Year-book 1931-32* (Geneva 1932) p. 22-23, but some figures revised.

Napoleonic wars and during the decade around 1850; it was largest during the decade following the Napoleonic wars and during the last three decades before the World War. The yearly rate of increase averaged $\frac{3}{4}$ percent for the entire nineteenth century and amply 1 percent for 1900 to 1914. The increase was largest in England and Wales and in Poland, where the population grew from 1801 to 1914 by a yearly average of about $1\frac{1}{4}$ percent (see Table iv). It was smallest in France, where the average yearly increase was only about $\frac{1}{3}$ percent. In Ireland the population increased from 1801 to 1841 by about 1 percent per year, but decreased from 1841 to 1914 by about $\frac{1}{4}$ percent.

During the World War the population decreased in most of the belligerent countries and also for Europe as a whole. While the total population numbered about 462,828,000 on June 30, 1914, it was only about 455,367,000 on December 31, 1920. There had moreover been an increase in the latter part of this period, which, although it cannot be accurately ascertained, may safely be assumed to have been considerable; in a territory comprising about 322,472,000 inhabitants on June 30, 1919, the population amounted to about 327,367,000 on December 31, 1920. The decrease for all of Europe in the five years from June 30, 1914, to June 30, 1919, may indeed be estimated at about 12,000,000. From 1920 to 1930 the population of Europe increased again by about 1 percent per year; that is to say, at almost the same rate as from 1900 to 1914. From 1770 to 1930 the population of Europe increased by about $\frac{3}{4}$ percent per year.

TABLE V

POPULATION OF EUROPE AND THE UNITED STATES, 1800-1930

	EUROPE POPULATION (in 1000)	UNITED STATES POPULATION (in 1000)
Dec. 31, 1800	185,759	6,000
Dec. 31, 1900	400,012	76,938
June 30, 1914	462,828	97,928
Dec. 31, 1920	455,367	107,375
Dec. 31, 1930	505,100	123,630
ANNUAL INCREASE PER 1000		
1801-1900	7.7	25.8
1901-1914	10.9	18.0
1801-1914	8.1	24.9
1914-1920	-2.5	14.3
1921-1930	10.4	14.2
1901-1930	7.8	15.9

Source: For Europe see Table III. For United States the 1800 figure is an estimate; the figures for 1900-30 are from United States, Bureau of Foreign and Domestic Commerce, *Statistical Abstract of the United States 1932* (1932) p. 3.

The population of the United States in-

creased in the course of the nineteenth century by about 2.6 percent per year and from 1900 to 1930 by about 1.6 percent (see Table v). While the annual population increase of Europe from 1900 to 1930 was the same as in the nineteenth century, the population increase of the United States dropped considerably during this period. But from 1900 to 1930 it was still about twice as strong as in Europe.

Although the available information on the population trend in the rest of the earth is rather scanty, it is safe to say that the population increase from 1900 to 1930 was smaller in Asia than in Europe but much larger in America and Oceania (see Table vi). The population of the earth seems to have increased in that thirty-year period by about $\frac{3}{4}$ percent per year.

TABLE VI

POPULATION OF THE CONTINENTS AND THE EARTH, 1900 AND 1930

CONTINENT	POPULATION (IN 1,000,000)		ANNUAL INCREASE PER 1000 FOR 1900-30
	1900	1930	
Europe	400	505.1	7.8
Asia	859	992.5	4.8
Africa	141	142.4	0.3
North America	106	168.75	15.6
South America	38	82.75	26.3
Oceania	6	9.88	16.8
Total	1550	1901.38	6.8

Source: For Europe see Table v. For other continents 1900, see Table i; 1930 see League of Nations, *Statistical Year-book, 1931-32* (Geneva 1932) p. 18-23. The 1930 figure for China used in this table is 342,000,000 instead of 452,791,000.

The white, or Caucasian, population of the earth increased in the period from 1800 to 1930 by about 1 percent per year; namely, from nearly 200,000,000 to nearly 700,000,000. This rate of increase can perhaps best be appreciated when it is pointed out that if the same rate had persisted since Caesar's death, one couple living at that date would by 1933 have had 700,000,000 descendants. Prior to the nineteenth century therefore there cannot have been a definite population trend. Periods having an excess of births must have alternated with periods having an excess of deaths. What took place as a rule was that in "normal" years births exceeded deaths, while in periods of famines, and especially epidemics, deaths exceeded births. Similar conditions still prevail; for example, in Africa and in China. But in Europe births exceeded deaths in every year from 1801 to 1915 and again since 1918.

This striking change in the population trend of Europe, and in general of countries predominantly inhabited by the Caucasian race, is due to a decrease of mortality and cannot be attributed to an increase of natality. (Natality certainly was not constant; the available statistics indicate ups and downs all through the period from 1750 to 1885, but no marked trend in either direction.) The reduction in mortality was due largely to progress in medicine and hygiene, without which the population of Europe would possibly have remained stationary in the nineteenth century as it did in many former centuries. But it was not such progress alone that made possible the excess of births over deaths. It reduced mortality from certain causes; but famines, economic wars or birth control would have largely prevented the ensuing population increase if there had not been an accompanying economic and technical revolution which enormously enlarged the available means of subsistence for those living in Europe and at the same time made possible the emigration of scores of millions of Europeans overseas.

This population increase, however, was not confined to the white population. Thus among others the Japanese, the Malays and, in the United States, the Negroes have for a more or less long period considerably increased their numbers. Therefore it cannot be surprising that the suspicion is often held that the strong population increase has gone beyond the optimum point and that it may be a contributing factor in the social and economic maladjustments of modern times. The test generally used for measuring the optimum population is the average standard of living; if this constantly decreases, the optimum population is apparently exceeded. It is impossible, however, in many cases to foresee the final trend of the standard of living. Germany, with 45,000,000 inhabitants at the beginning of the 1880's, had apparently passed the optimum point, as the standard of living was constantly decreasing and each year hundreds of thousands of its inhabitants emigrated. But thirty years later it counted 20,000,000 inhabitants more, and in spite of an annual excess of 800,000 births immigration exceeded emigration and the standard of living had enormously improved. Other tests would likewise in many cases point to overpopulation, when in fact the optimum population has not yet been reached. Thus a heavy percentage of unemployment may as often be a proof of underpopulation as of overpopulation.

Even if the optimum population has not yet been reached on our planet, there remains the fact that if humanity were to increase for 250 years more at the same rate as it apparently increased from 1900 to 1930 and would then reach 10,000,000,000, it would not only have exceeded the optimum population but would have reached about the maximum population that the earth is able to sustain, even allowing for all conceivable advances in science and technique and assuming that all human efforts be directed to the maintenance of a maximum number of people. It is most unlikely, however, that the earth's population will continue much longer to increase at such a rate. The increase of $\frac{2}{3}$ percent came about apparently through an increase of 1 percent for the whites and an increase of $\frac{1}{3}$ percent for the other races combined. It is of course possible that those other races may increase in the future at a faster rate than heretofore. Those who are afraid of the "yellow peril" point particularly to the possibility that the Chinese population, which probably has not increased at all in the course of the last generation, may, once it abolishes civil war and infanticide, double in forty or fifty years. But it is just as possible that the Japanese may adopt birth control on a large scale and that the Chinese, by following that example, may check their possible population increase. As matters stand any prediction of the future population trend of the colored races would be a mere guess.

As to the white population, the present increase in numbers is no indication of its future growth, as it has undergone a considerable decrease of natality in the course of the last fifty years. In 1931 in northern and western Europe, for instance, with a population of 193,000,000, births exceeded deaths by about 800,000. This excess, however, is not due to present fertility and mortality, but rather to the fact that in the present population the proportion of women of childbearing age is particularly large (because of the large number of births around 1900) and the proportion of young children and old persons particularly small. The present age constitution of that population therefore tends to swell the number of births and to lower the number of deaths. But the present age constitution has been shaped by fertility and mortality trends of the last hundred years.

Twenty years from now the number of potential mothers will be largely determined by the small number of girls born during the last decade, and the number of old people will be largely

determined by the high number of persons who are now between twenty and fifty years of age. With present fertility and mortality the population of western and northern Europe may still increase for some time to come. But the increase will become smaller and smaller, and deaths will exceed births long before the age constitution of the population will correspond to present fertility and mortality. Once the latter stage is reached, that is, roughly speaking, when there will be fewer women of childbearing age, because mothers now have few children, and when there will be many old people, because mortality under sixty years has been so much reduced, the population will decrease by perhaps $\frac{1}{3}$ percent per year.

Conditions are not the same, however, for every white nation. Among countries predominantly inhabited by whites for which adequate data are available three groups may be distinguished: first, European Russia (about 135,000,000 inhabitants in 1933), having a net reproduction which is enormous and probably as rapid as it ever was, since mortality has decreased at least as much as fertility; second, southern Europe (Portugal, Spain, Italy, the Balkan states), central eastern Europe (Czechoslovakia, Hungary, Poland, Lithuania), Canada and Australia (a total of about 200,000,000 inhabitants), each of these countries having a net reproduction less than half as rapid as that of Russia and in some cases very low; and, finally, the United States and western, northern and central western Europe (a total of about 330,000,000 inhabitants), where the population no longer reproduces itself. The second and third groups cover the countries of the western capitalistic world. If for them fertility and mortality should remain constant or should decrease to the same extent, the excess of births over deaths, which is now due to a temporary age constitution, would be bound to decrease, as their genuine population growth, if there still be any, is negligible.

Public opinion on the purport of such a decisive turn in the population trend within the western capitalistic world has recently undergone a marked change. Up to the World War practically all governments and the great majority of the people viewed a large and increasing population as an economic asset. The rise of the standard of living and of prosperity in general in countries like the United States, Germany or Great Britain was attributed largely to the increasing number of consumers, such a growth being considered a necessary prerequisite for

the development of natural resources and for progress in every branch of business. Thus France was cited as a typical example of a country which economically, and therefore also politically, lost ground as a consequence of her stationary population. Since the World War, however, several governments and the majority of the people have taken the point of view that a large and increasing population constitutes an economic burden and that unemployment, poverty, wars and many other social and economic evils are to be attributed to overpopulation.

Theoretically there exist four means for checking the increase of population in an individual country: reduction of births, increase of deaths, promotion of emigration and restriction of immigration. But some of those means are either objectionable or cannot be effectively used. Thus an increase of deaths involves heavy sacrifices; promotion of emigration seldom works satisfactorily, because those inhabitants who are ready to emigrate are often those a country might better keep or those who for one reason or another are not welcomed by other countries. There then remain but two means to restrict the size of a population: restriction of births and restriction of immigration. Both means have been applied in the United States with ever increasing intensity. The result has been a slowing down of the population increase which, if fertility and mortality remain what they are, will finally lead to a decrease in numbers. But it seems doubtful whether the prevailing population trend will actually bring about economic relief. Because of the increasing competition of foreign countries, which makes more and more difficult the export of large quantities of food-stuffs, the problem of finding an outlet for the output of American producers, particularly the farmers, is becoming increasingly serious. Many experts believe that the present unemployment is due to the artificial restriction of the numbers of consumers and that the unemployed may find no cure for their troubles in a stationary or decreasing population.

As matters stand it is still impossible to give a scientific comprehensive appraisal of the social and economic effects of the marked change in the population trend within the capitalistic world. The relations of population growth and decrease to economic pressure and relief are more complicated than is commonly realized. Any decision as to a population policy requires therefore the utmost caution. The trend of population, whatever direction it takes, is a serious

matter, with far-reaching consequences, good and bad.

R. R. KUCZYNSKI

THEORY. In modern population theory three important aspects should be distinguished. The demographic phase deals statistically with population composition and movement per se. The bio-social phase is concerned with differential rates of movement—especially of human fertility—as correlated to social and economic status and to organic inheritance with reference to the bearing of these differentials on the quality of the population. The socio-economic phase considers the interrelations between population and social and economic institutions with primary reference to the standard of living.

Thus defined population theory is necessarily a comparatively recent development in the social sciences. Demographic analysis has become possible only with advances in scientific vital statistics. Such analysis, however, is barren without consideration of the institutional complex within which population movements occur. A fully rounded theory must therefore deal with the interrelations of such movements, especially increase or decrease. It must take into account natural factors, such as the supply of land and natural resources; geographical factors, such as the distribution of population by regions; dynamic cultural factors, such as the state and progress of the arts; institutional or socio-psychological considerations, such as subjective standards of living and trends in social and political sentiment; specifically economic factors, such as new forms of industrial organization and structural changes in world economy; and, finally, the known facts of organic heredity in man.

The objective of population theory is an understanding of the effects of these interrelations on human welfare. While the population policies which prevail for a given region or period must be considered, such policies should be distinguished from theory. A population policy which aims specifically at raising the standard of living must obviously be based on an objective analysis of the considerations, natural, demographic and technological, which determine both the actual and the theoretically realizable standard of living; and in such an analysis population theory may set forth clearly with what factors control must deal and the limits beyond which such control cannot go. Generally speaking, however, population poli-

cies have been based on traditional ideologies and nationalistic political and commercial sentiment rather than on reasoned analysis. The history of primitive communities, of the nations of classical antiquity as well as of modern states, discloses evidence of population policies sanctioned in the main by religion and custom. Only in the sense that all human policy is based on some dim reasoning concerning fitness of means to end can there be said to have been any theory. While the idea that primitive peoples consciously sought to maintain such a balance between numbers and resources as would provide an optimum standard of living scarcely stands critical examination, there were practises, such as infanticide and abortion, which helped to check increase. These practises were common throughout Greek history. Greek population policy included moreover great colonizing enterprises influenced by commercial considerations but governmentally regulated to insure the food supply and relieve population pressure.

In the writings of some of the Greek philosophers, notably Plato and Aristotle, may be found the beginnings of a population theory. In the *Republic* Plato makes a clear statement of the relation of population increase to warfare. His ideas on the proper size of the city-state and his radical proposals for eugenic reform were, however, dependent on the full development of his ideal community. Aristotle, who rejected this ideal community, advocated instead a rigid control of marriage and compulsory limitation of offspring based not on eugenic but on property standards, which therefore bore a closer relation to the concept of the regulation of population according to resources.

The population policy of the expanding Roman state did not go beyond a conception of the common people as breeders of children for the state. The more definite population policy of Augustus, embodied in *Lex julia de maritandibus ordinibus* (4 A.D.) and *Lex papia poppaea*, was designed to encourage marriage and procreation primarily among the nobility, since the birth rate in that group was declining. These laws had little effect although they were copied in the Spanish edict of 1623 and in Colbert's legislation of 1666.

From Greek antiquity to modern times no population theory was evolved. In the early Middle Ages the barbarian invasions, the disintegration of the Roman Empire and the transition to feudalism removed incentive to political philosophy. The writings of the early Christians

were much concerned with sex, but the church formulated no population theory and no policy except refusal to sanction family limitation. Incidental recognition of population pressure may be found in the works of Jordanes (c. 550), Paulus Diaconus (c. 720–c. 800) and Geoffrey of Monmouth (c. 1100–54). As feudal particularism gave way to nationalism, interest was centered in measures to stimulate population increase. Such fragmentary population theory as is encountered in early post-Renaissance political philosophy was for three centuries mainly rationalization of nationalistic aspirations. Recognition of the positive checks of famine and pestilence is to be found in Machiavelli's *Discorso sopra la prima deca di Tito Livio* (Florence 1531) and thereafter with increasing frequency. Botero's allusion (*Delle cause della grandezza della città*, Rome 1588) to the strength of the sex instinct, to the limitation of subsistence and to positive checks anticipated by two centuries some of the ideas of Malthus. As early as 1677 in a work of Sir Matthew Hale published posthumously in 1682 (*The Primitive Origination of Mankind . . . according to the Light of Nature*), in *An Essay concerning the Multiplication of Mankind* by Sir William Petty and later in 1741 in *Die göttliche Oränung in den Veränderungen des menschlichen Geschlechts* (2 vols., Berlin 1741) by Johann Peter Süssmilch the theory of geometrical increase was set forth. A large number of English, French, German and Italian writers of the seventeenth and eighteenth centuries recognized either natural or institutional checks. Toward the end of the eighteenth century, in increasing opposition to the populationist doctrines of the mercantilists, there appeared in various writings the essentials of the theory later set forth by Malthus, among whose immediate forerunners were Jean Hersenschwand, Abbé Théodore Mann, Giammaria Ortes, Benjamin Franklin, David Hume, Robert Wallace, Joseph Townsend, Sir James Steuart and William Paley.

None of these theories, however, received marked attention; and when Malthus, who at that time did not know of previous writings on population, published anonymously in 1798 his *Essay on the Principle of Population*, it seemed to break new ground. Its immediate acceptance was due not so much to the fact that its reasoning accorded with the contemporary natural law philosophy as to the fact that it appeared at a time when the upper classes, terrified by the French Revolution, found in it a much needed

justification for the existing order as against the radical proposals of Godwin and Condorcet, whose theories Malthus attacked at great length. Only a few pages were devoted to the "principle" that population "tends" to exceed subsistence and if not checked by prudence must be limited by such positive checks as war, famine, disease and misery. Among his predecessors who had expressed similar ideas Townsend in *A Dissertation on the Poor Laws* (London 1786) had used the principle as an argument against poor relief, while Wallace in *Various Prospects of Mankind, Nature and Providence* (London 1761) had reluctantly concluded that communism was impossible because of it. Malthus' principle, posited as an inescapable natural law, involved a condemnation of all such attempts and a defense of the institution of private property, which he argued was the basis of the check of prudence. Since, however, he had described prudence as closely associated with prostitution and other vices, critics considered that the implication that God had placed man in a position in which he must either be vicious or starve was close to blasphemy.

In the rewritten and enlarged second edition (1803) Malthus admitted the non-vicious check of "moral restraint," by which he meant late marriage and premarital chastity. Although this admission of the possibility of control destroyed the cogency of much of his original argument against a reorganization or improvement of social institutions, Malthus avowedly did not expect much from moral restraint and was strongly averse to contraception. He was thus able through six editions to stand by the three fundamental corollaries of his principle: communism is impossible; poor relief defeats its own purposes; and, finally, the working classes can improve their conditions only by reducing their numbers.

These theses became almost axiomatic postulates in English political economy. Most economists everywhere, even in the United States after the publication in Georgetown, 1809, of the first American (from the third London) edition of the *Essay*, accepted the essentials of the theory, which not only became a corner stone of Ricardian economics but had significant political influence. Among literary men and the clergy as well as among those who did not let cold reason interfere with sentiment the *Essay* was severely criticized, and the resultant copious literature became a seesaw of debate. But aside from Francis Place's courageous advocacy of

birth control (*Illustrations and Proofs of the Principle of Population*, London 1822) population theory made little advance for a century. The critics of Malthus may be classified in four groups: first, those who attacked all his premises and conclusions; second, those who held that population is regulated automatically by some physical law, without vice or misery, or by Providence; third, the "physiological" theorists; and, fourth, those who relied for control upon psycho-social influences. Representative of the last group and, despite his prolixity, the most noteworthy of all the writers of this period was Sir Archibald Alison (*The Principles of Population, and Their Connection with Human Happiness*, 2 vols., Edinburgh 1840). Although like Alexander Hill Everett and others he was optimistic about future food supply, he saw that in an advanced society population must be restrained and thought this would be accomplished through rational control and the development of "artificial" wants. "The principle of increase is no doubt strong, but the desires destined to restrain it are at least as strong." More than any of his contemporaries, with the exception of the socialist William Thompson, Everett foresaw the probable effect of rising standards of living.

After 1840, although the physiological school gained some adherents, interest in population theory declined as the Malthusian specter was removed by rapid improvement in agricultural, transport and industrial technique, a flood of oversea foodstuffs and raw materials and seemingly limitless room for expansion in the New World. Megalomaniac worship of numbers and increase became everywhere the popular attitude; no attention was paid to the significance of enormous absolute increases; and not until the German controversy over the *Agrar-* versus the *Industriestaat* in the late 1890's was the future of the European food supply brought into serious question.

Meanwhile the decline in European birth rates, while slow and accompanied by declining death rates and increases in population wholly unprecedented in absolute amounts, began to alarm militaristic nationalists interested in the balance of power. For a quarter century before the World War the declining birth rate was the main theme of population literature. Economists had practically ceased to contribute to population theory, and sociologists and biologists took it up, not always with scientific caution. Under the influence of Darwinism, from the time of

Galton (*Hereditary Genius*, London 1869) sociological interest in quality of population as affected by declining and differential fertility led to premature application of doctrines of natural and social selection. A large literature, much of it superficial and propagandistic, began to accumulate and is still growing.

While most sociological writers assumed that the decline in birth rates was due to the spread of contraception, the physiological school, led by Dr. Thomas Jarrold, attributed it to some hidden organic factor. They argued that not only fertility but fecundity was declining. The often cited theories of Sadler and Doubleday are scarcely worth consideration, but Spencer's theory of "individuation and genesis" (first set forth in the *Westminster Review*, vol. lvii, 1852, p. 468-501) gained wide attention and was adopted bodily by the American economist H. C. Carey as disproof of Malthus and vindication of God. The physiological school has had considerable vitality, despite its slender backlog of scientific data and its quasi-mystical faith in hidden "laws." It is more recently represented in England by Brownlee's hypothesis of long term cycles in "germinal vitality" and in Italy by Gini.

Somewhat allied are the biologists and statisticians who, following the early lead of Quetelet and Verhulst, posit a bio-statistical, or more specifically a "logistic," law of increase. Belief in such a law requires faith in some mechanism which automatically and independently of human will or social conditions predetermines the shape of the population growth curve.

Population theories like others change with the spirit of the times and with different conceptions of scientific method. The Malthusian theory expressed the natural law philosophy of its time; the "principle of population" like the "immutable" principles of classical political economy was universal. Many of the critics of Malthus were unknowingly revolting against this fatalistic metaphysics. The "relativity of economic doctrine" was advanced first by the Ricardian socialists and the German historical school and later, despite their "economic determinism," by the Marxians. Thus the institutional approach slowly gained ground as a powerful rival to the Malthusian theory. Against Malthus' contention that prudence is based only on private property and fear of losing social position, William Thompson (*An Inquiry into the Principles of the Distribution of Wealth*, London 1824) held that the economic independence

of women and a higher standard of living for the masses would be far more effective.

Marx' theory of population, essentially institutional in nature, was incidental to his theory of capital accumulation and the resultant inevitable collapse of capitalism. There is no one law of population. Every form of society has its own institutional influences governing the population movement. "Overpopulation" is due not to limited productive capacity but to the maldistribution of income peculiar to capitalism. Saving, especially when coupled with mechanization of industry, involves cumulative transformation of variable capital (wages fund) into fixed capital (plant and machinery), displacement of workers (technological unemployment), progressive concentration of money income, deficiency of consumer purchasing power and consequent underconsumption or overproduction. The resultant "reserve army" of unemployed gives the appearance but not the reality of overpopulation. Confronted with the fact that the enormous capital accumulation and industrialization of the nineteenth century have not decreased but rather have greatly increased employment opportunities in absolute numbers, a group of neo-Marxians beginning with Rosa Luxemburg have revised the doctrine. The industrial countries have found markets for investment funds and goods in backward, "non-capitalistic" countries. As soon as the latter become industrialized and no longer furnish a dumping ground for industrial products and loan funds, the full effect of capital accumulation and technological progress will be felt in deeper and longer depressions, unusable productive capacity and unprecedented chronic unemployment, which will lead to the collapse of capitalism. Under socialism there will be no unnecessary saving, the equalization of income will provide the masses with purchasing power ample to remove from the market all the goods which industry can produce, unemployment will cease and with it all appearance of overpopulation.

This line of analysis leaves untouched one basis of the Malthusian theory, the law of diminishing returns, which stands potentially in the way of indefinite increase of subsistence. The socialists like others rely on technological advance in agriculture to obviate this difficulty, and in the light of present day redundant agricultural productivity this attitude, especially with the prospect for cessation of population growth, is within limits justified. Few candid students will deny that the neo-Marxian insti-

tutional theory of population in relation to productive capacity and distribution of income is now pragmatically far more valuable and applicable than the "natural law" approach.

Whereas in the first years after the World War numerous students, impressed with the volume of population increase, were rediscovering the potency of geometrical ratios and were pointing out that pre-war rates of increase could not continue long without disastrous consequences, more recently the whole aspect of the population problem has changed radically. Unprecedentedly precipitate declines in birth rates have brought them to levels so low that in western Europe and the United States, unless there is an increase in net fertility or an improbable decline in mortality, stationary population within a few decades seems certain. What the population movement will be in the Orient cannot now be predicted. This outlook, especially when considered in connection with prospective increase in production and with the still greater increase which a rationally planned economic system may provide, gives rise to new problems of great complexity and economic significance. Among these are the effect on agriculture, industry and international trade, more specifically on employment, need for new capital and the distribution of wealth and income and of population itself. Little has been published on these problems in England or in the United States, but there is already a considerable German literature. So many factors and variables are involved, including technological advance and the unpredictable future forms of society, that analysis is difficult and for the present possible only in general and contingent terms.

Obviously the problem of population in a rapidly changing society is one of highly complex economic dynamics. Dynamic population theory therefore merges into general dynamic economics and cannot be developed apart from consideration of economic structure and process as a whole and of the current speed and prospective amplitude of technological and economic change. Thus it is found that the institutional approach is more likely to yield applicable generalizations than the older and more conventional method.

Traditional Malthusian thought in terms of numbers and subsistence is no longer of immediate practical interest except in countries where population and productive resources are essentially in equilibrium at a poverty line standard of living. The desideratum of a rationally and

socially utilitarian population policy is to secure that size of population required, with some chosen division of the day between work and leisure, to operate available productive resources at the point of maximum per capita output. Output may be defined in physical terms or in terms inclusive of physical wealth, services and leisure or, finally, somewhat subjectively and indefinitely, in terms of welfare. Practically, so far as the relation of population to production can be treated quantitatively, the most feasible course is to measure output in terms of a stabilized price index of physical production of consumers' goods. The concept of an optimum population and its correlative optimum or maximum standard of living have been criticized as merely conceptual ideals incapable of scientific, i.e. quantitative, treatment. While it is true that statistics cannot as yet approximate quantitative treatment more than distantly, it does not follow that adequate basic data and statistical method, perhaps in the form of a reliable prosperity index, may not be developed in the future. In any case the optimum concept, defined in terms of standard of living, seems ethically superior both to the older desideratum of merely avoiding absolute overpopulation and to the desiderata of nationalistic or commercialistic character which spring from consideration not of the interest of the individuals who compose the population but of some "superorganic" complex like "the nation."

While the institutional set up with its trend toward vastly greater productivity is now the most significant factor in the problem, in the longer run of centuries rather than decades the supply of raw materials and power will become more and more important; for these, even with the most efficient organization and technique that unhampered engineering ability may achieve, will condition fundamentally the standard of living. In the long run the fundamental numbers-resources or man-to-land ratio, which was the basic idea in the Malthusian theory, regains the significance that it lost in nineteenth century expansion of opportunity and declining birth rates, not so much through population increase as through the inevitable decline in natural resources. This, however, is a realm of theory that is valuable chiefly because of the salutary time perspective on current problems which it affords.

Of some political and ethnical interest is the difference in rate of increase between certain races and world regions. With the approach of

stationary population in western Europe and America the old problem of balance of power, which is erroneously regarded as conditioned primarily by relative numbers, causes concern to some speculative writers. Danger spots in population are discussed, the twilight of the white race is pictured and the decline of western culture predicted. Whether such speculations are justifiable depends upon the future course of economic and political development as well as upon subjective elements in philosophical valuations.

A well rounded population theory, with true perspective on ascertainable facts, will not ignore the final or potential operation of natural law (specifically the tendency to diminishing returns) but it will consider also the entire cultural situation and movement. On the economic side it will provide a much more careful and elaborate analysis of the effect of changes in production and distribution than is as yet found in population treatises. It will recognize, with Marx, that the population problem, in the form it is likely to take in the next fifty years, is more one of distribution than of production. It will, as much of the continental literature now does, concern itself with the fate of vast industrial populations which may be cut off from world markets by the industrialization of new countries. It will scan the possibilities of trade with the agriculturally developed tropics and give serious attention to the future availability of essential raw materials. Taking a longer run of time in view, it will bring into the picture the whole problem of power resources and reserves of coal, iron and other natural materials. On the geographical side it will consider the distribution of population according to natural areas and their resources, in so far as the significance of natural areas is not diminished by introduction of improvements such as cheap transportation. On the political side it will give thought to the significance of nationalism as a factor favorable or unfavorable to the most efficient use of resources and knowledge. It will face the problem whether each nation is entitled to a standard of living based on the richness of its own natural resources or whether moral sentiment will demand the pooling of resources, unrestricted migration and a general leveling, geographically, of standards of living—in short a sort of world communism of resources. Finally, on the socio-psychological and cultural side it will attempt to evaluate the rational and institutional sentiments which affect the population

movement under different phases and trends of culture.

POPULISM. See AGRARIAN MOVEMENTS; RUSSIAN REVOLUTION.

PORTALES, DIEGO (1793–1837), Chilean statesman. Portales had a business career before he became active in politics. Through the revolution of 1829–30, which resulted in the victory of the conservatives, he became the chief cabinet officer of the provisional government and remained in office until 1832. Portales was a strong executive and completely dominated the government. His aim was to end revolution and to set up a powerful centralized regime which would guarantee internal peace. He destroyed the turbulent militarism of the time by eliminating all army officers of liberal tendencies and by creating and drilling a volunteer national guard. He brought about the exile or dismissal from the government service of other liberal leaders and checked with severity any attempt at conspiracy. Through his efforts moreover the country was placed upon a solid financial basis. The landed aristocracy and the clergy cooperated with Portales and under his influence the constitution of 1833 was framed on conservative lines to insure strong central power; this constitution provided Chile with its essential governmental organization for many years.

Although from 1832 to 1835 Portales was not in the cabinet, he remained a powerful influence in politics. When he returned to office the country was faced with the problem of the confederation of Peru and Bolivia under the leadership of General Santa Cruz, who was trying to foment a civil war in Chile. Resolved to destroy the confederation, Portales insisted upon a declaration of war and in order to prepare the country for the conflict assumed and exercised special powers. He thus established what was practically a dictatorship. Portales was put to death in the course of an army revolt.

PORTALIS, JEAN ÉTIENNE MARIE (1746–1807), French jurist and statesman. Portalis was born at Beausset in Provence. He began his career as an advocate at the Parlement of Aix. At the instance of Choiseul he collaborated in the drafting of the edict of 1787 in favor of the Protestants. On the eve of the revolution, in his *Lettre au garde des sceaux sur les édits de 1788*

(Paris 1788), he described the dangers of the immediate suppression of the *parlements*. He was imprisoned in 1793, but his release was effected by a clerk of the *procureur* of Aix, who had become a member of the Commune of Paris. In the year III he was elected to the Council of Ancients, which soon chose him president. He opposed persecution and the proposals for spoliation and was accused of taking part in a royalist conspiracy, whereupon he took refuge in Holstein.

Returning to France at the beginning of the consulate, he was presented to Bonaparte by Lebrun and named government commissioner of the Prize Court. He was appointed also a member of the commission for the drafting of the civil code, and together with Maleville supported the principles of the Roman law in opposition to Bigot de Préameneu and Tronchet, who favored those of the customary law. The colleagues of Portalis recognized his preeminence on the commission by entrusting to him the preparation of the preliminary discourse to the code, still regarded as a guide to the interpretation of French law, in which he sought to reconcile tradition with reason.

During the same period Portalis prepared the decrees dealing with the application of the concordat and with the exercise of the Protestant and Jewish religions. He became minister of public worship in 1804, and in this capacity he organized the religious seminaries, recognized the religious congregations and directed the preparation of the catechism for elementary catholic instruction. A year before his death he was elected to the Académie Française. During his lifetime he published various works to combat skepticism and too hasty reform. He was always a moderate. After his death his son published his *Discours, rapports et travaux inédits sur le Concordat de 1801* (Paris 1845).

PORTS AND HARBORS. A port is a haven for ships, properly equipped to facilitate the transshipment of freight between water and land carriers. A harbor is a body of water protected from wind and wave action with water of sufficient depth and with bottom of good holding ground so that vessels may find haven in it and anchor safely. Inasmuch as a marine terminal for transshipment must have protection

from wind and wave action, a port may be defined therefore as a harbor with terminal facilities.

Many of the great seaports of the world are far from the sea, being situated on rivers or canals. The port itself, in its modern form, has been dug out of the banks of the rivers and the upland has been turned into harbors. The channel to the sea, sufficient for the merchant ships of a century ago, is now kept by constant dredging at a depth adequate for modern steamships. There is a historical reason for the inland location of seaports. Early merchants went as far up stream as the draft of their ships would permit in order to avoid the depredations of pirates and other marauders. Moreover inland commerce was carried on over the navigable inland waterways, which were safer and much cheaper avenues of transportation than the caravan routes on the highroads. Thus London, Bordeaux, Antwerp, Bremen, Cologne, Hamburg and many other towns were situated at points where ocean and river vessels could meet as far from the high seas as possible. Rome, Paris, Cologne and other ports of antiquity and the Middle Ages have ceased to be seaports. Others have saved themselves from becoming inland cities by dredging to provide for the increased draft of steamships. Some modern ports, like Manchester, England, and Houston, Texas, always were inland cities until they were connected with the ocean by canals.

The following tabulation indicates how far inland some of the great ports of the world are located:

CITY	DISTANCE FROM THE SEA IN MILES
New Orleans	114 from Gulf of Mexico
Philadelphia	63 from Delaware Bay
Baltimore	180 from Atlantic Ocean
Portland, Oregon	112 from Pacific Ocean
Richmond	104 from Atlantic Ocean
Houston	50 from Gulf of Mexico
Amsterdam	15 from North Sea
Manchester	54½ from Irish Sea
Rotterdam	18 from North Sea
Bremen	54 from North Sea
Hamburg	67 from North Sea
Antwerp	50 from North Sea
London	67 from North Sea
Nantes	78 from Atlantic Ocean
Bordeaux	60 from Bay of Biscay

In addition to the length of time required to navigate channels at slow speed river ports have other decided disadvantages. There are usually many changes of course; the channels moreover are restricted as to depth and width and the

ports are cramped for anchorage and turning basins. On the other hand, marine terminals located in natural bays a short distance from the sea favor navigation in many ways: as regards steaming time from outside the jetties to the piers, straightness of the course, manoeuvring room and spacious anchorage. The following are great world ports situated on bays close to the sea: Boston, New York, Norfolk, Charleston, Galveston, San Francisco, Havana, Callao, Rio de Janeiro, Hongkong, Brest, Liverpool, Southampton, Cherbourg, Wellington. The following are breakwater ports where the harbor is made artificially by a mole and jetties so that they are directly on the sea or wide bays: Los Angeles, Kobe, Vladivostok, Danzig, Copenhagen, Dover, Calais, Le Havre, Naples, Genoa, Barcelona, Valencia, Fiume, Trieste, La Guaira, Vera Cruz. Ports entirely won from the open sea with mole breakwaters are Casablanca and Zeebrugge. It should be noted, however, that natural advantages will not make a port. Commerce makes a port, and men make commerce by using the natural advantages and overcoming the natural handicaps. Indeed merchant ships in order to get paying cargoes will go wherever there is water to float them.

The first essential unit of a marine terminal is the wharf to which a ship may be moored directly, with an adequate depth of water at all stages of tide or fluctuation of water level. A wharf structure may be an open pile platform or a solid fill back of a quay wall. The structure usually extends into deep water from the shore at a 90° or 60° angle to the main channel, with slips alongside for the berthing of vessels. Wharves not more than two ships long are commonly called piers. The most economical arrangement as to trucking distances and handling on the wharf with least congestion is the quay system, in which all the component parts of the wharf are parallel with the ship in its berth. The customary method of obtaining this result in all artificial ports where the facilities are developed by dredging the basins and filling the land above mean water level is the use of the quay pier type. This is a solid fill structure of sufficient length to accommodate two, three or four vessels of the size frequenting the port and of sufficient width for two complete terminal units back to back.

The next terminal unit back of the quay wall or open wharf stringpiece is the transfer working area. This wharf apron, as it is called, as a rule has a width sufficient to accommodate two

harbor belt railroad tracks, or a space about thirty or thirty-two feet to the face of the transit shed.

The transit shed is the structure on the wharf where outbound cargo is assembled in segregated piles to facilitate rapid stowage in the ship according to the nature of the cargo and the ports of call. A modern ship can load or discharge more in one day than trucks and box cars can haul into or out of the terminal in three days. The transit shed is the covered wharf area designed to facilitate this movement of cargo; also it receives cargo turned out from a vessel for segregation according to marks and consignees.

The warehouse is another important element in the port's terminal equipment. The function of the warehouse is very different from that of the transit shed. The warehouse is for longer term storage; that is, for the storage of merchandise as distinguished from the handling of merchandise at the point of transshipment. It is intended to store goods indefinitely until sold or reshipped. Thus the warehouse is the fly-wheel of commodity movements and financing, and it balances commodity movements, most of which are seasonal in nature. Public warehouses, through receipts or warrants, make possible storage of merchandise under conditions of safety from fire, theft or deterioration, so that merchants may hypothecate or lombard the warehouse warrants as security for loans at the banks.

Inbound cargo movements at a commercial wharf consist, in the first place, of transfer between ship and wharf after breaking out by the hold crew of stevedores and, in the second place, of handling to place of rest and segregation in the transit shed and handling out to car platform or truck tailboard. A large run of uniform cargo to a single consignee may permit transfer direct from hold to freight cars on the wharf apron tracks. Outbound cargo is received by truck, railroad, canal barge or lighter and assembled in the transit shed according to the nature of the cargo, the stowage plan, ports of call, the trim of the vessel, safety of cargo and vessel and other stowage questions. Barges and lighters usually transfer direct to ship on the off side from the wharf. The movements involved are handling into transit shed and segregation and handling to transfer wharf and to hold and stowage in the ship.

Transfer and handling are the crucial marine terminal operations. These account for 50 percent of the ship's time and for about the same

percentage of its operating costs. To speed up transfer in order to give the ship a quick turn around and to reduce the time, cost and damages of handling are the two problems which most concern terminal and ship designers. Transfer and breaking out or stowage are functions of the contracting stevedore, who hires longshore labor for this work. This cost is met by the ship operator out of the ocean rate. Handling is a wharfinger operation and is paid for by the shipper to the operator of the wharf. Under conditions of competition, wharfage and handling charges are usually absorbed in through movements by the railroad or the ship operator or both. Frequently the ship operating line leases the wharf from the owner, whether city, county or state, and is responsible for stevedoring, handling and storage in transit. These costs are paid by the shipper in the level of rates, even being paid by inland shippers in higher line haul rates who do not use the marine terminals.

Shipping out from the transit shed to local or interior consignees is accomplished either by belt railroad switching to main lines, by motor truck or by barge. A modern terminal plan presupposes access for these three types of inland transportation. A harbor belt railroad, to perform its purpose adequately, must be able to furnish flexible switching movements from ship side to any industrial siding on the belt railroad or to any distant point on one of the railroad systems serving the port area. Switching rates must be equal from any wharf to any siding or any trunk line, otherwise the port will be split up and not a unit; Boston is an example of this serious evil. Likewise there must be provided main motor truck highway access, preferably by the by-passing of congested city traffic, to the marine terminals, to ship side, to transit shed, to warehouses, to open storage wharves and the like. In addition barge line inland waterway feeders are important factors in port development. Outstanding ports which have been aided by this form of inland transportation are New Orleans, Montreal, New York, Hamburg, Rotterdam, Amsterdam, Bremen, Stettin, Antwerp, Ghent, Bruges, Manchester, Liverpool, Galatz and Brăila. The function of a port is to afford economical transshipment and storage facilities, between water and land carriers, for goods destined for the hinterland of the port. This hinterland is limited in extent, in the first place, by what the traffic will bear in transportation costs and, in the second place, by the line of neutral advantage between the hinterland of

one port and that of the next competing port as measured by the total of transportation costs—land, port terminal and water. Where costs are equal, the port with more frequent sailings and better handling facilities as to both dispatch and absence of conditions causing damage will get the business, often at a premium in rates.

At most ports little progress was made in efficiency or mechanical substitutes for hand labor until recent times. As half the cost of transportation is at the transshipment points, the improvement of port facilities to lower costs of handling and to save the time of the ship in port is a most important economic factor. But during the past half century, chiefly as a result of the action of public bodies, there have been achieved great advances in port administration as well as in the extension and equipment of harbor works and terminals for the accommodation of increasingly larger vessels. Nevertheless, the economies possible in terminal operation have lagged behind the economies attained in the line haul; and the costs of transshipment at ports could be still further reduced, particularly through improved design, mechanical equipment, administration and management. When the canalization of the short reach of rapids in the St. Lawrence River makes another Baltic Sea out of the Great Lakes, there will be an opportunity to build absolutely modern seaports from the ground up and to apply those principles which will materially reduce costs of transportation. The result will be the liberation of the economically isolated interior of the country from its present disadvantages of high transportation costs for raw materials and finished products from and to world sources and world markets. Extension of older seaports will conform to modern methods and result in economies despite the heritages of obsolete equipment, now in existence.

With the growth of steam power and the increase in size and draft of steamships there came the parallel development of the large capacity steam dredge. This has succeeded in digging channels and harbor basins to increased depths and widths to accommodate ever larger vessels, so that today a port with less than 30 feet of channel depth is considered second class, although this depth will accommodate 96 per cent of all cargo vessels. The new transatlantic superliners have drafts of 34 to 39 feet and there is but a small number of ports which have been deepened to accommodate them. The Suez Canal has been deepened from time to time

until today it has a depth of 36 feet; the depth of the Panama Canal is 41 feet.

Various forms of port administration exist not only throughout the world but in individual countries as well. As a result of the experiences of the past century it has been demonstrated that the most effective means of control is to be found in the so-called public port trust or port authority, an independent non-political body with delegated sovereign powers. These as a rule consist of the rights of eminent domain, dues levying, bond issue and police power. In this way the port authority owns and operates the port as a public trust monopoly for all the people.

In Great Britain and Canada many of the great ports are administered by these public trusts. Control is in the hands of a representative body which is mainly elective but which also includes a small number of nominated persons. Examples are the Port of London Authority for London, the Mersey Docks and Harbour Board for Liverpool and the Clyde Navigation Trust for Glasgow. Generally the elective group consists of representatives of the principal shipping and trading associations using the port. In the case of London the nominated group includes representatives of the Board of Trade, the Admiralty, the London County Council, the City Corporation and Trinity House (the recognized institution for controlling the lighting and buoying of the coast and of the river entrance channels).

Another type of port administration is to be found in state agencies, usually in government departments. This is the method prevailing in France, Italy, South Africa and in a modified form in the United States. In France for many years all ports were built and operated by the central government under the *Ingénieurs des Ponts et Chaussées*. As a result all local initiative of port cities in France was destroyed; and while German, Dutch, Belgian and Italian ports forged ahead, French ports made little progress. After the World War, however, various French ports were given autonomy and under this form of control *ports autonomes* succeeded in catching up with continental rivals. Bordeaux and Le Havre are examples of these *ports autonomes*. In South Africa there is a special Ministry of Railways and Harbours, which has been given complete control over ports to the exclusion of outside corporations. Here as in France and Italy the government assumes charge of and responsibility for the construction and maintenance of outer protective works, navigable ap-

proach channels, quays, basins and docks. But the actual working and exploitation of the ports is entrusted to a local body, as a rule a specially created consortium.

In the United States there are a number of types of public port organization. The most common form of port authority is the city department, called in many cities the department of docks or the department of wharves, docks and ferries. The head of this department is appointed by and responsible to the mayor and more frequently than not is an influential member of the ruling political party. Increasingly there has begun to appear the so-called non-partisan port commission whose members act without pay, as in the case of the trusts of the British ports, and who are appointed or elected to serve for various overlapping terms. There is also to be found the state commission, appointed by the governor for a term of years and serving without pay. New Orleans and San Francisco are examples of ports administered by such agencies. Latterly another development has been the creation of the bistate port authority, of which the outstanding example is the Port of New York Authority. This body, following a compact, supported by concurrent legislation, between the states of New York and New Jersey in 1921, has drawn up a comprehensive plan for the development of the port, including belt lines and tunnels and a complete reorganization of all the rail facilities of the area. It is to be noted too that in the United States both public and private agencies have been regarding the public port trust with favor. The state of Michigan has on its statute books an enabling act permitting the creation of such an authority; and in 1932 the port of Monroe in that state was organized in conformity with its terms. In Ohio, under the leadership of the Ohio section of the Great Lakes Harbors Association, agitation was begun in 1932 for the passage of a state enabling act to permit the creation of port districts under a corporate body and with delegated sovereign authority.

In addition to public port administrations there are a number of privately operated ports. The port of Southampton, for example, is the creation and property of the Southern Railway Company; the port of Cardiff is operated by the Great Western Railway Company; and Emden is controlled by the Prussian-Hessian railroad system, which is owned by the states of Prussia and Hesse.

In the United States the federal government

also plays a significant role in port development. Thus the Corps of Engineers of the Department of War performs the following tasks: it builds breakwaters to protect harbors from wave action, and jetties at the mouths of rivers and harbors to control the water flow of currents; it constructs revetments, dikes, levees, locks and dams in rivers; and it performs dredging operations. Port projects are authorized by the Rivers and Harbors Committee of the House of Representatives, following the conduct of a local survey under the auspices of the district office of the Corps of Engineers and its approval by the functionaries of the Department of War. The community desiring such a development is required to show the harbor plan involved, the public benefit to be expected by shippers from savings in transportation, the methods of financing of the harbor plan and its terminal facilities and the nature of the port authority to be entrusted with design, construction and operation. The funds are provided by Congress in the Rivers and Harbors Bill, which is part of the Department of War appropriations. The policy of Congress was clearly stated in 1911 when it was declared that the secretary of war was not to recommend harbor or other waterway improvements unless the community in question provided public terminal facilities open to all on equal terms; moreover the secretary of war was to withhold grants for aids to navigation if these provisions were not met by the community.

The rivers and harbors work of the United States government, which began in 1825 with federal improvements of the port of Philadelphia, had cost by June 30, 1930, a total of \$1,660,336,226. The distribution of these expenditures by projects is as follows: seacoast harbors, \$535,694,516; Mississippi River and tributaries, \$426,330,492; Mississippi flood control, \$228,968,264; operation and maintenance canals, \$103,093,354; Great Lakes harbors and channels, \$183,816,262; all others, \$182,433,338.

Other government activities at seaports and at some Great Lakes ports are: the customs work of the Treasury Department; immigration regulation by the Department of Labor; the coast guard activities of the Treasury Department; the lighthouse, beacons and buoys services of the Bureau of Lighthouses of the Department of Commerce; steamboat inspection by the Bureau of Steamboat Inspection of the Department of Commerce; quarantine by the Department of the Interior; and the navigation aids of the Coast and Geodetic Survey of the Department

of Commerce. Private companies as a rule furnish towage, lighterage, car floats, car ferries and floating elevators. In some ports towboats and elevator equipment are owned and operated by the port authority.

Ports should be self-liquidating. It has been argued by one group of experts, which is particularly representative of the opinion of the inland waterway port cities of Europe, that the public benefits and the increase in returns and taxes from manufacturing and wholesale distributing enterprises attracted to the port must more than compensate the public treasury for any losses in the cost of operation, interest and sinking fund charges on particular port investments. However, a carefully planned port, which is based upon a clear understanding of the economic benefits it can confer upon a large and active hinterland and additions to whose plan are made only as initial terminal units become crowded, should reasonably be expected to pay for itself. Returns from rates for transfer, wharfage, handling, warehousing, switching and the like may be counted upon not only to pay for operation, maintenance, interest and sinking fund charges but also to pass on substantial savings to the users.

POSITIVISM is a term which designates a philosophical tendency oriented around natural science and striving for a unified view of the world of phenomena, both physical and human, through the application of the methods and the extension of the results whereby the natural sciences have attained their unrivaled position in the modern world. From the point of view of methodology the term "positive" is conceived in polemical opposition to the metaphysical abstractions of traditional philosophy. One calls "positive" the facts and things of immediate perception as well as the relations and uniformities which thought may discover in them without transcending experience. On the other hand, one calls "metaphysical" every inquiry which claims to go beyond the sphere of the empirical and seeks either hidden essences behind phenomenal appearances, or ultimate efficient and final causes behind things, as well as any attempt to attribute reality to species, ideas, concepts or the mind's logical "intentions" in general. Inasmuch as the natural sciences, which early became dissociated from such sterile inquiries, have rapidly achieved a notable degree of exactness and objectivity and have been able to avoid the vain fluctuation of opinion, it is permissible to believe that through a similar delimitation of its sphere and an analogous purification of its concepts philosophy too might reach the same degree of certainty and scientific objectivity.

From the standpoint of results and aims of knowledge positivism shares with science the

practical ideal of knowledge in contrast to the merely contemplative and speculative goals of metaphysics. The aim of knowledge should not end with knowledge itself, with an otiose complacency in its own superiority and aloofness from the interests and cares of ordinary existence; it should embrace the real world. To know in order to foresee and provide, that is to say, to know in order to have a useful guide for conduct and to be in a position to control the forces of nature for the sake of the commonweal, is the motto of science and of that philosophy which would ally itself to science. From this circumstance arises the special significance of positivism for social problems—that the practical ideal of knowledge which positivism champions finds its most useful and immediate expression in the field of human relationships, where a sagacious labor of coordination and of scientific discipline might readily achieve new levels of efficiency and order.

But against these incontestable advantages of the positivist program there may be noted certain defects which are more or less latent in its very scientific structure. These have become progressively more apparent in the course of the development of positivism. Not only the extreme difficulty of maintaining itself on a level strictly positive and not exceeding the limits of experience but also the tendency, which it shares with science, to identify objectivity with materiality, have often caused positivism to range over into materialism, that is, into a metaphysics, in contradiction to its own premises. Moreover the sudden and brutal transference of scientific procedures valid in the world of material and inanimate nature into an order of psychic and spiritual facts of an incomparably higher level has had the effect of impoverishing such facts and often of mutilating them. It is therefore not difficult to understand the reaction against the positivist interpretations of the human spirit which has developed from the side of traditional philosophy, reaching maximum intensity at the turn of the present century. Throughout the ages traditional philosophy had gathered, along with considerable dross, much experience of great profundity and subtlety concerning the spiritual life; and it therefore resented the mutilated pictures of the mind presented by positivism.

If account is taken of the positivistic trends associated with scientific thought, the history of positivism extends through the three centuries of the modern period in which the progressive

expansion of the natural sciences has taken place. From the beginning of the seventeenth century through the eighteenth there is a more or less latent positivism which reflects the increasing successes of the scientific conception of the world. But only in the nineteenth century does the positivist tendency become explicit and conscious and take form in a definite system, that of Comte, who not only gave it its appropriate name but also made its appearance the necessary end of all modern civilization in accordance with a historical law of the evolution of human thought.

The earliest traces of positivism in modern times date from the beginnings of English empirical philosophy in the seventeenth century. Francis Bacon expressed confidence in the brilliant future of the natural sciences and of humanity under their guidance. To the realization of his vision of the *regnum hominis* he made the solid contribution both of his scientific methodology and of a social program sketched out in the fragment of the *New Atlantis*. In the *Novum organum* he laid down the principles of a scientific procedure based upon observations of facts and upon inductive generalizations, singling out as goals of thought not so much universal concepts as *axiomata media*, which are really the laws of the individual sciences. In the *Advancement of Learning* he made a first classification, from a modern point of view, of the branches of knowledge, both in order to take inventory of the conquests already made and also to indicate the tasks still to be accomplished. On the other hand, in the *New Atlantis* he painted a vivid picture of a humanity saved and guided no longer by the old traditional aristocracies but by the new aristocracy of science. The new rule would substitute for the barbarous and inhuman domination of man by man the peaceful and profitable domination of nature by man and thus succeed in raising to the highest potency the inventive and constructive capacity of human genius.

Later empiricism, from Locke to Hume, went deeper into some parts of the Baconian program but neglected others which were historically less ripe. It set in ever greater relief the antimetaphysical aspect of the new scientific conception of the world, eliminating those relics of scholasticism which still remained in Bacon's thought. Locke restricted the sphere of valid consciousness to the field of pure experience as presented in sensation and elaborated by reflection. With Berkeley the metaphysical concept of substance,

which was still retained in a shadowy manner in the Lockian distinction of primary and secondary qualities and which served to give an objective and material support to sense perceptions, was entirely abolished; and the existence of objects was reduced to their perceived existence. Nevertheless, there persisted the idea of a world of spirits, in whose divine nature was placed the transcendental cause of sensible appearances. Hume cast aside even this metaphysical concept of productive causality; he held that relations of cause and effect were only temporary relationships of phenomena which habitually occurred in succession; their "necessity" was merely the result of a confirmed habit of mind. In this way the last bridge which still joined the new empiricism with the old metaphysics was broken, and the natural world was reduced to a complex of phenomenal data bound up with relations equally phenomenal; the corresponding subjective and mental world also was resolved into a bundle of sensations held together by empirical bonds of an associative nature. The mind, fortress of traditional metaphysics, was reduced to the level of nature and thus became, at least potentially, subject to the application of the same scientific methods which proved so fecund in the study of nature.

If the Baconian ideal of a science founded upon facts and empirical generalizations may be said thus to have been in process of realization, Bacon's other aspiration, that of making science the instrument of human power, social organization and progress, still remained unsatisfied. The partisans of classic empiricism were still too individualistic to be able to appreciate the social aspects and implications of the advent of the empirical sciences. Moreover in the eighteenth century the habit of the positive study of human facts was not yet fixed, being counterbalanced by too many doctrinaire influences of metaphysical origin. The latter consideration serves particularly to explain the attitude of the French Enlightenment. From the time when the young Voltaire, early in the eighteenth century, began to popularize Newtonian science in France, and Locke's doctrine of knowledge began to gain adherents in educated circles, France was won over to the new scientific ideals. But these acted on the historical consciousness as a solvent of the ancient traditions rather than as positive principles of reconstruction. For the philosophers of the Enlightenment the object of reverence and even of worship was not at all the idea of science as representing a collective labor

scarcely begun and moving forward with deliberate and cautious step—it was rather science as the symbolic incarnation of reason, capable of wiping out in one broad stroke human prejudices in every field. For this reason the *philosophes* missed precisely the most positive and empirical aspects of the new scientific revelation and in the name of science placed upon throne and altar a perfect and rational "human nature," and a no less rational "cosmic material" as the equalizer of all beings; in other words, they summoned up new incarnations of the old metaphysics. Yet in this still transcendent and utopian form the ideal of a humanity whose perfection is entrusted to the work of science and culture received under the Enlightenment certain suggestive expressions, like that of the *Esquisse d'un tableau historique des progrès de l'esprit humain* (1795) of Condorcet, which puts forward as a goal of progress the abolition of national and class distinctions and the intellectual and moral perfection of the individual.

More akin, however, to the positivist spirit of English empiricism are the utilitarian currents which converged in Helvétius in France and in Bentham in England. The idea of utility presented itself to reflection as an immediate datum of observation; scientific method was to help to free it from its too individualistic roots and from ethical criteria founded upon the confusion of utility with egoism. This work was performed with lucidity and vigor by Bentham, who was able to point out that, far from being necessarily neglected, individual utilities tend to adjust themselves in such a way as to further the general interest. This harmony of interests at the same time made possible the transition from scientific generalization to that of practical deontology; for, if the interest of the greater number is the goal toward which the spontaneous integration of the individual interests aspires, the realization of that goal becomes a duty of the ethical consciousness. There sprang from this realistic consideration of utilitarian activity two sciences: first, economics, which at least at first evolved independently of Benthamism, as analysis of the logic immanent in the play of interests in their mutual implications and complications; and, second, the science of law and legislation, the object of Bentham's most assiduous attention, which took as its starting point a radical criticism of the old teleological and metaphysical (natural law) conceptions of law and installed in their place utilitarian and empirical views. Thus Bentham sketched a constitutional code which

aimed so to place every member of the political society that his particular interests would coincide with those of the greater number. The utilitarian doctrine of law formulated by Bentham was championed in England by John Austin (1790-1859), who, however, drew from the same premise—that the general interests form the principal aim of justice and law—a directly opposite conclusion. Austin contended that the general interests would be better attained by a hereditary aristocracy than by the radical democracy favored by his predecessor.

The foundation of a definite positivist school, in which these implicit tendencies became completely explicit, dates from the French philosopher Auguste Comte (1798-1857). He had devoted himself to scientific studies and in his youth frequented Saint-Simonian circles, so that he was led by his very education to bring together the speculative and practical trends which were to form the system of positivism. Comte's *Cours de philosophie positive* (1830-42) made the advent of positivism the epilogue of the intellectual evolution of humanity and enunciated the famous law of the three stages of philosophic thought: the first, theological, in which thought has recourse to the intervention of supernatural and divine beings for the explanation of phenomena; the second, metaphysical, in which abstract rational entities, such as substance, essence, form and cause, are posited as explanatory principles; the third, positive, in which facts are understood in their empirical certainty and in their phenomenal connections. In order to present a positive theoretical picture of the intellectual cosmos Comte sketched out a general classification of the sciences according to the degrees of increasing complexity of their subject matter, which were, correspondingly, degrees of diminishing generality of their respective concepts. Thus at the initial stage of the scientific hierarchy (more general and less complex) he placed mathematics; above this, astronomy; then physics, chemistry, biology; and finally sociology as the doctrine of human facts and relationships, which are the most complex and particularized of the whole series. In his conception of this order he avoided the easy simplifications of materialism: every stage represented something which could not be reduced to the preceding stage—a new phenomenal level demanding its own explanation, connected, to be sure, with that of the lower grades but emerging above these with autonomous specific character.

It was to sociology, which he had placed at the summit of the hierarchy of the sciences, that Comte devoted his attention by preference. In depicting the structure of this discipline he made considerable use of his Saint-Simonian experiences, which inclined him to consider society as an organic whole of an order superior not only to physiological organisms but also to the psychic individuals composing it; he endowed it with its own autonomous life governed by its own peculiar laws. But, as was true also of his Saint-Simonian predecessors, Comte exaggerated the bearing of these organismic premises, even to the point of making society a compressing force obliterating the freedom of the individuals subjected to it as well as of sanctioning, under the aegis of science, a new despotism, graver than that which in the past had inspired the theocratic and to a certain extent the natural law systems (those, for example, of Hobbes and Spinoza). Moreover in his last years, by a sort of theological involution of his thought, he made sociology the formative principle of a religion of humanity and founded a positivist church; although to some of his own followers, such as Littré, this appeared to be a deviation from the scientific tenor of his thought, it later found many groups of adherents in Europe and the United States.

Stemming from Comte, and with more or less dependence on his system, the idea of a new positive and scientific era of human thought was adopted widely by scholars during the second half of the nineteenth century, each striving individually to mold it to his own special interest. Thus John Stuart Mill, pursuing the tradition of Hume and Bentham and developing it in the light of the new ideals, gave systematic formulation to the principles of inductive and deductive logic and of empirical epistemology. Spencer and Huxley labored to graft upon positivism that great branch of modern science which, under the name of evolutionism, arose from the researches of Darwin on the origin and transformation of organic species. And even in the schools of metaphysical origin the positivistic command to remain within the limits of experience was strongly felt. Especially among the followers of Kant there arose the cry, which had loud reverberations in Germany and elsewhere, *keine Metaphysik mehr!* Under the name neo-Kantianism the slogan gave rise to a movement tending to dissociate the pure philosophy of Kant from the metaphysical and theological deformations which it had suffered at the hands

of the post-Kantian idealists, Fichte, Schelling and Hegel. As Comte himself had recognized, Kant was the one metaphysician who had approached most closely to the positive philosophy; his *Critique of Pure Reason* had restricted the domain of valid consciousness to the experimental field of phenomena and had denounced the illusions of reason which attempt to invade the forbidden realm of things-in-themselves, or noumena. If Kant had in some degree gone beyond the limits of phenomenal relationships in his ethical doctrine, his disciples, more imbued with the positive spirit, easily succeeded in ruling out these incursions from their thinking, confining themselves rigorously to the phenomenalistic conclusions presented in the *Critique*.

Particularly fruitful was the union of the positive mentality with Darwinism in humanistic culture and the social disciplines. In the science of language new vigor was given to researches of a genetic and comparative nature; in scholarship philological investigations took on a preponderating importance; in literature and art realism and naturalism struck out along new paths, aiming to express life as it is rather than to idealize and embellish it; in literary and political history large philosophical syntheses were set aside in favor of minute and patient reconstructions of facts; in the science of religions the human factors in the development of religious experience were sought out; while in the social disciplines the interest of the inquirer revolved about ethnographic and palaeo-ethnographic reconstructions and the comparative study of the various forms and stages of civilization. Even the circles at first most hostile to positivism, such as those of Catholic culture and tendency, were drawn more and more in the new direction, although they remained perplexed and reserved. In the field of literary criticism the example of Brunetière is typical; he saw in evolution, which contradicted the belief in a rationally perfect human nature, an unexpected confirmation of the Christian dogma of original sin and therefore applied evolutionary criteria to the studies of the literary genres, conceived by him, after the manner of organic species, as capable of development, transformation and degeneration.

Comtian sociology, the positivist science par excellence, had its most systematic devotee in Émile Durkheim, who stripped it of its theological residue as well as of the reactionary political influences of its founder. Durkheim succeeded in maintaining with vigor and scien-

tific clarity the autonomy of the social organism as distinct from the individuals who compose it. Uniting, mingling, fusing together, the individual psyches give birth to a being, psychic perhaps, but constituting a psychic individuality of a new order, which is not a metaphysical entity but simply connotes the specific nature of the social phenomenon. And to avoid the danger which Comte had incurred, of an oppression of the individuals by society, Durkheim in *De la division du travail social* (1893) showed that the same factors which have produced social specialization and hence have apparently encroached upon the autonomy of the individuals have in reality contributed to their progressive emancipation. The division of labor itself promotes this liberation, because the individual human natures by becoming specialized become also more complex and therefore exempt in part from collective action and from hereditary influences, which can coerce only simple and general entities. Thus society may exist and impose itself upon the individual without depriving him of his own *raison d'être*: between the two forces there is cooperation, not conflict. On the basis of this conciliatory criterion Durkheim and his school have carried out broad scientific explorations of human society and have investigated the laws which govern the different forms of association and the various institutions in which the organizing spirit of humanity has become embodied in the course of history.

At the present time positivism can scarcely claim that hegemony over world culture which it maintained until the close of the nineteenth century. Other movements have sprung up in rivalry and often in opposition to it. All that may be stated with certainty is that positivism has largely permeated with its own spirit its contemporary rivals and antagonists, each of which in its own way tends to achieve a positive view of reality, and, even when reverting to the metaphysical trends of the past, cackles the more abstract and purely speculative elements. But Spencer's ideal of a philosophy as a universal synthesis of the results of all the separate sciences is being rapidly discredited. The immense progress made by the sciences in a few decades has shown how precarious is every philosophical construction founded upon provisional and transitory conceptions; and at the same time the very logic of philosophy could not but hasten the repudiation of a conception claiming to construct a universal system as a mosaic of disparate pieces, never recast in the crucible of

thought. The positivistic movement has proved much more fruitful in the task of critical reflection upon the sciences of nature than in the non-critical prosecution of scientific work.

From this point of view Mach's empirio-critical conception is particularly important. He views the work of science under the category of economy, seeing concepts, hypotheses and laws as so many means of abbreviation and simplification enabling the thinker to grasp with a minimum of effort, and hence with a maximum of economy, the infinite multiplicity of perceptible and experimental data. In his *Die Mechanik* (1883) Mach shows how this principle works in the development of a single science and how it implicitly necessitates the gradual repudiation of complicated and abstract concepts; for example, that of metaphysical causality. His *Analyse der Empfindungen* (1886) provides a further application of this principle, showing that it is uneconomical to complicate the unique reality which consciousness reveals by setting up a dualism of an objective material world and a subjective sensible world, and that it is possible to reduce to sense data all that is needed to satisfy the demands of scientific objectivity and conscious subjectivity.

Following the same line of thought the empirio-criticism of Avenarius, in a very abstruse psycho-physiological inquiry, traces the origin of the principle of mental economy to the functional mechanism of the central nervous system itself. A positivist character attaches also to the so-called phenomenology of Husserl, who would confine philosophical research to the sphere of the immediate revelation of consciousness, eliminating every problem of transcendental existence and causality as tending to force thought beyond the limits of empirical consciousness. A kindred position is that of the so-called philosophy of immanence (Schuppe, Rehmke and others), while analogous motives may be discovered also in certain exponents of modern English and American realism. These same tendencies have recently found new expression in the "logical positivism" of the Vienna School (Schlick, Carnap and others), which has assigned to theoretical philosophy the task of studying pure mental structures, that is, logical articulations of psychic complexes, and has excluded, as pertaining to metaphysics, every quest for physical and psychical essences.

These various trends, with the possible exception of that of Mach, which seems to some intellectual exponents of Russian socialism to

furnish the criterion of a positive interpretation of human society, are generally sterile in social and political application. Some phases of American pragmatism, on the contrary, appear to be very fertile in this respect, particularly that represented by John Dewey. In a broad sense Dewey may be called a positivist in that he champions a scientific view of reality and extols that active experimentalism which has in modern times profoundly modified the attitude of the mind toward physical nature. But for Dewey reflective and critical work on the theory of science represents but a preliminary part of the philosophical task; the other and more important part must consist in the application of the methods of science to the organization and control of the relationships of human society, which in numerous respects are still dominated by antiquated traditions and customs. The notorious incongruity between the perfection of scientific technique and the imperfection and disorder of the machinery of social organization constitutes a powerful incentive to reforming and reconstructive activity guided by philosophical reflection.

POSOSHKOV, IVAN TIKHONOVICH (c. 1652-1725), Russian writer. Pososhkov, of peasant origin, was a craftsman, inventor and indus-

trialist by turns; toward the end of his life he attained some affluence. His personality presented a characteristic synthesis of the traditionalism of holy Russia with the progressive spirit which animated the reformism of Peter the Great. Superstitious and yet thoroughly alive to the advantages of the new learning, uneducated in the western sense and yet widely read in the literature of Muscovite Russia, shrewd in business and an idealistic patriot, he was typical of the self-educated merchants and industrialists who had risen above the general level without sharing as yet in the wealth and culture of the ruling group. Moved by his profound knowledge of the inveterate evils of Russian life, which brought to naught Peter's reformatory ukases, he tried at his own peril to help the cause of reform by suggesting to the authorities practical methods of combating ignorance and lawlessness. He wrote in a plain but picturesque style on every conceivable subject—religion, family life, law, politics, social legislation. His longer writings are: *Zerkalo ochevidnoe* (The mirror obvious), completed in 1708, an erudite but spirited tract against religious old believers and Protestant sectarians; *Zaveschchanie otecheskoe* (A father's testament), written in 1719-20, a book of very detailed rules for orthodox Christians to guard them against the "luxurious, easy going and lustful" habits of "Lutheran" foreigners; and, most important of all, *Kniga o skudosti i bogatstve* (Book on poverty and wealth), written in 1721-24, whose presentation to the emperor led to its author's death in prison.

The views expressed in this treatise on political economy, the first in Russia, are those of an advanced mercantilist: the importance of agriculture is not underestimated, but encouragement to commerce and trade is stressed. Increasing the wealth of the people is a better road to state power and prosperity than attending to "the fulness of the czarist treasury." The first prerequisite is the substitution of a rule of law for the regime of injustice—the compilation of a new law code with the aid of freely elected representatives of all estates and a radical change in the judicial personnel. Peasant dues must be limited by the state, the division of peasant families halted, the tax system reorganized, the coin in circulation increased and improved, universal education introduced. Some of Pososhkov's proposals are similar to those made by Walter Raleigh in England, Pieter de la Court in Holland and Marshal de Vauban in France, while others anticipate programs advanced by

non-Russian writers at a later date; in either case direct foreign influence is improbable.

POST, ALBERT HERMANN (1839-95), German jurist. Post wrote on the primitive forms of law and society, especially the family, and developed a system of ethnological jurisprudence. Upon the methodological assumptions of positivism he aimed to construct in a purely empirical manner a universal history of law. Strongly influenced by the progress of the natural sciences and especially by biology, he conceived of ethnology "as the natural science of social life" and proposed, postulating a universally similar and at the same time necessary course of evolution, a "comparative ethnological method" which was characterized by the neglect of varying factors and a predilection for typical cultural phenomena. He thus hoped to make possible the discovery of the natural evolution of law and society, "a consistent historical evolution towards definite goals," since "ethnology finds humanity subject to a rigorously determined course of evolution." Ethnographic parallels among the most diverse peoples, for example mother right, seemed to him therefore "emanations of general human nature." Thus he posited a series of stages in societal evolution which everywhere and necessarily lead from a "primitive age of the family organization" of matrilinear sibs, through a "territorial-associational" to a "dominative" and finally to a "social" order of human life. Even though Post has remained the most important representative of ethnological jurisprudence, his system nevertheless was bound to collapse with the recognition that a divergent evolution of the various peoples is possible and demonstrable. Because of this Post's grand attempt to create a system of primitive law and universal legal history now belongs to the past. His material insufficient and not always exact, he relied upon an unhistorical method, and despite his strictly empirical point of departure, he ended by doing violence to the

facts and forcing himself into an a priori scheme that was possible only as the result of psychological construction.

POST, LOUIS FREELAND (1849-1928), American publicist. After an apprenticeship as a printer Post studied law and was admitted to the bar of New York in 1870. His interest in labor politics led him to run for Congress as a Labor party candidate in 1882 and for attorney general of New York on the Greenback ticket in the following year. In 1890 he abandoned the law to preach with clarity and force the single tax doctrine of Henry George, whose staunch disciple he had become. Already widely known for his editorials in *Truth* and in George's weekly, the *Standard*, Post founded the *Public* in Chicago in 1898 and during the fifteen subsequent years of his editorship made it a vigorous supporter of free expression as well as the leading exponent of George's economic gospel.

Agreeing with George on interest and public management of utilities, Post accepted his program more completely than most single tax advocates. He held that great fortunes could be accumulated only by impoverishing large numbers of men and that wealth was generally an index only to its holder's astuteness in playing a predatory game. Opposing monopolies as levies on the industrious, he regarded socialism as enforced cooperation and hence monopoly under another name. He considered natural competition a prerequisite of the ideal economic order and believed that trade freedom and not political federation bound the states of the American union.

As the single tax movement has achieved little in practical results, Post probably will be remembered as the first assistant secretary of labor (1913-21) and particularly for his efforts to halt the anti-alien hysteria in 1920. Convinced by the records that the Department of Justice had

exceeded its rights, he permitted the deportation of only about one fifth of the aliens for whom warrants were issued. Few Americans have upheld so staunchly the civil liberties guaranteed by the bill of rights.

POSTAL SAVINGS BANKS are savings institutions established by the government and operated as a part of the general postal service. Among the considerations which have prompted the establishment of such institutions is the desire on the part of the government to provide savings facilities to the small depositor, whose interests are frequently neglected by the ordinary banking institutions, and to encourage thrift among the low income groups of the population. Still another consideration is the possibility of mobilizing such savings for purposes of public borrowing. The outstanding virtue of postal savings banks is that the safety of the deposits is secured not only by stringent reserve requirements but by the national credit of the country. They consequently appeal to the small saver, for whom safety of the principal is the foremost consideration. With the exception of Germany, postal savings banks exist in almost every country in the world. The relative amounts of postal savings deposits as compared with general banking deposits vary, however, both in time and in place; they form a larger proportion in countries where general banking policies are of doubtful soundness and frequently increase in times of business crises, when the public is likely to become apprehensive with regard to the solvency of the private financial institutions.

Postal savings banks were first established in Great Britain in 1861 and it is in that country that they have been most successful. The earliest proposals date from the beginning of the nineteenth century and at various times were

the subject of discussion in Parliament. The usual argument that they would encourage thrift among the comparatively poor was most commonly put forward, while the opposition came largely from the joint stock banks, which feared the competition of the new savings institutions. The ultimate adoption of the plan was largely brought about by the enthusiastic support of William E. Gladstone and Sir Rowland Hill. Originally limits were placed on the amount of a single deposit and of the total on deposit, but these have since been withdrawn. At first too there were several obstacles which made withdrawal of deposits a long and laborious task, but these have for the most part likewise been removed. In 1893 arrangements were made for the withdrawal of deposits by telegram. A depositor might telegraph for his money and have his warrant sent by return post or by telegraph. In 1905 a rule was introduced by which a depositor, on presentation of his pass book at any post office doing a savings bank business, could withdraw on demand not more than £1; the amount has since been increased to £3. This privilege obviates the expense of telegraphing for small amounts, and the large increase in withdrawals on demand and the corresponding decrease in telegraphic withdrawals indicate that it is greatly appreciated. Deposits bear a rate of interest of 2.5 percent. The very marked success of the postal savings banks in Great Britain is shown by the increase of deposits from £187,248,167 in 1913 to £283,658,417 in 1926 and £290,235,317 in 1930. Moreover the books of the postal savings banks showed that on December 31, 1930, government securities to the value of £188,472,183 stood to the credit of holders.

In the United States, postal savings banks, established only in 1911, are under the direction of a board of trustees, consisting of the postmaster general, the secretary of the Treasury and the attorney general. They have not proved as popular as in Great Britain for a number of reasons: first, the facilities granted to depositors are not so numerous; second, they are not so well advertised; third, there exist in the United States a large number of savings banks which pay a higher rate of interest on deposits; finally, Americans are more inclined to risk their earnings in speculative undertakings than are the British. The postal banks in the United States have, however, had a wide appeal among the immigrant population, who, untrained in banking habits and frequently the victims of unscrupulous banking practises, prefer the safety

afforded by a government institution. The sum of \$1 is sufficient to start an account and individual balances may not exceed \$2500. The rate of interest paid is 2 percent, but deposits in excess of \$20 may be converted into government bonds which pay interest at the rate of 2.5 percent. Postal savings deposits in the United States rose from \$152,143,349 in 1928 to \$347,416,870 in 1931 and to \$784,820,623 in 1932; the number of savings accounts increased from 500,000 in 1928 to 1,545,190 in 1932. The marked rise in 1932 reflects decreasing confidence in the ordinary banks and the obvious desire to place savings in institutions which have behind them the credit of the national government. The bulk of the funds is deposited by the postal authorities in designated banking institutions, which comply with certain specific collateral requirements.

In France the corresponding term for postal savings bank is *caisse nationale d'épargne* or *caisse d'épargne postale*. The establishment of postal savings banks was preceded by legislation in 1875 which authorized post offices to act as agents of the existing savings institutions. The attempt was none too successful and postal savings banks were organized in 1881. In 1913 the maximum deposit for one person was 1500 francs, but it has since been increased to 12,000 francs. In 1913 the total deposits amounted to 1,818,000,000 francs at the pre-war rate of exchange. In March, 1931, deposits amounted to 16,132,973,736 francs, but the franc was equal to only \$0.0392.

In Canada the postal savings banks have not progressed with the country and both the number of depositors and the sums deposited have shown a slow but steady decline. This is due partly to the prevailing confidence in commercial banks and partly to the fact that these institutions offer greater facilities to depositors than do the postal savings banks. The rate of interest paid by both is the same—2.5 percent—but the commercial banks, unlike the postal savings banks, permit a liberal use of checks drawn on savings deposits. In addition the withdrawal of a part or the whole of a deposit in the postal savings bank involves a far more complicated and lengthy procedure than the withdrawal of savings deposits from a commercial bank. In 1932 the balance due to depositors in the Canadian postal savings banks was \$23,919,677 as compared with \$24,750,227 in 1931. The new accounts opened during the fiscal year ending March 31, 1932, numbered 6361, while during

the same period 6657 accounts were closed. Deposits are of course likely to diminish during a period of depression, but it is true also that diminution was noticeable throughout the period preceding the depression.

POSTAL SERVICE. The postal service in all countries was inaugurated as a government undertaking, although at its inception it was not a government monopoly. The reason for its establishment was the necessity for the carriage of government communications, in order that outlying sections might be apprised of new laws and ordinances and also that the government might keep posted on what was taking place in distant parts of the country. At the same time the carriage of private communications was taken over by the governmental posts. This enabled governments to become acquainted with public opinion and to obtain information about the activities of suspected persons by opening and reading their letters, a practise, incidentally, still resorted to by existing governments to a much greater extent than is generally realized. The mails have often also been made instruments of formal censorship.

Besides the government posts those who could afford to do so utilized the personal messenger, who traveled the whole journey and delivered the letter or letters to the addressee. In addition to the fact that such service was limited to the wealthy classes, it lacked the speed of the regular posts, which relieved each other in their arduous work. The relay system under government protection was both cheaper and swifter, although lacking in privacy.

The history of the postal service goes as far back as the ancient eastern empires. In China under the Chou dynasty (1122-255 B.C.) a system of mounted and foot couriers was established for the carriage of state ordinances and edicts. In Upper Egypt there have been found

state letters in the form of clay tablets dated about 1400 B.C., while Darius about 500 B.C. had an elaborate system of messenger posts in Persia. The special dependence of these early empires on the acquisition of knowledge of what was going on in different parts of their widespread territories necessitated some kind of postal communication.

Under the Roman Empire the postal service was brought to a high stage of development. Known as the *cursus publicus*, it was established throughout all parts of the empire. Although, as usual, the primary objects of these posts were governmental, they were soon employed for the carriage of both private communications and passengers on public business. With the excellent roads, built primarily for military purposes but also admirably adapted for the carriage of posts and the system of relays, a rate of speed was maintained which was not surpassed until the nineteenth century. Moreover the security afforded was much greater, for the power of the Roman Empire was used to free the roads of those gentry of easy morals who later infested the countryside of mediaeval and modern Europe.

In the Middle Ages there were postal systems of sorts in most European countries. These were concerned almost exclusively with the conveyance of government messages, and the range of their activities was very restricted. Indeed this restriction was so pronounced that private agencies found it necessary to undertake postal services as late as the sixteenth and seventeenth centuries, and even later as far as the foreign posts were concerned. In the Middle Ages in France a postal system was established by the University of Paris, and private individuals were allowed to make use of its system of messengers. At the close of the thirteenth century these messengers were freed from tolls and a very marked development resulted. Not only private letters but persons were carried, although the whole scheme was unauthorized by law. A royal, or government, system of posts was established in France in the fifteenth century in the reign of Louis XI, who is considered the founder of the French post office. The edict establishing the royal post set severe penalties for the carriage of private messages, but later the carriage of private letters and individuals was taken over. The edict of 1681 granted a monopoly to the royal posts with regard to the carrying of letters.

In Germany at an early period there were established state, monastic, scholastic and private

posts. Many towns and guilds had their own services. Maximilian instituted an imperial system for state purposes. These soon took over the custody of private letters and later the conveyance of travelers. Maximilian's first postmaster general was Johann von Taxis; the house of Thurn and Taxis maintained a close connection with European postal affairs until well into the nineteenth century. The members of this famous house not only held the German imperial postal monopoly as hereditary postmasters general but were employed by various other countries to supervise their domestic postal affairs. Their systems reached into the Netherlands, Spain and Italy.

The history of the British post office dates from the beginning of the sixteenth century, although long before this, as on the continent, a system of communication had been inaugurated both for the special use of the government and for the conveyance of official letters and documents. These continued to be the principal functions of the royal posts until well into the seventeenth century. The royal posts were at first messengers who traveled the whole of the journey and delivered the letters directly to the people to whom they were directed. A different style and a precursor of a more modern method was established by Edward IV. During the war with Scotland he found himself in need of a better and speedier system of communication between the seat of government and the battlefield. In pursuance of his plan he placed post horses along the great road between England and Scotland, so that his messengers supplied themselves with fresh horses along the way and the dispatches were carried at a speed of a hundred miles a day.

The English government seems to have been interested only or primarily in the conveyance of domestic dispatches. As far as the foreign post was concerned, there were during the sixteenth century three ways of sending letters between Great Britain and the continent aside from such opportunities as were afforded by occasional travelers and messengers: the government post, the foreigners' post and the merchants adventurers' post. The foreigners' post was managed by a postmaster general, nominated by the Italian, Spanish and Dutch merchants residing in England and confirmed by the council. These posts were used extensively by English merchants, which seems to show that they were efficient in the performance of their duties or at least that they supplied a service that was ren-

dered inadequately if at all by the state system.

The seventeenth century witnessed the imposition of very high postage rates in most countries, the postal establishments having come to be regarded as sources of governmental revenue. Indeed they were openly used as means of taxation. The rates varied to some extent with the weight of the letter or parcel carried, but still more with the distance. These high rates led to much evasion, which was facilitated by the rule that the postage might be paid by the recipient of the letter or parcel as well as by the sender. Since the receiver of an unpaid parcel was at liberty to refuse payment while benefiting at the same time from the information that a letter or parcel had been proffered to him, there was collusion with the sender to establish a free code of communication. Nevertheless, despite this evasion and the curtailment of the use of the posts resulting from the prevalence of the high rates, there was undoubtedly a larger net revenue than has been generally realized.

Although the high rates continued during the eighteenth and part of the nineteenth century, a cheap post was established in the city of London as early as 1680. Before this date there was no post between one part of the city and another. A Londoner having a letter for delivery in London had to send it by a special messenger. Such was the state of affairs in the largest city of the world until William Dockwra organized his famous penny post. He employed a controller, an accountant, a receiver, thirteen clerks in the six offices and about a hundred messengers to collect and deliver letters. There were numerous places in London where letters and parcels might be posted. Shops and coffee-houses were used in addition to the regular offices, and in almost every street some door or shop window would bear the sign, "Penny Post Letters and Parcels are taken in here." There were four deliveries a day to most parts of the city and six or eight to the business centers. The postage fee for all letters or parcels was one penny, payable in advance. The rate was the same for all letters or parcels up to one pound in weight. Thus London in the seventeenth century had, as far as city letters were concerned, a postal system superior in many respects to that of today.

Nevertheless, the importance of Dockwra's accomplishment should not be exaggerated. It remained for others to point out that a cheap method of communication throughout a whole

country as well as between different countries is more important than such service in a single city, and that the distance a letter is carried plays but a small part in the total cost. In other words, the cost of collection, sorting and delivery is much greater than the cost of carriage between the places of origin and delivery. This was stressed in a famous pamphlet published in 1837 by Sir Rowland Hill, who inferred that if the charge for postage were to be made proportionate to the whole expense incurred in the receipt, transit and delivery of the letter and in the collection of its postage, it must be made uniformly the same for every post town to every other post town in the United Kingdom, unless it could be shown how so small a sum as one thirty-sixth of a penny could be collected. And, inasmuch as it would take a ninefold weight to make the expense of transit amount to one farthing, he held that, taxation apart, the charge ought to be precisely the same for every package of moderate weight.

The demand for a system of rates, irrespective of distance, was strongly supported by the public, especially by business people, and as vigorously opposed by postal officials. The latter were ignored by Parliament, which in 1839 passed an act empowering the Treasury to establish uniform penny postage throughout the United Kingdom; in the following year the act went into effect. Among its provisions was the prohibition of parliamentary franking and the stipulation that if postage were not prepaid, double rates should be collected from the recipient. Postage stamps were then introduced for the first time, and the idea was quickly adopted in many other countries. A postal money order system had been legalized the previous year. Postal savings banks were first introduced in England in 1861, and in 1864 postal life insurance and annuities were established. Other arrangements, however, were not adopted until considerably later. The principle of compensation for registered letters was not accepted in England until 1878; and a parcel post was not made available until 1883, some years after an international one had been established. The parcel post was for a long time left to private initiative, but it is now almost universally a postal enterprise.

Despite the imperial monopoly of the house of Thurn and Taxis regional postal systems had developed in Germany for various political reasons. The result was a rather chaotic state of affairs. The most important of the German

postal systems was naturally the Prussian, which had been founded by Frederick William, the Great Elector. The present postal system of the German Reich is largely the result of the development of the Prussian establishment under the direction of Heinrich von Stephan, the renowned postal reformer, whose name is also closely associated with the organization of the Universal Postal Union. Under Stephan the German postal system was not only unified but made into a truly popular institution. The Taxis monopoly was legally abrogated in 1867 on the eve of the formation of the North German Confederation, of which Stephan became the postmaster general. He was appointed to this post likewise in the new empire with its larger territory, although Bavaria and Württemberg still retained independent post offices, which were not abolished until after the founding of the republic. One of the innovations introduced by Stephan was the post card, which was, however, first adopted in Austria rather than in Germany as a result of his suggestion at a postal conference in 1865. Stephan also did much to develop the parcel post and rural delivery, which was begun in Prussia as early as 1824.

In France the postal powers of the University of Paris were considerably curtailed early in the eighteenth century but were not wholly abolished until the revolution. In 1758 a penny post was established in Paris by Piarron de Chamousset in imitation of Dockwra's London penny post. At that time the government posts were producing a large and steadily increasing revenue. Although they were called government, or royal, posts, they were in reality managed by private entrepreneurs, who paid to the government a sum determined by agreement for the privilege so granted. This practise, quite common in European countries at one time or another, was followed more consistently in France than elsewhere and was not abolished there until 1788. The policy of "farming" the posts had the advantage of producing a considerable and positive revenue for the government; but this advantage was in many cases counterbalanced by the collection of rates higher than those which the "farmers" were legally entitled to impose.

Until 1774 the posts in the American colonies had been under the control of the British government, although such control was more nominal than real. Benjamin Franklin was the last postmaster general to be appointed by Great Britain, but his appointment was canceled when

the colonies declared their independence. He was immediately reappointed by Congress and when sent as ambassador to France, his son-in-law Richard Bache was granted the post.

Postage rates in the United States before 1863 varied with the distance the mails were carried. If the cost of carriage is to be considered in fixing rates, something is to be said in favor of such a policy where the distances are considerable and the country is thinly settled. In such cases the strongest argument that can be advanced for uniform and low rates is the desirability of furnishing a cheap system of communication for social and economic reasons. In 1863 a uniform rate was fixed at three cents and in 1883 this was reduced to two cents, where it remained until the period of the World War. The rate was again made three cents in 1932 but reduced the following year to two cents for the carriage of local mail. The franking privilege, which was very much abused, was temporarily abolished in 1873 but was restored later subject to certain modifications which have made it less objectionable than before 1873.

The extension of the free delivery system in the United States has been very marked. Inaugurated in 1862 on a paying basis, it was made free in the following year for most of the larger cities. Year by year the number of cities and towns to which this service applies has been increased, and in 1896 a beginning was made in the extension of this privilege to the rural population. In 1885 a policy was adopted for special delivery in cities and certain towns of letters on which an extra fee had been paid. The registration of letters was introduced in 1855. A money order system was first established in 1864. A new postal agreement with Canada was adopted in 1888, which removed many of the restrictions hitherto imposed upon the transfer of merchandise by post between the two countries. As postal rates and practises in the United States and Canada are for the most part the same, this and later agreements have made them virtually one postal area. In 1910 Congress authorized the establishment of postal savings banks.

The modern postal systems, it must be apparent, have progressed far beyond the mere collection, carriage and delivery of the mails. The discharge of these traditional functions has been immensely facilitated by the successive appearance of railroad, motor and aerial transport. But the postal departments of most countries have also come into direct competition

with the commercial and banking interests by the organization of the parcel post, the issue of money orders and the establishment of savings banks. This competition with important and influential corporations explains to a certain extent the comparative failure of many governments to advertise or extend their activities along these lines, and the same statement holds true in those few cases where governmental insurance and annuities are available. On the other hand, in some continental countries the postal departments have at least provided competition with commercial interests by extending facilities which are not available in England or the United States. Thus in some continental countries there may be obtained postal letters of credit and postal checks, and the post office will even collect money and protest commercial paper. In Germany and Switzerland, for example, the carriage of passengers still survives, although it is no longer a government monopoly.

With the exception of the United States, most of the industrialized countries of the world have also established the telegraph and telephone as monopolies of the postal establishment. There are two important arguments in favor of such an arrangement. The first is that postal departments can provide such services more economically by making use of existing post office buildings and the postal staff. The second is that it is not only fair but necessary that the government should own and operate methods of communication which compete directly and indirectly with the postal service proper. There is more to be said for the first argument than for the second. In so far as the latter has any force it is applicable also to the other non-postal interests of governments. Moreover anyone who is familiar with the government telegraphs and telephones of Great Britain and continental Europe must be aware that the services rendered by them are inferior to similar services of private corporations in the United States and Canada. It is only fair to add that in the case of Great Britain the excessive price paid for the purchase of private and corporation telegraphs and telephones has been a great handicap to the government in its endeavor to make them a financial success.

In the United States various proposals have been advanced in favor of a restricted plan of government ownership of telegraphs. In 1888 the postmaster general in his annual report advocated the appointment of a commission

with power to construct short experimental lines. His successor, John Wanamaker, was a consistent and vigorous advocate of a limited postal telegraph service. He was in favor of the collection and delivery of messages by the postal department for a small fee, while existing corporations were to furnish instruments, lines and operators. Rates were to be fixed by the government. In Canada more than half the telegraph mileage is owned and operated by the Canadian National Railways Company, while in the prairie provinces there is government ownership of both telegraphs and telephones.

The first step toward the formation of the Universal Postal Union was taken at Paris in 1863, when delegates from most of the important countries of the world met under the presidency of the French postmaster general. The agreements reached were not very important, but they formed a basis for the famous treaty of Berne in 1874 and for the still more adequate provisions adopted at Paris four years later. At Berne delegates of twenty-two states, representing 350,000,000 people, were present; the leading figures were Stephan, representing Germany, and Vincent, representing Belgium. The treaty of Berne provided for a half ounce unit of weight for ordinary letters, a uniform rate of five cents per half ounce for letters from any one country within the union to any other, uniform rates for newspapers and the like, a much lower transit rate and a regulation that each post office should retain its own collections and that payments due for transit should be estimated from accounts taken only twice in each year. At the same time an international board was established, to be supported by countries bound by the treaty. The convention which met at Paris agreed to further facilities in postal communications not only between the countries which were members but also with those not represented. Provision was made at this meeting for a periodic revision of the existing rules and regulations, and postal conventions have since met every five or six years. The Universal Postal Union has tended to make the whole world one postal territory.

POST-GLÖSSATORS. See GLOSSATORS.

POTASH, or crude potassium carbonate, is one of the basic plant foods, nine tenths of the commercial output of which is consumed as fertilizer in agriculture. It is likewise an important constituent in metallurgy and in the manufacture of glass, soap, chemicals, drugs, aniline dyes, gunpowder, matches, photographic film and a host of other products.

Potash—the name is a combination of "pot" and "ash"—was originally obtained by leaching wood ashes and evaporating the solution to dryness in pots. The process was employed by the Greeks and Romans. Until recent years the potash compounds used in the arts were obtained in the form of crude potash by this simple method; and for some time after the use of fertilizer had become a common farm practise, wood ashes constituted an important source of supply of potash for fertilizing purposes.

The modern potash industry is based largely upon the mining and refining of potassium salts, made possible by the development of a chemical process in Germany in 1860. Commercial deposits occur most commonly as sylvinite, as hartsalz or as carnallite. The deposits lie at depths of from a few hundred to several thousand feet; the production of crude salts is a mining process similar in its basic characteristics to the mining of coal or salt. The crude salts are relatively low in potassium content and as a rule refining is necessary before they can be utilized. The fundamentals of the refining process are simple, resting upon the basic fact that

potassium chloride is more soluble in hot water than in cold and hence will separate through crystallization by the cooling of a solution which has been saturated at a higher temperature. In order to avoid unnecessary transportation charges refineries are customarily located adjacent to the mines, and the potassium salts are transported in concentrated form.

Before the World War the commercial production of potash was virtually a German monopoly. The German industry dates from 1861, when a factory was erected near Stassfurt for the production of potassium chloride from crude potassium salts accidentally discovered in shafts sunk by the Prussian state in 1857 in its search for more abundant supplies of common salt. In 1861 the duchy of Anhalt also completed a shaft for the mining of potash. Until 1875 these two German states had a mining monopoly, although refining was in private hands. Following the liberalization of mining laws in various German states from 1865 to 1870 in an effort to attract private capital into the mining industry, two privately owned potash mines were opened in 1875 and 1877. With the breakdown of the fiscus potash monopoly a period of vigorous price competition ensued. This led in 1879 to the formation under the leadership of Prussia of the first fiscus potash cartel. Between the organization of this loose syndicate and the enactment of the potash law of 1910, which brought the industry under government regulation and gave stability to the syndicate, the history of the German industry is largely a story of the organization, dissolution and reorganization of the syndicate arrangement under the leadership of the Prussian fisc, directed immediately toward control of production and regulation of price. Although the details of the organization changed from time to time, in its mature form the syndicate represented a central sales agency for the industry, among the members of which total production was allocated in conformity with production quotas. Meanwhile German exports of potash had risen from about 100,000 tons in 1900 to over 450,000 in 1913.

The guaranty by the syndicate of the sale of potash in a closed market and the insurance to individual companies of a share in that market served as a powerful stimulus to the inflow of capital. Improvements in the technique of potash discovery and production, and expansion in the geographic area over which potash was found, contributed toward the same end. The result was a boom in potash mining of specula-

tive proportions shortly after the close of the nineteenth century. In 1900 the number of quota bearing shafts was 15; within five years it rose to 35 and in ten years to 73. Although the world demand for potash showed a significant increase, it did not keep pace with productive capacity; the average output per quota bearing shaft declined from 202,469 metric tons in 1900 to 139,388 metric tons in 1905. By 1910 average production per shaft had shown a further significant drop.

Under the pressure of increasing overhead costs and decreasing output per shaft it became constantly more difficult to maintain the cartel intact. In 1909 when it became apparent that the syndicate agreement would not be renewed, contracts were entered into between important members and leading American purchasers covering approximately four fifths of the annual American imports at prices from 18 to 49 percent below prevailing syndicate prices. With the existence of the potash monopoly thus threatened, the state intervened through the enactment of the potash law of 1910. The law fixed the price at which potash could be sold thereafter and provided for the allocation of production for foreign or domestic markets among the various producers in accordance with the allotment quota. Excess production was punishable by a prohibitive tax. The result was a compromise settlement with the American firms which had purchased potash at non-syndicate prices and the reestablishment of the syndicate's monopoly policy.

Although designed merely to stabilize the potash industry, the law of 1910 contributed to a further expansion of capacity. In the four years immediately following the enactment of the measure the number of shafts for the mining of potash increased almost threefold, reaching a total of 194. Average production of crude potash salts per shaft declined to 42,121 metric tons as compared with an average output of 202,469 metric tons in 1900. Just before the World War the syndicate was selling 45 percent of its output in foreign markets. By 1913 its exports of pure potash to North America, mainly the United States, the most important foreign customer, had reached a total of 233,066 metric tons; the totals for some of the other countries were: Holland 43,673 tons, France 42,436 tons, the Scandinavian countries 34,134 tons, England 17,479 tons and Italy 7320 tons.

At the close of the war, when the seventeen Alsatian mines and the youngest, richest and

potentially the most valuable of its potash deposits were lost by Germany, its world monopoly in soluble potash salts was ended. Moreover the German industry was in a demoralized condition: it was crippled by overcapacity and obsolescent equipment, and its foreign markets were gone. The cartel system seems to have been directly responsible for many of its ills, which are typical of monopoly under modern conditions. Through allocation of production and control over prices the cartel encouraged the development of excess capacity and retained high cost producers in the industry. Restrictions placed on individual plant output necessitated small scale production and retarded technological progress. Production was frequently from potash deposits of an uneconomic character, when judged by their geological stratification or their chemical composition. In order to meet vigorous competition from the new French industry, drawing upon the Alsatian deposits, a comprehensive program of rationalization was undertaken. Inefficient mines and refineries were closed down and their production quotas taken over by the more efficient plants. As their scale of operations expanded, these mines were modernized and mechanized. The number of operating shafts was reduced from 152 in 1913 to 60 in 1928, and the average output of crude potassium salts per shaft increased from 78,661 metric tons to 208,133 metric tons. Machines displaced man power, and the output per man per shift rose from 1.56 metric tons to 3.08 metric tons. Similar developments took place in the refining branch of the industry. The number of operating refineries was reduced from 75 in 1921 to 31 in 1928 with an increase in average yearly output per factory from 9600 metric tons of K_2O to 43,000 metric tons and a rise in output per man per shift from .37 metric tons in 1924 to .86 metric tons in 1928.

The rationalization program was made possible and was accompanied by a concentration in control of the industry. This process had been begun before the war but was now greatly accelerated under the influence of the socialization program of 1919 and the inflation of the currency before 1923. In 1914 the potash mines were under the control of 33 concerns representing combinations of 2 or more companies, and of 11 independent concerns; no one concern controlled as much as 10 percent of the total output. By 1928 the concentration of control had proceeded to the point where 3 major combines controlled more than 80 percent of the entire

sales of German potash and practically dominated the syndicate's policies.

As the German potash industry was reorganized and rationalized, it was subjected to more rigorous governmental regulation under a socialist regime in an endeavor to insure its functioning on behalf of the public welfare. Under the potash law of 1919 the Reichskalirat (State Potash Council) was established as the industry's governing body, composed of 30 representatives of the producers, distributors and consumers of potash and representatives of the laborers and technicians in the industry. Although apparently designed as a sort of economic parliament for determining the broad policies of the industry and for regulating prices and labor conditions, in practise the primary task of the Reichskalirat has been the regulation of price, a function performed directly by the syndicate in the early history of the industry and by the Bundesrat under the potash law of 1910. The law of 1919, ostensibly a socialization measure, in effect resulted in no marked departure from previous control.

The World War deprived the German potash industry of its foreign markets. American imports, which in 1913 totaled 272,400 short tons of K_2O , declined sharply. As the war continued, the decline became progressive, and by 1918 importations had practically ceased. The price of potash rose more than elevenfold. These circumstances stimulated the growth of an American potash industry, which resorted to a variety of practises in its search for commercial potash. Giant seaweed on the Pacific coast, lake brine in California and Nebraska, cement mill and blast furnace dust, were all made to yield potash in commercial quantities. By the end of the war the American industry produced approximately 207,600 short tons of crude potash with a potash content of 54,800 tons. But the industry succumbed for the most part to the vigorous post-war competition of the more mature and more richly endowed foreign industry. Of the 128 plants producing potash in the United States in 1918 all but 7 had suspended operation by 1926 and output had decreased to less than one half the output of 1918. The American Potash and Chemical Corporation, representing a striking exception to the general development, produces potassium chloride as a major product and borax as a by-product from the salt brines of Searles Lake, California. With a plant capacity of 250 tons of potassium chloride and 125 tons of borax per day, this concern has accounted for most

of the output in the United States in the post-war period.

The rapid decline in American output served to intensify the search for natural deposits of potassium salts which had been initiated prior to 1914. Pioneer exploratory work conducted by the Texas Bureau of Economic Geology under the leadership of J. A. Udden and by the United States Geological Survey had by 1926 delimited an area in the Permian salt basin of west Texas and eastern New Mexico, in which potash in commercial quantities might be found in numerous scattered places. Private exploration resulted in the discovery of deposits of sylvinite rich in potassium chloride, which have since been exploited. Meanwhile public and private research has been directed toward the perfection of a process for the refining of potassium sulphate from polyhalite, of which numerous deposits have been discovered. While no venture in this field has yet been carried to commercial success, it is possible that potassium sulphate derived from polyhalite, despite the more complex and expensive refining process as compared with the production of chloride salts from sylvinite, may yet find a place in the American market. Exploration has revealed additional deposits of sylvinite, which are now being developed. Ultimate American independence of foreign sources seems likely. For the past several years the peak of war production has been exceeded, and a new high point was reached in 1931.

Although the loss of Alsace at the close of the war broke the German potash monopoly, it did not result in the establishment of a permanently free market for potash. The French industry, under the control of a single private producer, Kali Sainte-Thérèse, and the government owned mines, Les Mines Dominales de Potasse d'Alsace, are organized in syndicate form. While the French industry increased its output sharply in the years immediately following the war and offered vigorous competition to the German product in the world market, competition eventually forced an agreement. In August, 1924, the two great producers agreed to a division of the American market, approximately two thirds being allotted to the German industry and one third to the French. A more comprehensive agreement between the German potash syndicate and the French syndicate was entered into in 1925 and renewed in 1926 for a provisional period of ten years. Under its terms sales in the world market were to be shared jointly, 70 per cent to be supplied by the German industry and

the remaining 30 by the French industry, until total sales exceeded 840,000 metric tons of K_2O . Sales in excess of this amount were to be shared equally. In case sales should not total 840,000 tons by the fifth year of the contract, beginning with the sixth year sales in excess of the highest figure reached during the first five years were to be divided equally between the two contracting parties. The contract reserved sales within French territory to the French industry and within German territory to the German industry. A uniform price policy was provided for and a joint sales and propaganda organization was established. This arrangement eliminated competition effectively.

While they still dominate the world markets, in recent years the French and German industries have been losing ground to the potash industries of the United States, Poland and Spain. The United States, the world's second largest consumer of potash, still secures the major portion of its supply from abroad. Imports have declined sharply in recent years, however, and domestic output has shown an increase. The output of the Spanish industry in 1930 was 54,811 tons, more than double that of 1929; serious inroads have been made into the Franco-German market in the Netherlands. Polish output has held up relatively well. Polish competition was harnessed in the spring of 1932, when a five-year commercial agreement was concluded between the German potash syndicate and the Polish society for the exploitation of potassium salts, under the terms of which Polish production was allotted a 4 percent quota in the world market and brought under control of the German syndicate.

PRODUCTION OF POTASH, LEADING WORLD PRODUCERS,
1928-31
(In metric tons of K_2O)

	1928	1929	1930	1931
Germany	1,691,128	1,787,775	1,608,514	1,077,642
France	406,640	492,097	506,370	368,870
Poland	55,611	63,735	55,230	52,741
United States	54,349	55,873	55,583	57,951
Spain	24,323	24,395	28,644	28,116

The world's developed deposits contain a visible supply of potash adequate to meet the world's demand for hundreds of years. Available world capacity is far in excess of consumption. Although consumption may be expected to increase with declining soil fertility, it is overpro-

duction and not shortage of potash which constitutes an ever more serious threat to the industry. Particularly in the United States, in view of the broad area of the Permian salt basin (approximately 70,000 square miles), in which potash may be found in commercial quantities, and in view of the prevailing legal and economic system, there is danger of long run gross overdevelopment in the absence of an intelligent program of social control. This condition exists in many other industries producing raw materials and finished products. What is needed both at home and abroad is not merely control over output, but control over capacity to produce with some guaranty that the resulting economies may be passed on to the consuming public.

POTHIER, ROBERT-JOSEPH (1699-1772), French jurist. Pothier was born at Orléans, where he served as magistrate and as professor of French law at the university. His lonely existence as a modest provincial was given over entirely to the law. He published a study on the Pandects, *Pandectae justinianae in novum ordinem Digestae* (3 vols., Paris 1749-52), in which he strove to arrange Justinian's compilation in logical order; but his other works are all devoted to the French civil law, which he surveyed in a series of separate treatises, that on obligations

being particularly notable. It was from Pothier's works that the provisions of the *Code civil* of 1804 were in large part drawn.

Most of the jurists who preceded Pothier had confined themselves to the study of the local legislations which divided France under the old regime. Imbued with the spirit of the eighteenth century, Pothier sought to give encyclopaedic treatment to the whole of French private law. While the commentators on the local customs had generally emphasized the originality of the institutions described by them and had concentrated upon the peculiarities of a particular local law, Pothier, bringing to the study of the whole of French legislation the methods of exposition which he had learned from the Roman jurists in the course of his work on the Pandects, dwelt upon the central ideas and the elements of cohesion common to all customs, with the result that the customary law took on a more homogeneous aspect. This method, based on reason, not only introduced a principle of unity among the customs but likewise related the customary law of the north with the Roman law which still prevailed in the south, so that these two systems of law thenceforth seemed less dissimilar. Pothier's work thus prepared the reconciliation which was to be accomplished in the *Code civil*. Indeed his texts were often literally incorporated in the *Code*.

Moreover in imitation of the Roman jurists Pothier had set himself the task of separating juridical science from political conditions. Having allowed no place in his work for public law, he could not be suspected of partiality toward any specific political regime. His influence was destined to grow when the time came to find a model for the drafting of the *Code civil*, which required adjustment of the juridical conceptions of the old regime to those of the revolution without a revival of political passions.

As one of the fathers of the *Code civil* Pothier enjoyed great prestige in France until the opening of the nineteenth century. But as the Napoleonic code recedes into the past, as the law becomes renewed and as social and economic conditions change, his authority tends to be effaced. Pothier remains nevertheless a name venerated by French jurists, for it was he who showed how a private work might serve as a legislative model.

POTTER, GEORGE (1832-93), English labor leader. Potter, a London carpenter, became prominent as leader in the builders' nine-hour movement in the years 1858 to 1861. This struggle, which came to involve the very existence of trade unionism, deepened the sense of unity among all trades and in London led to the formation of the Trades Council. Striving to place the trade union movement upon a national basis, Potter cooperated with provincial leaders and thus contributed to the formation of the Trades Union Congress, the immediate precursor of which was a national conference he assembled in 1867. In 1861 Potter founded the *Bee Hive*, which became an able trade union organ under his editorship. About 1864 a feud developed between Potter and the leaders of the amalgamated unions who formed the Junta of the Trades Council, Potter emphasizing militancy and solidarity, they moderation and particularism. It is true that Potter had no reasoned class conscious philosophy, yet certain implications of such a philosophy appear not only in his conflict with the Junta but in his speeches and writings from 1858 to 1870. When danger threatened trade unionism in 1867 the Junta stressed pacific policies and legislative protection for insurance funds. Potter regarded such a program as inadequate for unions which held strikes to be of primary importance. The unsatisfactory legislation of 1871, which taking the Junta leadership at its word penalized picketing and obstruction, led to a realization of the necessity of wider cooperation among all trades. Hence the congress of 1871, of which Potter was chairman, took over the conduct of the struggle and the Junta dissolved. Thereafter they and Potter cooperated.

During the agitation for the franchise Potter organized the London Working Men's Association, which in 1869 participated in the formation of the Labour Representation League. A Liberal in politics, he endeavored several times to enter Parliament. He was the second working man elected to the London School Board.

POTTERY

PRIMITIVE. Pottery has little utility to nomadic peoples because of its fragile nature; its successful use demands the relative stability of habitat which is made possible through knowledge of the cultivation of plants. The geographic distribution of pottery among primitive peoples corresponds roughly to that of agriculture; both in the Old World and in the Americas they appear to have developed almost synchronously and as a rule to have traveled together. The sporadic appearance of pottery in late palaeolithic deposits in western Europe prior to its full development in megalithic agricultural settlements can probably best be accounted for as the work of a vanguard of neolithic peoples coming from the east who had previously practised the craft, although it may in certain instances have been the result of diffusion without migration. In North America there are instances of the use of pottery by a few tribes beyond the margin of the agricultural area, but these exceptions are found among nomadic Indians who made some use of pottery objects manufactured by their sedentary neighbors and among tribes in regions where agriculture was probably once practised. A crude ceramic art is, however, to be found among the tribes of the Yukon River in Alaska and of the Arctic coast; this development may be ascribed to influences from northeastern Asia. In South America the marginal peoples of Tierra del Fuego and of eastern Brazil possess no pottery and among south African, Australian and Polynesian natives it is also unknown. It was more extensively used by Melanesians formerly than at present.

Primitive pottery is made by four different methods, which may also be used in combination: by direct shaping through scooping out and forming a lump of clay, by the coiling method of building up rolled strips of clay, by molding in forms already made and by turning. The theory of the accidental origin of pottery manufacture through the inadvertent burning of clay plastered baskets is untenable since it ignores the many factors indispensable for the successful firing of a pot. Baskets have, however, been widely used as accessories in the shaping of clay vessels; bowls molded in baskets have been

found to be among the earliest types of pottery in the southwest of the United States. The prior use as vessels of baskets, gourds and shells also led to the use of these as models for the shaping and decoration of pottery modeled without the aid of basket molds. Coiled pottery built up spirally is readily adapted to patterns comparable to those of coiled basketry. The shape and ornament of the bell beaker, a widely distributed form of pottery in the megalithic period in western Europe, are often declared to have been derived from basketry prototypes; one authority suggests that both the bell beakers and the similar earliest known Egyptian pottery are imitations of grass basketry forms used in Africa. In Iberian Spain, however, a whole series of gradations can be observed in the development and maturation of the bell beaker from the low waisted bowl independently of basketry prototypes.

The fact that pottery is fashioned in the Americas without the aid of the potter's wheel, which is characteristic of the Old World, and the evidence of geographical distribution support the hypothesis of independent centers of development on the two continents. It remains for future archaeological research to determine the time and place of origin of Old World pottery; the consensus of authoritative judgment places it in southwestern Asia not later than 6000 to 5000 B.C. The art of pottery making in America is thought to have diffused from Central America, which was the culture center whence spread such advanced elements of native American culture as corn growing, cotton cultivation and stone masonry. An almost unbroken development from the earliest and crudest forms through intermediate stages to the perfected styles of later times, independent of Mexican influence, can be traced in the case of the pottery of the southwest of the United States; as pottery does not appear in this area, however, until some time after the introduction of corn, which proves contact with Mexico, the basic knowledge that vessels could be made from clay may also have been derived from this source although its subsequent development was local. Important advances in the technique of working the clay and in the surface treatment of pottery were made independently in the east Andean region of South America.

Wherever pottery has been manufactured, practically imperishable potsherds are found in abundance; rubbish heaps and artificial fills have made possible stratigraphic excavation which

often affords chronologically serialable specimens. The rise and spread of predynastic cultures in Egypt and the time sequences of other ancient cultures are traceable largely by studies of ceramic types and of their stratigraphic relation to one another; likewise pottery has proved to be the most serviceable single criterion in ranking the ruins of the American southwest in correct chronological order. Because of the distinctiveness which wares possess, knowledge of the fashions of area, region and site enables archaeologists to designate the source of potsherds and to reconstruct the cultural connections between regions. Forms of pottery, for example, the bell beakers and decorative techniques such as the "comb" ornament, have been of great value to students of prehistoric European cultures in their attempts to determine the interrelations between different areas. The migrations of living primitive peoples can sometimes be traced through their pottery, as in the case of the Navaho, who in their movement southward through the Pueblo region retained the style of pottery they had learned to make in the plains. The processes of selection and combination of clays, of ornamentation—whether by imprint, by incising, by carving or applied relief, by white or colored slips, by varnishes or paints—and of firing to the requisite degree of hardness, all involve complex technical knowledge and skill; for this reason pottery affords one of the most reliable indexes of the technical resources of a people. Involving as it does individual craftsmanship and permitting virtuosity in its manufacture, primitive pottery also affords an excellent medium for the study of the processes of primitive art and of the psychology of the artist. The character of pots and burial urns and their decoration often throw light on the customs of primitive communities.

Pottery is generally but not invariably made by women in the Americas and in Negro Africa and India wherever pots are fashioned by hand. Where pots are turned on the wheel, men are the potters. Stylistic specialization and differentiation of pottery are sometimes emphasized by social organization, as in the case of the guilds which governed Aztec manufacture and trade. The manufacture of a distinctive type of pottery is in many instances a village, family or individual tradition; pottery making then becomes a profession conveying prestige rather than merely a household art.

BERNARD J. STERN

HISTORICAL. The developments in pottery since prehistoric times have generally been dependent upon larger social and economic changes, which extend the uses of pottery in the domestic life of the upper classes, condition its manufacture as an exportable commodity, stimulate technical experimentation in the search for cheaper methods of production, superior materials and novel aesthetic qualities and beget new contents of decoration.

A hundred distinct types of pots and dishes have been developed since the sixteenth century. Ceramics have been used also in bric-a-brac, toys and decorative sculpture and applied to architecture in bricks, tiles, conduits, acoustic devices, ovens and sanitary fixtures. Variety of type is determined not only by the elaboration of practical needs, with the growth of material culture, but also by aesthetic interests, as is indicated by the fact that most of the new pottery forms developed since prehistoric times are show pottery; ordinary kitchen crockery exhibits a relative stability of type or a modest dependence on the show types. Pottery becomes an important aesthetic object in those cultures and classes which practise elaborate formal ceremonials in secular hospitality and in religious rites. When taste changed in the later eighteenth century from rococo to neoclassic art, there was a corresponding change in pottery.

The varied aesthetic changes in pottery form and decoration have been determined by technical and material developments in so far as each new material or technique affects the shape, color and texture of pottery. Since many of the new materials and techniques were investigated in order to produce desired aesthetic effects, the relation of technique and style is not a one-sided influence, but an interaction in which aesthetic problems modify technique and technical discoveries suggest new aesthetic types. The development of aesthetic types has been affected also by purely commercial interests, for the competition with a successful type of pottery encouraged either the local imitation of that pottery, with the consequent abandonment of a previous local style, or the search for a new type, if only of a glaze or a color, to compete with the rival fashion. In countries like Holland and Portugal, which in the seventeenth century profited commercially from the carrying trade in far eastern goods, little effort was made to reproduce the Chinese wares, especially in Holland, where there was also a native faience industry which would probably have

been ruined by a local porcelain establishment.

The success of English pottery in the later eighteenth century was due not merely to the change in taste from the rococo to the neoclassic but to a superior mechanical mode of manufacture, to the cheapness of the articles and a greater durability. But these material advantages are ultimately inseparable from the taste for the neoclassic, since the latter arose in opposition to the unproductive sensuality of the court and extolled the bourgeois virtues of simplicity, orderliness and economy. The rise of Wedgwood as a manufacturer and the growing popularity of his particular ornament were thus not unrelated phenomena.

Within the limits of the pervading style of a time or place pottery exhibits unique and independent aesthetic qualities, which may in turn influence other arts of the period. The blueness of delftware, which was copied from the blue of Chinese porcelain, is a quality restricted to Dutch ceramics, but the shapes of the pottery and the ornament itself accord with the general principles of Dutch art at this time. From the technique of ceramics may arise peculiar formal devices, like the cloisons or cells in old oriental tiles, which are transferred in turn to textile ornament. On the other hand, pottery forms may be subordinated to another contemporary art of quite different material and function, as in the case of the eighteenth century wares which become pictorial surfaces or imitate the effects of stone sculpture.

There are few details of modern pottery manufacture, whether aesthetic or technical, which do not presuppose the inventions and fantasy of the past and of non-European countries. The ancient Orient already knew the wheel and practised glazing of a high order. Besides the alkaline glaze of the Egyptians, which had a limited application elsewhere, the tin and lead glazes, crucial for subsequent eastern and western ceramics, were employed. In the archaic period of Greece, from the ninth to the seventh century B.C., the typical painted ornament of Greek pottery included numerous animals and plant forms taken from the repertoire of oriental art; but by the sixth century they were replaced by a native decoration of human figures in mythological or genre scenes. Already in the eighth century B.C. pottery had become one of the chief industries in Greece. It was made chiefly for local use, for feasts, for display and for funerary and religious purposes. After the

eighth century it was manufactured also for export and in greater variety of specialized types. The self-consciousness of the industry is indicated in the choice of themes from pottery manufacture as the subjects of the painted decoration, especially in Corinth, and in the appearance of signatures as trademarks and ultimately as expressions of personal pride in craftsmanship. In the period between 650 and 550 B.C. Corinthian pottery was exported all over the Mediterranean region and even beyond the Alps. The role of Corinth was taken over by the Athenian potters, who possessed a local clay of fine quality and were artistically more enterprising than the Corinthians. There pottery manufacture became a primary industry organized in workshops of twelve to fifteen men, usually slaves, with a division of labor. The prosperity of the industry was bound up partly with the export of wine and oil stored in pots and also with luxury, since the Athenians made especially fine ware as show pieces for banquets and gift offerings. In the sixth century B.C. they acquired a monopoly, which was enforced by embargoes, tariffs and even by violence. The style of painted decoration shows a steady development of naturalistic forms, based largely on the development of monumental painting and sculpture at the same time, but with a retention of the earlier black and red figured techniques. The industry passed during the fourth century from Athens to Rhodes and Italy and then to various Hellenistic cities.

Painted pottery was gradually superseded during the second century B.C. by the cheaper molded vases, especially by "terra sigillata," a hard, reddish, glazed ware, with molded and stamped ornament of light mythological and animal subjects, copied from the vessels of precious metal then fashionable in the wealthier Roman and Hellenistic homes. This pottery, also known as Samian and Aretine ware, was the common table ware of the Mediterranean world up to the third century A.D. and has been found from the Euphrates to Scotland. It was produced industrially in Italy and Gaul and was stamped with the names of the potters.

Little of the pottery of the early Middle Ages has survived in western and eastern Europe. The change in funerary customs with the spread of Christianity may account for this in part, but more important factors are probably the lowered standards of living, the shift from city to country and the use of metal vessels and glass by the church and the nobility. The pottery which

has survived is generally, although not always, unglazed; it is of very simple form, recalling prehistoric and primitive pottery, especially in the incised or crudely stamped decoration and in the plain bulging shapes of the vessels. By the twelfth and thirteenth centuries, eastern and Spanish Islamic wares, influenced especially by Persian ceramics, were imported in Italy, France and Spain and were employed not only domestically but also as an architectural decoration. A definite technical advance then became evident in western pottery.

The finest wares of the Middle Ages were produced in Persia and China. The Persians continued to use the materials and techniques of the older Orient, including the lead and tin glazes, on tiles and pottery. By the ninth century they or a neighboring people had discovered a method of luster painting which gave the pottery a delicate iridescence. Persian pottery was produced in various centers usually associated with a royal court. These wares reflect in the common scenes of hunting and feasting and in the heraldic animals or game painted on them the ideas and interests of the royal court. The painted ware shows the utmost finesse and calligraphic freedom in its naturalistic rendering of human and animal figures. The work, however, remains impersonal, entirely attached to a class distinct from the artisan's; it carries no signatures and few references to the place and the date of manufacture.

Chinese pottery, the history of which can be traced as far back as the third millennium B.C., is not entirely detached from western Asiatic traditions. The oldest prehistoric wares resemble those of Susa in Persia and show wheel marks which indicate a western Asiatic influence. The occasional lead glazing in the pottery of the Han dynasty (206 B.C.—220 A.D.) also points to the Near East. The wares of this period are preserved as funerary pottery and include ceramic sculptures of domestic objects, family figures, animals and even buildings. In the period after the Han dynasty there appears a proto-porcelain, a semitransparent pottery in which kaolin has been imperfectly utilized. The oldest assured examples of porcelain are Chinese exports found in Samarra on the Tigris in a palace of the ninth century. The manufacture of Chinese porcelain was an experimental art; new shades and textures were continually discovered in the processes of mixing and firing, but traditional types were not abandoned for many centuries after such innovations. The

porcelain had a varied use, entering into almost every aspect of life from religious ceremony to the tea service. In later times it was produced under royal administration with the greatest care and supervision and involved a detailed division of labor. Special types were manufactured for Persian and western taste, which was devoted both to the material qualities of porcelain and the images of Chinese life and Chinese decoration. Since the eighteenth century, Chinese pottery has been eclectic and uninventive, like the pottery of Islam and the west.

Apart from the stoneware of the Rhineland and its English derivatives, the development of western pottery between the fourteenth and nineteenth centuries was conditioned largely by the imitation of Islamic and Chinese pottery, in so far as the typical techniques and problems arose from the effort to reproduce the tin glazed and lustrous wares of Islam and the hard porcelain of the Chinese. From the first proceeded the majolica, faience and delft wares of Italy, France and Holland; whereas the far eastern wares were copied in the various artificial and true porcelains of Italy, France and Germany. This effort to reproduce the imported article locally indicates the aggressive, inventive character of western industry in contrast to that of the Persians, who seem to have made little effort to discover the true technique and materials of the porcelain. In the West, almost since the first acquaintance with Chinese porcelain in the Renaissance, a ceaseless search was begun with the hope of finding the secret of porcelain. This search resulted at first in an expensive, artificial soft porcelain, which had the appearance and surface of porcelain but not its essential hardness. It was manufactured in establishments subsidized and protected by individual nobles or the king. Several varieties of the soft porcelain were invented before Böttger, in cooperation with von Tschirnhaus, discovered the true composition of hard porcelain in 1707 and also deposits of the essential ingredient, kaolin, in the neighborhood of Meissen in Saxony. Böttger's effort was subsidized by the elector of Saxony, Augustus the Strong, who hoped to acquire great wealth by the production of native porcelain. In accord with this mercantilist policy a privileged factory with secret processes was founded at Meissen, which for the next fifty years was the chief source of European hard porcelain. But the secret was soon stolen and porcelain was manufactured throughout Germany and in Austria. The chief decorations of

the hard porcelain were either exotic Chinese subjects or themes of rococo eroticism based on French paintings of the time. Later in the century the subjects became less exotic, until the classic movement of the 1760's and 1770's introduced a primarily mythological, heroic and moralistic content. Then porcelain lost much of its appeal and was replaced by techniques which provided a plainer surface. At this time English potteries practically dominated the European market. They provided a hard stoneware as durable as porcelain, at a far lower cost and with a sentimental or neoclassic decoration congenial to the bourgeois patronage of the period. Through a whole series of inventions the English potters had developed methods of mass production which virtually revolutionized the industry. They discovered a bone pottery of extraordinary hardness, a convenient salt glaze, mechanical methods of decoration (transfer printing) and molding as well as superior kilns, mechanical and steam power for the wheel and the mixing of clays. At the time these newer processes were introduced there was a distinct deterioration in decorative qualities, which, however, cannot be attributed to mechanical methods as such, since decorative arts in general show a decline during this period in the East and West, even where handicraft persisted.

The pottery of the nineteenth century, produced in large factories, has been eclectic for the most part and subject to rapid changes in historical and aesthetic fashions. In the second half of the nineteenth century there were numerous movements to restore pottery as an artistic handicraft. This trend was stimulated not only by the study of older pottery, which was beginning to be collected, but also by the increasing luxury of bourgeois life. Such efforts to revive pottery were part of a larger movement to overcome the supposed effects of industrialism on craftsmen and artists by a revival of handwork. The products have been mediocre and have commanded only an ephemeral attention; they have not risen far above the level of cheap mechanical production. They have been too expensive to reach any but the wealthier classes, despite their imitation in factory wares. On the other hand, a vogue has been created throughout the western world for simple, naïve pottery which has quickened the market for cheap colonial and central European wares with primitive and peasant designs.

POVERTY. Fundamentally poverty is a negative term denoting absence or lack of material wealth. Such absence, however, is seldom absolute and the term is usually employed to describe the much more frequent situation of insufficiency either in the possession of wealth or in the flow of income. As J. H. Hollander has pointed out, in ordinary usage poverty is applied to three distinct conditions: economic inequality, economic dependence and economic insufficiency. But his judgment that only the last "forms the real problem" perhaps limits too narrowly the scope of the problems created by inequalities within modern economic organization. Acceptance of insufficient flow of income as the essential aspect of poverty merely shifts the difficulties of definition, since this concept predicates the assumption of standards, physiologic, psychologic or social. There can scarcely be a satisfactory answer to the question as to how much is enough without some arbitrary agreement as to the objective. Since there is obviously a clear distinction between human needs and human desires, the latter may include desires of a negative, definitely injurious nature, as, for instance, for narcotics; and there may be important needs, such as for cleanliness or education, which are not expressed as conscious desires. The determination of the state of poverty must therefore be based upon some distinction between legitimate and excessive desires, a dis-

tinction resting not only upon physiology but also upon some underlying theory as to the purposes of human existence.

If preservation of life and health is assumed as the fundamental and universal objective, the power of reproduction and child rearing follows as a necessary corollary. But in addition to this simple principle there is the quest for happiness or satisfaction. Furthermore an appraisal of individual deviations from a prevailing level of economic well being depends upon a particular theory of the historic destiny of human society.

Modern social science treats poverty as an aspect of social pathology. Since the term pathological is used to describe an abnormal condition of deviation from the average or the prevailing type rather than from an ideal condition, such a concept obviously arises within a society whose economic development has succeeded in forcing nature to yield in sufficient quantity the products necessary for its well being. The process by which such development has been progressively achieved for a tribe, a nation or even humanity as a whole has been fairly continuous despite the many interruptions imposed by natural calamities, such as droughts, crop failures and devastating epidemics, or by the mass destruction of wealth resulting from violent group conflicts. The exact statistical measurement of such increase, however, is not a simple matter. It cannot be gauged merely by monetary units because the purchasing capacity, or the command over goods, of any monetary unit has undergone many changes. Nor can the degree of discrepancy between recognized wants and desires and the opportunities for their satisfaction serve as a basis for measurement of increase, for there is no contradiction in the phenomenon of an increased degree of felt and recognized poverty at the same time that there is an increase in objective material wealth. Failure to observe these fundamental considerations may lead to an entirely erroneous appraisal in comparison of conditions of communities separated from one another either geographically or historically.

Moreover as one passes from the consideration of the poverty of an entire community to that of individuals, families, groups or classes within the community, the problem becomes more complex. In addition to the discrepancy between existing needs and available resources as a whole one must take into account such factors as the influence of prevailing social standards, the inevitable if sometimes semicon-

scious comparison of differences of standards within the community and its resultant stimulation of desires. Thus it becomes apparent why the realization of conditions of comparative poverty has led more often to social change than has absolute poverty.

In the final analysis a definition of poverty must therefore be based upon comparative scales and standards of living. These become more complicated as the degree of social wealth increases and as economic and social contrasts multiply. From this point of view it might be said that notwithstanding the scarcity of goods among primitive people the extent of poverty is probably not great, not only because they are able to satisfy—except in times of natural calamities—their limited wants but because the degree of inequality and the resultant sense of unjust deprivation are less pronounced. On the other hand, the poverty of the masses within the level of civilization prevailing in the oriental countries stands out in sharp contrast to the vast accumulations of wealth in the possession of a small privileged class in these poor countries even more than by comparison with western standards. The existence in this area of a social tradition which until recently favored the passive acceptance of these differences by the poverty stricken masses points to the distinction between absolute and felt poverty. Such distinction is applicable also to the poverty of the masses throughout most of the world in past generations, when the static social structure and the political and religious thought discouraged any attempt to wipe out or to mitigate class differences.

It might therefore be said that the concept of poverty as based upon scales and standards of living is comparatively recent and has arisen in dynamic industrial societies, although of late it has been applied to other communities as well. There have been many efforts to establish a classification of standards of living. The classifications usually accepted comprise five fairly recognizable levels: insufficiency, minimum subsistence, health and decency, comfort and luxury. If these grades could definitely be established, the extent of poverty could be measured. But it is obvious that these distinctions are fluid and are subject not only to changing conceptions as to the share in the social product of the individual or group, but as to the meaning of the terms which constitute the distinctions. Luxuries become comforts, comforts become necessities; and repeated emphasis of the fact that in

comparison with civilizations of the past or more backward contemporary cultures the poor in the United States now enjoy what would have constituted unusual luxuries a thousand or even a hundred years ago may lead to an entirely barren conception of the problem of poverty as an aspect of distribution of wealth. Thus an increase in perceived poverty is a phenomenon particularly characteristic of American life during periods of so-called prosperity.

The recent efforts in industrial countries to measure the extent of poverty have usually been based on data as to the distribution of wealth and particularly of income. The standard of income is necessarily reduced to terms of monetary values which fluctuate rapidly even within short periods of time. In the United States, for instance, the estimate of the normal annual income required to maintain a standard of health and decency for a family of five has jumped from \$600 at the beginning of the twentieth century to nearly \$2000 at the end of the third decade. A similar rise is to be noted in English estimates. The difference is due not entirely to increase in monetary costs but also to a large extent to changing standards. Presumably all families whose total income falls beneath the standard are in the poverty group. But within the group itself there are wide fluctuations as to both the amount of the income and the means by which the deficiency is covered, if at all. Account must here be taken of the extent to which "free services," such as education and recreation, are available in the community. More important, however, is the question whether the groups usually classified as dependent, because their members supply readily available statistics—those maintained in public or private institutions, by outdoor relief, through old age pensions—can properly be used as a yardstick for poverty when in fact they indicate only the extent of relieved dependency or destitution. Moreover, if the form of relief is at all adequate or if, as in the great majority of institutions for child care, the standards of health and comfort are decidedly above those prevailing in the community at large, it is doubtful whether the recipients should be included in the poverty class despite their dependency. In any case there must be further distinctions within the poverty class to include not only the destitute, the pauperized and the dependent but also a large self-supporting group whose income does not permit the minimum of health and decency. The setting of a minimum for various

communities at various periods to cover this latter group requires a much more laborious process than the computation of figures of dependency and can yield only approximate results. Information as to both the minimum required and the percentage of the community which does not possess the means for its attainment has been gathered largely through inquiries into family budgets and costs of living, although such surveys were not necessarily intended to determine the extent of poverty.

The earliest and most comprehensive attempts to estimate the extent of poverty were made in England, where the tempo first of the agricultural and then of the industrial revolution created a more acute and widespread problem of relieved and unrelieved poverty. The estimates of Arthur Young with regard to rural poverty and of Sir Frederick Eden were the forerunners of the notable survey of Charles Booth at the end of the 1880's. Young estimated that the poor in England in the second half of the eighteenth century numbered about 8,000,000. By the middle of the nineteenth century it was estimated that one out of every seven families was aided by poor relief. Booth's conclusion that the poor constituted over 30 percent of the population of London and those in comfort somewhat under 70 percent was based upon a rather hazy classification of four major categories: the very poor—the lowest class of paupers and those who had only the earnings of casual occupations; the poor—those with irregular earnings or regulated minimums; the comfortable; and the well to do. He set 21 shillings as the minimum weekly subsistence. Ten years later Rowntree's study of York showed that these conclusions were roughly correct for smaller towns as well. These findings have been confirmed in subsequent studies of the urban poor and also of agricultural wage laborers. From the 1880's to 1923 the character of this poverty changed greatly. Modifications in the poor law led to a marked proportional decrease in institutional relief and a steady expansion in outdoor relief. The absolute numbers of the population receiving poor relief in both forms remained more or less constant—approximately 1,000,000—but with the advent of old age pensions the proportion increased from about 4 percent in 1913 to 6 percent in 1923. The apparent decline to 3.11 percent in 1924–25 was due to the introduction of unemployment insurance. Another factor in this change within the group was the introduction of wage boards in the sweated

industries and in agriculture. After 1924, however, as unemployment increased, the number of persons receiving relief, particularly outdoor relief, rose sharply.

The net result of the introduction of many forms of social insurance and more adequate poor relief has been the diminution of misery among what was formerly the group included as the "very poor." It has not appreciably decreased the size of the total group, however, for the cost of such public measures has been partially borne by the employed wage earners. This fact together with the rising cost of living would in the opinion of the group which conducted the London survey in 1929 raise the minimum standard on Booth's basis from 21 to 40 shillings, and by this standard 25 percent of the London population in that year were in the poverty class.

In France and elsewhere on the continent attempts to estimate the extent of poverty were simultaneous with the development of revolutionary and utopian ideas. Here the slower tempo of industrial change and the provisions for local community and church responsibility made the problem of misery and destitution for the bulk of the rural population seem less acute. The introduction of social insurance in Germany at an early stage of industrialization gave the problem a somewhat different cast until the period of extreme misery after the World War.

Estimates in the United States concerning the number of persons receiving charitable relief in the period from 1911 to 1933 have ranged from 4 to 10 percent of the population. These estimates are as true for small semirural towns as for the large cities. One of the earliest writers on the subject, Robert Hunter, made in 1904 what was considered at the time a sensational estimate of 10,000,000 poor in the United States. Subsequent estimates, however, suggest that his figure was conservative. In 1916 Maurice Parmelee concluded that "at least half and probably more of the families of this country are in a state of poverty." In the period between 1900 and 1930 the national wealth of the country nearly quadrupled. Yet in the prosperous year of 1919 the National Bureau of Economic Research estimated that nearly 86 percent of all family incomes were below \$2000; and at that time families with such low incomes would probably have been generally considered decidedly poor but not necessarily dependent. If the number of the unemployed and their dependents rather than those receiving public or

private relief is taken as a possible index of poverty, the figures in this period varied from 2,000,000 to 3,000,000 at the end of 1920 and the spring of 1930 to almost 6,000,000 in August, 1921. While the figures of the depression year of 1933 of some 12,000,000 to 17,000,000 unemployed (of whom an increasing percentage, perhaps as large as 35 percent to 50 percent have been receiving public or private relief) and the estimates of a total of 20,000,000 to 25,000,000 within the poverty level may not perhaps be comparable with the figures cited for the increase of national wealth, they do indicate nevertheless the instability of the position of the masses in a country rich in natural resources and highly developed industrially. Moreover, even if the number of unemployed were drastically reduced, the poverty class would still include millions of underpaid and underemployed workmen. The general level of economic well being even in the United States, which is most advanced in industrial development, has probably declined during the last decade; and the situation is fundamentally the same in every highly industrialized country.

Nor is the picture of mass poverty very different for predominantly agricultural countries or for those in an earlier stage of economic development. Recent surveys of the conditions of the rural masses in China and in India indicate a steady pauperization. T'awney estimates that in China 50 percent of the families in the east and 80 percent of those in the north have incomes below the barest subsistence minimum and concludes that conditions for this class are worse than they were two centuries ago.

During the last fifteen years the Soviet Union has presented the unique example of a country in which not only the elimination of poverty but the removal of wide extremes in incomes has become the predominating feature of economic policy. Russia traditionally has been described either as the richest country in the world because of its natural resources and potential wealth or as the poorest of all modern nations because of the low income level and standard of living of both its agricultural and its industrial populations. Any effort to estimate the extent of poverty in old czarist Russia and also in Soviet Russia involves the difficulty of finding a reasonable basis of comparison. Thus, for instance, the recent attempt to classify the peasantry into the poor (*bednyak*), the middle class (*srednyak*) and the rich, or exploiters (*kulak*), obscures the fact that local standards have put

into the kulak group peasants who would be classified in the United States as very poor farmers.

Consideration of factors responsible for the conditions described by the term poverty will be influenced by the particular content given to the word. It is comparatively simple to attribute the poverty of a community as a whole to unfavorable external conditions, such as limited natural resources or severe climate; or to a low level of civilization, in which the poverty of the masses may be cause as well as effect; or to some set of political circumstances. At the other extreme, in consideration of individual poverty as a deviation from the status of the group, it has been common in the past to look for individual causes; that is, a variety of causes representing variations either of individual opportunity or of individual physical, intellectual and emotional endowments. Thus responsibility is shifted to the individual himself, and what should be an objective scientific problem, an appraisal of factors and resulting conditions, is converted into a moral problem. When, however, the poverty of a whole group, as, for instance, the modern wagedworking or agricultural population, is under consideration, discussion of the causes must deal in the main with the factors producing that economic status and less attention be devoted to the element of individual responsibility.

Thus basic to all other factors in the consideration of the poverty of wage earners is the prevailing wage level and the extent to which it fails to meet the cost of all the goods and services which make for a clean, healthy and satisfying existence. The destructive results of a low wage level are aggravated by all obstructions to the regular flow of wages. Of primary importance among these are death or disappearance of the wagedworker who carries the economic responsibility for the family; temporary or permanent loss of earning capacity because of illness, accident or old age; and, finally, lack of employment whether as a result of strikes, lock-outs, boycotts or general economic depression. Unless there is some means of systematic relief, these primary factors constitute the majority of cases of individual poverty as distinguished from the general low wage level. Of lesser importance are such factors as lack of occupational training, excessive size of family, emotional difficulties resulting in inability to hold steady employment, criminal behavior which leads to imprisonment, intellectual deficiencies or physi-

cal handicaps. While any discussion as to the degree of personal responsibility for any one of these conditions inevitably leads into the problem of determinism, it has been established by a large and constantly growing volume of observations that the causes already mentioned account for the vast majority of individual instances of poverty among wageworkers.

In the case of the farmer or the peasant the general causes do not affect his economic status to such a catastrophic extent. In so far as he is self-employed or able to supply his basic needs, he is not to the same degree dependent upon an uninterrupted sale of his labor power. The family rather than the individual remains the economic unit in agriculture, even though the patriarchal family has been breaking up and the average number of children is decreasing, while the substitution of mechanical for human energy has created a surplus of labor power on the farm. But poverty may strike the independent farmer through such extraneous factors as a fall in the price of agricultural products or an increase of the burden of taxation or interest. As these are mass phenomena, agricultural poverty has more of a mass character than poverty of wageworkers, although here adverse individual factors may have importance. The growing tendency toward tenant farming in all countries increases the chances of further impoverization; and, to the extent that agricultural labor replaces independent farming, the life of the agricultural laborer will be controlled by the same conditions as affect any other wage-worker. Studies of rural standards of living reveal that in addition to low incomes rural communities are at a disadvantage as compared with urban in educational and health services, and in such sections as the southern states of the United States both the Negro and white agricultural populations have a per capita income below that of the poorest sections of the urban masses.

Modern industrial development has resulted in a tremendous increase of the middle classes, the white collar workers and the small business men as well as the self-employed professional men. While the economic condition of these groups is normally higher than that of the wage-worker, they too are subject to the same poverty inducing influences; and in addition they are affected by loss of custom, business, trade or clientele, resulting from inefficiency, lack of personal popularity or sudden economic upheavals which may destroy established behavior

patterns, make their services or business unnecessary or deprive their clients, customers and consumers of their purchasing capacity. If the elimination of the middle class does not proceed so speedily as was predicted by Marx half a century ago, nevertheless every economic crisis does precipitate part of the middle class to the level of wageworkers, the poor or even the dependent, at least for the time being.

From a comparison of a series of reports of many relief agencies the pioneer American student of poverty, Amos G. Warner, many years ago came to the conclusion that in the United States some 25 percent of cases were ascribed to personal misconduct (primarily laziness, shiftlessness and insobriety) and the remaining 75 percent to personal misfortune. British studies estimated that the proportion of misconduct reached 40 percent, while in Germany the percentage was so small as to be negligible. The differences obviously reflected variations in points of view rather than in underlying conditions. To a large extent these differences may be observed today both in scientific and in popular discussions of the problem.

Although it is by no means easy to draw a definite line of demarcation between misconduct and misfortune, personal and social factors, individual and social responsibility or responsibility and a blind sequence of events, these two types of explanation have been regarded as mutually exclusive and have provoked much controversy in economic and social literature. An analysis of the arguments supporting either of these two views to the exclusion of the other readily shows that back of ostensibly scientific differences there are differences primarily in attitude toward procedures designed to correct the situation. Assumption of social or objective responsibility serves as a starting point for the development of plans for social amelioration, whereas emphasis upon personal subjective responsibility tends to serve as a bulwark against state intervention.

Social thought and popular opinion have gradually shifted from a fatalistic or apologetic to a critical and constructive point of view toward poverty, its meaning, its causes and effects. The religious or fatalistic explanation of wealth as a gift from the deity and of poverty as a visitation, punishment or trial was useful as consolation for the poverty stricken individual or group. Many of the earlier attitudes or even the ostensibly scientific explanations offered at the present time are probably based upon the

same need of waiving responsibility for the existence of poverty in the midst of plenty or wealth. It is understandable therefore that the assumption of individual responsibility should retain its popularity among the more fortunate upper class minority and among its apologists in the press, pulpit, chair or legislative hall. The poor are held to be sinful, worthless, lazy, inebriate or of low biologic stock. In learned literature recourse was had to such semimystical subterfuges as "the sacrifice of the individual to the welfare of society" in sociological works; the substitution of economic laws for the decisions of the deity in economic theory; and "the necessities of social evolution" in pseudo-Darwinian writings. Malthus' theory of overpopulation whereby poverty was considered inevitable for the major part of society was undoubtedly influenced by the desire to explain in terms of natural law the recognition, not always frankly admitted, that the ethical theory of poverty was untenable. These explanations were voiced also by the early leaders in the modern philanthropic movement, despite the fact that like their successors in modern social work they were concerned with ameliorating poverty by attempting to cure some if not all of these personal deficiencies.

But throughout the development of social thought there has been a countercurrent, which in the last century has become more articulate and more widely accepted with its growing prestige in studies which likewise lay claim to scientific objectivity. It is most logically expressed in the theory of exploitation of one class by another; of the majority by the minority; the peasant, free or serf, by the manorial lord; the slave by his owner; the working man by his employer; the small dealer by his stronger competitor; the independent producer by the trust; the merchant by the banker. While the militant, monistic economists of the masses developed this point of view as an indictment of the ruling minority or of a particular type of society, its origin may interestingly enough be found among classical economists under the scientific disguise of the "iron law of wages." A survival of the same attitude may still be recognized in the definition of economics as a "science of price rather than of happiness."

The modification or dismissal of this pessimistic attitude among economists toward the problem of poverty has been the result not only of the industrial progress of the last century but of the attack of the Marxian school, which,

taking conventional economics at its word, carried it to a logical conclusion by insisting that nothing short of the overthrow of the capitalistic system, under which poverty was claimed to be inevitable, could eliminate it. The productivity school, the psychological school and the ethical school produced new theories of a gradual automatic improvement through increased productivity of labor—a substitution of an optimistic *laissez faire* for the old Malthus-Ricardo pessimism—or through planned social effort. In the first two decades of the twentieth century a large number of books on relief, abolition or prevention of poverty appeared and at the same time much statistical evidence was brought together to break down the force of Marx' destructive criticisms. It was repeatedly declared by many writers that modern capitalism possessed the power to relieve, reduce, cure and entirely prevent real poverty. This optimistic attitude was particularly prevalent in the United States during the phenomenally prosperous post-war era.

What all these critical, apologetic or optimistic attitudes have in common is that they view poverty as an evil which must be either fought or explained away as inevitable. But this point of view has not always obtained. Poverty has been defended as holy on religious grounds; as a healthy and normal state on physiologic, hygienic or philosophic grounds; and as a condition conducive to physical, moral, mental and spiritual well being generally.

The positive values of poverty were assumed to be primarily moral, a point of view which followed quite naturally from observation of the cruel methods whereby the few obtained their excessive wealth and of the crude uses to which it was put. This attitude has to some extent survived to the present day. A substantial rise in the general economic level, a wider distribution of wealth among the masses, a corresponding rise in the prevailing standard of living, an increase in comforts, luxuries and leisure—all these changes had to occur before observation and comparison could establish the destructive influences of poverty not only upon the life, health and happiness of the individual but upon the welfare of society as a whole.

A study of these influences leaves little scientific basis for glorification of poverty as a social ideal, notwithstanding many impressive examples of individual achievements. That poverty destroys health and life itself is shown not only by comparison of death and sickness rates of

communities on different economic levels but also by similar comparisons of the economic strata within the same community. The study of mortality statistics of Great Britain has indicated a very marked negative correlation between the economic level and the death rate of various classes of the population. The American life insurance companies have found that the death rate for the industrial policyholders (the poorer masses) is very much higher than that of the general policyholders in more fortunate circumstances. Special studies of the United States Children's Bureau have brought out that infant mortality rates rise in inverse correlation to the family budget. A national economic breakdown, such as that in central Europe during and immediately after the World War, resulted in a considerable increase in mortality, especially from infantile disease, general debility and tuberculosis. That poverty causes illness is as certain as is the inverse causative relationship between disease and poverty.

Poverty has a destructive influence upon standards of social behavior. The fact that crimes are often committed by the most prosperous and that honesty, charity and nobility of character may be found among the poor does not affect the accuracy of observations indicating a greater incidence of crime against property and person among the poor or an increase of the frequency of crime in times of depression. Statistics of crime in many European countries before and after the World War offer abundant evidence on this point. Much capital has been made of the fact that the great depression which began in the United States in 1929 has not had similar results and that mortality and morbidity rates have actually declined. Favorable mortality statistics for the period 1930-32 have been quoted by many optimists to show, first, that the extent of unemployment and need was exaggerated and, later, that existing need was being satisfactorily relieved. Similar statements have been made with regard to crime, although in the United States statistics of crime are entirely too fragmentary to permit definite conclusions. It is argued by other statisticians, however, that the only evidence that has been produced reflects a statistical lag which is to be expected in communities with substantial reserves, such as were to be found in the more prosperous industrial sections of the United States.

Even more detrimental is the influence of poverty upon mental health and happiness. A

sudden reduction in the level of economic well being creates fear, depression, despondency and suicides. Persistent chronic poverty results in apathy, inertia, indifference and loss of initiative. Mass poverty has been responsible for most revolutions. Comparative poverty causes envy, bitterness, self-depreciation of the ego and perhaps is mainly accountable for that overvaluation of material goods as compared with intellectual and social values which is most strikingly characteristic of modern western civilization. A true valuation of the benefits which the individual and society can derive from the greater availability of material goods may perhaps be reached only after extremes of wealth and need have been eliminated or disregarded. If wealth alone is not necessarily a guaranty of happiness, it is within reasonable limits a necessary condition. Little support can be found in modern science, whether biologic, psychologic or social, for the mystic fear that humanity may perish through excessive abundance of material wealth; but technological progress and the rate of its acceleration are now such that universal plenty is no mere utopian dream.

The effort to ascertain the causes of poverty, which has become much more articulate as society has passed from a scarcity economy to a surplus or abundance economy, really expresses a desire to find a way to eliminate it. Many of the older theistic or moralistic explanations now appear untenable. Malthus' theory of the inevitability of poverty has likewise broken down in the face of a falling birth rate which has made a stationary population for the major portion of western civilization almost a certainty within the immediate future. Nevertheless, since neither this factor nor technological progress has accomplished the task of furnishing a sufficiency of material goods for all, every modern explanation must begin by admitting the imperfections of the social and economic mechanism, at least as far as the processes of distribution of the aggregate output are concerned.

In the opinion of the more radical, however, poverty is due not so much to the imperfections of the mechanism as to its very nature. The theory of minor imperfections would require at least a gradual reduction of the extent of poverty as social intelligence succeeds in eliminating these defects. On the other hand, evidence that poverty as here defined is on the increase lends support to the criticism of the fundamentals of modern social organization. In de-

fense of both these opposing social philosophies, differing in the interpretative as well as in their pragmatic aspects, there is a wealth of statistical evidence concerning fluctuations in wage levels, standards of living and volume of unemployment. The strong mass fluctuations in the general level of economic well being give predominance now to one, now to the other of these alternative viewpoints. In the United States the period of unprecedented prosperity (1923-29) was marked by a flood of optimistic economic writing, while the ensuing years of depression have encouraged an attitude of pessimism and despair.

As properly controlled experiments are practically impossible, final judgment must rest upon an accumulation of a great variety of observations. Comparison with the more primitive societal groups or with societies in a more backward stage of economic development affords slight opportunity for conclusions, not only because of the wide difference of standards of living but because they represent another type of economy. On the other hand, the evidence furnished by the organization of life and industry in the Soviet Union is by no means conclusive. Viewed in absolute terms by comparison with many capitalistic countries with higher standards of living, the Soviet Union certainly has not as yet wiped out poverty among its workers. It is claimed nevertheless that, although periods of almost universal shortage of food and other necessities are not unknown, the Soviet Union has succeeded within one decade of planning and reconstruction in raising the standard of living for its masses and moreover has eliminated comparative, or psychologic, poverty by the complete abolition of vast accumulations of private wealth. Strict application of logic to the problem of comparative poverty leads to an absolutely egalitarian ideal of distribution of wealth; but even in the Soviet economy this approach has been challenged by the conscious inauguration of differentials in money wages and other forms of labor remuneration, which, however, never approximate the extremes found in capitalistic countries.

Those who hold that poverty can be eliminated by more or less gradual reforms and those who insist on a revolutionary overthrow of the entire capitalistic system assume that their methods are mutually exclusive. This assumption may nevertheless be questioned. The reformist, or gradual, point of view proceeds from a pluralistic explanation and in the main en-

deavors to deal with each factor or cause separately. It undertakes to attack the problem of immediate need by relief, the destitution arising out of emergency situations by a program of security and social insurance, the general low wage level by legislative regulation of conditions of labor and wages or by facilitating and encouraging greater bargaining power on the part of waged workers through legalization of labor organizations and the like. It studies the possibilities of reduction or elimination of causes of such emergencies as industrial and other accidents, disease or unemployment through industrial sanitation and safety regulations, improvement of standards of public health, organization of medical aid or stabilization of employment. It attacks such general social problems as excessive size of family, lack of occupational training, physical or mental deficiency, anti-social or criminal behavior patterns, through birth control, hygiene and eugenics.

The radical, or revolutionary, insists upon the monistic interpretation of present day poverty and criticizes these numerous measures as palliatives. He is inclined in the heat of controversy to argue that these reforms cannot be effective under present social conditions, that they are worse than useless because they distract attention from the deeper problem, or even that they are harmful because they may produce moderate improvements and thus save capitalism by preventing conditions from becoming so bad that revolution will be the only immediate remedy.

Within these two major groups, however, there arise many differences of opinion on particular issues of support of more or less fundamental reforms and remedial measures. Not all reformists agree on all the proposed reforms, and there are still to be heard among the more conservative many protests against state intervention through social insurance. On the other hand, revolutionary parties are at present the most articulate advocates of state social insurance and maximum relief, at least as part of their campaign to attract mass support. The fact that in the Soviet Union, the only large area of revolutionary reconstruction, many of the institutions developed by reformists and commonly thought of as part of their program have been found necessary and desirable is explained on the ground that these differ in their essential nature and control.

Certainly the question whether abolition of poverty does or does not require complete re-

organization of the very fundamentals of modern industrial society remains and is likely to remain for many years the most challenging problem for economic theory and practise.

POWDERLY, TERENCE VINCENT (1849-1924), American labor leader. Powderly was born of Irish parents at Carbondale, Pennsylvania. At the age of twenty he moved to Scranton, where he was active as an organizer among the machinists and the Knights of Labor. In 1878 he was elected mayor of Scranton on the Greenback Labor ticket and began the study of law. The following year at their second national convention the Knights of Labor elected him grand master workman, a position which he retained until 1893. Up to 1884, when he applied for a post in the newly created Bureau of Labor Statistics, he continued in office as mayor and as county health officer; for a time he was part owner and manager of a small business. It was not until 1886 that he devoted full time to the Knights of Labor.

After Powderly's removal from office in 1893 he was admitted to the bar in Pennsylvania. He supported McKinley in 1896, was made United States commissioner general of immigration in the next year and held various positions in the United States Department of Labor until his death. He wrote *Thirty Years of Labor* (Columbus, Ohio 1889, rev. ed. Philadelphia 1890) and a number of articles on labor matters.

An unusually effective orator, Powderly carried into the revolutionary 1880's, when the Knights were at the height of their power and represented the most effective and aggressive labor organization the United States had known, the temperament and ideas of the generation of the Civil War, when American labor was interested in reforms, many of them of a legislative propagandist nature. His chief interests were in temperance and land reform. His best work as representative of the Knights of Labor was his negotiation with the Roman Catholic authorities, especially Cardinal Gibbons, which resulted in an understanding by which the Vatican recognized labor organizations. Believing in arbitration and conciliation, in legislation for the eight-hour day and other reforms, he used his influence wherever possible against what he considered the unwise militant tactics of the Knights in their strike, boycott and other activities in 1885-86. He called off potentially successful strikes, refused to participate in the May Day movement for the eight-hour day and denounced the men condemned in the Haymarket riot.

In the period of social unrest of the late 1880's and early 1890's Powderly's lack of aggressive leadership, the rise of many opposing factions

and the fact that his organization was not well adapted to strict collective bargaining for wages, hours and conditions of work enabled Gompers to set up and maintain against the Knights the business unionism of the American Federation of Labor. While the Knights of Labor moved to the left and Powderly moved in the opposite direction, Gompers stood sturdily between the two.

POWELL, JOHN WESLEY (1834-1902), American geologist and anthropologist. In 1867 and 1868 as professor of geology in Illinois Wesleyan College Powell led research expeditions to Colorado; he was thus the first instructor to combine field teaching with western exploration. These expeditions initiated his broader scientific career, for they revealed to him the vast possibilities for geological and geographical research and stimulated his interest in ethnological work. The following year, on an expedition under the direction of the Smithsonian Institution designed primarily to collect ethnological data, Powell and his party explored in boats the canyons of the Green and Colorado rivers; his account of this difficult and dangerous feat has become one of the classics of exploration in the United States. He then participated in a series of successive surveys devoted to geological and ethnological problems, until in 1879 he was put in charge of the newly organized Bureau of American Ethnology. In 1881 he succeeded King as director of the United States Geological Survey, which he had helped to create two years earlier; in 1894 he resigned to devote his attention to the development of the bureau. It is largely because of his effective administration of these organizations that he ranks as one of the most influential American scientists of the nineteenth century.

Powell's theoretical contributions to geology and physiography were related chiefly to his work on erosion and deposition. He was instrumental in promoting correct knowledge of the arid lands of the United States and their possible economic utilization; his comprehensive and now famous report on this subject written in 1877, warning of the danger of monopoly in the ownership of the nation's water supplies, inaugurated the movement which resulted in the

establishment of the United States Bureau of Reclamation.

Powell's studies of primitive society were strongly influenced by the writings of Lewis H. Morgan; his specific contributions in this field were his authoritative linguistic map of North America north of Mexico, some notes on the Ute Indians and a study of the Wyandot government. He participated in the animated controversy on totemism, which he sought to explain as a doctrine of naming. Under the influence of Lester F. Ward, Powell contended in his sociological writings that human evolution is fundamentally intellectual evolution and that, in contrast with the lower animals, man transforms the environment. Toward the close of his life he sought to formulate a system of philosophy, which he called a "science of intellection," designed to reflect recent advances in scientific thought

POWER, INDUSTRIAL. It is difficult to limit the definition or to restrict the application of the term power, which includes all forms of technical utilization of natural energy. In its industrial aspect, however, the term may be limited to the most accessible and the most widely used forms of power. These include the use of water or wind power; hydraulic pressures where these are applied for motive power purposes; the combustion of fuel of all kinds to drive, directly or indirectly, power equipment, where the main activity is contributory to the production of some article of economic value or to some service which is translated ultimately into the production, distribution or marketing of industrial products or services. It must be borne in mind that in an economically highly developed nation the non-industrial uses of power may transcend its industrial uses; thus it has been estimated that in the United States, in 1929, 72 percent of an available 1,000,000,000 horse power was installed under the hoods of pleasure automobiles.

Under modern conditions almost every economic activity is conditioned by power as applied to industry and the exploitation of natural resources. Industry is dependent on power, even though there are still a few groups of activities, such as small rural industries, which in some

measure use manual power; but even these industries require raw materials, the extraction and elaboration of which may be dependent on power driven processes. The output of coal has been enormously increased and a whole group of new industries has come into existence to supply power or the means of generating power, including electricity, gas, oil and to some extent also water; in addition there are of course the industries manufacturing the many types of machines using power. At the same time the production of power, formerly subsidiary to the enterprises using it, has become, in the dominant form of electricity, a separate industry of gigantic size. The fact that the capital invested in the electricity supply industry alone amounts in the United States to over \$12,000,000,000 and in Great Britain to more than £370,000,000 affords some conception of the importance of the power industries. The electric power industry ranks next to the railways in capitalization and constitutes the second largest industry in the leading industrial countries; if all the industries generating power or supplying the necessary fuels were combined, the aggregate capitalization would exceed that of the railroads.

Four periods may be distinguished in the evolution of industrial power. The first was coincident with man's struggle to rise above his environment and to create the conditions necessary to the evolution of some form of civilization. This period begins with the very early ages of civilization, when in addition to manual labor a successful attempt was made to harness animal power and apply energy, as yielded by the sun or water or by the combustion of fuel, to the immediate production of goods. Among the factors working toward the development of power was the discovery of the wheel, which is one of the earliest and most fundamental of technical developments (followed at some considerable distance by the elaboration of transmission methods, allowing one wheel to drive another wheel some distance away); the knowledge of differences of pressure, caused by the changing level of water; and the effect of differences in temperature, as applied to the working of metals. All the earliest civilizations—the Assyrian, the Egyptian, the Aegean and the Persian—had in common a fairly accurate knowledge of the use of water power. It was a condition of their existence that such knowledge should be applied immediately. The first real movement toward the exploitation of power was the development of irrigation along the Nile and the

Euphrates and in China, with its ancillary operations, such as water pumping and distribution; the use of the water wheel to carry out fundamental agricultural operations, such as milling; the providing of materials and equipment necessary to maintenance of life, for example, pottery, domestic appliances, agricultural implements and even armor. The Greeks of the Alexandrian period developed a miniature steam engine of a rudimentary kind, but the discovery was looked on as part of philosophic speculation and not as economic necessity, while the Romans had no genius for research or at least no clear perception of the direction or significance of the scientific investigations made by the Greeks.

The second stage was an expression of the emergence of capitalist industry and the capitalist spirit in the period of the Renaissance and of the Reformation; it came to a conclusion with the French Revolution, which may be regarded as the victory of the capitalist spirit—and all its implications in political and social change—over the spirit of feudalism and conservatism. During the whole of the feudal period there was no real demand for power in the mass, and there may be discerned only a beginning of the scientific approach to power both as a cultural and as an industrial problem. The researches carried out by the Greeks were completely unknown, since the great mass of Greek thought and literature had still to be discovered, and the mediaeval guilds were a poor substitute for the public corporations elaborated by the Romans; the great engineering and structural achievements of the Romans, all part of a policy of public works construction, had been allowed to fall to pieces. There was consequently no knowledge of the necessary engineering calculations and no memory of actual technique; while the predominance of mediaeval scholasticism, which began to lose its grip only with the discoveries of Galileo, made it quite certain that the spirit of inquiry, necessary to economic development and upon which in turn the development of power depended, would be stifled at birth.

As the Renaissance merged into the Reformation and capitalism acquired increasing ascendancy, a whole series of manufacturing industries came into existence in certain well defined regions, such as Lyons, Florence and Milan; and the spread of these industries to other countries, political and religious persecutions being among the contributing factors, brought with it the first main movement toward industrialization.

Although there were no changes in the sources and application of power, there was considerable technological development; machines, including pumping apparatus in mines, were becoming more numerous and heavier, creating the problem of more efficient forms of power. It was moreover essentially a time of speculation, research, inquiry and experiment, when a love of knowledge was conditioned by a desire to apply it to a practical purpose. At the end of the seventeenth century no state in Europe, within the limits of existing power resources, could be regarded as capable of meeting much longer the needs created by the rapidly increasing tempo of economic progress, by the fast multiplying demands made on industry and the social structure, by the widening extent of world communications, world trade and world finance. Economic and technological forces pressed toward the development of new forms of power.

The third stage is coincident with the discovery of steam as a prime factor in developing mechanical energy and in the invention of industrial machinery which could utilize the new form of energy. The industrial application of the high pressure steam engine, from the rudimentary product created by James Watt to the enormously powerful reciprocating engine capable of driving miles of shafting in a factory, resulted in a great development of the arts of engineering and machine construction and in an enormous expansion of the output and productivity of industry. The researches of Michael Faraday and his discovery of the principle underlying the electric generator led to the creation of fundamental industries producing mechanical and electrical energy in volume sufficient to supply very large industries. Further inventions relating to the transformation and transmission of energy widened the range of the earlier appliances. A new power age was definitely ushered in.

The fourth period in the development of industrial power dates from about 1880. At the beginning of this period the single prime mover of importance was the steam driven reciprocating engine; its application took innumerable forms both in industry and in transport, including shipping. While the steam engine had stimulated a great development of machinery, it now imposed limitations on the types and efficiency of machines and on factory organization. Between 1881 and 1890 this position was changed by the discovery of the steam turbine, by the invention and elaboration of the gas engine and

the resultant internal combustion engine using oil or gasoline, and by the application of all three engines—the steam turbine, the gas engine and the oil engine—to the generation of electricity.

These developments brought about a wide expansion of power production. Thus in the United States the capacity of all forms of prime mover rose from 10,000,000 horse power in 1849, of which work animals represented 7,747,000 horse power, or 76.9 percent, to 684,000,000 horse power in 1923, of which work animals accounted for 21,500,000 horse power, or 3.1 percent. Animal power fell from 25,262,000 horse power in 1909 to 21,500,000 horse power in 1923. Prime mover capacity in manufacturing rose from 1,100,000 horse power in 1849 to 19,728,000 horse power in 1923; in mines and quarries, from 50,000 to 5,000,000; in steam railways, from 435,000 to 74,600,000; in shipping, from 734,000 to 22,000,000. In 1923 automobiles accounted for 507,000,000 horse power, 53,724,000 being used in commercial automobiles.

The power structure of the contemporary world and its corresponding mechanical equipment are founded on the steam turbine, the internal combustion engine and electricity. The outstanding characteristic of these new prime movers is their capacity to generate power at a very much lower weight per unit of output than that of the reciprocating engine, and there is no apparent limit to the size of the engine itself. The reciprocating engine prior to 1880 had reached the highest standard of thermodynamic efficiency that could be expected with the knowledge of materials, temperatures and pressures prevailing at that time. As a matter of fact such improvement as did take place in the efficiency of the reciprocating engine was not strongly marked, while there was a very definite limitation as to size, because of the enormous masses of metal involved. It was only in marine propulsion that the very large reciprocating engine generating many thousands of horse power could be used. The new prime movers were free of these limitations. Thus the gas engine, which in the early 1880's reached the limit of 220 horse power, has been improved and extended so considerably that units have been installed of over 8000 horse power. The gasoline driven engine has not reached such very large capacities, because the tendency has been to reduce weight consistently for a given output and thus allow the engine to be used for purposes to which

other types of prime mover do not lend themselves; for example, airplane propulsion, high speed propulsion in small vessels and road transport over difficult areas. One elaboration of the internal combustion principle has been the Diesel engine for both land and marine purposes, and there is no immediate limitation to the capacity of the Diesel unit in power stations. Generating sets of 15,000 horse power and above are in commission. The thermodynamic efficiency of the gas engine and the internal combustion engine has been much higher than that of the reciprocating engine, resulting in a great economy of the fuels used to generate energy. It is in the steam turbine, however, that the most revolutionary changes have taken place. Through the exact study of temperatures, pressures, the behavior of materials under temperatures and pressures and through the selection of materials themselves it has been possible to achieve with the steam turbine results which were quite inconceivable in the early 1880's. Even until 1920 it was thought that the maximum limit of size of the steam turbine would be between 30,000 and 40,000 horse power, while for purposes of electrical generation about 15,000 horse power was considered a very large capacity; in 1932 the largest single turbine on order had a capacity of 200,000 horse power. The entire development has been toward realization of higher speeds, temperatures and pressures. The weight per effective horse power and the floor space required, if attention is confined to the largest turbines, was in 1933 less than one fifth what it had been in 1918. Thus a 60,000 horse power turbine in the later year occupied no more space than one of 12,000 horse power in 1918.

This movement toward higher units and higher thermodynamic efficiencies has been ac-

companied by more exact study of fuel economy and fairly rapid reduction in the consumption of coal; in other words, more successful methods have been found for extracting energy from a given amount of coal. In 1920, 3.5 pounds of coal were required to generate 1 kilowatt hour of electricity in central generating stations, whereas in 1929 only 1.9 pounds were needed. In each case the average consumption of coal for power production in steam generating stations in the United States and Great Britain has been taken. Coupled with this movement toward fuel economy has been the very rapid development of water power, particularly in the United States, Japan, New Zealand, Canada, Scandinavia and central and southern Europe. The output of hydroelectric water power in 1929, the year of maximum electrical development, was over 120,000,000,000 kilowatt hours, equivalent to the energy generated by 100,000,000 tons of coal in steam generating stations, while the world output of electrical energy was about 300,000,000,000 kilowatt hours. If the output from steam and fuel burning generating stations of the world, 180,000,000,000 kilowatt hours, had been produced with a fuel consumption of 3.5 pounds per kilowatt hour, as in 1920, the coal consumed would have amounted to about 282,000,000 long tons; but in 1929 the average fuel consumption was about 1.9 pounds of coal per kilowatt hour generated, and the world output required 152,000,000 tons—so that the combination of fuel economy and water power had cut down coal consumption by 230,000,000 tons a year. These figures are not given as absolute but merely as an indication of what is taking place in the power industries. In 1913, 88.5 percent of the world's production of power was supplied by coal; in 1931 the proportion had declined to 66.5 percent (Table 1). Coal as

TABLE I
WORLD POWER PRODUCTION, 1913-31
(In 1,000,000,000 British thermal units)

* Including lignite, which contributed 3 percent in 1913, 3.4 percent in 1920, 3.6 percent in 1925, 3.7 percent in 1929 and 3.4 percent in 1931. (One kilowatt hour is equal to 3,415 B. T. U.s.)

Source: For 1913-25 see World Power Conference, International Executive Council, *Power Resources of the World* (London 1920) n. 79. For 1929 and 1931 computed by author on basis of statistics of production issued by the League of Nations.

such is becoming less and less important, along with the industries attached to it, while the process of substitution and elimination has gone so far that a new set of economic problems has come into existence. These problems affect the economic and social future of large parts of the world and some of its greatest industries. It is wrong, however, to assume that, measured on an effective energy basis, the power available from the combination of coal has declined. Progress in heat economy has been more rapid than the decline in world coal production. Even if in 1931 world coal output should have been, at 1,000,000,000 tons, only 70 percent of the 1913 total, the effective energy arising from it was very much greater.

The substitution of electrical energy for purely mechanical energy has resulted from technical change. It is difficult to give a statistical analysis of the conversion to electrification because of lack of adequate statistical data. It is known, however, that in 1930 of all the prime movers installed in industry in the United States 76 percent were devoted to the production of electricity; in Great Britain about 66 percent; in Germany about 64 percent; in Canada 86 percent; in France and Switzerland 90 percent; and in Italy 75 percent (Table II). For the principal

about 14,000,000 horse power. The justification for this change has been purely economic and has followed on technical development. The creation of very large units, with very high standards of thermodynamic efficiency, was possible only in conjunction with the production of electrical energy, since electrical energy easily lends itself to distribution over long distances and complicated areas and because the disappearance of the smaller units has led to greater and greater concentration on central generating stations.

A double movement can be traced: on the one hand, toward greater mechanization and use of power in industry and, on the other, toward the substitution of electrical generating plant for plant supplying mechanical energy directly. The capacity of all prime movers in Great Britain rose from 10,749,000 horse power in 1907 to 20,457,000 horse power in 1930; in the United States from 32,397,000 horse power in 1910 to 70,850,000 horse power in 1930; in France from 3,501,000 horse power in 1906 to 13,410,000 horse power in 1931; in Germany from 7,865,000 horse power in 1907 to about 27,500,000 horse power in 1931. In the principal industrial countries the increase in the capacity of all industrial prime movers was greater than the capacity of all installed prime movers in 1906-13, the capacity having more than doubled. The transition has been even more remarkable in countries which owe to the epoch following the World War much of their industrial development, as, for example, the British dominions, Italy, Japan, Argentina, Russia and Spain. Since 1924, as far as it is possible to judge, practically the entire productive capacity added to the prime mover plant in industry has been devoted to the generation of electricity.

In transport, on the other hand, this conversion has not taken place to any serious degree. Railway electrification has been carried out on a large scale in Switzerland, Italy, France (to a lesser extent), Austria, Hungary, south Germany, Spain, New Zealand and parts of South Africa. In the more developed industrial countries with large power resources, such as Great Britain and the United States, the tendency has been to electrify suburban lines only; but conversion, although delayed, is nevertheless taking place, and the modern swing toward large scale operation has caused executives to favor railway electrification. Thus the maximum capacity of high speed steam locomotives is about 2500 horse power, whereas an electric locomotive of

Source: Adapted by author from census figures and official returns. For Italy and Switzerland the census data of 1927 and 1929 respectively were supplemented by information as to later extensions of generating plant. For the United States see also Silver, A. E., "Operating Engineering Problems" in National Electric Light Association, *Bulletin*, vol. xix (1932) 467-72.

industrial countries taken in the aggregate the production of electricity accounted for the employment of about 70 percent of all prime movers installed, exclusive of those used in transport. The annual world rate of increase in electric generating plant before the crisis of 1930-33 was

less weight and greater elasticity of power has been designed for a capacity of 8000 horse power. In marine transport the shipping driven by reciprocating steam engines or by turbines driving the propeller shaft directly has constituted a steadily decreasing proportion of world shipping and now accounts for less than 90 percent; but here again the introduction of turbo-electric drive in combination with reciprocating engines or without the latter has tended to bring back propulsion to the steam engine and to combine with such propulsion the generation of electricity.

While the position of industrial power at present is extremely complex, it is gradually becoming simpler and more clearly defined; and as a result of such definition there has been greater efficiency, better application of power to its essential use and a fairly steady reduction in the amount of fuel consumed.

The effect of this combination of increased mechanization and the use of electricity has been to produce basic transformations in a large number of industries. Not only has there been a change in the character of machines, but the labor force and factory organization have likewise been modified (*see* MACHINES AND TOOLS). The tendency of small industrial units to disappear has been stimulated as a result of centralization of power and its greater availability through widespread distribution systems. It is possible, however, to overestimate the importance of very large units. Thus in the United States there are over 200,000 factories using power in some form or other and in Great Britain more than 140,000, the statistics excluding in each case the basic industries of mining and quarrying. Again, in the power industries themselves the movement toward concentration has by no means reached its peak. In the United States there are about 4000 individual generating stations, quite apart from isolated units scattered throughout commerce, agriculture and mining; in Great Britain more than 3000; and in Germany at least 6600. But in these three countries fewer than 100 generating stations account for more than 80 percent of the national output of electricity. The small unit in industry and in power, however, has shown an extraordinary capacity for resistance to change. This may be expected by reason of the fact that innumerable industries still retain purely local application and definition.

While the development of electricity as the dominant form of power has been accompanied

by increasing industrial concentration and urbanization, there are some indications of development in the opposite direction. Steam power necessarily meant the geographic concentration of industry, adjacent to coal regions; and it was conducive also to the overrapid growth of cities. Electric power, because of long distance transmission, can become a potent force for the geographic decentralization of industry and its more even distribution, a development already manifest in many regions and countries. This and the advent of new methods of transportation based on the oil engine may help to check the spread of excessively large cities. At the same time, although the generation of electricity is dependent on giant plants, electric power and the type of machine it can serve also make possible a large amount of technological and economic decentralization of industry. While it must be admitted that these aspects of electric power are thus far more latent than actual, certain industries, such as pottery, woodworking, textiles and paper making in its finer stages, have not been destroyed entirely by large manufacturing units with national marketing systems. In some respects in fact the new developments encourage, from the purely technological angle, the persistence and development of small scale industry. Electricity and the internal combustion engine with its high standard of operating efficiency have enabled the rural industry to increase its output, standardize its product and cut down cost at the same time; and in many areas distant from centers of population, these industries have shown a marked tendency to increase rather than to decline. Mechanization has spread also to farming operations, largely through the use of the internal combustion engine for outdoor farming and of the electric drive for all other operations. There has been a very large increase in production, so large indeed that during the world crisis the basic agricultural products, influenced most of all by mechanization, were a glut on the market.

The new power age has caused important economic changes. It has led to the development of the power industry as the greatest single industry after the railways in the modern economy. Through the process of technical change it has brought about the concentration of power producing units in very large centers of production. In order to take advantage of technical progress it has intensified the development of a system of very large scale production, which has extended to every industry of importance; and

although possibly this has been overdone in some cases, the only real exception is the small rural industries with local markets, which have the widespread distribution of electric energy to improve their competitive position. This new power age has resulted in a considerable displacement of labor as between one group of industries and another. In basic industries, such as coal, iron and steel, shipbuilding, agriculture and chemical manufacture, the introduction of power into every operation has increased output and displaced labor. In the manufacture of articles for general consumption, for example, in the textile, paper, woodworking, rubber, brewing and milling industries, the increase in power facilities has not so much intensified the movement toward mechanization, since all of these industries had already been mechanized as far as possible, as it has improved efficiency in production and consequently led to a rapid fall in price. In some of the industries producing consumption goods, above all in textiles, the emphasis has been on design and quality to insure continual stimulation of consumers' demand. The power age has given new prominence also to the industries supplying the material for power equipment and power production, for example, the manufacture of electrical equipment and machine tools, light engineering, automobile engineering, light steel and industrial textiles; and, finally, through the progress of scientific and technical research it has disclosed a whole series of new requirements, particularly in amusement and transportation, which were unknown before and which in the majority of cases are linked up with the production and utilization of power machinery.

Power development in the whole period since 1890 has caused emphasis to be placed on capital investment and on the production of capital goods, since it has necessitated an entirely new equipment in the main producing industries. The application of investment to the new power industries has introduced new forms of corporation and public financing, while the rapid growth of the power industry itself has entailed new methods of control in order that the public interest might be protected (*see PUBLIC UTILITIES*). The electric holding company, for example, as in the United States or in Italy, can control the destinies of companies supplying as much as 25 percent of the national production of electricity and in addition has been able to form international affiliations with a view to securing similar control in other countries, particularly

in the Far East and in Latin America. In recent years there has been a marked tendency for a special type of financial institution, associated with important banks, to enter more and more fully into the public utility field and in this way to set up extremely complicated commercial and trading relationships. The development of holding companies to obtain financial control over operating companies has proceeded so far that the public has ceased to have any real control over the direction and cost of the services supplied by such companies. In many countries the problem of supervision is being tackled, as far as production and main transmission of electricity are concerned; the tendency is to subject the new public utilities to much the same type of legal control as that over railways and concerns which are developing water power resources.

It is too early even now to determine what will happen as a result of this change, just as it is difficult to make any estimate of the realignment which may take place in the industrial geography of the world. It is common knowledge that the exploitation of water power has allowed new countries to become industrialized with very great rapidity, particularly Japan, France, Italy, Switzerland, Austria, Scandinavia, Chile and other Latin American countries, New Zealand, Canada, southern Germany, the southern states of the United States and outlying areas in India. The industrialization of these countries has caused a change in the distribution of world trade; there has been a decline in the consumption of coal from predominantly coal exporting countries, like Great Britain, while their industrial development has moved toward industries producing power equipment, so that international competition has borne very heavily on what are generally regarded as the new industries. There can thus be observed some movement toward equalization of economic effort as between one group of countries and another, but this equalization has not proceeded very far and has not been such as to open up world markets, outside of the United States and possibly Canada.

There may be a time subsequent to the present period of adjustment when the combination of power with the proper study, control and utilization of natural resources will lead to very rapid economic expansion in the principal countries of the world and through them in the world as a whole. Power consumption is still greatest in the four major industrial nations, and even

TABLE III
POWER CONSUMPTION IN VARIOUS COUNTRIES,
1925-31*

(In 1000 long tons of coal)

YEAR	UNITED STATES	GREAT BRITAIN	GERMANY	FRANCE	TOTAL
1925	681,426	179,244	156,271	72,221	1,089,162
1927	730,125	192,122	163,332	79,085	1,164,664
1929	781,859	186,658	180,331	87,422	1,236,270
1930	694,467	181,449	155,918	90,168	1,122,002
1931	602,644	169,387	130,101	83,628	985,760

* The basic data include net consumption (production plus imports minus exports) of coal, oil, water power in electric generation and, in the United States, production of natural gas. Conversion to a coal basis is on the assumption that 1 ton of oil = 1.405 tons of coal; 1 cubic meter of natural gas = 3.13 pounds of coal; and that the water power required to generate 1 kilowatt hour = the average amount of coal required to generate 1 kilowatt hour in electric generating stations in Great Britain, i.e. 2.40 pounds in 1925, 2.16 in 1927, 1.97 in 1929, 1.90 in 1930 and 1.82 in 1931.

among them it is unequal (Table III). Many countries at present are necessarily limited in their output and consumption of power because of insufficiency of the fuels now utilized in power production. Despite a number of experiments in the harnessing of new sources of power, such as thermal energy from the ocean on the equator; the use of vegetable liquid fuels, such as alcohol for power production; and the careful study of solar radiation, no serious increment in power capacity can be expected from such sources within any appreciable time. On the other hand, suitable research as to the use of tidal waters would tend to show that the tides can be used, provided engineering technique can design the proper machinery. At the present time there appears to be no physical impossibility, but the required capital investment is so high and the resultant cost so great that such means would be resorted to only in the event of a power scarcity; such scarcity would occur as a result of exhaustion of fuel and oil resources, and there is no indication yet of such exhaustion. A number of countries with no water power and no fuel may well study the possibility of tidal power, but transport charges have become so low that energy generated by imported fuel would probably compete with energy generated locally through tidal power.

In the future the expansion of power networks may be expected to cover whole countries, such as Great Britain, Germany or France, or groups of states, as in the United States. There is likely to be imposition of state supervision or control over such networks, coupled with the rapid decline in cost of power in industry, transport and agriculture. New centers of economic activity may be anticipated, particularly in rural

areas; while the availability of power in small bulk, particularly electricity, may be expected to change the habits of the people. The electrification of domestic processes, resulting as it does in greater leisure, will exert its maximum effect when society itself begins to develop an organization to control important services with a view to the most widespread national requirements. The task of the future will be found not so much in the development or the utilization of power as in the study of the adjustments which must be effected in social relationships so that economic effort may be enlisted in the service of social utility.

POWER, POLITICAL. Despite the diversity of processes subsumed under the general category "political" it is possible to detect a com-

mon element implicit in all forms of political activity; namely, the effort to develop and utilize organized social power. Organized social power may be defined as that type of power which is engendered and maintained by joint human activity guided by a more or less explicitly agreed upon set of rules, and which is converted into action by special organs deciding upon and determining those rules. Political power is distinct from all the other forms of social power by reason of the function which it performs in organizing and integrating into action the interrelated activities of the inhabitants of a particular territorial area. The underlying necessity for political power arises from the fact that notwithstanding the widest disparity of personal, regional, economic, religious, party and other interests the people within certain territorial boundaries are forced to agree upon some broad, comprehensive *status vivendi* as the only alternative to civil war and invasion. In order that this *status vivendi* may be established and perpetuated, special institutional mechanisms are set up to apply in concentrated form the power thus accumulated.

The distinction between political power and the other forms of social power with which it is organically interrelated can be determined only by a consideration of the relation of political power to the politics of the state, for its peculiar character derives in large part from the role which it plays in the organization and action of the state. The state is a territorial organization which is able to enforce its power as against all other associations and persons within its borders and thus to regulate and give an integrated expression to the interrelated social activities of its inhabitants. The objective social function of political power may be at marked variance with the subjective intentions of the individual agents who give concrete expression to its organization and activities. The subjective motivations which induce the inhabitant to perform military service or to pay taxes are of minor importance. For political power, no less than every other type of social power, is a cause and effect complex, revolving about the objective social effect and not, at least not exclusively, about the subjective intent and attitude. Thus the aim of the politician who exercises political power may be to enrich himself; but in so doing he must, if he wishes to avoid political as well as economic catastrophe, take careful cognizance of the peculiar laws which govern political power.

Although they are intimately related, concep-

tually as well as concretely, a distinction should be drawn between state power and political power per se. For political power is exercised not only by the state but also by smaller political associations within it: by political organizations extending across state boundaries as well as by those groups—churches, entrepreneur associations, trade unions and the like—which have no inherent political function. Not every political power as such is state power, but, in the eyes of its incumbents at least, every political power is potentially state power. The only way the minor power group can be certain of imposing its will on the common life of the population is through the achievement of the ultimate in power; namely, state power. For state power towers above the power exercised by smaller pluralistic groupings in that it controls the system of law which is set up and perpetuated by state organs. Since the state is equipped as a rule with the most powerful, the most highly developed and the most efficient organization, every other political power, in order to find concrete expression, must strive—not to gain control of this organization as a whole—but to take its appropriate place in the larger system.

By way of further qualification it should be noted that not every activity of the state can be considered as involving the exercise of political power. The exact point at which social power becomes political power is determined by the historical and social situation, especially by the degree of social and political homogeneity of the population as well as by the concrete form of the state. In general political power may be conceived as restricted to that social power which, by reason of its own autonomous decisions, succeeds or at least hopes to succeed in bringing about a basic transformation of the distribution of governmental power, in relation to either domestic or foreign policy. In this sense neither the routine activities of state administration nor as a rule the social and cultural activities of the state may be considered as involving the exercise of political power. Political power resides in those groups which initiate and direct policy rather than in those which execute it. Thus in the constitutional state the legislative and governmental agencies enjoy a virtual monopoly of political power to the exclusion of the administrative and the judicial; while under the "integrated" dictatorial state the judicial and administrative agencies likewise share in this power, at least as technical adjuncts.

Since there is a reciprocal influence between

every process involving political power and the various other forces in the social complex, the most that can be said is that a particular exercise of power is predominantly rather than intrinsically political in nature. In virtually all cultures the exercise of political power has been buttressed by religious and church authority. Long after the disappearance of the theocracies of the ancient Orient and the religiously grounded polity of the Greeks and Romans the alliance between throne and altar was perpetuated. Even where, as in the Middle Ages, there was an open conflict between church and state or where, as in the modern period, the political process is saturated with secularism, the power of the priesthood has served—sometimes voluntarily, more often under state pressure—as a powerful factor in sanctifying the exercise of political domination. In the attempt of the modern fascist dictatorships to harness the national church a conflict has inevitably been precipitated between the implicitly pantheistic tendencies of the national cult and the essentially supernatural monotheism of the Christian religion.

The interrelationship of political power and military power touches upon one of the most crucial sets of forces in the entire state process. Although military power is often misconstrued as merely the most highly developed form of political power, its social function is dependent in the main on the fact that it is essentially an instrument of the political. Otherwise it is merely an association for plunder. Since, however, the threat, if not the actual application, of the ultimate force of arms assists in the maintenance of internal and external security, military power is a necessary ingredient of political power; and the greater the physical danger to the state from within or without, the more intensive will be the development of the military organization. Militarism arises only when the degree to which the military power gains in strength as compared with the political is out of all proportion to the actual exigencies of the domestic or international situation.

The most acute problem of modern statecraft is the relation of political power to economic power. In the Middle Ages political power had to fight for its autonomy against religious power, while nowadays it has to struggle for it against economic power. According to the historical materialists political power is merely the instrument of the dominant capitalist class in its program of exploitation. If, however, as Engels emphasizes, authority is a prerequisite of any

type of social organization, political power must continue to occupy a separate sphere, even in a society based on real economic solidarity; that is, unless the territorial-political and the economic are, in defiance of all reality, indistinguishably heaped together and unless at the same time international politics is altogether ignored. The fact that in every class society the exercise of political power is guided, among other things, by economic considerations of class aggrandizement no more invalidates the autonomous status of political power than the fact that the education of children is prompted in part by economic considerations makes the function of pedagogy identical with that of economics.

It goes without saying that the exercise of power in the political sphere, as in every other sphere of society, is grounded in the economic situation of the time. The exercise of political power is unthinkable without adequate economic resources. To supply their own economic needs the agencies of political power must intrude with their regulations into the economic field. In the early modern period the successful exercise of political power entailed a basic transformation of the existing economic system and was thus responsible in large part for ushering in capitalism; the capitalistic production of goods was stimulated in supplying the tremendous new market offered by the increasingly well equipped mercenary armies. To bolster its power the mercantilistic state set out, deliberately and with carefully formulated plans, to direct the progress of capitalism. Such regulation of economic activity presupposes a sufficient degree of homogeneity in the people to enable the agencies of political power to subject the territorial-social coactivities to effective control. At all periods therefore the exercise of political power has involved regulation of the economic system with a view to easing social and economic tensions.

The effectiveness of political power at the present day is threatened on the one hand by the absence of social homogeneity and, on the other, by the fact that it lacks sufficient economic grounding to weld together in a really effective manner the crucial social cleavages. Liberalism opened the way for the staggering accumulation of capital in private hands: as profound class fissures appeared, the foundations of political power began to crumble. At the same time further regulation of the mammoth economic system became difficult, if not impossible. Extreme tension developed as economic power became concentrated in the hands of a few people and

political power became more widely distributed as a result of democratic government. Until the nineteenth century the politically powerful were also the economically powerful. During the Middle Ages and even in the early modern period political power was the monopoly of the landowning nobility and, to an increasing degree, of the moneyed bourgeoisie in the towns. Absolutism, which through its mercantilistic policy made the state the outstanding residuary of economic power, stripped the feudal estates of their political power and monopolized it for the state. But at the same time it not only left to the nobles their land but, through a policy which soon proved of incomparably greater historical significance, helped to bring into being a powerful bourgeois economic power in the form of industrial, commercial and financial capital. To these economic forces the liberal state guaranteed almost unlimited freedom of action.

The increasingly concentrated power of capital gradually extended its sway over an ever larger number of media of economic power, but under the democratic system did not gain an equal hold on political power itself. The trust baron of course enjoys a greater degree of political power than accrues to him from the single vote to which he is entitled as an ordinary citizen. His immense economic power enables him, thanks to those agencies both within and without the party organization which cannot ignore financial considerations, to play upon leader and masses alike. The enormous political power which he thus wields is increased still further by his indispensability to the state in times of financial embarrassment, by the possibility that if thwarted he will become the hacker of openly revolutionary shock troops and, finally, by the fact that his highly developed business sense and perspective, attributable in no small degree to his international connections, is far superior to that of the state bureaucracy. But it remains true, at least where there are a professional bureaucracy, imbued with a sense of its historical traditions and intolerant of venality, and a well organized and articulate labor group, that the political power of the trust baron is by no means commensurate with his economic power. On the other hand, the political leader is much less able to array against the intruding economic power that body of political power which the democratic state constitution has entrusted to him.

This divergence of the axis of economic power from the axis of political power is the source of

the most characteristic tension of present day capitalistic democracy. For on one side the great masses of the people desire to bring the regulation of the economic system within the radius of the ballot box and the legislative assembly, while on the other the economic leaders, threatened by that democratic interference which they are at one in deploring, strive to gain control, direct as well as indirect, of political power. This basic form of social tension is bound in one way or the other to resolve itself in the very near future. Either the incumbents of political power, by somehow tapping new sources of economic strength, must proclaim and actually enforce their independence as against the forces of private wealth, or the efforts of the economic leader will result, at least tentatively, in bringing to an end the democratization of political power.

In addition to the religious, the military and the economic ramifications of political power there are the very real, if less tangible, intellectual and cultural forces, which are likewise organically interrelated with the general process of political power. The greater the recognition political power can win for the validity of the legal and ethical norms which it professes to embody, the more effective and the more enduring it will be. In seeking to invest itself with the resplendent mantle of legitimacy it may invoke either tradition, the charismatic attributes of a personal leader or the prophetic genius of the leader as revealer of certain religious, ethical, political or other verities. A further stage of consolidation is reached when the exercise of power is accepted as an expression in political guise of a living culture in which all concur. Thus considered language, literature, the plastic arts, as well as science and technology bear an integral relationship to the exercise of political power. Accordingly the modern nation state has laid great emphasis on the promotion of culture at home and the dissemination of cultural propaganda abroad. In every form of state political power must seek to legitimize itself in intellectual and cultural terms. Even under the system of *laissez faire* indifference characterizing the constitutional state, art and science and the church could not proceed beyond an at least implicitly delimited safety zone; while in the eyes of the modern dictators all intellectual and spiritual activity is merely an instrument in the execution of political power, and in the fond hope of bringing about spiritual homogeneity they use all weapons of their political power to enforce spiritual uniformity.

As noted earlier, the relation of political power to state power is characterized by the fact that state power differs from all other forms of political power in that it has at its disposal a system of law established and maintained by state organs. In an analysis of the very significant and frequently misunderstood relation between political power and law it is necessary to reemphasize that every type of political power strives to express itself in a legal system which is instituted and perpetuated through the organs of the state. It manifests this tendency by reason of the fact that in the modern state law is the inevitable expression, at once technical and ethical, of every type of political power which really succeeds in maintaining itself. In its technical but not necessarily political aspects law is the most perfect expression of political power, since by and large it makes possible the most precise and practical guidance and regulation of political activity; or, in other words, the least fallible weighing and balancing of the behavior which constitutes and activates political power. Its precision and practical effectiveness are due to the fact that the promulgation and the execution of law—in contrast, for example, to ethical codes, conventions and international law—are performed by the state power, which for this purpose maintains a special apparatus that has proved as a rule the most powerful decisory-executive unit within the state. This institutional system issues authoritative pronouncements on the various questions relating to the residence and incidence of political power and at the same time is in a position, thanks to its organizational equipment, to give concrete normative embodiment to the fluctuating and evanescent manifestations of political power. On the basis of these rules of law, which may be at variance with the actual political power situation, an answer is provided not to the often unanswerable question as to who really exercises the decisive political power—the autocrat, his minister, his banker, his valet or his mistress—but to the more precise and practical query as to which of them is vested with political power according to the law.

Thus state power is always legal; that is, legally organized political power. Political power succeeds only in so far as it is able to find moral authority for the ethical principles of its law. The ideologist who worships force *per se* spurns the idea that power is built up by means of law, while the ideologist who pays homage to peace is equally averse to conceding that law is an

instrument in the service of power. But since an absolute, homogeneous legal community is unthinkable, even in a society based on economic solidarity, unless the ultimate elimination of all personal differences can somehow be conceived, the inevitable adjustments required by common life in society create an essential function for a political power which promulgates the positive law and proceeds to apply it against the refractory. Each day bears new witness to the progress of the factitious toward the normative, in the course of which power that at first was the sheerest *de facto* might—acquired none too fastidiously—manages to gain for itself, slowly but surely, first acquiescence and then acclaim.

The actual process by which the exercise of political power becomes localized, a process which in its realistic setting may reveal marked divergences from the body of juristic theory professing to describe it, is determined by or rather determines the type of state. In a democracy the apparently iron law of the smaller number, as developed at length by Michels and Ostrogorsky, serves to localize power in a dynamic, active minority of parliamentary and extraparlimentary party leaders on the one hand (*see PARTIES, POLITICAL* and *MACHINE, POLITICAL*) and in a professional, bureaucratic civil service on the other. But however much democracy in its later stages may have belied the extravagant hopes of its early doctrinaire exponents, the significant fact remains that the organization of the democratic constitutional state, with its separation of powers and guaranty of fundamental rights, imposes invaluable constitutional restraints on the arbitrary exercise of political power and without discrimination distributes among the masses a modicum of social and political power in the form of various types of liberties.

At the opposite end of the scale the localization of political power in the hands of a single, all powerful ruler is as unrealistic as the corresponding juristic formulation of the democratic ideologists. For no autocrat is wise enough or powerful enough to manipulate single handed the mammoth organization of the modern state, even in its domestic ramifications. Consequently the absolute monarch and to a far greater degree the post-war dictator must parcel out his power: first and foremost among his bureaucracy and other governmental agencies, and to a lesser degree among national and international churches and the economic and various other types of

power groups on which the monocrat must lean for day to day support. And yet, here again, it cannot be denied that the localization is valid as establishing a clear line of demarcation to set off this type of state as against the democratic, constitutional state. Although the brushing aside of all constitutional restrictions in no sense implies that all political power is actually concentrated in the person of the dictator, it does mean that this political power must establish its limits by trial and error reference to the actual, concrete power patterns traceable in the contemporary social complex. The more astute dictator, drawing upon the rapid technological advances of the last century, is in a position to manipulate the manifold instruments of mass appeal and mass exploitation and thereby to achieve a monopolization of political power hitherto undreamed of.

PRAETORIANISM is a word frequently used to characterize a situation where the military class of a given society exercises independent political power within it by virtue of an actual or threatened use of military force. Like so many of the terms current among political scientists, this word represents a generalization from the ever suggestive field of classical history. The concept of praetorianism was developed with reference to the history of the praetorian guards of ancient Rome. The declining days of Rome saw a pro-

gressive assumption of political power by the soldiery. By the third century the imperial office had become a prize for the contending ambitions of the legions, which made and unmade emperors in order to secure special donatives and privileges for themselves. Although all the legions participated with varying fortunes in the profitable struggle for political power, the praetorian guards became notorious as the most strikingly successful. Established from the time of Augustus as the sole military force within the city of Rome, their proximity to the capital frequently enabled them to play a dominating role in imperial politics. Their most celebrated exploit was the murder of Pertinax and the sale of the empire at public auction to Didius Julianus. This and other striking acts of military usurpation have led posterity to look upon them as the typical representatives of their age, although they were only the most consistently successful of many contemporary military groups which were competing for political power.

The career of the ancient praetorians illustrates the distinction between praetorianism and the concepts of Caesarism and militarism, with which it is frequently confused. Caesarism, being a form of personal absolutism, is fundamentally opposed to all independent political pretensions of the military class as of all other competitors for power. It is notable that even those emperors who were enthroned by the praetorians were soon forced by the exigencies of their situation to try to consolidate their imperial position by military discipline. Militarism, on the other hand, differs from both these concepts in that it refers not to a form of political power but to a type of political purpose. Militarists are characterized solely by their special desire to direct the energies of society into military channels and not at all by the nature of the political power at their disposal for the attainment of that ideal. The fact that military men are not necessarily militarists is indicated by the rapid decline of Roman military efficiency during the period when the self-indulgent soldiery were supreme.

The application of the generalized concept of praetorianism to another context than the Roman presents certain difficulties, since the political power of the military is seldom so unambiguously apparent. Even when political changes are obviously effected by military rebellions, it cannot always be concluded that the military have been playing an independent

political role. Any militantly revolutionary movement requires armed forces: sometimes, as in the case of Italian Fascism, armed forces are improvised; sometimes the regular army is won over to the cause. Thus rebelling armies are frequently nothing more than the tool of other powers. At other times, particularly when revolution merely serves military class interests, it is clear that the military are acting with praetorian independence. Such occasions arise sufficiently often to give the concept a certain utility despite the difficulties of historical interpretation involved in its marginal applications.

Military discipline normally subordinates the army to the established political authorities. Praetorianism flourishes only when the weakness of political institutions encourages military independence, and consequently appears most frequently after revolution, which is at once a cause and a symptom of the declining prestige of established political institutions. The only praetorian interlude in English history, for example, occurred during the post-revolutionary Commonwealth. This connection between praetorianism and revolution is quite natural, since the absence of traditionally respected institutions makes political power a prize for competing social groups. Of course the military class does not necessarily triumph in this competition. Highly developed economic interests, for instance, often emerge victorious; and it has been observed in South America, where praetorianism has been especially frequent, that plutocratic tend to replace military oligarchies with the advance of industrialization. But where there are no other strongly organized competitors for power and where a warlike national tradition, as in Rome or the Spanish speaking countries, or the exigencies of protracted revolution, as in Cromwellian England or South America, have created a powerful and self-conscious military class, praetorianism frequently results. When the dissolution of traditional forms leaves society in an anarchical state of nature, it is not surprising that power falls to men technically trained for conquest.

The problem of revolution and hence of praetorianism assumes peculiar intensity in countries devoted to republicanism. Absolutism thrives on traditions of passive obedience; but successful republics require a strongly homogeneous general will, which in turn depends on a thorough social homogeneity and a long republican tradition. Sharp racial, social, economic or religious cleavages and even any con-

siderable difficulties of communication prevent the formation of a general will. Republican institutions thus have a peculiar vulnerability. It is significant that imperial Rome and the Spanish speaking countries of the nineteenth century, two of the most important seats of praetorianism, were both engaged in untimely republican experiments. Veneration for the institutions of the city-state caused Rome to adopt the pseudo-republican system of the diarchy. Strong autocratic forms were not developed until Diocletian, although current political techniques permitted no true republicanism within a larger area than the city-state. Similarly, subservience to contemporary liberal fashions led in South America to premature experiments with democratic forms suited only to more developed societies. Devotion to unworkable republican institutions in both these regions retarded the achievement of stability and helped to cause a recurrent anarchy favorable to praetorianism.

Praetorian methods naturally vary according to the circumstances. Since the permanent military subjugation of a civil population is extremely difficult, praetorians ordinarily seek to exploit rather than to destroy existing political institutions. Exploitation is possible without overt acts in unstable states, where the mere possibility of military revolt gives the soldiery great influence. Frequently, however, a military group conspires or spontaneously determines to seize power forcibly. To destroy the armed defenders of the existing regime is a technical military problem. The methods used to convert the resulting military supremacy into political power must vary according to the nature of the existing political structure. In monarchies the problem is to assert control over the king and his ministers. The capture and coercion of the monarch by revolting military groups have occasionally occurred in Spain, notably during the Revolt of the Sergeants in 1836. To coerce presidents and parliaments is equally possible, and South American legislatures have often suffered military intimidation. A peculiarity of democracies, however, is that the resources of coercion can be used in the selection of an entirely new set of authorities. Hence South American revolutions are normally followed by the banishment of presidents and the dissolution of parliaments, military power being used in the subsequent elections to intimidate the electorate, to control the press and otherwise to prejudice the result. The regularity with which elections have confirmed the results of armed revolt bears

testimony to the political effectiveness of military power.

Nevertheless, the power of the soldiery finds no permanent institutional expression. The ancient praetorians asserted vague claims to a constitutional right of electing emperors; military juntas have governed briefly in South America. But the ultimate result has always been the installation of a new emperor or president rather than the creation of a formal military oligarchy. Once raised to the pinnacle of power, however, the most devoted military partisan, aware at once of his insecurity and of his opportunities, tends to seek political independence of the military. The latter, still institutionally powerless, can reassert themselves only by a fresh resort to force. Consequently praetorianism results in a recurring series of rebellions. An external force is needed to break the vicious cycle. Sometimes, as in the case of the Chilean gentry under Portales, aroused elements of the nation may intervene to reestablish order. More frequently a dictator, himself perhaps a creature of praetorians, succeeds in crushing the army and in establishing a personal absolutism. The consummate statecraft of such figures as Díaz of Mexico has often provided long periods of peaceful development, during which lasting progress has been made toward the attainment of the social prerequisites of political stability. In South American history is found general confirmation of Machiavelli's opinion that an individual of outstanding *virtù* is needed to achieve the reformation of a state.

PRAGMATISM. Like many other philosophic labels, pragmatism denotes more an attitude of mind than a system of ideas; it is applied to

many different, and often conflicting, systems. All such systems, however, have in common certain fundamentals, such as the plurality and diversity of things and thoughts, the primacy of change, movement and activity, the genuineness of novelty and belief in immediate experience as the court of last resort in validating ideas. In accounting for the differences between true and false, right and wrong, good and bad, beautiful and ugly, they may be said to employ the Darwinian notions of spontaneous variation and the struggle for survival.

The intellectual climate into which this pragmatic attitude was born may be characterized in Santayana's apt phrase as "the genteel tradition." The differentiating sources of this tradition are to be found in Calvinism. Its view of man and nature is monistic. It regards the universe as a single block, the nature of whose every part is determined by its place and relationships within the whole. It assumes for each man, each thing, each thought a predestined history and fate. Although Calvin had made this predestination dual, dividing all mankind into the eternally elect and the eternally damned, the notion of eternal damnation has fallen into disuse. Today there is a very widespread consensus among the heirs of Calvinism that man is fore-ordained only to a happy ending in a good life in eternity. The paramount spokesman for this faith was Ralph Waldo Emerson. The difference between him and Jonathan Edwards is a difference made mostly by the American scene and a little by Germanic transcendentalism. The high point of this doctrine is reached in urban America, and its attainment goes with the use and spread of the comforts and culture of city life.

On the countryside the Calvinism of the fathers underwent another sort of change. The countryside was first and last wilderness and frontier. Those who dwelt in it or wandered over it were pioneers gambling with the uncertainties of climate, soil, animals and Indians, risking their lives and fortunes on an unknown future. For these actual risks the certainties of Calvinistic predestination could serve only as imaginative compensations. Pioneer life dissolved the inevitabilities of the genteel tradition into the chances and changes of the struggle for existence in the wilderness. With them were worn down all the fixed orders of inherited caste and custom. Achievement replaced status as the measure of value. Rank and birth gave way to works. Men ceased to be born good, they "made

good." That pregnant Americanism tells the story. It shows that considerations of the past have given way to creations of the future, that what is from day to day vital to Americans is not established order, routine and finality, but initiative, enterprise, innovation, and that these are judged not by their premises but by their consequences.

Industry exhibits an analogous transformation of mood. Its captains, of course, risked not so much their lives as their fortunes. But its rank and file, who filled the textile factories, laid the railroads, dug the ores and smelted the metals, came first adventuring from the countryside, with the habit of initiative and experiment strong in them. Later they were partly pushed upward and largely supplemented by immigrants from all Europe. But in these the pioneer mood was set up by the very act of migration, which imposed innovation and adventure among the new conditions of a new life. Thus industrial enterprise in America elicited, from both native and immigrant whites, attitudes, qualities and valuations like those of the wilderness. The mood was continental.

When the American mood became aware of itself and sought to define its inward quality and direction there was nothing in the genteel tradition which it could employ. Emerson, when he was most American, was least traditional; Whitman could speak at best of "democratic vistas." The theme needed another language. This was derived for it first from the victory of Darwinism, with its vision of so many novelties entering a world not made for them, struggling for their lives in it and winning the struggle by the workings of their organs and ideas upon the recalcitrant world, by their "making good." The new language came, secondly, out of the sciences, out of an analysis of their method and logic. This analysis tended, from Mill's day on, to maintain the thesis that "laws of nature," the concept of classes, of genera, of species and other general ideas depend for their validity on verification by piecemeal experiments, each yielding a concrete, specific, sensory experience.

The coming together of the American mood with an interest in the logic of scientific method had the effect of standing the traditional philosophic conclusions on their heads. Multitude and variety of existence were asserted against the traditional organic unity and homogeneity; immediate experience of terms and relations was exalted over the traditional sheer rationality.

Time and change were treated as elemental and primary; eternity was treated as an empty concept; chance was put above necessity. Rationality itself was reduced to familiarity, convenience or some other mode of adjusting the vital economy. In sum, empiricism, pluralism and temporalism were recognized as possessing a congruity with our day to day experiences of both theory and practise which the genteel tradition, however Hegelianized, entirely lacked, inasmuch as its function with respect to these experiences was equilibrating and compensatory, not vital and programmatic; its monism, necessitarianism and optimism merely projected beyond experience the determination of the effortful will which was making good its way within experience. Although, as in Emerson's case, the tradition was sometimes invoked in behalf of freedom, for the most part it was used as a guaranty of the status quo. Great landlords, captains of industry or of finance, invoked it chiefly to justify their overlordship when that was challenged or to vindicate both chattel and wage slavery.

But the foremost conscious concern of the professional spokesmen for the genteel tradition lay outside the social scene. It lay in the challenge of the sciences. This challenge had various forms. One was rigid and intransigent. Like the young Hegelians, philosophers of science were likely to reply to the idealistic dogmatism of the genteel tradition with a harder materialistic dogmatism of their own, crying "matter, matter," where the tradition cried "mind" or its equivalents. On the other hand, others who were analyzing the daily procedure of the sciences regarded such mind and matter as hypotheses by no means proved in experience. Thus, to the Germanic physicist Mach, physics and psychology have the same subject matter and are alike to be handled by the methods of science. These methods, he pointed out, are rules of thought's economy, born of "our psychological need to find our way in nature" and functioning to formulate ideas which summarize and anticipate experience so that we may control it. The structure, precision and consistency we give such ideas do not pertain to experience. We manage phenomena by their means, but cannot discover what lies beyond them. Science, Mach concludes, is no revelation of nature; it is only a device for handling her. The French mathematician, Henri Poincaré, comes to an analogous conclusion. Experience, he finds, is rich, multiple, varied and changing. Our imagination

plays on it; fixes, with a sort of direct intuition, upon some one of its innumerable qualities or relations and on it builds up a system. The system is neither a priori nor inevitable; it has numberless alternatives. Should it prevail among scientists, it would do so only because it serves their convenience, because it enables them more successfully than its current rivals to handle facts. In this success its truth consists. If need be, however, it can be translated into another, and even contrasting theory, applicable to the same facts; a theory is preferred over an alternative one because it is simpler and more convenient when judged by its experiential consequences. The American scientist and logician, Charles Peirce, also came to conclusions like these. The conception of any given object, he showed, can consist of nothing else than its anticipated consequences. These are necessarily sensory, and guide conduct by determining our future attitudes and action. Conceptions are systems of expectation and plans of action which arise out of sensory experience and lead back into it and cannot pass beyond it.

On the whole, such analyses of the methods of the sciences as those of Mach, Poincaré and Peirce make for a relaxation of dogma, for skepticism and agnosticism. Concerning metaphysical ultimacies scientists more and more abandoned "I know" for "I don't know; I suppose." Among the spokesmen of the genteel tradition a similar relaxation of dogmatism was to be observed. The infallible certainties of revelation gave way to the vaguer assurances of dialectics. Here also a certain skepticism was manifest. Revealed truth became merely projected belief. F. H. Bradley was a foremost voice of this mood in England, Vaihinger in Germany, while among the French Renouvier's exaltation of faith without dogma—fideism they called it—directly influenced William James. The general maxim was "I don't know; I believe."

Fideism and agnosticism are the consequences of the impact of science on religion and of religion on science. Pragmatism may be said to have been born in the mind of William James as a consequence of this impact. James grew up in the atmosphere of the genteel tradition, but he early became convinced of scientific determinism. The clash between these two ideologies became the surrogate for a deep inner conflict and anxiety, which were resolved when he applied Renouvier's teaching to his own life. He willed to believe in free will and trusted the validation of this belief to its consequences.

The attitude that was thus formed was the initiation of James' pragmatism. It absorbed and transformed what James had learned from Peirce. It directed James' sensibilities toward the unconventional, the new, the marginal and anarchic in experience; it fixed his sympathies with the individualism, the equalitarianism, the adventure, the struggle, the risk and the innovative remaking of the American scene. Hence he viewed life and mind as streams of effort, of constant choosing between alternatives, of constant struggle to make the choice good by its consequences. As the consequences fall out, he observed, so things are judged—true, false; good, evil; right, wrong; beautiful, ugly. Such judgments are retrospective, not prospective, and they apply as well to all the establishments of civilization as to events in a biography. Law, religion, government, art, science or what you will receive meaning and value not from what they are but from what they accomplish. They are neither the first things of life nor the last; they are only its ways and means.

James' teachings make paramount the functional nature of mental activity and the instrumental character of knowledge. The extension of this philosophy to the analysis and interpretation of social institutions and to the redefinition and redirection of education was the work of his younger contemporary, John Dewey, who brought in the term instrumentalism as the synonym for pragmatism. James' world, especially his intellectual world, had been European as much as American. Dewey's was all American. From the Vermont hill town of his youth his work took him to the busy cities of the midwest plain. He saw the machine economy grow up and transform its agricultural predecessor and he was sensitive to it as James was not. A convert to Hegelianism, which brought him the vision of a hitherto missed unity in his ideas of the self and of the world, and a convert to James' functionalism, which gave concreteness and substance to the unity, Dewey realized men and events as a continuing process "of communication and participation" between each and all. He redefined thinking and knowing as a sort of instrumentation by which blocked movement, thwarted activity, balked will, overcame their obstructions and again flowed free. Ideas, it followed, were in nature active organs and instruments of integration, continuity and survival. Especially are they such, Dewey found, in education, which focalizes upon the growing human his available social inheritance and is

thus the most naturally potent organization of "communication and participation."

In England the Oxonian Schiller, also under the influence of James, worked out a theory of life which he then called humanism and now calls voluntarism. Beginning in a primeval protoplasmic will, the human psyche develops by postulating the satisfaction of a need as a quality of the external world. Every axiom began as such a postulate and the whole dynamics not only of human thought and human conduct but of the worlds of history and of nature are the creations and recreations of this postulative activity. To Schiller man was the starting point and the goal of all experience and the measure of all things.

Now experiences are manifold, inwardly diversified and outwardly changing. Obviously no one view of their basis, character and function could be more than a way of seeing them, of controlling and interpreting them. A system of metaphysics is no less an instrument of adjustment and control than a spade or a harness. As the history of philosophy well attests, to set up a system as final, unchanging, eternally valid, is to destroy its value as a tool, to denature it into an idol and to open the way for its competitors. The recognition of this fact constitutes the essential metaphysic of pragmatism. It points out that all systems of ideas, metaphysical and non-metaphysical alike, are relative to the situations in which they arise and the personalities they satisfy, and are subject to continuous verification by consequences. For Schiller a certain personalism or spiritism is basic; for Dewey the central thing is a split or conflict in experience which presents a problem and requires integration and unification; for James it is the radical empiricism which declares that the relations of things are as real and as immediate as the things themselves. Some thinkers with pragmatic leanings, like Ostwald, make their metaphysical ultimate an amorphous energy subject to control and transformation by means of mathematics. Others, like Papini in one of his early manic states, make it a sort of theosophic personalism. Still others, like Edward Scribner Ames and the religious humanists, tend to make their conclusion a philosophic depersonalization of the god both of theology and of mystical experience into "the highest social ideals" and to conform it, as Dewey suggests, to the "current intellectually acceptable beliefs."

Pragmatism has had its richest effect on education. It is not too much to say that educational

practise and theory in the United States, in Russia, in Mexico, in Turkey derive from John Dewey. Moderns owe to Dewey the stress on the child as a growing, changing personality, on the school as an instrument to facilitate this growth and change, on teaching and learning as processes of communication and participation whereby the child appropriates and assimilates the past and creates the future. From Dewey and his followers also flows a pragmatic influence on politics which has its high point in the principles and the program of the progressive movement, through which it also enters legislation and administration of the law. Indeed since 1910 it has not been uncommon to find reference to James, Dewey or other pragmatists in judicial decisions of state and national courts, including the Supreme Court of the United States.

The influence of pragmatism on the social sciences is yet too early to measure. It shows itself chiefly in the decline of sociological dogmatism and the growing refusal to accept as final and definitive either the quantitative or descriptive treatment of "facts" or the deductive handling of social theories. The pragmatic attitude in the social sciences identifies itself with the determined use of scientific method, and to pragmatists scientific method here includes: the continuous discrimination and analysis of problematic situations; the invention and the candid and sympathetic consideration of alternative hypotheses and programs to resolve the problems; the verification of these alternatives by direct testing and experiment. This method pragmatists extend to established institutions as well as to new conditions. Family, state, church, industry, art or science—all are considered as instrumentalities to be judged by their consequences. The pragmatist in the social sciences therefore cultivates a skepticism of the instrument and is ever watchful against its hypostasis, or conversion from a tool into an idol.

By and large, pragmatism has never had a widespread acceptance among either academic philosophers or the philosophic public. Its rejection seems due to the fact that men in any walk of life whatever require of their philosophies that they shall be closed systems establishing once and for all the ultimate nature and destiny of man and of the universe. This the genteel tradition in its various forms does, and it continues to prevail among academic philosophers. It is supported moreover by the vested interests of the ecclesiastical and industrial es-

establishments. Among the philosophic public, especially the rebellious portion of it, and among the natural scientists who deal directly with the stuffs of nature and are not troubled by problems of the logic of assumptions and methods, the prevailing philosophic dogma is materialism—either in the form of Marxist dialectic or of mathematical physics. To these also pragmatism is too tentative, pluralistic, temporal and relativist. It can offer struggle and hope, courage and belief at one's own risk, but it cannot offer either instant assurance or ultimate consolation; it cannot insure certainty. Vision of life born of the union of an insight into scientific method with the mood of a democratic social experience, of an adventure which has lapsed, pragmatism remains too difficult a rule of conduct for many to live by. Although it is an unconscious component of the general common sense, only a prolonged and assiduous realization of the nature of scientific method, coupled with the renewal, amid the establishments of the industrial economy, of the pioneer spirit and democratic purposes of early America, could maintain pragmatism as a consciously held philosophy of the multitudes.

Even if this should be desirable, it is unlikely to be attained. For not only are the conditions lacking in the trends of social life, but pragmatism itself is antagonistic to it. A widely accepted philosophy consists of dogmas held as eternal and necessary verities. Pragmatism dissolves dogmas into beliefs, eternities and necessities into change and chance, conclusions and finalities into processes. But men have invented philosophy precisely because they find change, chance and process too much for them, and desire infallible security and certainty. Pragmatism is no philosophy for them. It calls for too complete a disillusion.

PRATO, GIUSEPPE (1873-1928), Italian economist and historian. Prato belonged to the group of scholars trained in the rigid scientific atmosphere cultivated in the 1890's by Cognetti de Martiis in the institute of economics of Turin University. After some excursions in the problem of Italian emigration, which was much debated in Italy at the time, Prato turned to the study of economic history and soon gained a reputation as one of the foremost Italian economic historians. His numerous studies on the economic development of Piedmont, which constituted his chief interest, are masterpieces of scientific research. He did not subscribe to the materialistic interpretation of history, nor did he aim to reconstruct economics through history; he was simply an economist who studied economic history and achieved lasting results. Marcel Marion, in prefacing a volume in honor of Prato, ranked him with Fustel de Coulanges, Levasseur and Lavissee; only the limited knowledge abroad of the language in which he wrote set bounds to the fame to which he was entitled.

Prato was keenly interested in current economic problems; he wrote with prophetic insight on the need for the protection of labor, before the exclusion of foreign labor became common all over the world; he subjected to a critical analysis the problem of collective bar-

gaining and its economic implications; and by his attack on "municipal mercantilism" he was instrumental in the ultimate abolition of the petty customs barriers which until recently surrounded so many Italian cities.

PRECIOUS STONES are minerals which because of their beauty of color, durability and rarity are valued for purposes of adornment. At present they include the diamond, the ruby, the sapphire, the emerald—often by extension the opal, notwithstanding its lack of hardness, and the pearl, although it is not mineral but organic. A vague term, semiprecious stones, covers alexandrite, garnet, jade (precious in China and Japan), quartz, spinel, topaz, zircon and many others. The diamond has to a marked degree all the qualifications of precious stones and it is generally acknowledged the most precious. Rarity is an extremely important factor; a fine pigeon's blood ruby is one of the most valuable gems because of its scarcity, while the garnet, which has beauty and durability but is relatively common, is not very highly valued. Glass was considered precious in China until the Chinese learned how to make it. Fashion has made gems valuable during certain periods and historical associations have sometimes lent value which would otherwise be absent. To this day the Chinese prefer jade and the pearl to the diamond; while the modern vogue of diamonds for engagement rings, particularly in the United

States, has helped to maintain the demand for this stone.

Early man probably collected small stones peculiar in color or shape, which he strung into ornaments even before he wore clothing. These stones were also esteemed for their magical and medicinal powers. The tradition that the opal brings bad luck is one of the surviving remnants of such superstitions. In the ancient Greek world the amethyst was supposed to prevent drunkenness; from China to Rome the diamond was thought to dispel insanity; while pearls were one of the most prized among mediaeval medicines. But the chief use of gems has always been for jewelry. Tombs of Babylon, Egypt, Assyria and Persia have yielded ornaments of fine workmanship and many varieties of stones. A recently excavated Egyptian tomb revealed the body of a king on whose head was a massive silver crown incrusting with gems. The tools of the ancient goldsmiths were more effective on softer materials, such as amethyst, carnelian, lapis lazuli, turquoise and pearls. Many other stones have been found, particularly the Egyptian emerald. Incised cylinder seals, the forerunners of the signet ring, are the earliest known intaglios, dating at least from the fourth millennium B.C. Cameos (engravings in relief) date from the fourth century B.C. The breastplate of Aaron, described in *Exodus*, was composed of twelve stones, each engraved with the name of a tribe of Israel. As in all ancient accounts there is considerable doubt as to the identity of the stones here enumerated; it is only the comparatively modern science of mineralogy that has eliminated a perennial confusion of terms.

The sardonyx was the favorite stone of the ancients. Many other varieties of quartz and semiprecious stones were used, as well as the sapphire, emerald, ruby, diamond and pearl. In point of value Pliny ranked the diamond first, the pearl second, the emerald third, the opal fourth and the sardonyx fifth. India provided nearly all of the best stones, exported plentifully after Alexander's time; it had a complete monopoly of diamonds, while most of the pearls came also from India and the Persian Gulf. Minerals not actually Indian products—the lapis from Turkestan and the Egyptian emerald, for example—were so termed because they were obtained at Barygaza and other west coast Indian ports by Greek and Arab merchants. Northern European sources, now important, were practically unknown to the Romans. The

only gem material that Rome exported was the fine red Mediterranean coral, prized in India and shipped there in such quantities that it was becoming exhausted by Pliny's time. According to the latter, a bead of coral was as highly valued by an Indian gentleman as a pearl by a Roman lady. In late republican and imperial Rome precious stones were in high fashion; wealthy citizens and, later, emperors possessed fabulous collections. Precious stones were sometimes given as votive offerings to temples. Although their *adamas* was often the white sapphire, there is no doubt that the Romans had the true diamond. The Chinese also had the diamond, which they secured from India, using it chiefly in the shape of diamond points for mechanical work; "jade cutting knife" is one of their names for it.

The gem and jewelry trades were lacking in capitalistic methods; artisans worked to individual order, although the foreign trade in precious stones was carried on by large merchants. Syria and Alexandria were the great centers for the working of precious stones into jewelry, but in every great city a section was reserved for the shops and markets of the local artisans. The wheel gradually came to be employed in the engraving of gems. The utmost skill was required to achieve the beauty, delicacy and variety characteristic of the lapidary work of the ancient world. Gems were not only used in jewelry; cups, toilet articles, statuettes and other objects of art of high quality also were cut from gem material. In the late Roman Empire and the Middle Ages gem engraving declined along with most of the other arts, but it continued to flourish in Byzantium.

Some uses of precious stones were extended while others declined during the Middle Ages. Christianity frowned upon the luxury of jewelry, but rings were recommended as talismans. Signet cutting practically disappeared, specimens used being largely ancient. Crowns were set with precious stones; and the number and design were used to indicate rank in the coronets of nobles. Knights wore them to battle; even armor and weapons were jeweled. The guilds, always jealous of their honor, made strict rules to prevent deception in the use of stones; Parisian jewelers nevertheless were notorious for making imitation gems. Apprenticeship in the crafts of goldsmiths and jewelers was unusually prolonged, ten to twelve years being required in some cases. The best work, however, was done in the monasteries. Insignia of church

prelates, covers for missals and other manuscripts, reliquaries and ornaments for the statues of saints were often adorned with the most precious stones. The treasures of the great abbeys equaled those of kings. Rosaries, most often of coral or carnelian, were sometimes of diamonds, rubies, sapphires or pearls.

The Renaissance emphasized the relationship between jewelry and costume, luxury of personal ornament reaching such heights that attempts were made to curb it by law. Spain set the fashion and New World discoveries raised the limits of extravagance. There was a revival of the lapidary's art. Many of the Renaissance artists gained their reputations as goldsmiths who were also gem cutters and gem setters. Stones were usually table cut, and diamonds were polished roughly with diamond dust. In the fifteenth century the jewelry trade of Amsterdam received an impetus with the influx of Jewish lapidaries from Portugal, the best artisans of the time; the position of the Netherlands in this craft has since remained unsurpassed.

While the desire for conspicuous personal adornment probably was the most important factor in the demand for gems, the vogue which loaded the clothes of men and women with thousands of pearls and diamonds was due in part to the fact that precious stones were a portable form of wealth which could easily be hoarded. This was one of the reasons which led the Jews to invest in diamonds. Often they were a girl's dowry held against times of misfortune. This hoarding of precious stones was especially characteristic of the Orient; Indian princes, who had a monopoly of the products of the mines and first choice of the pearls taken from eastern waters, were notorious for their treasures of precious stones. The value of these hoards may be indicated by the relative prices Benvenuto Cellini gave to the four precious stones, prices which approximate those of today: faultless one-carat rubies 800 gold scudi, emeralds 400, diamonds 100 and sapphires 10; the gold scudo was about equal in purchasing power to five gold dollars of the nineteenth century.

Improved methods of cutting and polishing led to changes in the art of the gem engraver and the jeweler. Where formerly settings had required imagination and creative design, during the seventeenth century they became merely the framework of the stones, which had a value of their own; the jeweler and goldsmith parted company. As the prejudices of bourgeois Calvin-

ism were worn down, jewelry came into more general use and imitations became a necessity, since not everyone could afford the genuine. At the same time jewels were flaunted primarily as tokens of wealth, often with complete disregard for artistic quality. Taste and workmanship declined until the renaissance of crafts in the latter half of the nineteenth century.

Until the seventeenth century India was still practically the only source of diamonds, although her output was declining. About 1725 came the discovery of diamonds in Brazil; adventurers sought precious stones as well as precious metals. The kings of Spain reserved for themselves one fifth of all gems found in their possessions. Until 1834 the mining of diamonds in Brazil was a state monopoly, employing considerable slave labor. Between 1721 and 1870 the Brazilian deposits were very productive and constituted Europe's source of supply; the present yield is comparatively small.

India no longer holds first place in the production of precious stones, but the best rubies still come from Burma. Good rubies are found also in Siam together with excellent sapphires; the latter are likewise mined in Ceylon. Other important sources for these stones are Afghanistan, Hindustan, China, the Ural Mountains, Queensland and North Carolina. The best emeralds come from mines in Muzo, Colombia; they are found also in Brazil (of the light green variety, however), in the Urals and occasionally in the United States (North Carolina). Other gem varieties of beryl, and other precious stones, are distributed widely over the world.

During the last few decades synthetic rubies and sapphires have been produced on a commercial basis, with no great effect on the prices of real stones. Thus far similar attempts to manufacture the diamond and emerald have resulted only in the formation of microscopic stones of no commercial value. Artificial pearls, first made in Paris about 1680, are now so perfect that they have undoubtedly affected the vogue for real pearls. The artificial culture of pearls, carried on for centuries in China, has been studied scientifically in Japan for fifty years. Mikimoto began his famous experiments in 1890, and pearls are now obtained from 60 percent of the oysters treated, 5 percent being marketable. The tissue from a living oyster is tied around a tiny seed pearl and inserted in another oyster, which is then left for seven years, during which time it deposits a secretion around the irritating foreign body, gradually forming a

pearl. Because of the bitter opposition on the part of oriental pearl producers to the labeling of these culture pearls as genuine, they have had little effect on the prices in the pearl market. Culture pearls sell for approximately one fifth as much as similar natural pearls; the difference between them can be perceived only if they are cut in two.

The pearling center of the world has always been the Red Sea and particularly the Persian Gulf. The celebrity of India in connection with pearl fisheries rests upon the fact that Indian merchants furnish much of the capital and Indian divers the labor. Pearls from the Persian Gulf are the most famous, but they are obtained also from the South Sea Islands, the coasts of Lower California, China, Japan, India, Australia and the islands of the Caribbean. Fresh water pearls are widely distributed in Europe, the United States, Japan and China. Methods of diving are practically the same as those described by mediaeval travelers. With or without diving equipment the hazards are many, particularly the dreaded "bends" and the danger of sharks; the pearl diver seldom lives long.

During the eighteenth and the early nineteenth century the world output of diamonds was comparatively small, averaging \$1,500,000 to \$4,000,000 yearly; but with the exploitation of the South African mines the output rose to \$20,000,000 in the 1890's and from \$70,000,000 to \$90,000,000 in the 1930's. The great diamond discovery was made in Hope Town, Cape Province, in 1867. Hundreds of prospectors staked out small claims and recovered the stones from the soft, yellow ground by washing. With deeper mining the process became more difficult and expensive, until the small owners gradually disposed of their holdings. Two dominant groups then emerged, and after a long drawn out competitive struggle a consolidation was effected in 1888; this was the De Beers Consolidated Mines, Ltd., organized largely through the efforts of Cecil Rhodes, who used the newly formed monopoly to promote his plans for empire building. For a time open pit mining was continued and the diamond bearing blue ground, known as kimberlite, was hoisted to the surface. When such methods were no longer feasible, underground mining by means of shafts and drifts was inaugurated. For many years the hard kimberlite was softened by a weathering process lasting four to eighteen months, but with the use of machinery it is now

possible to crush and wash it immediately with considerable saving. The remaining steps in the recovery of the diamond are jiggling, sorting, cleaning and evaluating, all except the last done by machinery. The diamond mines depend upon native workers, who live under a compound system, which entails confinement in closed camps after working hours during limited periods of contract. This system insures the physical efficiency of the miners and prevents theft and the squandering of savings. Wages are low and all the skilled, better paid labor is white. Attempts have been made to check silicosis, a disease which is, however, more serious in the gold mines.

Although De Beers Consolidated dominated the industry, there were other great producing companies—Jagersfontein, the Premier and the Consolidated of South West Africa. In 1893 the Diamond Syndicate was formed; it has succeeded in controlling the supply, increasing prices in normal times and preventing complete collapse during depressions. In 1930 this syndicate set up the Diamond Corporation, Ltd., to take over the surplus diamonds. The Diamond Syndicate, however, no longer has a world monopoly of the output; in 1920 it supplied 70 percent of the total, in 1929 a bare 50 percent, the principal competitors being Angola, Belgian Congo, British Guiana and West Africa. The government of the Union of South Africa has been trying to capture the diamond cutting industry, but this industry is still centered for the most part in Belgium and Holland, the former forging ahead because of the diamond supply from the Belgian Congo. There is the usual tariff struggle to keep manufacturing near the old craft centers and markets. London is the diamond market of the world, while Paris is the chief market for pearls.

The United States is the major importer of precious and semiprecious stones; it takes the largest percentage of the world's output of diamonds. The American imports increased from an average of \$42,637,000 in 1910-14 to \$79,650,000 in 1929; diamond imports rose from \$34,658,000 to \$55,956,000 and pearl imports from \$3,325,000 to \$10,389,000. These precious stones are the core of a flourishing jewelry business; in 1929 there were in the United States 20,095 jewelry stores with sales of \$536,950,000 (exclusive of jewelry sales in other stores). There were 1468 establishments manufacturing jewelry, employing 27,922 wage-workers and having an output valued at

\$181,387,000. A considerable amount of machinery is used both in lapidary work and in jewelry manufacture. An increasing proportion of the output of jewelry factories consists of cheap jewelry set with imitation stones, some of which is for sale even in five and ten-cent stores.

Imitations have limited the vogue of precious stones as means of conspicuously displaying wealth and thus attracting attention to success. The authenticated owner of a famous string of pearls may wear an indistinguishable imitation. To wear the genuine is to invite robbery, and to display apparently expensive stones without being known to possess any is considered bad taste in our pecuniary society. On the other hand, there are always people who wear and collect precious stones for their intrinsic beauty and historic interest.

PREEMPTION, RIGHT OF. See PUBLIC DOMAIN; HOMESTEAD.

PREHISTORY seeks to reveal and to analyze the processes which led up to the inventions and shaped the institutions whose development is studied in history; the written record begins in Egypt and Babylonia about 3000 B.C., in Greece about 700 B.C. and in England at 43 A.D. It likewise carries on the story of life as revealed by geology and palaeontology until that story merges into history.

Prehistory differs from history in the absence of contemporary written records. As a consequence it is excluded absolutely from access to the individual as a historical agent; its purview is at best restricted to the individuality of human groups, nations, peoples or races and to their reactions to economic and geographical conditions. Prehistory is distinguished from geology and the other natural sciences by the fact that it deals with the activities of rational beings, into whose motives an insight can be had which is impossible in the study of mollusks or molecules.

The materials utilized by the prehistorians are largely archaeological, relics—the movable objects like tools, weapons and ornaments—and monuments—the dwellings, tombs and rock carvings left by early man. The data of prehistoric archaeology may be supplemented and combined with a study of the skeletons of early men (physical anthropology), of words and place names (comparative philology and toponymy) and of beliefs and customs which are presumed to have survived from prehistoric times among backward and isolated groups (ethnography and folklore). Prehistory should be a synthesis of all these disciplines; but inasmuch as prehistoric archaeology has outstripped the kindred disciplines and an agreed synthesis seems rather remote, it often monopolizes the name prehistory.

As a historical discipline prehistory is concerned with processes and events occurring in time. The first task of the prehistorian is therefore to establish a chronological framework for his data. A relative chronology is provided in archaeology primarily by stratigraphy; the superimposed layers resulting from the continued occupation of a cave, for instance, will provide a sequence of distinctive tools or vessels in which the oldest come from the lowest levels. The familiar division into stone, bronze and iron ages is based logically on observations of this kind. Such divisions are valid, however, only over a limited area. An absolute chronology applicable to the entire world or large portions

thereof may be obtained in the earlier phases of prehistory by reference to great climatic changes, the ice ages in high latitudes and pluvials in others. The earliest human remains have been correlated with these geological phenomena and thus related to one another in time by reference to the general framework offered by the succession of ice ages (*see* MAN). For later periods it is possible to establish connections between the preliterate barbarians and the more civilized peoples who kept written records, the Egyptians, Sumerians, Greeks and eventually the Romans in the Old World and the Mayas in the New. Such contacts make possible the establishment of chronologies in terms of calendar years or centuries.

Once chronology is determined, it is possible by studying the relics of a given period and area in relation to the environment and by constant reference to similar objects still made and used by backward peoples to give a fairly clear picture of the material culture and economic organization of the inhabitants; the prehistorian can state, for instance, the extent to which a group was dependent on trade and how far industry was specialized. Some fairly reliable inferences may also be drawn as to religious beliefs and social institutions. Archaeology thus discloses various stages in man's progress toward civilization, marked by increasing control over his physical environment. This control is effected by improvements in material culture—tools, weapons, dwellings and means of transport—in conjunction with consolidation of the social structure marked by a growth in the size of the groups, increased internal division of labor and extension and intensification of trade between groups.

The findings of prehistoric archaeology have radically altered the scale of historic values and have produced an enlargement of man's knowledge in time comparable to that in space following the discovery of America. It is now evident that the beginnings of human industry and institutions go back several hundred thousand years. Fire had been brought under control and the first primitive tools of stone had been manufactured near or even before the beginning of the Pleistocene period. During the first 200,000 years of what is termed the old stone age the sole means of livelihood attested is a parasitic gathering economy based on hunting, fishing, trapping and the collection of shellfish, wild roots and berries, conducted by small seminomadic units possessed of few standardized tools. In the later phases of the same age, after

about 50,000 B.C., favorably situated groups elaborated a variety of specialized tools and hunting weapons, including engines like the bow, and had a highly developed art presumably inspired by a system of magical ideas, while the economy remained purely parasitic. The new stone age, which began in the Orient about 6000 B.C., witnessed the initiation of food production through small scale agriculture (garden, or hoe, culture) among a few favored groups. Agriculture and stock breeding first made man to a large extent master of his own food supply and permitted an expansion of population, since each generation could bring fresh land under cultivation. The earliest farmers remained self-sufficing and often largely nomadic, but they developed new arts, such as spinning and weaving, and eventually discovered the process of smelting metal. The adoption of metal as an indispensable material for weapons destroyed the self-sufficiency of the group, which was generally obliged to import the raw material, and at the same time entailed a regular division of labor within it, since forging and casting would not be carried on as home industries combined with farming. Before 3000 B.C. the wheeled cart, brick building, the arch, systems of writing and numerical notation and a very nearly accurate solar calendar had all been discovered in the Orient. Attempts have been made to fill in details of the pictures supplied by archaeology from the beliefs, institutions and crafts of peoples still living on the same economic planes. Conclusions based on such analogies can be accepted, however, only with extreme caution.

The evolutionistic conceptions which have dominated prehistory have in practise always been modified by the historical concept of diffusion. Cultivation of the alluvial valleys of the Nile, the Euphrates and the Indus offered great rewards, but the cultivators were obliged to co-ordinate their forces on irrigation works and to import many vital raw materials. These conditions, which prevailed over the large areas supplied by the waters of a single river system, led to the aggregation of men into cities dependent on secondary industry and foreign trade as well as on farming. The demands of the urban communities for raw materials and their satisfaction, whether by peaceful trade or by economic imperialism, facilitated the diffusion of their discoveries and ideas in a manner comparable to the spread of ideas from the Atlantic coast into Asia and Africa during the nineteenth century. The advance through the Old World of intelli-

gent metallurgy and of certain religious ideas symbolized in the dolmen can to some extent be understood through these lines of inquiry. Attempts to trace the process of diffusion from the Old World to the Americas have been less successful.

Historical interpretation of archaeological data is rendered more explicit by the concept of culture defined as a group of traits, such as specialized types of tools, vessels and ornaments, artistic styles and burial rites, regularly found together in a continuous area. A culture moves about in space and evolves in time; in its archaeological aspects it is the material side of a community of language, institutions and traditions. Prehistory can by a study of cultures trace the interactions of peoples, their migrations and conquests. Comparison of the distribution of a specific culture with that of place names of a given type has in several cases made possible the application of a linguistic name (Celts, for instance) to the authors of a given culture. On the other hand, it has not been possible to identify any culture with one of the larger linguistic families, such as Indo-European or Semitic, nor has it been possible to identify a culture with a distinct physical variety of man or race; racial mixture and interbreeding began so early, apparently in late palaeolithic times, that pure races are practically unknown.

A more ambitious version of the idea of a culture underlies the doctrine of culture cycles (*Kulturkreise*) propounded primarily by German and Austrian Catholic prehistorians. According to this hypothesis all cultures may be traced to the migrations and interactions of a small number of primary and secondary culture cycles, which can either be observed directly in a fairly pure state today among certain savages, as, for example, among the pygmies of Malaysia, or deduced from the distribution of associated groups of institutions and material devices. It is contended that the stone age archaeological cultures thus defined can then be equated with the cycles of the ethnographer and the religious ideas and social institutions distinctive of the latter be read into the former. Ethnographers are far from unanimous as to the legitimacy of the method and still less agreed about deductions based thereon, while the applications of the theory to the archaeological material still seem rather forced. In American prehistory the emphasis is often laid less on the historical questions, which have attracted most attention in the Old World, than on the adjustment of human

groups to their environment, and there has thus arisen the concept of a culture area which is spatial rather than temporal.

The systematic investigation of prehistoric remains in Europe goes back at least to the seventeenth century, but for a long time it was regarded merely as a means of illustrating the classical authors' accounts of the Britons, Germans and Druids. Prehistoric archaeology in Greece began about 1870 with the search by Schliemann for the cities described in Homer, and its method of approach was therefore classical and literary. The recognition in 1786 of the kinship between Sanskrit and Greek, German and Welsh, widened the scope of prehistory. After the work of Bopp, F. Max Müller and others had popularized the idea of an Aryan people and had suggested that their culture and religion as well as their speech might be reconstructed, the identification of the cradle of the Aryans and their culture became an objective of prehistoric archaeology. Similar lines of inquiry were followed in the study of other linguistic families, such as the Semitic and the Bantu. A more radical change was effected when in 1859 Boucher de Perthes convinced geologists that certain stones found with the bones of extinct animals in geological deposits near Abbeville were implements fashioned by man. Prehistoric archaeology was thereupon linked up with natural science and was obliged to adopt its rigorous methods and thus to emancipate itself from theological presuppositions. The concept of evolution enunciated by Darwin cemented the alliance. With the discovery beginning in 1848 of the fossilized remains of men specifically or generically different from *homo sapiens*, zoology also began to contribute to human prehistory. Other landmarks in the study of prehistory are the establishment on archaeological grounds by Thomsen in 1836 of the succession of stone, bronze and iron ages already deduced by the Roman poet Lucretius; the discovery of the prehistoric cultures in Egypt in 1895 by Petrie and de Morgan, of the painting of mammoths and other extinct beasts in the caves of Spain and France in 1895 and of the great Minoan civilization in Crete by Evans in 1900. Since the World War northern and southern Africa, Iraq and India have effectively been brought within the scope of scientific prehistory and a beginning has been made in China. The discovery of the Peking man in 1927 is one of the latest triumphs of prehistory.

Recent disclosures have shown that by 3000

B.C. India possessed an urban civilization of its own, a peer of the Egyptian and Babylonian, and that manufactured articles were being exchanged between India and Babylonia about that time. Yet in the same period the forerunners of the Nordic race were savages living on shellfish and game along the shores of the Baltic, and for two or three thousand years barbarism prevailed everywhere north of the Alps. On the other hand, Roman authors exaggerated the savagery of the northern peoples; the architectural skill displayed in the forts of Gaul and the brochs of Scotland and the fine taste of early Celtic and Germanic art are still admirable. Similarly the conquistadores grievously underestimated the pre-Columbian civilization of America. Archaeology has revealed that in addition to their highly developed material culture the Mayas possessed considerable astronomical knowledge, which they had applied to the establishment of an accurate calendar system. In South America also many of the important discoveries of the Old World, such as the combination of copper and tin to form bronze, had been reached independently.

PRENATAL CARE. *See* MATERNITY WELFARE.

PREPAREDNESS. *See* NATIONAL DEFENSE.

PREROGATIVE in its most general sense is the "power to act according to discretion for the public good without the prescription of the law and sometimes even against it" (Locke, *Of Civil Government*, bk. ii, sect. 160). This generalized conception, however, of prerogative as discretionary power has not become widely accepted,

for it was in contravention of the distinct legal connotation of the word, which was carefully guarded by English lawyers until the nineteenth century. Generally speaking, four periods may be distinguished in the evolution of the legal concept of prerogative: the feudal, the absolutist, the constitutional and the parliamentary.

The feudal concept of prerogative is essentially that of a congeries of rights of the king in his capacity as feudal overlord. These rights are primarily of a procedural variety, like the right not to be sued upon ordinary writ as tenant to lands but only by petition. A long list of such procedural privileges is given in Cowell's *Interpreter*. This notion of prerogative as procedural privilege is reminiscent of the original Latin word which was applied to the comitia which could vote first in the Roman assembly. The equivalent on the continent of these feudal privileges was the monarchical regalities (*jura regalia*). In accordance with the mediaeval notion of law as founded upon immemorial custom all such privileges were interpreted as existing according to the law of the land, but with the disintegration of the feudal order and the concomitant expansion of legislation there appeared a tendency to curtail these royal privileges by special enactment. The king and his advisers were bound to make efforts to resist such tendencies, and as a result of these endeavors there emerged the doctrine of sovereignty (*majestas, plenitudo potestatis*), as set forth, for example, by Staunford in his *Exposition of the King's Prerogative*. Staunford defined prerogative as "a privilege or preëminence that any person hath before another, which as it is tolerable in some, so is it most to be permitted and allowed in a prince or sovereign governor of a realm." To be sure, this trend was opposed, but cautiously, by writers like Sir Thomas Smith, who in his *De republica Anglorum* (bk. ii, ch. v) pointed out that of the five sovereign rights—legislation, war and foreign policy, taxation, appointment of officials and administration of justice—the king in England possessed only the second and fourth. Sir Thomas' discussion called attention to the way in which the notion of prerogative in this period tended to be confused by the royalists with that of sovereignty. This transformation became apparent to everyone through the writings of James I.

Nowhere is the new absolutist doctrine of prerogative stated with greater succinctness than in James' speech in the Star Chamber on June 20, 1616, in which he warned the judges

against encroaching upon the prerogative of the crown. The king claimed that residuary discretionary power with which someone must be entrusted if the state is to survive in times of crisis. In order further to buttress his contentions and to forestall any misapprehensions James proceeded to make the very significant distinction between what he termed his private prerogative, regarding which he was willing to be subject to the law of the land, and the absolute prerogative of the crown, which he claimed was beyond all law. This distinction anticipates the later constitutional development in which the crown becomes the legal framework within which the cabinet exercises the king's discretionary powers. In a sense it anticipates also the distinction between political and constitutional issues characteristic of American constitutional law and, again, that between *l'acte de pure administration* and *l'acte du pouvoir discrétionnaire* in French administrative law, or, as Hauriou termed it, the distinction between *l'acte administratif* and *l'acte gouvernemental*.

The most vigorous objection to the absolutist doctrine of the prerogative was raised by Sir Edward Coke, who declared that "the King hath no prerogative, but that which the law of the land allows him" (12 Coke 76). By thus returning to the formula of the feudal period Coke raised once more the issue of the lawmaking power and initiated the constitutional doctrine. This doctrine did not reach fruition, however, until the parliaments of the English revolutionary period had explored the alternative of parliamentary prerogative. To be sure, under the Protectorate the word disappeared together with the king of whom it was reminiscent; but the ultimate discretionary power which absolutist theory had attached to it oscillated between Parliament and Cromwell, while the Restoration refused to face the issue squarely. After the Glorious Revolution, however, the doctrine of the separation of powers demanded a reconsideration of the issue and gave rise to the general theoretical doctrine of Locke, from which are derived the conceptions of the emergency power, the police power and the pardoning power in the United States. For here as elsewhere the American constitutional order is built upon the conceptions of Locke and his age, while the English constitutional system worked out a new concentration of powers in the hands of the parliamentary executive. This parliamentary executive of course claims the same discretionary powers as does the American chief executive, the essen-

tial difference lies in the fact that in the former case such a claim is not resisted by Parliament. The ancient conflict may be said to have arisen in another quarter, for the heated debate over the sphere of administrative law, as epitomized by writers like Robson and Lord Hewart, turns fundamentally upon the problem of discretionary powers. It is in this sense that the controversy over dictatorship in the United States and Great Britain may be considered a revival of the constitutional struggle of three hundred years ago. This time, however, the progressives are on the opposite side.

PRESCHOOL EDUCATION. Philosophers and educators from the time of Plato have insisted upon the importance of the earliest years in shaping the destiny of an individual. It was not, however, until modern times that society began to assume a large share of responsibility for the nurture and training of the child from birth to the conventional age of school entrance. This extension of community interest in the young child has resulted in the development of

several distinct institutions for preschool education and a variety of methods of teaching.

The general attitude toward children in pre-Reformation days and during the Reformation period was repressive, by reason of the prevailing doctrine of original depravity, according to which the natural was virtually synonymous with the sinful. The only education considered necessary for children was moral and religious training. In the seventeenth century there arose within the Lutheran church the Pietist movement, the aim of which was to make religion less sterile and formal, more directly applicable to the problems of life. One of its leaders, August Hermann Francke, professor at the University of Halle, established a system of schools in which not only the children of the well to do but also poor children might obtain suitable education. In connection with this project he opened an orphan asylum where teachers of young children might be trained. Francke's work was far reaching in its effect: orphan asylums modeled on the one at Halle were founded in various European cities, and an interest was awakened in training people to work with little children. During this same period other religious groups motivated by a common philanthropic spirit opened charity schools in England and on the continent. While not especially preschool in character, these institutions often devoted considerable attention to the needs of young children.

At the beginning of the nineteenth century concern for the welfare of children found expression in the "infant schools," a by-product of the humanitarian impulse which sought to mitigate the social and economic disturbances accompanying the industrial revolution. The infant school was originated in England by Robert Owen on the theory that social injustice and all the ills of men could be eliminated if the right sort of universal education were begun in infancy. Accordingly in 1800 Owen organized an infant school at New Lanark, where children might be "rationally" trained from their second year onward. Discipline was to be positive and free from all harshness, and games and music were to be an important part of the curriculum. Owen's work was coincident with the period when socially minded people in England were much concerned about the prevailing neglect of the young children of the poor, and the idea of "educating" these boys and girls in socially useful habits as well as giving them shelter made a strong appeal. Unfortunately Owen's followers, especially Samuel Wilderspin, did not share

his idealistic views and the schools soon became formal and joyless. The movement, however, spread rapidly: in 1824 an Infant School Society was founded by Lord Brougham and James Mill, and in 1836 the Home and Colonial Infant School Society was established under the direction of Charles and Elizabeth Mayo. The latter society supported a model infant school and a training college for teachers based on the methods of the Swiss educator, Pestalozzi.

Jean Frédéric Oberlin was the first exponent of the infant school on the continent. Believing that a good education which began with habit training in babyhood was the best method of moral redemption, he established schools for young children which he called *écoles à tricoter*. His efforts inspired a number of philanthropic women to open schools for the children of working mothers in Paris and other French cities. Under the patronage of a socially minded lawyer named Cochin, these schools, known as *salles d'asile*, developed rapidly and in 1833 were made a part of the national school system of France. The name was finally changed to *écoles maternelles* in 1881, and as such they exist today, an example of a well organized state project for the education of children of preschool age.

Elsewhere in Europe the early nineteenth century saw a similar development of institutions for the care and training of young children. The *Bevöhranstalten* of Germany and Holland stressed physical rather than educational care of the child. In Belgium *écoles gardiennes* were established, analogous in purpose to the French *salles d'asile*. In Italy Ferrante Aporti, a Catholic priest, drew up a plan for an infant school in Cremona, Lombardy; it was approved in 1829 by an imperial decree. In 1833, according to the records, 94 boys and 46 girls were educated gratis in the infant schools of Cremona.

While these social movements were under way, there were being developed definite theories of preschool education and a method of dealing with young children as individuals possessed of the right of self-expression. This new approach to the problem took into account the long neglected educational significance of the play impulse. The first theorist to concern himself in detail with the education of small children was John Amos Comenius, who early in the seventeenth century devoted much consideration to the training of the child from birth to the seventh year as a part of his comprehensive plan for education. In this period of life, he believed, were laid the foundations of all

later education. He appreciated the value of play, declaring that "... whatever children delight to play with, provided that it be not harmful, they ought rather to be gratified than restrained from it." Although Comenius had little influence upon the educational practises of his day, his writings foreshadowed later educational theory.

The work of Jean Jacques Rousseau, proclaiming as it did the essential goodness of human nature in opposition to the orthodox doctrine of original depravity, was a distinct factor in changing the prevailing attitude toward childhood. The right of the individual to life and happiness for his own sake was once and for all asserted. Rousseau drew attention to the need for studying child nature and to the differences among children as individuals. His theories likewise bore fruit in the work of later educators.

Friedrich Fröbel, founder of the kindergarten, contributed to the development of preschool education a comprehensive theory, a definite method and an institution which was intended to give little children real education rather than merely shelter, physical care and routine habit training. The writings of Rousseau and Comenius and the example of Pestalozzi as well as his own observation of children and his mystical philosophy based upon German idealism were the sources of Fröbel's educational theory. This theory found expression in the school for young children which he opened in 1837 in Blankenburg, Thuringia, and to which he later gave the name of kindergarten. The purpose of education, according to Fröbel, was to help children attain an understanding of the "laws of unity and interdependence" which, he believed, govern the universe. Kindergarten games, "gifts" and occupations used in prescribed sequences were designed to make the children recognize these laws. The plan took into consideration the social development of the child through group plays, as well as individual growth. The reactionary Prussian government, mistakenly identifying Fröbel's teachings with those of his nephew, Karl Fröbel, who had taken an active part in the Revolution of 1848, for a time prohibited kindergartens. In 1873, however, the Deutscher Fröbelverband was founded in Germany, which subsequently became active in promoting kindergartens. But the kindergarten has never been recognized as part of the national school system of Germany and has existed, if at all, on a purely voluntary basis.

In the United States Fröbel had a marked

influence on preschool education. Although the kindergarten movement had previously been launched by Germans who emigrated to the middle west in the 1840's, it was largely through the efforts of Elizabeth Peabody that the first kindergarten for English speaking children in the United States was opened in Boston in 1860. As a member of the Concord School of Philosophy, Miss Peabody was especially interested in the metaphysical aspect of Fröbel's theory and gave it prominence in her kindergarten. W. T. Harris, late United States Commissioner of Education, also connected with the Concord School, was instrumental in having the kindergarten introduced into the public schools of St. Louis in 1873. After the kindergarten demonstration at the Centennial Exhibition in Philadelphia in 1876 the idea spread rapidly. In addition to private schools and churches, settlements and other welfare organizations began to include kindergartens in their educational programs. The first kindergartens adhered strictly to the procedure enjoined by Fröbel and reinterpreted by Miss Peabody and her friends. But in 1888 there arose a movement for a different sort of kindergarten teaching—one which should take into account the child's play purposes and which should be free from the artificial restrictions imposed by Fröbel's philosophical ideas. Beginning in Louisville, Kentucky, through the work of Anna Bryan and of Patty S. Hill, one of the graduates of her training school, this newer procedure won the support of William H. Burnham, G. Stanley Hall and John Dewey. The progressive kindergarten group was distinguished by its eagerness for all the help which psychologists, physicians and other child specialists could give to education.

Because of its early introduction into the public school systems, the position of the kindergarten has been strategic in influencing the general trend of the education of young children in the United States. Enrolment in kindergartens, public and private, increased from 31,227 in 1890 to 777,899 in 1929-30. Of the 1929-30 total, 723,443 were enrolled in public school kindergartens. There has been a decrease in the number of private kindergartens, because in many localities the public school took over the work after its usefulness had been demonstrated by private philanthropic effort. In 1886 Connecticut and Vermont passed the first legislation giving school authorities permission to open kindergartens. During the next few years many states adopted some form of kindergarten legis-

lation, one of the most satisfactory being the California "mandatory-on-petition" law of 1913, according to which public education authorities must establish a kindergarten on the petition of the parents of twenty-five or more children of kindergarten age living within one mile of an elementary school. According to a report issued by the federal Office of Education, in 1931 40 states had some form of permissive or mandatory legislation for the establishment of kindergartens. In the remaining 8 states provision for children below the age of six is made possible under the general educational laws.

Although in England the kindergarten made its appearance as early as 1854, it has never become part of the school system because of the firmly entrenched position of the infant school. The latter in connection with its nursery classes for three and four-year olds has made use of certain of the methods and materials of Fröbel as well as of Maria Montessori. During the last quarter of a century criticism of the infant schools has been based chiefly on hygienic grounds. The first serious challenge came through a Consultative Committee of the Board of Education in their *Report . . . upon the School Attendance of Children below the Age of Five* [Cd. 4259 (1908)], which found infant schools unsuitable as regards both hygienic conditions and mental occupations. The committee felt, however, that many young children would be left "unsuitably minded" if they were not in school and recommended that nursery schools be provided for them. The first independent institution was established at Evelyn House in 1911, and it was moved in 1914 to a site given by the London County Council. The schools were avowedly planned to provide a better environment for toddlers than did the infant schools and also to bridge the gap between the time the child left the health supervision of the welfare agency which protected him during infancy and the time when he should have the benefit of school medical care. The work of Margaret McMillan and Grace Owen, pioneers in the nursery school movement, has been of enormous influence in England and led to the passage of the Fisher Act in 1918, by which nursery schools became a recognized part of the national school system. Because of inadequate funds, however, the act has had little practical effect. In 1932 there were in England 29 recognized nursery schools, with an aggregate enrolment of 1924 children. For the most part these schools are still designed to serve the under-

privileged groups. Bertrand Russell has been among the few to advocate nursery schools for children of the upper economic levels; a nursery school for her own and her friends' children has been established by Lady De La Warr at Fishers' Gate, Withyham.

On the continent there are few nursery schools as such, but other institutions for children under the age of six are numerous, because of recent developments in child hygiene and psychology which have laid increasing emphasis upon preschool education. In Paris in 1926 there were 1900 classes for children under six with an attendance of 39,000. By far the greater number of these children were enrolled in *écoles maternelles*, certain classes connected with the *lycées* serving the upper social groups. A few freely organized *jardins d'enfants* exist under the direction of social settlements. The education of young children has received careful attention from the authorities in Vienna, where kindergartens are a part of the municipal housing plan. In Italy Mussolini recognized the value of Maria Montessori's work by calling her to Milan to give a training course for teachers of young children. Although there is no provision for young children in the public schools of Germany, numerous private kindergartens exist, and the training of kindergarten teachers is regulated in nearly all of the states. In Soviet Russia preschool education is undertaken in connection with the crèche, or day nursery. The latter not only serves as an agency where children are cared for while their mothers are at work, but provides the groundwork for the development of physical and mental efficiency. Children are kept here until they are three years of age, when they enter the kindergarten. Both the crèche and the kindergarten are under government supervision and occupy an important place in the general educational system.

The nursery school in the United States has developed as the result of a widespread interest in child guidance and incidentally as a means of enabling professional women to arrange for suitable care for their children. It is in most cases an agency for research, experiment and demonstration in the fields of preschool and parent education, and for this reason it is often identified with child welfare institutes in colleges and universities. From the standpoint of preventive work in mental hygiene the nursery school is in a strategic position, in that it makes possible the early education of the child in desirable social attitudes and habits, and renders

expert assistance to parents in studying their own children with a view to promoting wholesome family relationships. Nursery schools are invaluable for research in child development, since they offer opportunity for scientific observation of normal children, rather than of those who are referred to specialists because of some mental or physical deviation. Through its program for parent education the nursery school is an important factor in promoting early education in the home. The origin and purpose of nursery schools in the United States have determined the economic groups which these schools serve, the training of nursery school teachers and the character of nursery school procedure. In contrast with the English, the American nursery school served first the needs of the professional and economically favored groups and has only lately been extended to the underprivileged. Whereas the English nursery school teacher is prepared for her work on the undergraduate level, the American nursery school teacher receives much of her training as a graduate and is expected to be able to advise parents and otherwise to exert community leadership in child study and child welfare. Instead of formal kindergarten procedure there is a high degree of freedom in the American school, and an emphasis upon the guidance of children in their social relationships.

In 1931-32, 203 nursery schools were reported to the federal Office of Education, of which 13 are connected with public schools, 74 with colleges or universities and 73 with private schools, while 43 are maintained by philanthropic organizations. In contrast with the kindergarten, which customarily offers a half day program, nursery schools for the most part operate on a full day schedule and provide meals and sleeping facilities. Of 252 separately organized nursery school units, located in 202 institutions in 1932, 43.2 percent were in session 5½ to 8 hours each day, while 9.5 percent were in session 8½ to 12 hours.

Both in England and in the United States the nursery school, although still in a formative state, is exerting profound influence upon the general trend of preschool education. In England it is affecting the infant schools; in the United States it is shaping current practice in the kindergarten and in the elementary grades. There is in the United States a tendency toward the unification of the entire preschool program and toward the elimination of any gap in procedure between the different levels of nursery, kindergarten and primary education. Only through

such coordination can preschool educational institutions function as effective agencies in child care and development.

PRESCOTT, WILLIAM HICKLING (1796-1859), American historian. Prescott was the first American historian who successfully combined learning, scholarship and literary brilliance, and the first to make a substantial contribution to European history. He was severely handicapped in his chosen career by partial blindness; but his ample means enabled him to overcome this disability so that he was in a position to employ readers and to bring to his library copies of documents and manuscripts from European archives. These formed the solid foundation for his historical works. Influenced in part by Washington Irving and George Ticknor, Prescott decided to explore the uncharted fields of Spanish history and in his first work, *A History of the Reign of Ferdinand and Isabella the Catholic* (3 vols., Boston 1838), and in his last, *A History of the Reign of Philip the Second, King of Spain*

(3 vols., Boston 1855-58), he presented the political and military history of sixteenth century Spain with a thoroughness, discrimination and literary grace never before achieved. Although Prescott's substantial reputation rests largely upon these essays in Spanish history, his fame is more popularly associated with his epic *A History of the Conquest of Mexico* (3 vols., New York 1843), a literary tour de force which has enjoyed a lasting popularity, and his scarcely less brilliant *A History of the Conquest of Peru* (2 vols., New York 1847).

Although he was essentially a literary historian, Prescott's reliance upon source material, conscientious research and critical acumen established standards of scholarship which justify the claim that he was the first American scientific historian. Subsequent research has added materially to Prescott's story of the sixteenth century Spanish monarchy and also has altered the perspective, yet it has impaired neither the accuracy of his account nor the fairness of his judgments. While new discoveries in archaeology have proved that Prescott's reconstruction of the Aztec and Inca civilizations was highly romantic, this fault was due rather to lack of reliable source material than to poor judgment, and the essential soundness of the story of the conquests has not been challenged.

Prescott's defects as a historian lie not in method or in scholarship, but in a certain superficiality of mind and exclusiveness of approach. His history was narrative rather than analytical, descriptive rather than philosophical, and the brilliance of the coloring conceals a lack of depth. His concern was with politics, war and diplomacy rather than with social or economic institutions; his Spain was the Spain of the court and nobility and not of the common people. His point of view was essentially conservative, and his picture of Philip II contrasts sharply with that which Motley was painting at the same time. Despite these failings, however, Prescott's services to history and literature were of a very high order. His observance of the most rigid standards did much to raise the level of historical scholarship in the United States, and his conception of historical writing as a literary form went far to popularize the reading of history by Americans and to prepare the way for Motley and Parkman.

PRESCRIPTION, LEGAL. *See* LIMITATION OF ACTIONS.

PRESS. As the term is used here, the press means the establishment which undertakes to purvey news and opinion to the general public through regular periodical outpourings of the printing press. As related to publishing through association with the printing press, from which it is derived, the term is highly absorptive. It is sometimes used, particularly in the discussions of "freedom of the press," to indicate the whole range of expression in print. It is also employed frequently as a general designation for periodical publishing and publications. In this sense it is customary to refer by way of limitation of the general term to the medical press, the agricultural press, the legal press and so on. News, a term whose definition by reference to its manifestations in the press has generated a substantial literature without decisive results, is used here in the elemental sense of reports coming to the person receiving them as new information. The difference between news and opinion is the difference between objective reports of developments and the judgments passed upon them by the press in assuming the role of adviser to the general public. It is the distinction in formal design between the news dispatch, which merely records an event, and the editorial or leading article, which passes judgment upon it—a distinction which inevitably breaks down in actual practise. The undertaking to purvey news, with which the purveying of opinion is inextricably linked, gains in importance to the public in proportion to the range of significant developments which lie outside the realm of first hand experience.

At present this enterprise is unfolded through thousands of daily publications and tens of thousands of weekly publications. Published in hundreds of languages, they range in circulation

from millions of copies per day to a few score copies per week or month, with attendant contrasts in the equipment and production organization brought into play. They are under the immediate control of persons of the most diverse social, cultural and political ideals, and their contents reflect these differences, as they also reflect great differences in the aspirations and interests of the publics to which they are addressed. They are shaped by governmental regulations varying greatly from one jurisdiction to another, as they are by contrasts in the economic organization under which they are produced and the economic resources available for their production. The press of the United States, for example, differs markedly from that of England and one of a great many reasons for the difference is geographical. The territorial bulk of the United States has thus far prevented the timely national circulation of a daily newspaper, as is feasible in England, and important divergences in the structure and performance of the press of the two countries flow from that fact. Likewise the press of France differs decidedly from that of England and the United States, one of the reasons being the historical fact that long sustained governmental regulation of the political content of the French press has served to enhance its interest in literature and the arts.

Nevertheless, in many respects the press is moving in the direction of institutional unity. The telegraph, whatever its limitations and advantages, tends, perhaps more than any other device, to fix the tempo of the news gathering process and hence, in important degree, the quality of its product. The press moreover is governed in its operations by the general dictates of a capitalistic economic organization. Even the Soviet press uses many of the same mechanical and editorial techniques employed in capitalist countries. Although there is perhaps a greater tendency to stress the institutional unity of the press to the point of gross inaccuracy than there is to emphasize the inevitable contrasts arising from linguistic, national and cultural barriers, there are always powerful factors promoting uniformity—forces such as those which enable American comic strip characters to cross the Pacific and to disport themselves in Japanese newspapers.

This tendency toward institutional unity emerges rather clearly from the study of the historical development of the press, which, while disclosing great variations of the types noted, reveals forces, such as those generated

by editorial and mechanical invention, discoveries in the art of profit making and ideas relative to freedom of the press which tend to shape the establishment as a whole. To trace the historical development fully it would be necessary to go far back of the introduction in Europe at about the middle of the fifteenth century of the device from which the name press is derived. The signaling arrangements used by primitive tribes are in some ways analogous to modern news services. The *Acta diurna* of the Roman Empire, an official publication in bulletin board form, which had its broadest development under Julius Caesar, was but for the absence of mechanical printing closely akin to the press of today. It contained news of crime, sports and sensational events along with official intelligence and propaganda and was extensively copied for dispatch to the provinces and reading at public gatherings. Following the collapse of the Roman Empire establishments bearing any close resemblance to the modern press seem to have disappeared from the western world, although there are evidences of the existence in China in the eighth century of something approximating a modern newspaper. In the sixteenth century, however, much the same methods used to circulate the *Acta diurna* were being employed systematically in Venice, where written news reports were regularly sent to appointed stations to be read aloud. Before the end of the century these reports were being printed, so that they came to qualify as early manifestations of the press. In the early seventeenth century the technique, preceded in direct line of development by regularly written news letters, which continued for some time to compete with printed news reports, had spread to a number of European countries.

In spite of crude mechanical facilities and the fact that literacy was still confined to a small part of the population, so that its products were in the luxury class, the advent of the press might not have been delayed for a century and a half after the introduction of printing had it not been for the fears of those in control of governments that it was dangerous to their authority. Thus when a *Weekly News* was launched in England in 1622 as the first contribution of the press in that country, it was restricted to the reporting of foreign news, presumably on the theory that news of developments far removed is relatively innocuous—a view, incidentally, which is not without current applications in the press. And although Cardinal Richelieu had a hand

in founding what is generally regarded as the first French newspaper, the *Gazette* (afterward the *Gazette de France*), in 1631 and in using it to further his political designs, he granted its proprietors a monopoly of news dissemination in order to keep this process closely under his control. Forces were in the making, however, which would weaken the authority of government over the press in favor of its control by capitalism, which, when the press came generally upon the scene in Europe, was moving toward a dominant position in economic life. In England Parliament and the crown were poised for a series of political contests, in which the former was to prevail and with it a larger scope for the popular ideal of freedom of the press. In France Richelieu, succeeding in large measure in his designs to give the crown control of a unified nation, paved the way for revolutionary reactions which, while they did not secure freedom of the press for France, were to provide intellectual slogans and patterns to hasten its expansion in other countries. Thus in America Jefferson, inspired largely by the philosophers of the French Revolution, later declared, "were it left to me to decide whether we should have a government without newspapers or newspapers without a government, I should not hesitate a moment to prefer the latter"; and, burning with zeal for a political ideal which embraced ". . . eternal hostility against every form of tyranny over the mind of man," he failed to see that under the scheme of economic organization which had "naturally" been adapted to the development of the press, freedom from governmental control would still leave it under important economic restraints.

If those who led the struggle for freedom of the press had considered that they were really fighting to have the function of reporting and interpreting news given over to establishments which must have private profit as their guiding star, it seems possible that their enthusiasm might have had some momentary lapses. Even Adam Smith, who in his *Wealth of Nations* argued so effectively for the public virtue of entrusting the direction of economic activity to private profit seekers operating under the restraints of competition and contract, made reservations about subjecting education, to which the work of the press bears certain resemblances, to this form of control. But the struggle for greater freedom of the press from governmental regulation during the eighteenth and nineteenth centuries was a contest governed at least out-

wardly by political ideals and not by economic considerations. Moreover it was waged for the most part on behalf of a small handicraft industry to which competing units could be added with relative ease by those who felt that the cause of truth was not being served by the existing establishments. In the United States, with fewer ancient prerogatives to block the way, the press entered the nineteenth century largely freed from governmental restraints except those imposed by the laws of libel and with guaranties of its freedom written into the national and state constitutions. In England the stamp tax, initially adopted in 1712 to facilitate governmental regulation of the contents of the press and to derive revenue, was finally eliminated in 1855; but not until the champions of freedom of the press had overcome wide opposition, including that of the proprietors of established journals, who preferred to pay the tax in order to avoid the competition of low priced publications which its abolition would encourage. That their judgment was sound is attested by the emergence of many penny papers immediately after the repeal. This was followed in 1861 by the removal of the import duty on paper, which eliminated the last of the major economic restraints on the English press. In France rigorous governmental dictation of the contents of the press persisting from the time of Richelieu served to stimulate the growth of an extensive clandestine press. This control was shattered by the revolution, which was accompanied by an avalanche of publications of enormous diversity of political opinion. Forceful regulation was restored, however, by the National Convention in 1793, which prescribed the death penalty for journalists urging restoration of the monarchy, and it was vigorously enforced by Napoleon, who said that the only news he wished printed was news so old that it was not worth printing. It was not until 1881 that a substantial and sustained degree of freedom was secured to the French press. Other European countries were participating in a general movement toward greater freedom when a new wave of suppression, attendant upon and following the World War, swept over them. The spending of the wave is nowhere in sight.

As the struggle to win independence from governmental restraints, pushed in England and the United States more successfully than in other countries, tended to shape the development of the press as a whole, so also did the devices and techniques invented for the exploi-

tation of this freedom. As new editorial, mechanical and commercial practises were found successful, they were copied extensively and thus promoted uniformity of development. In England the first products of the press, patterned on continental predecessors, were "news books," publications in pamphlet form without fixed title—unadorned news items or bulletins. Exhortation and entertainment by means of the printed word were carried on through separate media. By the middle of the seventeenth century, however, the reporting and interpretation of news, often in the most scurrilous terms, had been merged in single publications. Early in the eighteenth century polemic writing in the press, as developed by Addison and Steele and by Swift, who is credited with having devised the abiding technique for the editorial or leading article, approached the status of a fine art and quickly found emulators in other countries. In America James Franklin, founder of the weekly *New-England Courant* in Boston in 1721, the fourth newspaper in the colonies, added to his news reports writings by members of the "Hell-Fire Club" on the pattern of the British essayists as well as letters and verse.

As the reporting of news was soon merged in single publications with interpretation and opinion, so too were undertakings to provide entertainment and cultural guidance apart from the flow of news. To cite but a few of many examples, in 1719 *Robinson Crusoe*, whose author, Daniel Defoe, is often described as the father of British journalism, was printed in serial form in a London newspaper, thus inaugurating what has become a standard feature of a large part of the press. A few years later a Pennsylvania newspaper publisher undertook to reproduce serially *Chambers's Dictionary of the Arts and Sciences* but discontinued it after a few months. In order to lighten the labor of perusing the products of the press illustration was introduced very early. The *Gazette of Antwerp*, established in 1619, contained a woodcut used for a number of years to illustrate various events; it was produced by a method which remained essentially unchanged for two and a half centuries. In the year 1643 a weekly, *Mercurius civicus*, regularly illustrated with woodcuts, was launched in England. Symbolic illustration as a means of reenforcing editorial opinion also appeared at a relatively early date, a famous example in America being Benjamin Franklin's drawing of a severed snake with the caption "Join or Die," which was widely circu-

lated in 1754 to strengthen an appeal for united action among the colonies.

In the exploitation of news by types, such as crime, politics, war and so on, virtually all the avenues had been explored by occasional printed publications before the advent of the press. Local news alone remained relatively unexploited until the nineteenth century. In the printed news publications of the sixteenth century in England, which antedate the press because they did not appear regularly, crime received much attention, as did reports of prodigies, witches and other sensations, and there were certain traces of sport news, such as reports of walking contests. In the seventeenth century the political strife in England led to an extensive development of political news. Also by the middle of the seventeenth century the use of the press as an advertising medium was well begun. In England the first advertisement in a regularly printed news book appeared in 1625; and twenty-five years later many of these publications were given over in considerable degree to advertising, which by the following century was providing a large part of the revenue of the press. The modern telegraphic news agency was anticipated in type of organization in Venice of the sixteenth century, and in the eighteenth century in France Madame Doublet applied the same general plan in the organization of her salon. She kept two books, one for news regarded as certain and the other for news of doubtful authenticity; these were at first available as a written news exchange for members of her salon and subsequently in printed sheets containing theater notices, book reviews, poems, satires and anecdotes. They continued to be circulated for about forty years, along with many publications of the same general type, in spite of more or less continuous governmental efforts to suppress them.

Although by the end of the eighteenth century most of the paths it was subsequently to follow had been opened up, the press was still industrially a handicraft undertaking, its economic stature limited by crude mechanical facilities as well as by a relatively small but rapidly expanding market for its wares. In 1814, however, the management of the *London Times*, which in a half century had risen to great prestige and power, applied steam to its printing operations, an event characterized by Charles and Mary Beard in their *Rise of American Civilization* as of greater importance than the surrender of Napoleon in the following year. This departure

ushered in a mechanical revolution which made possible mass production, reduced press costs and brought a tremendous speeding up of the process. To provide a rapidly broadening basis for mass production of metropolitan journals the same mechanical upheavals in which the press shared so abundantly contributed to a great increase of population in the western world, attended by concentration in urban areas around batteries of machines whose mounting productivity stimulated a contest for markets accompanied by an enormous expansion of advertising. The upheaval was also marked by rising standards of living and an extension of social and political democracy which resulted in greater emphasis on popular education. To more than match the speed at which the press, by virtue of successive improvements in the art of high speed printing, was enabled to rush its products through the machines came the perfection of the telegraph and subsequently the telephone and the radio, making possible the transmission of news at lightning speed.

While the industrial foundations of the modern mass production popular press were laid in England, parts of its pattern were developed more rapidly elsewhere, to some extent because of the continuation of a stamp tax in England until 1855. A considerable portion of the die of the modern press was cast in the United States in 1833 when Benjamin Day, a printer, projected a small one-cent daily, the *New York Sun*, into a group of six-cent dailies concerned primarily with national political controversies, as most of the press had been since the founding of the republic, frequently under the impetus of direct or indirect subsidies from political factions. Day relied largely on a journalistic formula of long standing in certain reaches of the British press, that of emphasizing news of the police court and crime. By purveying news of this type designed to interest "mechanics," to whom the paper was specifically directed, Day gained within a few months a circulation larger than that of any of his six-cent contemporaries. Within four years he was circulating more than 30,000 copies per day of the *Sun*, which had been more than doubled in size, largely to accommodate advertisers; and arrangements were being made to apply steam power to the increased printing requirements. The success of the *Sun*, soon to be followed by the even greater success of James Gordon Bennett's *New York Morning Herald*, founded in 1835 on an investment of \$500 and a journalistic platform prom-

ising to "... support no party—be the organ of no faction or *coterie*, and care nothing for any election, or any candidate from President down to Constable," demonstrated possibilities of both profit and power for publications designed for low price mass consumption; quickly exploited in other cities, such publications were to have a controlling place in the shaping of the modern press.

Between Bennett's spectacular rush to success and the next great sweep of popularization there was a transitional period in the development of the American press, commonly known as "personal journalism," when something of the editorial fervor of the earlier political press was combined with improved industrial devices. Perhaps its leading exponent was Horace Greeley, who, in contrast to Bennett's frankly opportunistic attitude toward the press, held that "... we cannot afford to reject unexamined any idea which proposes to improve the Moral, Intellectual or Social condition of mankind." Greeley's New York *Tribune*, founded in 1841 and reflecting its high moral purpose in refusing to print crime news and patent medicine advertisements, gained a large following and such power as a vehicle of opinion, particularly through a weekly edition reaching at times a circulation of over 200,000, that some historians have attributed the defeat of the Union forces at Bull Run to the fact that it was Greeley's opinion that the battle should be fought at the time it was fought. During this period of American personal journalism the editorial power of the press in England also was perhaps at its peak. The first number of the *Saturday Review*, a weekly founded in 1855, announced that its purpose was to undermine the influence of the London *Times*, remarking that "no apology is necessary for assuming that this country is ruled by the *Times*. We all know it. . . ."

While the Civil War, both in the struggle over slavery precipitating it and in the actual conflict itself, produced striking examples of the power of the press as an organ of opinion frankly professing this objective, it contributed to a relative waning of the importance of that type of journalism. Just before its close the century was to see another war, the Spanish American, which has sometimes been characterized as "personally conducted" by rival newspaper proprietors seeking sensational news; but the influence of the press was to be exercised primarily through what purported to be the news of the day rather than through an explicit expression of opinion. Al-

though during the Civil War the populace was greatly interested in editorial judgments, the cataclysmic nature of the conflict aroused an even greater interest in the actual events. By this time moreover the telegraph had been developed sufficiently to provide a speedy flow of news. Following the example of the London *Times* during the Crimean War, special correspondents were sent to the battle fronts and their telegraphic reports were distributed through both individual publications and press associations formed for the common exploitation of telegraph facilities. For any except the wealthiest newspapers the cost of extended telegraphic reports was prohibitive; but by grouping several newspapers together, according to a general plan developed long before the advent of the telegraph, it was possible to reduce greatly the cost to the individual newspaper. The next step was the formation of press associations and agencies, organized both as cooperative ventures of the newspapers served and as private profit seeking corporations, to keep pace with the rapid territorial expansion of newspapers and the telegraphic resources. By 1860 there were a number of territorial press associations in the United States, which were later to be involved in a fierce struggle for supremacy.

Although in 1803 the proprietors of the New York *Evening Post* had advised their clientele that "... in fact, it is the advertiser who provides the paper for the subscriber," and advertising had gained steadily in importance as a contributor to the income of the press, in 1860 it still retained in form of presentation a relatively perfunctory role. This was due partly to the refusal of some newspaper proprietors to allow advertising a typographical scope which they feared might overshadow the news and editorial columns. Bennett, for example, long fought against allowing the column rules of his *Morning Herald* to be broken to accommodate large advertisements and against allowing them to be set in large type. This prompted his advertisers to resort to extraordinary expedients, such as repetition of the same sentence in small type set in single columns over an entire page. Toward the end of the century, however, these restraints were broken down to give broad scope to an expansively expressive technique of press advertising. For this the press of Paris seems to have been the pioneer vehicle, French department store advertisements set in very large type preceding by some years similar displays in the United States. Along with this change of typo-

graphical technique went a change in the content of advertisements; emphasis shifted to commercial news increasingly illustrated instead of the old standing notices of establishments. The new technique was applied to a rapidly growing volume of advertising occasioned in large measure by the rise of department stores. Toward the end of the century this contributed largely to another upheaval, which was to shape the development of the press elsewhere.

Industrially the period between the end of the Civil War and the close of the century was one of major discovery for the press. Perhaps the most important development was that of conversion of woodpulp into newsprint, which accounted largely for the fact that a dollar would buy about ten times the amount of this basic raw material in 1900 as in 1875. To this were added the linotype machine, making possible the high speed setting of type, devices to replace the venerable woodcut and to reproduce illustration rapidly and at relatively low cost for high speed printing, and constantly improved power driven presses, through which by the end of the century newsprint was running from rolls at express train speed and emerging, if desired, arrayed in colors, then to be picked up by automatic cutting and folding machines. These advances and many others in printing and closely related arts when applied to mass production made possible large reductions in the unit manufacturing costs of the press while enhancing the quality of manufacture. Under the peculiar economic dispensation controlling its development from the start—that of looking for its revenues jointly from its readers and advertisers—these reductions in manufacturing costs were reflected in part in a lowering of the price charged the reader and in elaboration and popularization to attract an even wider circulation, which could then be sold to advertisers.

At the turn of the century the process of elaboration and popularization reached spectacular heights in the competitive duel between Joseph Pulitzer and William Randolph Hearst. Pulitzer, previously successful as a St. Louis newspaper publisher, had acquired the nearly defunct New York *World* in 1883 and, after fixing a price of two cents for the daily morning edition and starting an evening edition at one cent in 1887, animated and expanded it with extensive illustrations, comic strips, large headlines, sensational news and many other features designed to attract a popular following. In 1895 Hearst, after testing various journalistic theories

in San Francisco, acquired the New York *Morning Journal* and immediately challenged Pulitzer's position. In the resulting contest, which had as its stakes not only personal aggrandizement but also preeminence in command of advertising revenue, all the devices (including promotion of a war) which money could command to give mass appeal to a newspaper were brought into play on an unprecedented scale. In his Sunday edition Pulitzer had introduced a comic strip having as its principal character a "yellow kid" with appropriately typographical adornment. As a result the journalism which he first geared to modern machinery came to be known as yellow journalism and the term was and has remained one of opprobrium. In its setting, however, which embraced a public rapidly being augmented by the expansion of public education and by immigrants eager but linguistically ill equipped to learn of affairs in their newly adopted land, it was a logical development of a press subject to the dictates of a competitive business regime. Largely in response to these dictates a marked expansion of evening newspapers took place toward the end of the century, one of the principal reasons assigned being the accommodation of advertisers, who reasoned that publications purchased late in the day went into the home for leisurely perusal by housewives, who controlled the bulk of the family expenditure; while morning editions were often taken out of the house by men bound for the day's work. The same general line of reasoning accounted in considerable measure for the growth of highly illuminated and bulky Sunday editions, of which much of the material was printed far in advance of publication date and bore no relation to the flow of news, as it did also for an emphasis upon "features" calculated to attract women. This popularization of the press did not of course dominate all of its reaches. While Pulitzer and Hearst were striving to outdo each other, many publications were prospering under quite another type of direction. The nature of the economic setting of the press was such, however, that these two publishers exercised an influence far beyond the immediate range of their newspapers. Their most successful devices in securing circulation were imitated by their fellow craftsmen and multiplied further through competitive necessity. Thus Alfred Harmsworth, afterward Lord Northcliffe, who from meager beginnings had built a successful business of publishing cheap popular magazines in England, followed many

or the American formulae for popular journalism when he became proprietor of the London *Daily Mail* in 1896. In catapulting to great commercial success, much aided by the expansion of compulsory education in England after 1870, Northcliffe exercised an Americanizing influence upon a broad segment of the British press, as he was in turn largely to provide the pattern for pictorial tabloid journalism, which, copied in the United States a few decades later, set off another wave of popularization of the press. The same economic principles underlying the organization of telegraphic press associations were applied to the distribution of newspaper "features" with the result that circulation winning devices spread from one publication to another and served, along with uniform telegraphic dispatches for simultaneous use in many newspapers, to promote standardization of the output of the press. This standardization extended to many small country newspapers through the distribution of "patent insides"—news pages which had been fully printed by a central distributing agency to be inserted between pages gotten out by the local publisher.

In the gathering and distributing of telegraphic news in the United States the closing years of the nineteenth century witnessed a fierce struggle not only between rival agencies but also between rival types of organizations. In this contest the Western Associated Press triumphed. It is significant that its triumph was largely due to the success of its management in securing exclusive news exchange privileges with Reuter's, a British agency which had built up news channels widely from its foundation around 1850 as the pioneer in telegraphic news agency organization. Shortly after establishing its supremacy in the field of American telegraphic news handling the Western Associated Press, which had been incorporated in Illinois, was held by the Supreme Court of that state [*Inter-Ocean Publishing Co. v. Associated Press*, 184 Ill. 438 (1900)] to be an enterprise affected with a public interest and hence liable to furnish its reports to any newspaper willing to pay a reasonable price. This decision prompted the association to abandon its Illinois charter and to obtain one in New York state as a gentlemen's club, a form of organization which the present Associated Press still holds. From a number of territorial news gathering agencies remaining after the Associated Press had swept its principal rival from the field, the United Press was formed in 1907 as a private stock corporation

and has since grown to be a formidable contender of the Associated Press, particularly in serving afternoon papers. Taking the lead in its formation, E. W. Scripps gave as one of his reasons a desire to forestall monopoly in the handling of telegraphic news, secured by the existence of only one agency of continental scope and the privileges held by members of the Associated Press to prevent the extension of its news services in the same competitive territory.

In 1878 Scripps had started as a pioneer in building a chain of newspapers with the founding of the Cleveland *Penny Press*, designed to appeal primarily to the laboring man; an opportunity to obtain press association service was vital to such an undertaking. Although Scripps had successfully launched his Cleveland paper on an investment of \$10,000—and similar examples of shoe string financing of successful metropolitan newspapers could be found elsewhere—opportunities of this type became increasingly rare toward the end of the nineteenth century and proprietorship of the metropolitan press moved rapidly into the category of "big business." It had become necessary in order to engage in newspaper publishing not only to make a large investment in industrial equipment but also to be prepared to operate for a long period at a large loss pending payment of that share of the cost which established journals received from advertisers whom the newcomer must attract. By the end of the first decade of the present century the outlay required for the establishment of a metropolitan newspaper was commonly reckoned in millions of dollars. The increasing financial difficulty of establishing a daily newspaper is reflected in the statistical record of the press, which during the nineteenth century was one of rapid expansion in the number of establishments and their circulation. Between 1850 and 1900, while the number of daily newspaper publishing establishments, as classified by the United States Census Bureau, was increasing from 254 to 2226, the circulation of their publications was increasing from 758,454 to 15,102,156 per day. During the first decade of the present century the number of such establishments continued to mount, increasing from 2226 in 1900 to 2600 in 1910; but the rate of increase was much slower than that of the circulation of their products, which in the decade jumped from 15,102,156 to 24,211,977 per day. In the decade from 1910 to 1920 there was a decline from 2600 to 2441 in the number of daily newspaper establishments, while the total

circulation of such publications continued to rise to 33,028,630 per day, a ratio of about 1 to 3 between circulation of daily publications and the total population, where the ratio had been about 1 to 31 seventy years before. By 1930 the number of daily newspapers had decreased to 2293, but circulation had risen to 42,947,824.

The decline in the number of daily newspapers in the decade 1910 to 1920 was concentrated in the latter part of the period when in connection with the World War the American press underwent an upheaval which was elsewhere also to result in a vital reshaping of much of the press. At the outset of the war the American press was subjected to a considerable amount of economic strain in adapting itself to heavy expenditures for news and circulation, to which advertising revenue, governed by contract, could not be quickly adjusted. This resulted in an impetus to the consolidation movement, which was to gain marked headway a few years later. In other countries more directly in the theater of the war and more profoundly shaken by their participation, there were not only sweeping changes in the press during the conflict but drastic changes of a more abiding nature in the post-war period of social disturbance. Examples are afforded by the Russian press, which was changed from something approaching a capitalistic form of economic organization to a communistic set up, with an attendant shift from dictatorship by the czarist regime to that by the Communist party, and also by the Italian press with the advent of the Fascist dictatorship. In numerous other countries the press has undergone striking deprivations not only of freedom of expression, such as that effected by the complete regimentation of the German press by the National Socialist regime, but also of economic resources for reporting and interpreting news.

When early in 1933 Goebbels, minister of propaganda for the Nazi regime in Germany, in announcing rules to govern the conduct of the press said that it "must be the keyboard on which the government can play," he followed a general pattern effected in Italy a decade earlier under the leadership of Mussolini. The technique employed by Mussolini in assuring his government a completely "cooperative" press was in part that of making enrolment in a Fascist press syndicate a prerequisite to the right to do journalistic work and a certificate that the candidate was "well conducted politically" a prerequisite to enrolment. The granting and revoking of such certificates by appointees charged

with the enforcement of rigorous rules against subversive news and comment bear out the conclusion of a former head of the press bureau of the Fascist government that "the press is absolutely controlled by Mussolini." In defense of his control of the press, which extends also to the export of news, Mussolini has remarked that "when there is no censorship of the press, the papers only publish what their paymasters, large scale industry and banks, want to have printed," a statement which may have peculiar force in Italy, because relatively few publications, of which it has fewer per capita than any other major nation, have prospered through the commercial channels followed by the press elsewhere, most of them being largely dependent upon support from patrons.

While in perfecting his dictatorship over the press Mussolini resorted on occasion to physical violence in dealing with publications in persistent opposition as well as to forced changes of ownership, he did not undertake a complete overhauling of the basic economic framework of the press but left most of it under a circumscribed private ownership. Thus his dictatorship in this field is for the most part merely an expansion of historical patterns, as is the case in Germany. In Russia, however, the dictatorship of the Communist party, growing out of the revolution of 1917, has eliminated private ownership of the press. "There are no privately owned newspapers in Russia," reported W. H. Chamberlin in 1930. "Every organ of the press is issued either by a Soviet, by a local or national Committee of the Communist party, by a trade-union, or by some other public institution or organization; and in every case the direction of the newspaper's policies by a responsible Communist is assured." This elimination of private ownership gives the Communist party a positive and constructive power in the shaping of the press that is not available to a dictatorship such as that in Germany or in Italy, which has undertaken primarily to hold private enterprise within limits considered safe to its interests. Revenue from advertising, which plays a small part in the Russian press, as well as revenue from circulation may be made incidental to the affirmative fulfilment of its purposes within the limits of the industrial equipment available. On this basis of operation there has been an enormous expansion of the press of the Soviet Union, to which rapid progress in the elimination of illiteracy has made an essential contribution. In 1932 there were in the Soviet Union, excluding

the factory and state farm papers, 2230 newspapers printed either every day, every 3 days or every 5 days in 83 national languages with a total circulation of approximately 33,000,000, about three fourths of it daily (*Soviet Union Review*, vol. x, 1932, p. 112-13); whereas in 1913, prior to the period of revolutionary change, there were 859 newspapers with a total circulation of about 2,500,000. In some parts of this greatly expanded press there is lively competition. The great Moscow dailies, *Pravda* and *Izvestia*, organs respectively of the Communist party and the Soviet government, which issue editions approaching 2,000,000 copies with simultaneous production in other cities, vie with each other for circulation; but such competition is on a plane of positive service to the purposes of the Communist regime, reinforced by the socialist form of organization which that regime has instituted and defends by the most rigorous methods. Thus the press in all its reaches, including a vast array of factory, collective and state farm and wall newspapers—the last, first devised as a means of circulating news in the Red Army barracks in 1920, have spread to all parts of Russia—is primarily a propaganda arm of the controlling party and, subject to the inevitable slips in dealing with an establishment which has expanded so rapidly, is shaped accordingly.

The press of other countries was also profoundly affected by the sweeping change precipitated by the World War. In all belligerent states there was rigid censorship. In France such censorship was extended even to weather reports, in so far as they dealt with the direction of the winds; and in the United States, where the press voluntarily imposed a large degree of censorship upon itself, it embraced almost all information which could be construed as bearing directly or indirectly on the war campaign. Although there were marked variations in the degree of submission to governmental dictation of press policies—a notable example of independence being Northcliffe's attack on Kitchener's direction of the British armies in France, which was largely instrumental in forcing his withdrawal—the continuance of such dictation inevitably dulled the sense of independence and critical capacity. The war expanded the market for the press by providing it with gripping news and a succession of patriotic "drives," which demonstrated the potentialities of "high pressure" advertising. It also paved the way for a post-war let down from high pitches of patriotic

fervor into a trough of cynicism and materialism, which contributed to an intensification of the process of exploiting the press along "strictly business" lines.

In England the years between 1900 and 1914 had witnessed the passing of a large proportion of the individual newspaper proprietorships and their conversion into public corporations. In 1913 nine tenths of the leading daily and evening newspapers belonged to limited companies, many of them dealt with in stock market operations. But the British press was merely on the threshold of a rearrangement of control which in the post-war period would result in bringing the bulk of it under the sway of a handful of giant corporate amalgamations formed to exploit the profit possibilities of the press along mass lines both of newspaper production and of stock certificates to be sold to the public. The history of these press combines, which is frequently dated from 1922 when the Rothermere group was created to consolidate the extensive newspaper properties controlled by Lord Rothermere with most of those controlled by his brother, Lord Northcliffe, has much in common in corporate complexity and ramifications with the history of electric power holding companies in the United States. In the creation of these corporate groups, of which the Rothermere, Berry and Inveresk are the most imposing, there has been not only a switching of press properties between groups but also the creation of interlocking corporate relationships, such as that by which the Rothermere group acquired a 49 percent share of ownership in the rival Beaverbrook group. Encouraging the formation of these giant concerns, which control all but a fraction of the metropolitan newspaper circulation of England and the bulk of the entire circulation, was the significant fact that in the middle 1920's conditions were peculiarly propitious for profit making in popular newspaper publishing. In 1924 it was estimated authoritatively that advertising rates were 200 percent higher than a decade earlier, the volume of advertising was expanding, the price of newsprint—the largest single item of newspaper production costs—was going down and there was a responsive market for popular journals. There was thus an alluring field for corporate exploitation, which was extended by fierce competition between groups to expand circulation and hence the capacity to command advertising. In this contest the rival groups took to insuring readers against death and accident, following the example set by C. A.

Pearson, a pioneer of the British popular press, who during an epidemic of influenza soaked an entire edition of his publications in eucalyptus in a successful effort to convince readers that by purchasing it they might secure immunity from the disease. Along with this competition for readers went a struggle to acquire more newspapers, which in 1927 and 1928 found the Berry and Rothermere groups in a terrific rush to capture newspapers in all parts of the country without reference to their party affiliations, once taken so seriously in England. When the Berry group forged ahead in the contest, the Rothermere group responded by launching plans to establish competitive newspapers in a number of cities; it was overtaken by the world economic depression, however, and abandoned these schemes in 1930. Two years later the Rothermere and Berry groups agreed to trade many provincial newspapers in consummating mergers which would virtually eliminate competition between them in this field. During the struggle for control the two groups together with the Inveresk group, which embarked upon its press proprietorship in search of "an assured market for the large output" of paper, had taken command of the greater part of the British press.

While the World War ushered in a somewhat less imposing rush to press consolidation in the United States than it did in England, the post-war period has witnessed a marked accentuation of the movement toward corporate consolidation both through local mergers and through the extension of territorial and national chains of newspapers. In 1931 there were 137 fewer morning, evening and Sunday newspapers printed in English for general circulation than there had been a decade earlier. This decline, which Sunday and morning newspapers shared to a greater extent than evening newspapers, was in large part accounted for by mergers, so that about 90 cities were reduced to but a single daily newspaper. At the close of 1929 about one sixth of the 1944 morning and evening newspapers, covering over a third of the total circulation, were in chains which also controlled almost one half of the Sunday circulation. Although chain newspaper development had begun about half a century before and chains of imposing size, such as those of Scripps and Hearst, had been established before the World War, a large part of the expansion came in the period, between the economic depression of 1920-21 and that beginning in 1929, when public offerings of subscriptions came to play a considerable role. By

the end of 1931 there were 56 chains, the largest of these being the Scripps-Howard organization with 25 newspapers and the Hearst with 21 newspapers.

One of the most notable recent examples of local mergers and chain ownership was that by which the Scripps-Howard group acquired the New York *World*, discontinued its evening and Sunday editions and merged its morning edition with the New York *Telegram*, which it had previously acquired. In defending the sale against attack on the ground that its terms violated the will of Joseph Pulitzer attorneys advanced the post-war expansion of tabloid journalism in New York City as a primary cause of the inability of the publishers of the old *World* papers to carry on. If they were right, a matter which has been bitterly disputed, the *World*, which the will of Pulitzer had aimed to protect and preserve as a public institution, was the victim of new adaptations of much the same sort of journalism as that by which he had risen to power and fortune, later to conduct his established publication along more subdued lines. The term tabloid journalism relates to the size of publication as well as to the journalistic technique employed; and there are some American newspapers, tabloid in size, which are more carefully and conservatively edited than many standard size journals. In the post-war period, however, the term came to be associated primarily with a newspaper technique, unfolded through metropolitan publications printed in a relatively small format, which extended the basic formula of yellow journalism principally by the use of greatly improved facilities for photographic illustration designed for mass appeal. By the use of this technique, of which one of the most audacious manifestations was the cosmograph, or lightly labelled fake photograph, the circulation of tabloids was greatly expanded in New York City, the pioneer and most successful of them being founded in 1919. A decade later it had attained a daily circulation of approximately 1,500,000 and a Sunday circulation approaching 2,000,000, the largest in the United States.

In contrast to the contraction of independent newspaper proprietorships through consolidations and chain ownership, the circulation of newspapers in the United States continued to mount after the war, as did the total volume of advertising at rates far higher than those prevailing in pre-war times. During the decade 1921-31 the circulation of newspapers in English for general consumption increased from

28,432,000 to 38,761,000 and that of Sunday newspapers from 19,041,000 to 25,702,000. Since 1927 newspaper circulation has remained relatively constant. The volume of advertising reached a post-war peak in 1927, when it was almost twice that of 1914. It approached the peak and, according to some calculations, exceeded it slightly in 1929, when with somewhat higher rates it is estimated that newspapers received an advertising revenue of \$900,000,000 together with approximately \$325,000,000 from newspaper sales. The fact that the 1929 volume of advertising revenues, although far larger in dollars and purchasing power than a decade earlier, was divided among fewer newspapers may be explained partly by the desire of advertisers to limit the number of publications which they would have to employ to canvass a given market. But as a result the advertisers often found that they had unwittingly increased the bargaining power of the newspaper managements in adjusting advertising rates. Another factor was the mounting cost of production, which, while lagging far enough behind revenues to give firmly established publications large profits, left a narrow margin of safety for competitors less fortunately situated.

In accounting for the rapid growth of chain newspaper ownership it is customary to list rather indiscriminately the advantages of large scale production, such as economies in mass purchasing and selling and the possibility of spreading the costs of high priced and peculiarly skilful executive services and editorial features over a large number of units. While no careful studies of the subject have been made, these advantages have probably been overemphasized. The business manager of one of the largest American chains asserts that there are no important economies which his organization is able to effect that are not available to a well managed individually owned newspaper, and the structure of the newspaper producing industry in the United States lends credence to this assertion. For example, a supposed advantage of chain ownership is the capacity, noted by Lord Northcliffe in 1901 in predicting a great expansion of such control, to secure "a practical monopoly of all the best writers and news services of the whole world" (*North American Review*, vol. clxxii, 1901, p. 82). The organization of newspaper publishing is such, however, that its press associations and syndicates—subject to certain local monopoly restrictions—make available to all newspapers material comparable to that pro-

cured by chain ownership and in some cases at relatively lower prices. One great advantage nevertheless is that chain ownership permits a mobilization of financial resources and a spreading of financial risks not possible for the proprietorship of a single publication. Thus a newspaper dependent upon local financial support may be fatally crippled by an advertising boycott, where a chain newspaper has outside resources upon which to draw.

With an expanding market for its wares and a declining number of establishments the press of the United States continued during the post-war period to elaborate and increase the bulk of its product, depending more and more upon advertising revenue to defray the expense. In the period 1914 to 1927 the percentages of newspaper revenue from advertising, as indicated by the federal Census of Manufactures, rose from 64.9 percent to 74.1 percent, while that for periodicals rose from 52.9 percent to 63.4 percent. Of this process of elaboration, which consisted chiefly in the multiplication of previously devised techniques, one notable feature was the development of telegraphic news services, especially in the field of foreign news. In 1929 over 20,000,000 words of press material were received in the United States from transatlantic cable and radio stations (Willey, M. M., and Rice, S. A., *Communication Agencies and Social Life*, p. 171). This was approximately two and one half times the amount received in 1916. While much of this material was forwarded by special correspondents of individual newspapers, the bulk of it was handled by agencies and associations. The Associated Press, the United Press and the International News Service (Hearst) undertake to provide a complete telegraphic news report. There are also a considerable number of supplementary telegraphic news agencies, limiting themselves to particular kinds of news and special treatment of it.

The general press associations, without one of which a newspaper cannot compete successfully as a recorder of public events, differ in form of economic organization. The Associated Press, which in 1932 served 1293 morning, evening and Sunday papers, is a mutual and cooperative undertaking. The cost of its basic news service, to which an imposing array of supplementary photographic and feature services have recently been added, is assessed against the membership according to a formula in which the circulation of the publication is a dominant element. Membership in the Associated Press is

not available to all willing to pay the purchase price. Members have the right to protest the extension of the service in competitive territory, and a vote of four fifths of the entire membership is required to override such protest. These protest rights, coupled with a by-law requiring members to furnish news gathered by them exclusively to the Associated Press, have occasionally caused the association to be attacked as a monopoly. The development of imposing rivals to serve afternoon papers has diminished the importance of these monopolistic elements in the Associated Press, which, however, still occupies a dominant place in the morning newspaper field. The services of the United Press and the International News Service, organized as profit making organizations, are available to newspapers without restrictions beyond the price set and certain guaranties of responsibility in the use of the services. The United Press, predominantly for afternoon newspapers, serves approximately 900 newspapers in the United States and 350 in foreign countries, many of them in Latin America; the International News Service, which is joined with the Universal News Service, serves about 500 newspapers.

The treatment of the news by these press associations has tended toward uniformity. When the United Press entered the field as a vigorous rival of the Associated Press, it emphasized the "human interest" aspect that characterized the Scripps-McRae newspapers (later the Scripps-Howard), of which it was an offshoot. The Associated Press had been previously given largely to matter of fact reporting of the news. But under the pressure of competition the two associations began to take on certain similarities. Both of them have tended to stress increasingly "color" and human interest, although there has been at the same time a prodigious expansion of straight reporting, notably in the transmission of full texts of important public documents. A remarkable exploit of the latter type was the Associated Press' transmission by cable in 1924 of the complete text (about 40,000 words) of the Dawes committee report on German reparations. The transatlantic flow of news is facilitated by cable rates for press material, which have been lowered gradually from five dollars to five cents a word, while the far smaller volume of transpacific news is partially accounted for by very high cable rates. The types of news handled have drifted toward uniformity also, largely because the press association wires often meet in the same newspaper office, so that the rival

associations can learn what news their competitors are carrying. This has led to a diminishing importance of "scoops," or exclusive news reports, which have been the inspiration of much newspaper romance.

In gathering the vastly expanded volume of foreign news the press associations depend both on their own reporters and on exchange arrangements with foreign press associations. When, as previously noted, the Associated Press won a clear ascendancy at the beginning of the century, it was due in large measure to its success in negotiating an exclusive news exchange contract with Reuter's agency. The United Press on entering the field as a competitor of the Associated Press attacked such arrangements on the ground that they allowed foreign press agencies, frequently under the control of their governments, to shape the foreign news purveyed to the American public. This argument, reenforced by the intensification of nationalism growing out of the World War, has contributed to an increasing reliance by American press associations on their own reporters, although there is still a large exchange, both formal and informal, particularly of routine and non-political news, between press associations organized along national lines. In 1932 the Associated Press reported exclusive news exchange contracts with agencies in 28 countries. The other press associations have alliances and exchange arrangements with foreign telegraphic news agencies. Unlike those of the United States, none of which has any official connection with the government, most of the European press associations are linked with their governments, sometimes through governmental ownership and regulation and sometimes through official and semi-official ties often cemented by subsidies of one type or another. The principal French telegraphic agency, Havas, enjoys a government subsidy and also administers the largest advertising agency in the country. Since, as stated by Pierre Denoyer, New York correspondent of the *Petit Parisien*, "to alienate Havas may mean for a newspaper the loss of practically all of its advertising revenue" (*Conference on the Press*, p. 132), the French government has a double leverage over telegraphic news.

In collecting domestic news for their wires, of which the Associated Press in 1932 leased approximately 225,000 miles for day and night services and the United Press 144,000 miles with supplementary telephone circuits, the press associations depend upon their own staffs and

the reportorial staffs of their member or client newspapers. At key news centers they maintain staffs whose members cover the news developments directly. At less important points they depend largely on the local newspapers with which they are affiliated for reports, which their representatives edit or rewrite to meet press association requirements. The associations maintain marvelously organized telegraphic systems made up of transcontinental trunk lines and territorial circuits, both fed from and feeding these lines, to handle news of more limited interest geographically. In the conduct of these wires, which bring all population centers of consequence into instant communication, news dispatches undergo a filtration process at control points calculated to give them proportions fitted to the desires of the newspapers served. Thus a dispatch may run to thousands of words around an eastern territorial circuit, to be cut to a few hundred for transmission along a main east-west trunk line, and end up in two lines or none at all on western territorial circuits. In this process, which is partly responsible for the injunction to "tell the whole story in the first paragraph," accuracy is stressed as a major requirement. In dealing with a complicated development, however, it is often extremely difficult to reconcile accuracy with a brief "lead" that attempts to tell the whole story. Also in so far as they depend upon the staffs of client newspapers for the first hand reporting, accuracy is not a matter immediately under the control of the press associations, a defect which extends to news received under exchange arrangements with foreign press associations or from staff correspondents abroad, who generally depend in large degree on the newspapers in their vicinity. In his study *The Ethics of Journalism* (New York 1924) Nelson A. Crawford observes that "except where a special bureau is maintained, the Associated Press paper in each town—practically always a politically conservative paper—is, by virtue of its membership, the Associated Press correspondent for that town." Thus to the extent that liberalism or conservatism affects accuracy in reporting, press association news may be shaped accordingly, although the diversity of points of view in the clientele of a large organization is an important safeguard of unbiased reporting.

What may be termed the theory of press procedure in the United States ignores the possibility that news may be affected materially by the point of view of the newspaper presenting it.

This theory posits a sharp division between the news, the editorial and the advertising and business departments, a division which is reflected in actual press organization only in its metropolitan reaches. The job of the news department is presumed to be that of gathering and presenting news solely by reference to the interest of the readers. Passing judgment upon the news is, in formal design, the work of the editorial office expressing the institutional views of the publication, which are generally held to be identical with those of the "right thinking" elements of the public. The fact that the reporting and judging processes are associated with a much larger economic undertaking, that of selling services to advertisers, is held to have no bearing upon the viewpoint from which they are conducted or the division between them. The newspaper must depend for its success primarily on its readers, so the theory goes, and the fact that advertisers are willing to pay enough for space to permit the subscriber to buy his newspaper at less than the cost of the paper on which it is printed is viewed merely as a peculiar bit of public good fortune. If the readers are not equipped to impose directly the standards envisaged by the theory, competition, actual or potential, is presumed to insure adherence to them. On a small newspaper when the functions of reporting, passing judgment and business are combined in a single person he may at one moment bargain fiercely for a lower price for newsprint, be called upon a little later to report an appeal to check the mass conversion of forests into comic strips or at another time to comment editorially on a campaign for high protective tariff on woodpulp. But he is presumed to have his mind so compartmentalized that he can adjust it quickly from the calculus of private gain to that of the public welfare or to the attitude of an objective reporter.

This theory, in the extreme statement above, is peculiarly an American conception. In England it finds frequent expression in so far as it deals with the inevitability of public service by the press, although there is less emphasis on the distinction between news reporting and "editorializing" which governs in peculiar degree at least the formal design of press procedure in the United States. On the continent, however, there is generally much less insistence on this distinction and on the divorce of control of these processes from the interests of those immediately in charge of them. In Germany the press is perhaps preeminently a purveyor of opinion,

and the news gathering function is tempered accordingly. This remains true in spite of the fact that the post-war period has witnessed a process of consolidation along lines which resemble in corporate outline those followed in England and the United States. In this process the pursuit of profit has frequently been blended with and sometimes made subordinate to determined propagation of political doctrines. Thus the operations of the most imposing press amalgamation in Germany, the Hugenberg *Konzern*, have embraced a press syndicate to furnish to provincial newspapers without cost editorial material reflecting the nationalist political views of Hugenberg and his associates. In addition to newspapers and closely related enterprises, such as telegraphic news and feature services, the Hugenberg combination produces many periodicals and controls the largest continental motion picture producing establishment. Before the advent of the Nazi regime it was matched in scope by the Ullstein *Konzern*, which was much more sharply oriented in the direction of immediate profit making than of the propagation of political doctrines. But the German press, with newspapers which in 1926 represented some twenty-six shades of political opinion, some of them subsidized directly by party funds, has remained since its beginnings predominantly a press of opinion, enforced either by the government or by party affiliation.

The development of the French press has been marked by a cleavage between *journaux d'opinion* and *journaux d'information*, which the press of the United States undertakes to maintain by departmentalization of single publications. Influenced greatly by American practise, there has been a marked acceleration of news purveying in recent years. In general, however, news reporting as an objective undertaking remains subordinated not only to the propagation of political doctrine, which came to have a dominant role at the time of the French Revolution, but to the discussion of art and literature, to which the French newspapers have been peculiarly devoted. As the formal distinction between news and editorial comment is less labored by the French press, so too is there less emphasis upon its divorce from immediate commercial considerations. It has been the practise of some French newspaper proprietors to treat writing positions, particularly those dealing with finance, as concessions allowing the holders to sell their services to the highest bidder. There have been instances also of less frank but no less direct sale

of editorial services, one of the most notorious being the secret subsidizing of a considerable number of newspapers by the Russian government immediately before the World War, which when disclosed caused no serious embarrassment to the French governmental officials involved. A relatively meager expansion of press advertising is held partly responsible for the fact that a considerable part of the French press does not have a distinguished reputation for aloofness from direct commerce in the sale of its influence, a suspicion which does not attach, however, to a number of important provincial journals. It also accounts in part for the relatively small size of the French newspapers, which generally run from four to six pages, as it does in some degree for the failure of the French press to participate to any appreciable extent in the widespread movement toward corporate consolidation. There has been some regional consolidation, and a number of the largest Parisian newspapers are governed by business agreements relating to such matters as advertising rates; but they are not under common ownership, and the French press continues on the whole to be a singularly individualized undertaking.

The degree to which the press of the United States validates in actual practise the theory of press procedure outlined above is a question about which generalization is hazardous. An imposing array of data could be mustered to indicate that the theory in its entirety bears little relation to actual press practise. Many examples may be found in any day's output of the press in which the much labored distinction between news and editorial comment is flagrantly ignored while ostensibly maintained. There have been frequent cases in which advertisers, contrary to theory, have successfully exercised direct decisive control over newspapers. And there have been cases in which check ups of press performance have led to the conclusion that neither the perspicacity of its consumers nor competition between press units has prevented distortion and inaccuracy in dealing with important developments. Thus representatives of the Commission of Inquiry of the Inter-church World Movement, which investigated the steel strike of 1919, reported that "it is inconceivable that the public which relied on the Pittsburgh newspapers could, by any human method of reading newspapers and allowing both for exaggeration due to bias and inaccuracy due to haste, have understood either the causes

of the steel strike or the significance of its incidents" (*Public Opinion and the Steel Strike*, New York 1921, p. 147). But to offset what can easily be made an impressive demonstration of the utter fatuity of the theory is the availability of an impressive array of data which may validate at least parts of it. In many instances, for example, newspapers endeavor most meticulously to give complete and impartial accounts of news developments which, so far as their institutional opinion is concerned, are most offensive to them. Under such circumstances it is safest to analyze the general conditions shaping the operations of the press which have a bearing on the possibility of validating the theory.

In undertaking to divorce news from opinion, with each appropriately labeled, the press of the United States sets up a standard so rigorous that few social scientists proceeding in the most deliberate manner would confidently assert their ability to live up to it. The metropolitan press operates at very high speed, especially in the afternoon newspaper field, which has expanded more rapidly in recent years than that of morning newspapers. Moving at this accelerated tempo the press is confronted by a vast range of material presenting no clear pattern of fact upon which it can proceed objectively. In reporting stock market quotations, election returns or baseball scores, where there is a clear cut and positive statement to be recorded, the press is able to operate surely and rapidly. In addition, however, there is a far wider range of developments where there is no such basis for objective procedure and where in the nature of the case reporting necessarily involves a process of discrimination in deciding the developments to be treated and the nature of their treatment. This difficulty, too obvious to need illustration, is enhanced by a propaganda industry, greatly expanded by governments, political parties and private enterprise as a result of the possibilities disclosed during the World War, which showers the press with an enormous volume of material; it is aggravated also by frequent resistance to the efforts of the press to get at the facts and, as will be indicated subsequently, by certain legal elements involved in the press undertaking. So far as the casual reader of the newspaper is concerned these difficulties are complicated by the compulsions of the technique of headline writing, developed initially as a form of salesmanship, which requires that what may be a long and involved account be summarized in a few lines, as well as by the practise of attempting to

tell the whole story in the first sentence or paragraph.

The part of the press entrusted with this crucial process of discrimination has a minor place in the financial outlays of the establishment. While there are considerable variations in newspaper expenditures for news gathering and interpretation, these functions rarely account for more than 15 percent of the total expenditures of a metropolitan newspaper. The wages of those involved are relatively low, although they have risen somewhat in recent years. A committee of the American Association of Teachers of Journalism reported in 1926 that "it is unwise to encourage young men to expect a satisfactory economic return from an aptitude in journalism that is restricted to straight reporting, copy-reading, make-up, etc." That the young men still seek such work is due in part to the glamour about the profession of journalism as well as to the fact that standards imposed for straight reporting, although theoretically the crux of the press undertaking, frequently do not call for a high order of craftsmanship. The organization of the news gathering services also tends in a rather odd way to perpetuate this condition. By serving hundreds of newspapers simultaneously it is possible for press associations to provide news from distant places at a cost per word that is only a fraction of that for local news to be used by a single publication. Thus the local news gatherer, although protected by a peculiarly powerful demand for local news, is placed in competition with news gathered by associations for mass consumption. Since the press associations along their main lines generate a far larger volume of copy than even the largest newspaper can print, the bargaining position of the reporters engaged on the local news is considerably weakened.

In presenting the record of the day's events as well as in passing judgment upon it the major goal of a newspaper, unless it is operated as an eleemosynary institution, must be circulation, for upon its capacity to attract readers depend its advertising revenues. There have been cases where newspapers have been embarrassed by a plethora of circulation because of an inability either to get advertising or to adjust rates commensurate with the circulation; and some newspapers also have succeeded commercially with a circulation far below that of their competitors. But it still remains true that volume of circulation is the principal factor in gaining advertising and with it financial success. According to the

theory of press performance stated, the surest way to accomplish this end is to present the best rounded and most accurate account of the day's news and the best balanced judgments on them. This assumes, however, that the consumers of the products of the press have high standards in this regard, are capable of determining the degree to which they are being fulfilled and have power to give effect to their opinions if these standards are not being fulfilled.

Apart from those to be inferred from the results of publishing ventures there is a notable lack of information about the standards the reading public wishes to have maintained. Efforts to enlarge this body of information accurately by direct questioning are difficult because of a tendency on the part of those questioned to express a preference for the parts of the diverse content of a modern newspaper which they think it good taste to approve. Although their true preference may be for comic strips or news of sports, they are apt to record a fondness for the editorial page or for articles about the League of Nations. The record of press development discloses clearly enough, however, a large appetite for the lurid treatment of sensational events as well as trivial backstairs gossip, in which neither interest in accuracy nor balanced perspective has a part. There is some impressive evidence to suggest that this tendency is on the wane and to support the findings of Walter Lippmann that "... the objective, orderly, and comprehensive presentation of news is a far more successful type of journalism to-day than the dramatic, disorderly, episodic type." So long, however, as there is a press establishment to minister to the appetite for the lurid and gaudy, it not only is assured of a following but also tends to exert pressure upon its competitors to borrow its methods, even against their will, if they are to survive in the struggle for circulation. Here the established journal has a strong advantage created by the habit of reading it, but this impact of habit serves to vitiate rather than to strengthen the role attributed to reading standards by the theory of press procedure. In so far as readers have the standards imputed to them by the theory, they frequently lack the equipment to determine directly whether or not the press is living up to them. The developments dealt with by the metropolitan press are far removed from first hand knowledge of the majority of readers, often by seas and continents and frequently by virtue of the fact that they deal with highly specialized ranges of experience. If readers pos-

sessed of these standards find they are not being fulfilled, they discover in increasing degree that their capacity to "do something about it" is limited both by local press monopoly and by the fact that setting up a newspaper establishment is a formidable financial undertaking. The radio as a disseminator of news has potentialities as a competitive check on the products of the press; but they have not yet been realized on any large scale, for the radio broadcasting establishments depend primarily on the press for news except that generated by formal pronouncements, such as political addresses. Florence Kelley, a lifelong student of the ways of consumers, observed that "newspaper readers are interested in whatever news is set before them and they accept unthinkingly the standard of the newspaper maker as to what is news, and as to its relative importance" (*Yale Review*, vol. ix, 1920, p. 389).

There is a widespread belief on the part of readers that the press tempers its news and editorial policies to favor large advertisers. That advertising influences the viewpoint of the press has also been the contention of some of its proprietors, notably the late E. W. Scripps, who in an effort to free the press from what he regarded as an undesirable commercial dependence persistently sought to demonstrate the commercial feasibility of a newspaper carrying no advertising. He financed an experiment in Chicago with a newspaper carrying no advertisements, which gave promise of being commercially successful when a sharp increase in costs of production attendant on the World War helped to bring about its discontinuance. The type of control by advertisers most stressed in the past was that of direct dictation of the news and editorial content. While there have been numerous instances of such control, its importance has been exaggerated. The press as a whole takes little direct dictation from advertisers, and the success of such dictation tends to vary inversely with the financial strength of the publications involved. But advertising has none the less and perhaps even more deeply an influence upon news policy. The fact that the press derives the larger part of its income from advertising gives it a major stake in that form of salesmanship and tends to dampen its interest in expositions of the weaknesses of advertising or of the system of economic organization out of which it grows. The press is on all sides stimulated to create a setting, both material and emotional, conducive to the success of advertising effort. The development of advertising has also served

in large measure to impart to much of the metropolitan press the status of a large scale business and industrial enterprise which, with notable exceptions, tends to make it considerate of enterprise of this type.

This tendency is heightened by the framework of legal restraints under which the press of the United States operates as well as by the nature of its political setting. For example, the press is governed by the common law of libel, which holds it responsible both civilly and criminally for defamation of character. A successful action for libel, however, presents great difficulties for the plaintiff, as is illustrated by the fact that one of the most sensational of the post-war crop of tabloid newspapers reported that libel suits for approximately \$7,000,000 of damages had been settled with an outlay of about \$5000. Although liability for libel is difficult to enforce, it tends to make the press somewhat skittish in dealing critically with the affairs of private citizens and corporations, particularly if they are in a position to test their rights fully. At the same time, however, an element of "privilege" protects the press from prosecution for libel in reporting governmental affairs, as a zone of "fair comment" protects it in passing judgment on them. The scope of privilege and fair comment, like the nature of libel, is unfolded in a continuing series of judicial decisions which do not permit of accurate generalization. But, with the exception of the judicial process which the courts have broad powers to defend from what they construe to be obstruction by resort to contempt of court proceedings, it gives the press wide immunity from prosecution for libel in reporting and commenting on governmental performance. Thus the press is under an impetus, created by the legal framework within which it operates, to use its critical faculties more actively on details of government than in dealing with the affairs of a great industrial corporation which, although it may have attained a power far greater than that exercised by governmental units, still enjoys the status of a private enterprise.

This impetus does not prevent certain portions of the press, specializing in the sale of sensations, from exploiting extremely intimate details of the private affairs of persons incapable of effective resistance, sometimes because the exploitation may be merely offensive to the sensibilities and hence not within the technical scope of the libel laws, sometimes because of the difficulties in suit for libel previously noted

and often because of the lack of financial means to prosecute. There has been consequently considerable agitation for laws to protect the "rights of privacy"; some slight statutory measures taken in this direction, principally in the field of advertising, have not served materially to check this type of exploitation.

Its legally privileged position in dealing with affairs of government, together with its command of resources for "reaching the public" on which popularly elected officials are largely dependent, has aided the American press in preserving a broad degree of freedom from statutory regulation and also the enjoyment of what amounts to a federal subsidy—of disputed proportions—in the form of postal service rendered without charge in some instances and at less than cost in others. Although the guaranties of freedom of the press, as set forth in the federal and state constitutions, permit a considerable amount of governmental regulation, there are few statutes dealing specifically with the press. When in 1926 the British Foreign Office, acting in response to widespread agitation for more effective regulation of newspapers and periodicals in the United Kingdom, published a survey of foreign press laws, it reported it could find none in Abyssinia, Argentina, Mexico, Venezuela and the United States. There is, however, some statutory law dealing with the press, principally by way of setting up moral standards, such as those embodied in a Connecticut statute, duplicated in substance in about a dozen states, which outlaws publications "devoted to . . . or principally made up of, criminal news, police reports or pictures and stories of deeds of bloodshed, lust or crime. . . ." There is also a considerable body of state law, such as that making it an offense to distribute advertisements of lotteries, which bears more directly on the press than that outlawing immoral publications and writings in general. Likewise the federal government, predicated its power largely on its proprietorship of the postal service, imposes certain regulations specifically on the press in addition to those of general application to all kinds of written material. Thus to enjoy second class mail privileges daily newspapers must file a sworn statement of circulation with the postmaster general twice a year in addition to the one of ownership which is required of all publications, with certain exceptions for those devoted to religious, fraternal, temperance and scientific matters. Incidental to the granting of second class mail privileges, which are not extended to publications designed

primarily for advertising, is a requirement that editorial and reading matter for which payment has been received be "plainly marked 'advertisement.'"

Initially granted on the theory that it would provide an essential stimulus to the press as an agency of popular enlightenment, the federal postal subsidy has become somewhat anachronistic in so far as it applies to the metropolitan press. But in sponsoring a recent proposal to let the president exercise the power of Congress to adjust postal rates, with a view to his undertaking to reduce or eliminate the subsidy, Representative Ragon of Arkansas remarked to his colleagues without any serious challenge, "We never had the intestinal fortitude in this House to stand up and adjust these postal rates" (*Congressional Record*, vol. lxxvii, pt. ii, 1933, p. 2025). The lack of intestinal fortitude required to deal ungraciously with the press has of course a bearing on the slight degree of control of the press by statute as well as on what is frequently the feeble exercise of power to protect governmental processes from interference, that of the courts to punish for contempt. Thus "trial by newspaper," or the prejudging of a case by the press prior to the actual trial, is extensively practised in the United States, not so much because the courts are without power to check it—as they do in some jurisdictions and often with hearty press cooperation—but frequently because they do not care to incur the disfavor of powerful press establishments. In England, where the legal framework controlling the press is similar to that in the United States, a determined judiciary has been successful in eliminating what the Wickersham Commission in the United States termed "this intolerable interference with the due course of justice."

In addition to the limited range of statute law dealing specifically with the press there is a larger body of federal and state law governing writings and communications in general. The postmaster general has, under a series of authorizations expanded over the past seventy years, the power to withhold from the mails, and to institute prosecution of the senders of, matter held to be "obscene, lewd or lascivious," that advocating "treason, insurrection or forcible resistance to any law of the United States" or that "of any character tending to incite arson, murder or assassination." Publications preaching radical political or economic doctrines have been subjected to the exercise of this power in a manner raising vital issues of freedom of the press. But

it bears rather lightly on the main body of the press because of the latter's self-restraint in this regard. To govern its competitive relationships the press has recourse to the general trademark and copyright laws, and in recent years there has been some development in the United States and abroad in the direction of investing news with the attributes of property. A significant step was taken in 1918 when a majority of the United States Supreme Court [*International News Service v. Associated Press*, 248 U. S. 215 (1918)] affirmed an injunction restraining a rival of the Associated Press from appropriating its news dispatches from newspaper bulletin boards until their commercial value to the Associated Press and its members had passed. The laws of a few states also affect the competitive press relationships to some extent by conferring on reporters the right to withhold information as to news sources from public law enforcement and investigating bodies, although the primary design here, which has been embodied in an unsuccessful proposal for federal legislation, is to protect the public in the full flow of news rather than to control competition in its handling.

In contrast to the slight body of statute law dealing specifically with the press in the United States, that of many countries is governed by a detailed legal code prescribing not only its permissible content but occasionally the qualifications of editors and the economic relationships between employers and employees. In numerous countries editors must be native born and in some countries they must meet certain intellectual qualifications. The laws governing content are generally designed to protect the government against attack likely to bring it into peril, the individual against libel and the general public against publications "repugnant to good morals." Under the laws of Peru authors and publishers of the last named type of newspaper, if they cannot pay the fine imposed by the court, are subject to the novel penalty of being forced "to inter corpses in the cemetery" for a period of four months. In many countries there are also laws designed to protect individuals against inaccurate and misleading statements by requiring the press to print conspicuous corrections.

Concerning the problem of governmental control of the press, on which a mere recital of statutes can shed little light without tracing fully the measures of enforcement, there is at present an unprecedented array of laboratory material. In Soviet Russia the press is completely social-

ized, in Italy and Germany it is rigidly regimented by the government and in the United States and England private enterprise has broad scope. However, to select from this material a technique of press control which conserves the virtues of the various methods and eliminates their weaknesses is a formidable undertaking even as an academic exercise. The conduct of the press as a private business enterprise little checked by governmental regulation has along with its great elements of strength a large variety of weaknesses. In one direction there is the danger of excess in competition for public attention that leads to sensationalism and distorted perspective. In another, toward which the press has gravitated in recent years, lies the danger of private monopoly in purveying one of the most important of public services. But when control of the press is passed to the government in any considerable measure, new weaknesses arise to take the place of the old. In Soviet Russia, for example, the devotion of the press to matters of statecraft and economic well being and its freedom from the exploitation of the trivial and vulgarly sensational are of immense significance, but they are achievements won by a dictatorship exercising rigid control over the industrial and intellectual processes of the press. It would be a counsel of perfection to look toward a press which would retain the prodigious and marvelously equipped enterprise which is peculiarly a characteristic of the press of the United States, extending on occasion even to the manufacture of engaging events; the grace and succinctness of expression of much of the French press; an intellectual plane still maintained by some reaches of the British press; a freedom from the dictates imposed directly and indirectly by the pursuit of advertising revenues such as that enjoyed by the press of Soviet Russia; and if not a detachment from special interests, governmental or otherwise, at least a system of labeling which would give a broad validation to the theoretical distinction between news and opinion.

PRESSURES, SOCIAL. The term social pressure, in the singular, is sometimes applied to the constraint of the social order on the organic or native impulses of man, which are variously represented as being inhibited or balked or "sublimated" or at least diverted, by the compulsion of the mores and the necessities of social organization, into new channels dissociated from the biological drives. This general point of view is common to various psychiatric schools and has inspired certain theories of the nature of society (see, for example, Burrow, Trigant, *The Social Basis of Consciousness*, New York 1927; and "Social Images versus Reality" in *Journal of Abnormal Psychology*, vol. xix, 1924-25, p. 230-35). Such modern theories are logically the successors of the social philosophies which opposed society to nature, prevalent from the time of the sophists and running through the social contract doctrine and other forms of individualism down to the current protests against the standardization of behavior and of individuality attributed to the machine age.

When used in the plural, however, the term has acquired a more specific sense. Beyond the range of direct authoritarian controls, effected through officials or other accredited social agents and expressive of established codes, there exist socially created constraints which emanate from less sanctioned or less responsible sources; informal and opportunistic in their operation, they fluctuate incessantly in intensity and direction. These constraints may be called social pressures.

A distinction may be drawn here between mass social pressures directed against minorities which do not conform to the demands of a dominating and emotionally charged popular movement and group social pressures emanating from particularist groups which seek to advance their interests through activities intended to restrain or divert the behavior of resistant elements. The former type would be exemplified by the unofficial coercions characteristic of the earlier stages of the Nazi campaign or by the ostracism of those who trade, intermarry or otherwise enter into relations with members of a group exposed to the hostile attitude of a dominant religious, racial, nationalist movement; the latter by the attempts of blocs or of business interests to induce favorable conditions by tactics which bring to bear at individual points the power of wealth, organization, power or position.

The distinguishing fact about social pressures is that they depend generally upon informal even if concerted tactics and that they operate directly against non-conforming individuals. One aspect of this fact is brought out in R. E. Park's comment: "The pressure group is not an army which seeks to win battles by frontal attacks on hostile positions; it is, rather, a body of sharp-shooters which picks off its enemies one by one." This statement, however, is more applicable to the second type of pressure group referred to above. Mass pressures do indeed operate at individual points but they also exercise a broad restraining influence on the opposing front. What characterizes both types is the informal, opportunistic, extralegal nature of the coercive tactics they employ. Social pressures are thus to be distinguished not only from authoritative controls but also from the regular processes of indoctrination and habituation to which the established mores of every group subject its members. They belong to an unstable condition of movement and of strife.

The relation of social pressures to authoritarian controls, on the one hand, and to the established mores of the society within which they are exercised, on the other, may assume a considerable variety of forms. Because of the element of coercion inherent in these pressures the former relation is of primary importance in determining both the varieties and the techniques of pressure tactics. Social pressures may be exerted by means which are legally permitted or by methods which the law forbids, or again not only the methods but also the objectives may

be opposed by the law. There is a distinction, for example, between the pressures which employ certain techniques of "unfair" competition banned by the law and the pressures directed against the law itself or its administration, such as the relatively successful attempts to defeat or nullify the Volstead Act. For all types of pressure it is obvious that the attitude of governmental agencies is of vast significance. Even for the large category of social pressures which do not directly clash with the laws a generally favorable or unfavorable attitude on the part of authority is an important limiting or releasing factor. This is true not only because social pressures, being usually expansive, tend to reach or pass the margin where they may be interpreted as contravening the law but also because the activity of lawmaking may be turned, as in the case of the boycott, against the exercise of the social pressure.

The significance of governmental attitudes toward social pressures becomes more apparent when it is realized that the administration of legal justice is itself subject to the constant impact of social pressures. These may seek to extend or limit the interpretation or application of the law, as in the Scopes trial; they may demand severity or lenience outside of judicial or equitable considerations, as in indictments for certain types of sexual offense or in the trial of certain types of offenders, from Negroes to business magnates; they may even obstruct the regular machinery of jurisdiction, as evidenced by the popular antagonism which made German lawyers reluctant to defend the Communists accused of the burning of the Reichstag building or as expressed in the boycott of the lawyer who defended Sacco and Vanzetti. On a smaller scale social pressures operate to limit arrests or convictions for petty violations of the law or for infringements of outmoded laws, which thus fall into desuetude.

At one end of the scale of relations between social pressures and authoritarian controls is the situation in which the extralegal pressures proceed from the authorities themselves. This situation is frequent under so-called dictatorial governments, where the executive dominates the legislative and judicial powers. Under democratic conditions is found the intermediate situation, in which governments or officials co-operate actively with particular pressure groups; in adding, for example, extralegal to legal trade restrictions or in supporting campaigns to give preference to domestic products. Another aspect

of this situation is illustrated by the alliance of political authorities with militant religious groups, so evident throughout the history of religious persecution and still occurring in minor forms, as in the treatment meted out by the New York City officials to Mrs. Margaret Sanger in her campaign for birth control. At the other end of the scale belong those cases where the authorities actively resist the social pressures or where the pressures are directed against the authorities themselves. This can occur on a small scale, as in movements against individual officials, such as magistrates or judges, or on a large scale, as when mass pressure is directed against the prevailing system of authority. The latter is illustrated by nationalistic movements, such as that represented by the Indian *swaraj* or by the Irish "home rule" agitation; but it appears also in non-revolutionary forms, as when an unpopular tax proposal is withdrawn by a government under indications of public resentment or when an unpopular government, under the parliamentary system, resigns from office apart from any constitutional necessity.

The foregoing cases reveal more particularly a quality inherent in some degree in all social pressures—their dynamic relation to the existing social structure. Like Hobbes' liberty they appear in the "interstices of law." They impinge restlessly upon the law-established order, sometimes supplementing it, sometimes limiting it and occasionally undermining it or even seeking to overthrow it. The conservative function is seen in the drives made against the disturbers of tradition or the prophets of a new order. Social pressures are directed against them, whether they occupy pulpits or university chairs or, more rarely, seats on the judicial bench or whether they merely stand on soap boxes in the public parks. The limiting function is seen in the way in which legal liberties are curtailed by economic impacts, as when advertising interests intervene to effect the inclusion or exclusion of news in the press. The revolutionary function appears particularly in those social pressures which are generated or accentuated by wars and economic crises, ranging from concerted resistance to the payment of taxes or the collection of debts to the great historical upheavals which overturn states.

For the same reason social pressures are specially brought to bear wherever a social order is in the making or when, for whatever reason, it is not adequately protected by law. This situation occurs, for example, where an alien

group, with prestige but without legal authority, exploits a "backward people." Again, in the absence of an authoritative international code pressure methods are resorted to in order to render effective the existing international mechanism of the League of Nations. These may operate as disguised or overt economic inducements or through the stimulation of public opinion in other countries, and if possible in the recalcitrant country, against the governmental policy detrimental to the functioning of the League. The barriers which political boundaries present to the permeation of opinion making influences set rather definite limits to the use of the latter method.

The relation of social pressures to the mores, the social as distinct from the legal codes, is also highly significant. Some of the cases cited above belong to situations where there is a clash between mores and laws. In such situations the mores, restrained in their operation, generate social pressures which bear on the authorities whose duty it is to administer or execute the laws. Normally, because of the diverse mores of groups bound within the same legal system, there is an unstable play of pressures and counter pressures. An illustration is offered by the history of the administration of the Volstead Act. More permanently the condition occurs in the struggle of economic groups which employ their various extralegal weapons for pressure purposes. In general it may be said that wherever groups are pitted against one another in any kind of struggle, whether they be class groups, race groups, religious or other cultural groups, there is resort to the techniques of social pressure.

When the mores rally strongly to the side of a pressure group and when at the same time the latter is able to control the governmental system, the tactics of pressure become irresistible. Such situations occur on a large scale when a people's sense of its own solidarity, thwarted or dammed up by historical vicissitudes and thus supercharged with emotion, breaks violently through the resistances to its expression. The mass social pressures thus generated are peculiarly domineering and oppressive with regard to non-conformities. There are then neither effective legal restraints upon them nor overt counter pressures which are found in more complicated situations. The Nazi outburst offers the most striking illustration of this type of pressure, although it is a distinctive feature of all "fascist" movements.

The term pressure group has recently come into use to signify any aggregate, organized or unorganized, which applies pressure tactics. This usage is serviceable if at the same time a distinction is drawn between an interest group and a pressure group. Even if it were true that all interest groups seek in some way or at some time to exercise social pressures, the distinction would be relevant. For the exercise of social pressure is not inherent in the concept of an interest group, say of a musical organization or a philatelic society, whereas it is the defining function of a pressure group. Social pressures, in a word, constitute a particular method of achieving results—one of the many methods which interest groups may adopt.

The tactics which are the essence of social pressures are intended not directly to change attitudes but to control the behavior of recalcitrant or non-conforming individuals. Thus, although propagandism may involve an element of social pressure, it is not necessarily a form of it. The attempt to convert another to one's faith by expounding its values may come within the order of propaganda but not of social pressure. Pressure involves more than persuasion: it implies some kind of external inducement to change or limit the activity of others, ranging from direct or indirect economic inducement to ostracism, intimidation and violence. In other words, it always acts by creating some tension in the individuals to whom it is addressed. If, as is frequently the case, it makes use of the symbols—the flag or the hearth or even the cross—dear to those whom it assaults, it does so in order to constrain or divert their actions, not to liberate them. It promises or threatens with a view to making others conform. This is true whatever the scale of the pressure, which may be as localized as the refusal of villagers to buy from a heterodox storekeeper or as far reaching as the march of the bonus army on Washington, of the unemployed on London or of the Fascists on Rome.

A pressure group is defined by its techniques, an interest group by its objectives. A pressure group as such has no internal function but is directed outward, to the overcoming of resistances. The concept of pressures is therefore of more limited significance for the interpretation of social systems than for that of interests. Interests may be opposed, but the relation of conflict is only one of the manifold relations they exhibit. Broader uniting interests may underlie narrower dividing ones. The theory of interests

can therefore be applied to explain alike the solidarity and the equilibrium of a social system as well as the conflicts that exist within it; whereas the theory of pressures can be made an explanation only of the divisions, the dominances and the resistances within a society.

The limitations of the pressure theory are manifest in the work which more than any other attempts to interpret social arrangements as merely the adjustment of unstable pressures: Bentley's *Process of Government*. It is true that this study is ostensibly confined to the field of politics, which might seem specially favorable for the exposition of pressure operations, but the result is nevertheless unconvincing. In the first place, Bentley does not effectively distinguish pressures from interests, although he denies implicitly the operation of a general interest which modifies and limits the techniques of pressure. Consequently, in the second place, he assumes too readily that the agreements arrived at in the political arena represent the sheer diagonal of particularistic opposing pressures, a view which seems hardly compatible with the relative stability of the political system and the orderly development which it exhibits over long periods. The manner in which cooperative factors are linked with competitive and conflicting ones is lost sight of, so that pressure processes are assigned a larger and more constructive role than they can maintain.

In general the theory of the function of pressures in society still awaits development. The number of descriptive studies of particular types of pressure has increased in recent years. In the political field there are various works on lobbies and blocs; in other works the intensive employment of social pressures in times of war is documented; in the economic field studies have been made of the pressure tactics of public utility and other corporations, including the investigations by the Federal Trade Commission; much of the literature on strikes, lockouts and boycotts likewise illustrates the phenomena of economic pressures. Particular pressure groups in other fields, for example, the Ku Klux Klan, have also been described in some detail. It is incidentally significant that while American writers have notoriously neglected the study of social classes, they have added considerably to the specific literature of social pressures. But there is lacking on the whole any effective analysis of the relation of social pressures to social conflicts; of their role in the building up and breaking down of social structures; of the

conditions under which they are most effective and of the various types of pressure which develop in different cultural situations; of their manipulation of the symbols and their attachment to the thought forms in or through which the mores of the various groups find expression.

The fact that the literature of social pressures is at once so descriptive and so recent is noteworthy, as is the fact that so large a portion of it is American. Pressure groups, as distinct from class groups, are characteristic of a heterogeneous and changeable society, offering special opportunities for the economic exploitation of new conditions and for the formation of unstable expansive groups not integrally related to the established order. Pressure techniques are facilitated also by the elaborate interdependence of a highly industrialized society and by the new means of communication and contact which modern invention has devised. When such conditions develop rapidly, foci of economic power emerge without preestablished status and outside of the authoritarian controls. Therefore, once the fact of their power comes to be realized and resisted, they inevitably resort to pressure tactics. The unorganized juxtaposition of diverse racial and national groups struggling for position and prestige dependent largely on their different facilities for the acquisition of wealth has been an additional factor. The extreme case of the dissociation of power from status is to be found in the organized "rackets" also characteristic of such a society, which are able to maintain themselves by pressures acting not merely on the groups they exploit but even, directly or indirectly, on the authorities whose duty it is to suppress their criminal activities.

The earlier, mostly European, writers on class conflict and the other more ancient forms of social struggle, such as those of racial or religious groups, did not envisage a situation of this kind. Hence the literature of social conflict throws little light on the actual operation of social pressures. It deals rather with the nature and development of opposing interests, the necessity and rationale of social struggle and the functions and results of conflict in general. It considers social conflict as analogous to military conflict, particularly as the broad clash of great organized collectivities on an economic or racial front. It treats rather sparingly the tactics of these struggles, much more their general strategy. But social pressures are concerned mainly with tactics. The pluralist as distinct

from the Marxist point of view conceives of society as diversified into manifold and relatively autonomous organized groups. It offers therefore a more likely approach to the study of social pressures. But most of the writers of this school have so far been more interested in the larger questions of the trend toward a pluralistic social structure, of the relation of voluntary associations to the state and of the reconstruction of society based on the explicit recognition of group autonomies.

PREUSS, HUGO (1860–1925), German statesman and political theorist. In his juristic mode of thinking Preuss was a pupil of Gierke and Gneist, to whom he owed particularly his conception of the associational character of law and of self-government. His scientific works were devoted above all to communal administrative law and to the history of the forms of German town organization. He was active for many years in the municipal council of Berlin. Politically, standing upon the same ground as Theodor Barth and Friedrich Naumann, he had championed as a publicist the democratic development of the Bismarckian imperial constitution, and to this end he had elaborated a series of definite proposals. After the collapse of 1918, while he was professor of public law at the Berlin *Handelshochschule*, Friedrich Ebert summoned him to prepare as state secretary a democratic constitution. As minister of the interior Preuss was a member of the first German national cabinet, resigning, however, with the signing of the Treaty of Versailles. Nevertheless, as "national commissioner" he presided over the constitutional convention to its very end. In his draft of the constitution Preuss sought to combine a strong central power (a popularly elected president) with a parliamentary system, and hoped to overcome the antithesis of Empire-Prussia by depriving Prussia of its position of hegemony and its statehood and converting it into a number of large self-governing units. As a rational plan this was well conceived and rested upon the belief that democracy would strengthen the national feeling of collective unity and break the force of dynastic tradition. But Preuss was mistaken as to the particularism of the individual German states, which continued to manifest itself even after the abdication of the princes. As a consequence his draft of the constitution underwent substantial modification in the course of the deliberations of the Weimar National Assembly of 1919; the federalistic element remained stronger than he had intended. His goal was a pan-German national republic, and with this in view he proposed the colors Black-Red-Gold as the national flag in abrogation of the German-Austrian separation of 1866. The old symbol of the year 1848 could not, however, find spiritual acceptance after 1918. Preuss had consciously strengthened the position of the national president in order to counterbalance the divisions of the German parties; but he did not recognize clearly enough that the system of proportional representation

went ill with the system of parliamentary majorities.

PREYER, WILHELM THIERRY (1841–97), German physiologist and psychologist. Preyer was born near Manchester, England, and was educated in Germany. He began his career as an exploring scientist, making a trip to Iceland in 1860; then he became professor of physiology at the University of Jena. He was concerned in his physiological work with the problem of sleep as well as with investigations in the field of the sensations. The former led Preyer into the problem of hypnotism and in this way into the realm of the psychological. At this point biologic functions began to interest him from the psychological standpoint. He wanted to study their genesis before and after birth and thus came to make those observations in the field of child psychology which he presented in *Die Seele des Kindes*, a book which long remained standard in the field of child psychology. For a period of three years he made observations on his own son. Although such studies of children had repeatedly been made before Preyer, for example, by Tiedemann, no one had carried out the observations so systematically, so persistently, from so many different angles and with such carefully worked out detail. The book had extraordinary success and influence. Diaries of observations on children, patterned after Preyer's, were made first in Germany and America and then in all civilized countries, and numerous

groups were established for the systematic study of the development of the child.

Later Preyer concerned himself with the application of psychological methods to child education and so became a pioneer in the field of pedagogic psychology. His great merit, however, lies in the impetus which his work gave to modern child psychology.

PRICE. *See* PRICES.

PRICE, RICHARD (1723–91), British nonconformist minister and writer on politics and economics. The son of a dissenting minister with extreme Calvinistic views, Price reacted toward a more liberal and philosophical theology. In his earliest publication, *A Review of the Principal Questions and Difficulties in Morals* (London 1758, 3rd ed. 1787), he foreshadowed Kant in insisting on the irresolvability of the concept of right and wrong into pleasure or into a perception of the "moral sense," although unlike Kant he was willing to accept pleasure as an accompaniment of a right action. Price's great fame was to come from other and widely scattered fields. One of these was life insurance, which was then passing through a series of financial bubbles and crashes. In 1769 Price applied his excellent but long suppressed mathematical training in formulating his observations on the expectation of lives in a letter to Benjamin Franklin which was published in the *Philosophical Transactions* of the Royal Society of London (vol. lix, p. 89–125). This and a subsequent paper, *Observations on Reversionary Payments* (London 1771, 4th ed. 1783), provoked a reform in the organization of insurance companies, and Price himself was invited to reconstruct the Equitable Society, one of the sounder life insurance companies. After this he

addressed an *Appeal to the Public on the Subject of the National Debt* (London 1771, new ed. 1774), in which he called attention to the dangerous practise of funding the debt by an increase of obligations. He insisted on the reestablishment of a sinking fund but magnified the virtues of that device on the theory that it could be combined with the compound interest principle to extinguish the public debt painlessly and in short order. He failed to realize that the principal as well as the accumulated interest and compound interest of the sinking fund is derived from taxation and that consequently the supposed gain to the taxpayer is purely illusory. The fallacy in Price's scheme was not noticed for a long time, and Price's pamphlet is supposed to have influenced Pitt to reestablish the sinking fund in 1786. It also won him an invitation from the American revolutionary government to take charge of its finances; the invitation was declined.

Like Priestley and other dissenters, Price had for a long time opposed England's repressive measures against the colonies. In 1776 he published his famous pamphlet *Observations on the Nature of Civil Liberty and the Justice and Policy of the War with America* (London 1776, 8th ed. 1778), which won the official approval of the City of London and played a considerable part in determining the revolutionists to declare for independence. A second pamphlet followed in 1777, and Price continued during the rest of the war to be the adviser and defender of the American cause. These pamphlets as well as the sermon preached in favor of the French Revolution on November 4, 1789, are important in the history of political theory for the revolutionary applications which they gave to the Whig principles of 1688. Price's sermon on the French Revolution called forth Burke's *Reflections* (1790), marking the beginning of the reaction against the "Lockian system," which in a hundred years had spread from England to America and had started the cataclysm in Europe.

PRICE DISCRIMINATION. The perfect competitive market envisaged by the classical economic theorists tended to establish a certain

fixity, stability or uniformity of price relationships for every good upon two planes. One was the plane of time: the price relationships among different goods were conceived to be subject to only slight variations from period to period, in accordance with occasional changes in the conditions of production or the directions of consumption. This tendency toward the establishment of what came to be known as normal price relationships was for classical economists the more engrossing subject of inquiry, and the study of competitive market adjustments in this aspect consequently became the most familiar as well as the major part of economic theory. The second plane of uniformity which the ideal competitive market tended to evolve was spatial. At any given time in one market area there could be only a single price relationship of each good to any other good there offered in exchange, so long as competition held sway. This tendency involved the fixation not only of an identity of offering price among different sellers of the given good to the same (prospective) buyer but also of an identity of the offering price to different (prospective) buyers of the given good from the same seller. This is the substance of what has been denominated Say's law.

The study of the actual deviations from and the limitations upon these two fundamental tendencies toward fixed (or uniform) relationships in a perfect competitive market made up a large part of the work of economists of the later nineteenth and the early twentieth century, with the alleged tendency toward stability of price relationships in time continuing to receive the most attention, especially as embodied in business cycle theory. Examination of the deviations from and the limitations upon the single price tendency, or the tendency toward spatial uniformity, was not, however, entirely neglected.

Price uniformity in all parts of a trading area for a particular commodity has not always been regarded as a criterion of a good market, nor is it universally so regarded today. Where trading is sporadic, commodities are unstandardized and traders are unspecialized, even though a conventional medium of exchange may be used, bargaining tends to be the chief factor in price fixation. Higgling becomes in these circumstances a fine art. Throughout mediaeval times, from the days of the itinerant merchant to the period of the great fairs, a good market from the economic standpoint was one which afforded the parties to a transaction full scope for the exercise

of their respective bargaining powers. Similar tactics still prevail in oriental bazaars. They are hardly less conspicuous in the purchase and sale of produce or livestock, other than the primary crop (if there is one), in agricultural regions. They are equally evident in real estate dealings everywhere, even in metropolitan centers, and in the employment of labor, especially for domestic service. That the discrepancies in the prices paid or obtained for substantially identical goods under such conditions offer occasion for chronic complaint is attested by the prevalence of persistent, if nebulous and more or less innocuous, conceptions of just price and of customary standards.

With the advance of commercialism, however, the standardization of goods, the growing dependence upon markets for the disposal of products and for source of provisionment, and the increasing frequency and volume of transactions, the way was paved for the emergence of a new idea of what constituted a good market. A fair price came to be regarded as one fixed by free competition in an open market. The "perfect market" of the classical economists was not an invention of a fertile imagination. It was only a belated rationalization of the common sense of a commercial community.

No sooner, however, had this ideal been explicitly formulated and legally sanctioned than vexatious hindrances to its realization began to appear. The machine technique with large scale production, heavy fixed capital investment, corporation finance, increased standardization of output, social stratification of consumers upon an income basis, and an unremitting pressure, on the one hand for technological advance, on the other for style distinction or novelty—these represent the basic features of the new industrial environment which were destined to play such havoc with the ideal tendency toward a single price. Their common characteristic is a tendency toward the depersonalization of trade and industrial relationships. Together they left slight place in the marketing process for the expression of personal tastes, the exercise of personal powers of suasion or the moderating influence of personal responsibility. Price discrimination in these circumstances was not to be explained in terms of the malevolence, chicanery or cupidity of traders on one side of the market or the other. Even if personal factors were not obliterated from price fixation, the chief source of deviations from the single price tendency, no less than of the forces which in theory sustained it, had to

be sought in the impersonal, objective, mechanistic background of the price making process.

The most common type of price discrimination in supposedly free competitive markets, perhaps the earliest type to develop and certainly the most persistent, is that among different sellers of substantially identical goods. In modern retail trade, especially outside the sphere of influence of the dwindling public markets, there is abundant opportunity for each merchant to exploit his customary patronage by setting market-plus prices upon some goods for which customers do not ordinarily shop around and strong inducement to attract new patronage by offering other goods at market-minus prices. The upshot is that in this field wide discrepancies in the prices of identical goods at the same time within clearly defined market areas are not at all infrequent. Doubtless this may be explainable in terms of the curtailment of free competition, yet the fact remains that these markets are as a rule legally and actually open to all upon the freest terms and that such discrepancies occur despite the absence of any sort of collusion. Moreover they are perhaps more common in large and active metropolitan trading centers than in sparsely settled rural areas.

In wholesale trade, especially since manufacturers have so generally taken over the wholesaling function, this type of price discrimination has become rampant. With the growth of large scale production and the inevitable concomitant of increasing standardization, the urge to "tie" customers to the product of a given manufacturer and thus give him an assured outlet for his mass output resulted first in the widespread identification of products by trademarks and brands. This was followed by more and more frenzied and devious efforts to differentiate the product of each manufacturer from that of his rivals. One outcome was fabulous expenditure for advertising. Another was price discrimination. For in the measure that particular producers were successful in their advertising campaigns they were in a position to do exactly as the retail merchants: exploit their goodwill by charging a slightly higher price than others were charging for substantially identical articles.

This constitutes price discrimination from the standpoint of consumers in the aggregate, notwithstanding the fact that the customers of each merchant or the consumers of the product of each manufacturer are all treated alike. The contention that it may all be explained in terms of the defectiveness of competition, while

strictly accurate, leaves out of account the circumstance that no one has ever been able to point out a way in which, within the industrial environment shaped by the machine technique, it is possible at once to retain an open market, foster free competition and avoid discriminatory prices of this type.

The second major type of price discrimination is that among different customers of the same seller. This is ordinarily regarded as the more pernicious or the least defensible, inasmuch as it smacks of deliberate favoritism. That it rests upon subjective rather than objective factors is true only as compared with the first type of price discrimination. Nevertheless, it was undoubtedly upon this ground that it was generally viewed as more obnoxious and that its suppression became a major object of public policy. Accordingly too it has received more attention from economic analysts.

The policy of charging different prices to different customers, or prices disproportionate to the difference in the cost of the goods delivered or the service rendered, found its earliest and most flagrant expression upon a large scale in railroad rate making. It is not less significant that its subsequent history has been intimately associated with the rise of the public utilities, or local public service industries, and with the emergence and expansion of industrial monopolies or trusts. The practise of "charging what the traffic will bear" implies on the one hand a readiness to reduce prices (or rates) to minimum limits well below the net unit cost of a particular class of goods or services offered, if necessary to secure the patronage, and on the other to raise prices (or rates) to maximum limits well above the net unit cost of the goods or services, if feasible without loss of patronage. Where price making is subject to arbitrary decisions within such widely separated limits, the opportunity, indeed the certainty, of discrimination among different buyers is manifest. Whether such discrimination be upon a personal, a geographical, a commodity or some other basis, its existence can have no other significance than a response to the lure of monopoly (how else could the losses on some prices below net unit cost be recouped?) or the exploitation of a monopoly (how else could the extra gains from some prices substantially above net unit cost be obtained with impunity?).

The earliest statutes specifically prohibiting price discrimination of this type were directed against the railroads, but the courts had been

enforcing the same principle in the regulation of public callings generally from mediaeval times. The numerous novel ways, however, in which with the advent of the rail carrier such discrimination came to be employed, such as concealed rebates and through rates favoring terminal points at the expense of intermediate localities, seemed to demand special condemnation. Moreover the vast aggregation of capital which these enterprises represented not only was unprecedented and therefore ground for apprehension, but it plainly made them on the one hand susceptible to close alliance with certain shipping interests and on the other immune to the protests and ill will of other shipping interests not so allied. In the United States the Interstate Commerce Act of 1887 merely followed the precedent of the earlier legislation in the several granger states in taking as its point of departure the evils of rate discrimination. The administrative record of the commission in ensuing years bears witness at once to the elusiveness of the non-discriminatory ideal and to the determination of the public to tolerate no other. In the regulation of local public utilities it appears that rate discrimination did not play the same dominant role. It was rather the danger, indeed the experience, of generally exorbitant rates that prompted such regulation, although here too the rate structure was required to be free of discrimination and favoritism.

The regulation of price discrimination by so-called private enterprises in the broad fields of manufacture and trade has been tardy and slight; in other words, the recognition of the need for some alternative to free competition and caveat emptor as a safeguard against unequal treatment of consumers has been slow. In the United States, where there has occurred the most striking development of industrial monopolization in the form of the trust movement, it was not until 1914 with the passage of the Clayton Act that federal legislation against this practise was adopted. Its limited effectiveness has been due principally to judicial reluctance to depart from the rule that, in the absence of malicious motives, the owner of property may dispose of it upon such terms as he chooses. Its applicability is, however, gradually being extended.

These efforts to protect the public—buyers—from the evils of price discrimination have disclosed the stubborn nature of the practise and have led gradually to some recognition of the powerful economic factors which under certain

conditions work toward a discriminatory price policy. These factors are prevalent in many industrial spheres far removed from that of railway transportation, in which their presence was first noted and analyzed. The most prominent is that of heavy fixed costs. It is not only or primarily that a large amount of capital is invested in a particular enterprise, for large is a purely relative term and so much might justly have been said, for example, of investment in a Venetian trading venture to the Levant in the fourteenth century. But modern industries employing the machine technique are characterized by heavy fixed costs in another sense. They require an irrevocable commitment of vast funds which cannot be and are not expected to be returned to their owners except piecemeal from continuous operation over a long period of years. Moreover not only is it impossible for such investments to be readily withdrawn, but as a rule they cannot readily be expanded in accordance with changes in market conditions, a fact which has more often been overlooked. Increased capacity cannot usually be given a coal mine shaft, a railroad right of way, an electrolytic copper refinery, a petroleum well or a blast furnace by piecemeal additions. None of them is incapable of duplication; but since, for one basic reason *inter alia*, surface area does not increase proportionately to increase of capacity of containers, it is much more economical to provide originally for units of large capacity relative to the contemplated initial requirements.

Business enterprises therefore find that as a substantial part of their total costs are inelastic, neither declining with a reduction of operations nor increasing with an expansion of operations, they have a strong inducement not to curtail output; they will try rather to augment it upon any terms whereby the old business retained or the new business secured contributes something, even if little, over and above the expenses for which it is directly responsible, to the meeting of these inelastic costs. Where there is a wide variety of potential uses for the output of the enterprise, as in the case of railway transportation services, the opportunity is greatest for an advantageous employment of the discriminatory price policy of charging what the traffic will bear. In few industries, however, is the demand for the product entirely homogeneous, and business men are continuously and assiduously experimenting to discover new divisions of their respective markets as a basis for formulating discriminatory price policies in the interest of

maximum utilization of capacity, maximum spreading out of fixed costs and maximum profits.

A second basic factor promoting price discrimination in many industries organized and operated along modern, mechanistic lines is that of joint costs. Wherever large scale operations predominate there is bound to be an accumulation of materials unutilizable for the major product. Under conditions of production upon a small scale it may be most economical to allow these secondary materials to go to waste. It is seldom so when the concentration of production decreases the cost of their assembly for an alternative use and increases the cost of their disposal unutilized. Moreover advances in technology, perhaps especially in connection with the development of chemical processes, are continually disclosing new ways for utilizing industrial materials. Finally, the advantages attendant upon the integration of successive processes in a given branch of industry have brought into technical and administrative conjunction the manufacture of numerous commodities which were once the output of entirely distinct trades. This integrative tendency has added greatly to the range of products produced under conditions which from the business, if not from the strictly technical, standpoint approximate the joint cost conditions so long recognized in and so well typified by the production of mutton and wool in sheep raising.

When this condition is linked with that of heavy fixed costs it creates a special susceptibility to price discrimination. The producer who has no means of gauging the unit cost of any product produced jointly with one or more others, and who is under a strong pressure to keep up and even expand his output, is easily induced to adopt the convenient policy of charging what the traffic will bear. Indeed he can follow no other policy. The buyers of some of these products will inescapably be required to absorb or indemnify the seller for a disproportionate share of the unallocable joint costs, in accordance partly with the degree of elasticity of the demand and partly with the degree of uncontrollability of the supply.

A third factor tending to encourage price discrimination is geographic dispersion of producers selling in a wide but common market. This factor is peculiarly applicable to industries turning out heavy or bulky products upon which transportation costs are relatively high. Prior to the development of railway transporta-

tion, when the markets for such products were perforce local and production was in any case upon a small scale, there was little opportunity for price discrimination in such industries. Under modern conditions, however, a few widely scattered centers of production supply what is essentially a national market, yet the geographical dispersion of particular producers among and around these centers may easily be, indeed actually is, such as to create special zones of relative immunity from outside competition in the vicinity, freightwise, of each plant. Each producer is thus tempted to take full advantage of his favored position in the area adjacent (freightwise) to his plant, which with more than ordinary justice might be termed his tributary market, and to achieve sales volume and thereby reduction of unit costs by quoting less and less remunerative prices to more and more remote customers. In this way each producer comes to be a confirmed poacher upon the market territory tributary to other producers. If the price structure is represented in a three-dimensional figure, the net realization prices of the producers, instead of forming a level plain as contemplated by the theory of free competition, make a hilly territory with the hilltops at the production centers and the valleys in between.

These conditions are most strikingly evident in the case of steel, lumber, cement, salt and sugar; but it is obvious that they are not confined to a narrow range of industries. Indeed so ubiquitous are they in modern industry generally that in the sphere of international trade they have latterly led to a practise of dumping (*q.v.*) on such a wide scale as to make this species of price discrimination hardly less notorious than that which first seriously challenged public attention, railroad rebating. Within domestic markets the unhindered pursuit of this type of discriminatory price policy is so full of jeopardy to the producers and so opprobrious to the consumers that persistent efforts have everywhere been made to limit and regularize (although not, be it noted, to eliminate) the discriminations. In the United States the most favored device to this end has been what has come to be known as the basing point price policy. The several scattered producers jointly agree to sell only upon a delivered price basis, which in each instance is so calculated as to include freight from a common basing point, arbitrarily selected, plus the base price of the producer (supposedly determined independently). A price structure so framed

retains glaring discriminations among the customers of each producer; but it does work to eradicate the individually arbitrary, unpredictable and marketwise demoralizing discriminations of particular producers upon successive sales, in short, to standardize the discriminations and thereby to forestall a general, cut-throat price war among the producers. From their standpoint this is its sufficient justification.

It should be clear that the extirpation of discriminatory price policies is not easily to be achieved or indeed altogether to be desired. The advantages to producers from discrimination under certain conditions are not outweighed or even balanced by the disadvantages to consumers. Nevertheless, the susceptibility to abuse of the practise is ever present, since its appearance is always associated with incipient or actual monopoly. The simple fact is that a genuine competitor cannot afford to discriminate, while a monopolist cannot afford not to discriminate. But it does not follow that genuine competition is everywhere feasible, let alone salutary. Nor is it to be conceded that monopolization without any curb upon the kind or degree of discrimination practised is socially beneficial simply because it may be the "natural" outgrowth of a wasteful competition. Increasingly the social attitude toward price discrimination, like that toward the profit seeking organization of industry from which it springs, is being determined by a matter of fact calculation of its specific effects in particular instances. But there appears also to be a growing realization that an adequate check upon the intolerable abuses to which it is in practise subject cannot be provided short of the institution of some integral counterbalance to the profit seeking motive in the organization of industry itself.

Regulation of Competitive Practices (rev. ed. New York 1929) ch. iv; Seligman, E. R. A., and Love, R. A., *Price Cutting and Price Maintenance* (New York 1932); Viner, Jacob, *Dumping* (Chicago 1923); Brown, H. G., *Economic Science and the Common Welfare* (5th ed. Columbia, Mo. 1931).

PRICE REGULATION is the intervention of government in the formation of prices, ordinarily by legislative act, with a view to raising, lowering or stabilizing them. Whenever a government is the only or the principal supplier of goods or services, it regulates their price by virtue of its monopolistic position. Thus in all countries prices of the postal services are regulated directly through fixed rates. This form of direct price regulation is present also wherever governments operate monopolies either for taxation purposes, as in the case of tobacco, spirits and matches in many countries, or for some wider political or social objective, as in the case of railroads in others. Governmental fixing of maximum and minimum prices, for example, the controlled rents in Germany during the inflation period or the guaranteed wheat prices in England during the World War, also constitutes direct price regulation.

It might appear that private monopoly in its various forms also engages in price regulation; the diamond syndicate, for instance, fixes prices unilaterally by agreement among the several producers and dealers, steadying and regulating them by transforming them from competitive into monopoly prices. Such price arrangements among individuals or groups ought not, however, to be called regulation. For price regulation is essentially a form of price policy; indeed in a society based on exchange it is the most important aspect of economic policy and as such is exclusively a function of government. It is a political, not an economic act, although it is almost always economically motivated and without exception leads to economic consequences. Governments may delegate the function to private groups, as in the case of the so-called *Aussenhandelsstellen* organized by the German government during the inflation period to fix export prices in the various trades. Or they may entrust a private group with the administration of a monopoly, such as the clove monopoly exploited by the Dutch East India Company. Apart from such cases the fixing of a monopoly price by a private group should not be termed price regulation. Nor is government toleration regulation: government non-intervention in a monopolistic market is quite as negative as that

in a competitive market, although perhaps less justified. But when private groups succeed in getting a monopoly price on the home market as a result of government restrictions of imports or tariff or monetary policies, it may properly be said that indirect price regulation is taking place.

Indeed indirect is far more frequent than direct price regulation. Import and export duties, quotas, subsidies and premiums raise or lower prices by dosing the quantities admitted to the market, although the price of the protected commodity is not fixed. Sliding scale duties have been used to introduce greater fixity of price, as in the case of the English corn laws from 1814 to 1841, through variation of the duty in proportion to the price on the home market. Such earlier forms of tariff control were less effective in the establishment of absolute prices than the more recent devices of quota and import boards; but all such regulation is indirect and relative, its incidence on producers and consumers varying considerably.

Regulation has generally been concerned with the prices of particular commodities or at most of a series of connected or related services and commodities, such as bread and beer in mediaeval England. The object is essentially that of more favorable treatment or discrimination in relation to other price groups. Controlled prices of basic goods and services are automatically transmitted forward; thus rent control in Germany reduced housing costs to next to nothing, enabling employers to keep wages low and providing them with a kind of (dumping) premium for exports. On the other hand, regulated prices of final consumers' goods are shifted backward; for example, wheat prices successfully raised by duties or government purchase are quickly reflected in inflated land values.

A general and equal regulation of all prices is meaningless: there is no object in fixing the price of wheat 10 percent above the market if the wheat growers' income is at the same time devaluated by 10 percent. The demand for general price regulation is equivalent to a demand for currency and credit manipulation: for inflation, deflation, reflation or stabilization. It implies regulation of the price level, not a general pro rata overhaul of all prices at the same time. General regulation of prices by some sort of price schedule has been attempted after an arbitrary diminution in the purchasing power of the monetary unit, in order to prevent this change from finding expression in prices. But in this case its object is the maintenance of a price

structure in which the relative position of component prices toward each other is stabilized. Vice versa monetary changes, inflation or reflation, are advocated when a rise of all prices is desired. Experience has shown quite clearly that monetary changes do not affect all prices equally and at the same time. Fixed salaries and fixed charges do not fall or rise proportionally to the fluctuation of general commodity prices. Therefore the demand for general price regulation by monetary means is essentially a demand for preferential treatment, sometimes of fixed income (deflation), but in most cases of variable income (inflation). It implies the regulation of particular prices which tend to depart from the existing relation to other (stable) prices, although its avowed object is simply the stabilization of the purchasing power of money.

Price regulation by an external authority is inevitable when there is no market mechanism for the comparative valuation of exchangeable commodities. For this reason schedules setting forth the values of different goods in relation to each other appear very early in the history of mankind. There is a table of fixed prices in the old Celtic laws (the Brehon Laws) in which all values are set, calculated in relation to the standard commodity, the cumhal, or female slave.

Early economic systems are constantly threatened by scarcity and uncertainty and some form of emergency price regulation is frequently necessary to offset the effects of disequilibrium. Indirect price regulation was initiated by Joseph when he withdrew grain from immediate consumption, contracting supply in the years of plenty and spreading it over the lean years, a case of primitive "valorization" which succeeded because of an accurate forecast of coming events. Price regulation has more often been applied after a disturbance of the equilibrium of demand and supply either by physical scarcity, by monetary depreciation or by a combination of both. Thus the famous Edict of Diocletian (301 A.D.), which tabulates a series of maximum prices mainly for mass consumption goods and for wages, probably resulted from a depreciation of the copper currency, from which the legionaries in particular suffered severely. Physical scarcity of goods may also have been involved, for a rapidly depreciating currency has always caused a deficiency of goods. The edict represents one of the earliest experiments in fairly general price regulation, for it attempted to coordinate all important prices with each other as well as with a depreciated currency.

This most famous of the many efforts to restore the equilibrium between money and goods, not by abolishing the causes of the disturbance but by forbidding people to profit from their consequences, failed completely.

Similar decrees have been issued again and again when there has been danger of scarcity. After Alfonso x had debased the Spanish currency, he endeavored to counteract the effects of this policy by decreeing maximum prices for bread for the entire country (1256). And when the great influx of precious metals into Spain after the first quarter of the sixteenth century had led to rising prices all over the peninsula, there was resort not only to indirect methods, such as the forbidding of exports and attracting of imports, but also to the imposition of price maxima in an effort to combat poverty, scarcity and dearth.

Mediaeval economic activities were of a kind appropriate to a more or less stable society, in which fluctuations of prices were considered senseless as well as immoral and illegal. Consumers, who had to have stable living costs to match stable incomes, were protected by a policy of "guaranteed sufficiency" best expressed by the Spanish term *policía de los abastos*. Producers needed a fixed income that they might live according to the standards of their class and satisfy consumers' wants regularly by continued production. In a stable well balanced market a "just price" which guaranteed to both a stable income and a stable position could normally be agreed upon by the parties themselves; if they failed or could not be trusted, the state intervened by fixing a price which gave the necessary minimum to the producer and safeguarded the consumer by a maximum. Such enactments were successful whenever they expressed a true equilibrium. When they failed to do so they were circumvented. Thus the Spanish peasant was quite willing to sell wheat at the legal maximum as long as the purchaser compensated him by buying olives and wine, which were free from control, at proportionally enhanced prices.

The recurrence of scarcity or monetary disorder led to an application of mediaeval principles of defense whenever such dangers threatened, even after problems which had been local and municipal became national and universal. And in many cases administrative difficulties which had baffled a mediaeval town council could be overcome by a skilled bureaucracy. Thus when the Terror (1793-94) was disorganizing France by destroying personal as well as

monetary security, maximum prices were fixed to prevent famine; and the revolutionary government was strong enough to enforce the maximum price whenever buyer and seller met openly. It could not, however, make supply flow to the market; and the maximum price system, although supplemented by requisitions, soon had to be abandoned.

The World War, which ushered in a period of more or less extreme physical scarcity in most countries, accompanied and augmented by violent currency depreciation, led almost universally to far reaching experiments with price regulation. Such regulation was made possible in the first place because of the enhanced power of government, due to military control and military necessities, and the patriotic sentiments which made people willing to suffer control as well as privations. It was made necessary by the fact that reliance on the natural play of demand and supply was out of place when victory was the only objective. Before the imposition of controls, the ordinary satisfaction of economic wants and desires became a mere side issue and costs were of secondary importance provided goods were furnished; as a consequence prices rose rapidly. Control of some sort became inevitable as well as possible.

Many different methods and forms of price regulations were adopted in the various belligerent and neutral countries. Agreements between buyers and purchasers were concluded more or less compulsorily; central government buying was resorted to in order to prevent price raising in a market of terrified consumers. In many countries a cost-plus system was developed under which producers and retailers were allowed to augment prices above their material costs by certain legal margins. A number of governments guaranteed minimum prices in order to assure continued production, particularly in the case of foodstuffs. Maximum prices of necessary goods were fixed to protect consumers. As the war continued, rationing and purchase by coupon were used to supplement or as a substitute for price maxima. Sugar, butter, margarine, lard, meat, bacon and ham, jam, tea and cheese were at one time rationed in England; in Germany the list included bread and many other necessities. Quantitative reduction of demand and guaranty of supply prevented frenzied competition, while requisitioning kept the producer from holding back.

These various systems of price control succeeded as long as physical necessities did not

press too hard and morale was good. Where hungry buyers and profiteering sellers combined to evade the law, the systems broke down and the well to do procured extra supplies above the maximum price. Since demand continued to exceed supply more and more as the war went on, the success of price regulation was bound to be incomplete; no system for distributing insufficient supplies backed by shrinking means of production can ever be successful. Broadly speaking, war experience indicated that direct price regulation by means of maxima and minima can work only if the prices fixed regulate the flow of goods in the quantities and in the directions needed.

After the Armistice a wartime economy continued in many countries, with inflation taking the place of physical scarcity. While in the United States a return to unregulated prices was effected almost immediately, in most countries price control was continued and in some cases intensified. Socialistic theory and bureaucratic war experience combined to make regulation attractive to many. But social dislocation made enforcement far more difficult, while the opening of frontiers and the flight from declining currencies presented new problems. Exchange control nowhere prevented flight of capital, but in a number of countries a system of guaranteeing a minimum price for the national currency was evolved.

Price control had not completely disappeared in 1929 when the world crisis made new regulation inevitable. During the previous decade the economic structure of most countries had become more rigid. Fixed costs and overcapitalization had increased, while collective bargaining diminished the elasticity of labor. Successful monopolistic industries and labor in sheltered trades refused to lower their prices. The result was an ever increasing impact on the prices of agriculture and of competitive industries. Half of the economic system remained fluid, but the other half became rigid, until the state was obliged to step in and attempt to restore equilibria. In Germany under Brüning monopoly prices were cut 10 percent by government decree, although some powerful groups were excepted; wages were reduced in the same ratio, and interest was cut by 25 percent. The argument was that labor would not accept a reduction in wages if bondholders were not subject to similar sacrifices, a political argument economically unsound. For in countries with high rates of interest there was no overproduc-

tion of loan capital corresponding to the glut of labor. But as political forces had had their share in the erection of the existing price structure, they could not be neglected when it broke down. In many countries interest was cut compulsorily either directly (as much as 22.5 percent in Australia) or indirectly by moratoria or by systematic currency depreciation. Minimum prices for the national currency were in most countries established successfully for the open market but were evaded, in many cases legitimately, by private clearings and "blocked" accounts. The emergency legislation inaugurated in the United States in 1933 represented a combination of general (monetary) price regulation with the establishment of minimum prices. The Federal Reserve Banks attempted to pump money into the market by buying government bonds on a large scale, while the government itself undertook an extensive public works program financed by borrowing. To counteract the resultant rise in stock market and commodity prices and to prevent them from outrunning wages and purchasing power an attempt was made to establish minimum prices for labor on a national scale, to contract labor supply by shortening hours and to raise purchasing power by the absorption of unemployed labor at stable wages. Increased costs of production were expected to be compensated for by increased output. Provision also was made for the fixing of industrial commodity prices, while agricultural prices were to be regulated by control of supply, the farmer agreeing to reduce production in return for a subsidy derived from a processing tax falling ultimately on the consumer.

Price regulation, however, has not always been of an emergency character. To economic liberalism governmental regulation of any kind was but clumsy interference with the complicated play of the economic forces of supply and demand. Liberalism's chief positive contribution to practical economics was the freeing of the markets on which prices were formed, by making land, labor and capital freely exchangeable. Had it succeeded in establishing a complete system of free competition among equals, there might have developed a price system which with absolutely no intervention would have satisfied the wants of all members of society better than any other system. But this liberalism failed to accomplish. Indirect price regulation was present throughout the nineteenth century, in the form of tariffs and later of social legislation. Thus although wages were left to be determined by

the play of supply and demand, restriction of working hours for women and children, in reducing the total labor supply, represented the beginning of indirect price regulation. Moreover government services to the public, the telegraph, for instance, were constantly being expanded; and as exclusive supplier of such services the government regulated their prices quite as directly as it regulated the salaries of civil servants. The prices of many public conveniences, like cabs and porters' services, had always been regulated by a price schedule in most European countries. Consumers were never quite unprotected. A maximum price for capital was maintained in the usury legislation of most countries long after the canonical injunctions against the taking of interest had fallen into oblivion.

The dangers of monopolies had been visualized and attempts made at their regulation long before the development of railroad transportation forced the issue to the front. Land monopoly had been attacked repeatedly, especially in countries like Ireland, where the agrarian crisis after 1879 finally led to the passage of the Irish Land Act of 1881 which created a tribunal with power to fix statutory rents for the majority of Irish tenants for a term of fifteen years. As agricultural prices continued to fall, new reductions became inevitable before the end of the statutory term. These periodical rent fixings, in many cases beneficial, led in others to wilful deterioration of the land. They did not destroy the monopoly price of land but ultimately shifted monopoly profits to the tenant, who finally became his own landlord.

The formation of monopoly prices was early attacked through legislation making monopolies illegal. Mediaeval statutes provided severe punishments for forestalling on the market; later, labor coalitions as well as combinations among manufacturers were strictly forbidden. The argument was that monopoly prices must be prohibited at all costs, since they not only give undue power to favorite groups and permit a discrimination in favor of privileged interests but also include an element of taxation levied by one citizen upon others. Early state constitutions in the United States (Maryland 1776, art. xxxix) as well as later state legislation (Kansas 1889), following English common law precedent, made combinations in restraint of trade illegal. The federal antitrust act of 1890, the so-called Sherman Act, and the Clayton Act of 1914 extended such prohibitions to the entire union.

Similar attempts at the suppression of monopoly have been made in other countries. As late as the end of November, 1923, a tribunal, the Kartellgericht, was created in Germany to regulate cartels, and it proceeded to declare some combination agreements illegal.

Monopolies have survived all attempts to abolish them and monopoly prices play an increasing part in modern economics. According to theory intelligent monopolists might be relied upon to keep prices so low as to extract from them the optimum profits. But since it cannot be assumed that all monopolists know the true theory of monopoly or that they always act according to it, the public is in need of protection. One form of such protection has been for the government itself to operate necessary or desirable monopolies, on the ground that the state can be trusted to treat all customers fairly and equally. A governmentally fixed monopoly price may indeed include a tax element; but there is no moral reason why the public authority should not levy taxes in this manner, while there is every reason why private citizens should not tax other citizens.

Nationalization of the railroads and municipal ownership of public utilities were resorted to in many countries in the late nineteenth and the early twentieth century. Where monopolies remained in private hands, price regulation became inevitable. It was ordinarily accomplished in one of two ways: government approval or disapproval of price schedules prepared by monopolists, or the fixing of prices by the government when granting a monopoly charter. In both cases such regulated prices were at first maximum prices; in practise they tended to be far higher than the rates actually charged. The need for greater flexibility and greater differentiation led in time to the appointment of special regulative commissions or tribunals. In the United Kingdom the Railways and Canal Commission was established in 1873, supplanted in 1921 by the Railway Rates Tribunal. In the United States administrative commissions were early set up by most of the states, and in 1887 the Interstate Commerce Commission was created by the federal government to prevent price discrimination, its powers being extended by subsequent legislation to make it in practise the rate fixing authority for the railroads.

Price regulation by such means is relatively easy in periods of economic stability, although even then it raises serious issues. When marked changes in the general level of prices are taking

place, the proper correlation between the price of the services and the value of the huge invested fixed capitals generally used as the basis for rate making presents grave problems to any administrative body. Price regulation must consider not only the immediate interests of the consumers and producers but those of the owners of the services as well. Partly for that reason and partly because some obvious standard was necessary, regulation has usually centered on the level of profits rather than of prices. Both the British Railways Act of 1921 and the United States Transportation Act of 1920 provided for the adjustment of prices and tariffs so as to yield a standard profit on the capital invested. Legal limitation of profits as a means for limiting prices has been tried also in other cases. Taxation of unearned increment from urban property has been widely advocated as a means of preventing speculative rises in value of real estate. In most countries banks of issue are limited as to profits, partly to induce them to keep discount rates low. During the World War the excess profits tax was utilized with the object of making profiteering useless. While some of these measures have been very successful from a fiscal point of view, their effect on price regulation has been less evident.

The forms of price regulation thus far discussed have been devised to defend consumers' interests. But price regulation is also being used on an ever increasing scale for the safeguarding of producers' claims to the maintenance of standards of living and (often inflated) capital values. One method is that of a guaranteed minimum price, high enough to cover the costs of the submarginal producer, maintained by a government monopoly which acts as purchaser and as distributor. Thus the Swiss government, for instance, in 1915 established a grain monopoly which bought all imported grain and paid to home growers world market prices plus certain increments fixed every year. A similar protection can be given by the taxing of foreign supplies at such rates as will enable the home producer to sell at a fixed remunerative price.

Direct methods for regulating the price of labor have long been used. Early English legislation, after the Black Death, regulated the price of labor in the interest of the employers. Minimum wage regulation in the interest of the laborer may be said to have begun in 1795, when the Berkshire magistrates' meeting at Speenhamland decided to supplement wages paid by the farmers to the poor by money allowances on

a sliding scale regulated by the price of bread, although the system, conceived originally to provide a living wage for the poor, developed into a premium to farmers and later to manufacturers for keeping wages low. The fixing of minimum wages by law began in Australia in 1896 and has since been adopted in more or less attenuated form in most western countries. The great development of collective bargaining in many countries after the World War led to joint monopolistic fixing of the price of labor by organized employers and employees, with the fixing of an "obligatory" compromise wage by the state in some countries when an agreement could not otherwise be reached.

Indirect price regulation in the interest of the producer has been very frequent. Most forms of protection fall into this category. By eliminating or discriminating against goods produced under more favorable conditions protected industries hope to contract supply; they usually fail, however, since protection stimulates production in the sheltered countries without diminishing it abroad. They therefore resort to monopoly to limit production or to restrict supply in the protected markets by dumping the surplus abroad. In collective bargaining labor has applied the same principle.

The usual contribution of governments to this type of price regulation takes the form of facilitating tariffs and quotas or labor legislation. When combines are made compulsory, as in the German potash industry, or when collective bargaining is universally enforced, as in Italy, governments have proceeded from toleration and aid to positive intervention. And when they buy up stocks with the taxpayers' money (cotton and wheat through the United States Farm Board) or finance the holding back of such stocks either by lending government money (Brazilian coffee loans) or by guaranteeing the banks to hold up prices (Canadian wheat pools), they are on the road to direct price regulation. If they do not guarantee a minimum price, they help to maintain one by curtailing supplies. There is a close analogy in the labor market: as long as unemployment benefits are paid by the unions themselves, the price of labor is still privately regulated; but when the taxpayers share the cost of unemployment benefits, thus helping to raise the price of labor by limiting its supply, an element of government regulation is present.

From suffering private monopoly governments have been forced to subsidize and ulti-

mately to organize it, whenever the maintenance of agreed prices was considered essential to safeguarding either the income of submarginal producers or the values of inflated capital or the continuation of production. Subsidies are not always paid in cash; they can take the form of taxing the home consumer by permitting and encouraging dumping or by limiting imports to quotas which are to be sold in the home market at monopoly prices (meat and bacon in England, steel in Germany). An even closer approach to direct price regulation occurs when governments take a hand in organizing private monopoly, either by making combinations compulsory or semicompulsory (German potash legislation, English agricultural produce quotas) or through more complicated methods.

Price regulation on a remunerative basis is apt to destroy itself by stimulating overproduction both abroad and at home. To avoid this it is necessary to restrict the production of new factories or plantations or resort to the physical destruction of superfluous stocks. For such purposes coercive legislation is essential, especially when international cooperation is needed. In German potash legislation the establishment of new concerns as well as the sinking of new shafts is prohibited, while existing enterprises are subject to compulsory quota reductions. Cuba has restricted the production of sugar and Brazil that of coffee. The United States is trying to induce farmers to restrict the cotton and wheat areas. Experiments with sugar, rubber, steel, oil, nitrate and other raw materials have shown that successful regulation in such cases depends on support from all producing countries, which is secured only with great difficulty. When restriction of future production proves inadequate to maintain a price, physical destruction of existing stocks may be necessary. In Germany superfluous shipping has been compulsorily "wrecked." After having valorized coffee successfully by the storing of surplus stocks through loans and by prohibiting the planting of trees (1902) the Brazilian government was confronted in 1929 with a huge surplus; an export tax of ten (later fifteen) gold shillings per bag was imposed, from the proceeds of which one million bags a month were bought and definitely withdrawn from the market by being burned.

It is relatively easy for an efficient government to insist on the observation of maximum and minimum prices in all dealings which come to its knowledge. On the other hand, evasion of

the law is not difficult wherever transactions can be carried on clandestinely. Thus rent control was far more effective than most types of price regulation since houses can be neither hidden nor withdrawn from the market, although even here grave abuses developed in Germany during the inflation. The real problem in price regulation, however, is not the enforcement of maxima or minima but the accurate estimate of the influence of such regulations on supply and demand. While a maximum price which is too high is useless, a maximum price which is not considered remunerative leads inevitably to scarcity; if the goods are produced, they do not appear on the market but are either consumed or transformed by the producers or sold clandestinely, until government requisitions and perhaps compulsory cultivation of some sort become necessary. A minimum price which is too high will increase the evil which it is meant to obviate: it will stimulate overproduction and make necessary forced reductions of area under cultivation or destruction of stocks. A minimum price which is too low will greatly endanger production if consumers are not willing to exceed it. To be successful the legislator must strike what is really a "just price." But in a competitive system such a just price is unworkable: producers do not produce under identical cost conditions, and consumers have not the same purchasing power. It is indeed this fact and this alone which makes for price regulation, which aims always at the protection of the weak consumer and the safeguarding of inefficient producers. Therefore price regulation is bound to result in the creation of monopoly, under which submarginal producers can be protected while price policies can be subjected to supervision in the interest of the weak consumer.

It is not difficult to set prices for commodities produced under monopoly conditions and see to it that they are properly observed. It is most difficult to judge of the social effect of such regulation, so great and so complex is the repercussion of regulated prices both on other regulated prices and on competitive prices. Fixed prices may or may not serve the interests of those immediately concerned better than would non-regulated prices. To judge from the analogy of privately set monopoly prices it is quite possible that the benefit accruing to those enjoying regulated prices may be offset by damage to other interests. It is also possible that in a society in which all prices were regulated, the relative position of various types and groups of incomes

might not be more advantageous or socially desirable than in a non-regulated society.

PRICE STABILIZATION. The many theories of economic, monetary or price stabilization developed during the nineteenth and twentieth centuries may be grouped roughly into two forms of profit-share theories, descending respectively from Malthus and Rodbertus, and two forms of profit-margin theories, descending respectively from Thornton and Ricardo. The profit-share theories place the emphasis upon the share of the national money income going to the "dynamic" factor, profit (Schumpeter), and upon the resultant economic disequilibrium or stabilization. For the United States in 1925 this share was estimated by W. I. King to be 25 percent of the national income. The profit-margin, which is at the basis of the other group of theories, comprises the variable margins of profit and loss as compared with the gross sales income in individual establishments. If stated in averages for all manufacturing and mercantile corporations in the United States this margin has apparently ranged in recent years from an average loss of 1 or 2 percent on sales in years of falling prices (1921, 1924) to an average profit on sales as high as 6 percent in a year of rising prices (1919), the median of the averages for ten years being less than 3 percent (United States, Treasury Department, *Reports*, Commissioner of Internal Revenue on Income of Corporations).

It is noteworthy that the legislative measures adopted in the United States from March to June, 1933, placed in the hands of the president the means of making experimental tests of practically every type of price stabilization theory. The expansion of public works and reforestation included in the legislation and in presidential policy comes from Malthus, who advocated a large increase of "unproductive" expenditure by landlords and government during the similar period of falling prices after 1815. By this he meant the production of services not coming upon the money markets and therefore not depressing commodity prices, but restoring employment for the unemployed, maintaining wages and increasing the consumer demand for commodities. Ricardo, on the other hand, was advocating further depression of wages and re-

junction of taxes and government expenditure, in order to increase the margins for profit and thereby to enable employers to take up the unemployed on the lower level of prices.

Malthus set up his theory as a means of recovery from depression. K. J. Rodbertus in 1837 ("Die Forderungen der arbeitenden Klassen," reprinted in *Aus dem literarischen Nachlass*, ed. by Adolph Wagner and T. Kozak, 3 vols., Berlin 1878-85, vol. iii, p. 195-223) and J. A. Hobson in 1922 (*The Economics of Unemployment*, rev. ed. London 1931) put forward similar theories as indicating the cause of depression and falling prices. According to Rodbertus the landlords and capitalists absorb for savings and investment the increasing output of technological productivity and the laborers are therefore unable to buy back for consumption what they have produced. The resulting overproduction, unemployment and falling prices can be prevented only by government action in establishing a normal working day and readjusting it, as well as wages, from time to time so as to guarantee to workers a proportionate share in the increasing productivity of labor. Trade union philosophy of the nineteenth century largely adopted this theory while substituting labor organization for government control. The theory came to the fore again during the fall in prices after 1920. As formulated by William Trufant Foster and Waddill Catchings (*Money*, 3rd ed. Boston 1927) it pointed to a supposed lag in purchasing power of wage earners due to the operation of the credit system, as a result of which laborers are unable to purchase, at the time of production, the whole of what they are then producing. Although these share theories err in interpreting the cause of depressions and unemployment, they may well be valid as a partial statement of the problem of creating consumer demand after a prolonged depression has made employers, investors and bankers afraid to borrow and lend for future production, when only government can create demand by producing at a loss, as it does in time of war.

The Thornton sequence of profit-margin theories began after the suspension of specie payments by the Bank of England in 1797 with the publication of Henry Thornton's *An Inquiry into the Nature and Effects of the Paper Credit of Great Britain* (London 1802). They are forms of a central bank discount theory. Thornton said that the upward limit to the quantity of paper credit (banknotes) turned principally on

a comparison of the rate of interest taken at the Bank of England with the current rate of mercantile profit. If the bank rate was below this margin for profit, merchants would increase their borrowings and the bank, no longer restricted by legal gold reserve requirements but judging its creation of bank credit only by the solvency of borrowers, would continue to expand its issues of paper money to meet the "legitimate" demands of solvent business on the rising level of prices. But if through a rise in the bank rate the quantity of circulating medium ceased to increase, then the extra profit would be at an end.

This theory reappeared about the time of the bank controversy of 1844 (especially in Tooke, T., and Newmarch, W., *A History of Prices*, 4 vols., London 1838-48; new ed. by T. E. Gregory, 6 vols., 1928); and at the close of the century Knut Wicksell in Sweden endeavored to tie the theory up with the whole process of increasing technological efficiency (*Geldsins und Güterpreise*, Jena 1898). He introduced a distinction between a natural rate and a market rate of interest. The natural rate turned on the concept, introduced by Jevons and Böhm-Bawerk, of a period of production such that in a non-monetary community, where only "real" capital is available and interest payments are made in physical goods at the end of the period, the rate of interest will represent the relative scarcity of this real capital, or real savings. But in a monetary community the banks, being able to create credit money in response to any demand for credit—except as restrained by legal reserve requirements—may supply money in greater or less amount than the amount of real savings, and therefore the market rate need not equal the natural rate. A rate below the natural rate will, following Thornton, tend toward increasing the quantity of money and raising prices; but a rate above the natural rate, by restricting borrowing, will tend toward restricting the quantity of money and credit, thereby reducing prices; while a market rate equal to the natural rate will tend toward stabilization of prices.

It is to be noted that this concept of a period of production, equivalent to the lengthening duration of Böhm-Bawerk's roundabout process, or the changing marginal productivity of real capital (adopted by the Austrian economists Mises and Hayek) is actually quite immeasurable for the guidance of business and bank policy. The nearest approach to its meas-

urement is in the concept already in vogue of a market instead of a natural rate of stock yield and bond yield or of new issues of stocks and bonds. These are anticipations, not of productivity but of profit-ability.

J.M. Keynes (*A Treatise on Money*, 2 vols., London 1930) has approached this market concept in his distinction between savings and investment. Investment is the profit seekers' expenditures for various forms of technological capital, which may proceed more rapidly or more slowly than monetary savings, depending on the current discount policy of the banks. Keynes' state of price equilibrium appears to occur when savings and investment are equal. R. G. Hawtrey (*The Art of Central Banking*, London 1932) has resolved these savings and investments into the "disparity between prices and costs," without differing greatly from Keynes as to the effect of changes in the bank rate. More explicitly than others, however, he has connected the bank rate with the "narrowness," or "sensitiveness," of the margins for profit. He has eliminated the production period and substituted an explanation of the interval as depending mainly on the state of producers' commitments, unfilled orders, inventories of stocks on hand and facilities for putting additional labor and capital to work. He has emphasized short term loans to carry inventories as the point where the banking system has most effective control; Keynes, on the other hand, has stressed long term loans to carry fixed capital. Hawtrey moreover has definitely connected the Malthusian sequence with the Thornton sequence of theories by directly relating contraction and expansion of consumers' (wage earners') income and outlay to the effect of the bank rate on the margins for profit.

The two historical sequences of theory—the margin for profit and the consumers' demand theories—have partial but unknown validity which might be tested experimentally in the application of a theory of multiple causation. This would include consideration of many other factors: international complications; selection of prices to be stabilized; the disruption of equilibrium by rising prices leading to further trade depression; confidence and fear; the validity of the public policy of counteracting a fall in prices arising from increasing efficiency; and similar problems.

The leverage depended upon by the Thornton sequence of profit-margin theories for practical control of price levels through changes in the rediscount rates of central banks lies in the

sensitiveness of the profit-margin. For while interest charges appear to constitute only about 1 percent of the average cost of production, yet, if the margin for profit is 3 percent of gross sales, they are more nearly 33 percent of the profit-margin. The proponents of price stabilization after the World War converge toward this theory of the narrow margins for profit, while its pre-war proponents based their theoretical structure mainly on a quantity theory of money, including the bimetallic and paper money theories. The transition may be seen in the work of Irving Fisher. From 1911 to 1920 adherence to a quantity theory of money—including quantity of bank credit—descending from Ricardo, led Fisher to propose a plan for changing the weight of the gold dollar to counteract a fall or rise of the general price level. But in 1932 he took account of the interacting network of many causal factors influencing price stabilization policies, such as the magnitude of debts, debt liquidation, distress selling, fall in commodity prices, changes in net worth (bankruptcies), decrease in profits or increase in losses, reductions or increases in stock market speculation or in construction, output, trade or unemployment, pessimism and optimism, hoarding and like phenomena. Similar post-war approaches to theories of multiple causation, anticipated by Mitchell in 1913, are presented by Robertson, Keynes, Cassel, Mises, Hayek and others, all of them focusing more or less on the degree of sensitiveness of the profit-margins to all kinds of change throughout the whole capitalistic system.

It is significant, however, that in the period of disorganization after the World War certain countries, chiefly France, Italy and Belgium, following an intimation from the Genoa Conference of 1922, reduced the weights of their standard gold unit as much as 80 percent, when they were compelled by business distress to stop their policy of forcing a precipitate fall in prices in order to restore the pre-war gold standard. It was to this extent a "voluntary" price stabilization remedy, although not clearly based on a quantity theory of money. Similarly in the United States the legislation passed in the spring of 1933 authorized the president to reduce the weight of the dollar as much as 50 percent, at his discretion, and to introduce free coinage of silver at a ratio to be determined by him, if thereby he could bring about an international agreement on a new gold standard.

The shift from advocacy of policies based on

a quantity theory derived from Ricardo and Fisher to those based on a profit-margin theory derived from Thornton and Wicksell is evidenced in the legislative history of the Goldsborough bill in the United States. From 1922 a bill to carry out the original Fisher plan of stabilization was repeatedly introduced in Congress by Representative Goldsborough, but when in 1932 the measure finally passed the House—it was rejected in the Senate—it was amended to require merely that the Federal Reserve system should use its existing powers, especially the bank rediscount rate supplemented by open market operations, to stabilize the purchasing power of money, as proposed in another bill frequently introduced by Representative Strong.

Experimental tests of the Thornton-Wicksell sequence of profit-margin theories have been afforded by central bank policies in numerous countries since the World War. In 1919 in a period of world wide inflation of prices the Federal Reserve system, at that time in effect a world bank, maintained its discount rates much below the current commercial rates of interest; but in 1922-23 by open market sales of securities and raising of the bank rates the system impounded the incoming gold, prevented it from increasing domestic prices and led to a world maldistribution of gold. When England in September, 1931, and other countries later were "forced" to suspend gold payments, their central banks, exaggerating the Wicksell theory of the way to prevent inflation, raised the bank rates to 6 and 8 percent and even higher, at which rates business on its narrow margins of profit could not afford to borrow and expand. These countries did succeed in stabilizing prices at the existing levels, whereas in the United States gold prices continued to fall rapidly until the president "voluntarily" suspended gold payments in March, 1933. England and Sweden within a few months after raising the rates proceeded greatly to reduce them, but business confidence had broken down and the low rates did not call forth expansion of business or reduction of unemployment.

The first major move toward international concerted action, conforming to Wicksell's theory, came from the Genoa Conference of 1922. Influenced more directly by Gustav Cassel, agreement was there reached that it was fundamental to the economic stability of Europe that the nations take steps: to reduce expenditures instead of issuing paper money; to avoid wide

fluctuations in the value of gold by concerted action of central banks and to return to a gold standard although not necessarily on the basis of pre-war weights. The second move in the international sphere was the creation of the Bank for International Settlements; the third was the suspension of gold payments by President Roosevelt and the subsequent legislative authorization of limited inflation of prices; a fourth was expected from the World Economic Conference opened in June, 1933, which, however, failed to reach any agreement.

Wicksell in his theory of price stabilization explicitly guarded against wars and the impounding of gold for war purposes; he could scarcely foresee the post-war impounding of gold by central banks which influenced the testing of his policies. The emphasis in most price stabilization theories has been upon the short credit cycles which move up and down across the long trends, up or down, of prices. An examination of these trends, however, shows them to be long term credit cycles, depending not only on gold or silver production or on technological progress but mainly on war financing, which creates demand by government and bank credit. The trend downward from 1815 to 1849 followed a twenty-five-year world war financed by England with paper credit. The trend downward from 1865 to 1897 followed the American Civil War and the release of American gold to Europe by substitution of government credit. The trend downward from 1920 after a war financed by credit may similarly be expected to continue perhaps to 1950, unless it be that through the new factors of central banks and international agreements among them, the recently announced policy in the United States, the prevention of further wars, the reduction of trade restrictions and similar eventualities a new era of world wide concerted action may halt the trend by the establishment of a more stable price level.

THEORY. *Price*. See VALUE AND PRICE.

The Price System. The price system may be conceived as a device for limiting the use of resources and the consumption of goods, which have alternative applications, to those particular applications which are deemed to deserve precedence, and to the extent required by their inadequacy to fill completely the selected applications. In other words, prices are a means of directing and checking both production and consumption. In themselves these prices are simply the monetary values of goods and services. They may be determined by custom, by an arbitrary authority enjoying some broad social sanction, by higgling in each separate transaction, by a privileged monopolist either buyer or seller, or in an open market with free bargaining in full competition on both sides. But by whatever method prices may be fixed, their ultimate *raison d'être* is to be found in the advantages afforded by the division of labor which they presuppose and the progressive development of which is predicated upon means for facilitating and expediting exchanges. Wherever, whenever and to the extent that productive functions are specialized, productive processes are lengthened and consumption is rationalized, there inevitably emerge differences, incompatibilities and conflicts among individual aims and choices which impose the necessity for the institution of some recognized method of articulation. In a pecuniary society, where goods are

produced at a monetary cost for sale in markets upon monetary terms to consumers who purchase with monetary means derived from the monetary rewards of productive activity, this coordinative function is served by the system of interrelated prices.

The regulative efficacy of prices in assigning specialized functions, distributing productive resources, providing for future requirements and diversifying consumptive activities is no doubt conditioned by the mode of price determination. What has to be accomplished is the enforcement of the negative checks upon and positive directions to productive and consumptive activities in such a manner as, at the minimum, to make the system of control tolerable and, at the optimum, to realize the prevalent disposition of the community. In certain circumstances a large measure of authority in price fixation, with enforced adherence to arbitrary and more or less inflexible price relationships, may alone suffice to insure a workable fit between productive inclinations and productive opportunities, between productive output and consumptive intake or between consumptive dispositions and consumptive opportunities. In other circumstances a large measure of freedom in the price adjustment process in the market, affording wide scope for the spontaneous expression of individual choices, may be quite compatible with, indeed better calculated to procure, an effective performance of this fitting function.

The price mechanism, it is clear, does not indefeasibly require autonomy. Indeed it has never enjoyed complete autonomy. For many ages price setting by sellers was not a discretionary act, was non-competitive; and so far as there was any volitional element in the process it came chiefly from the buyers' quite limited range of choice. The gradual evolution of legal forms and institutional patterns sanctioning a wide range of individual rights and a relatively free play for private interests may perhaps suggest that these were appropriate to the full development of a pecuniary economy. It is not difficult indeed to conceive this evolution as a function of the realization of the potential advantages from the spontaneous integration of specialized functions through an autonomous price system. But the assertion that freedom of contract and liberty of trade are essential concomitants of any price system is refuted alike by experience and by logic.

Moreover it is not inconceivable that the transformation of the economic organization of society from undifferentiated primitivism to specialized and integrated modernism might have been achieved by other methods altogether. For example, an economic autocracy might have accomplished a similar transformation by direct mandates in execution of a deliberately conceived policy. That historically it was rather the price mechanism in one form or another which provided the indispeasable coordinating agency in this development must be accounted for primarily in terms of its superiority under the given evolutionary conditions. This superiority appears to have rested upon two distinct considerations. First, the employment of money as a conventional unit of reckoning values facilitated comparison and presumably therefore made choice more informed and accurate. The use of prices, or money values, as guides to the selection of occupations, the purchase of goods and generally in the organization of productive and consumptive activities has tended accordingly to sharpen economic judgment and to make choice more fruitful. Secondly, the market price system afforded a convenient means of enforcing those checks upon the use of resources which in any case are inescapable, but the incidence of which may be borne with greater equanimity in so far as it appears to be the handiwork of fate. The application of scarce means to specific ends unavoidably excludes to that extent their application to other ends. Frustration and denial are thus in-

exorable features of the economic process. But these deprivations seem to be less onerous when they are not enforced by the arbitrary will of some human authority. It is not to be inferred either that market prices are the automatic, spontaneous, utterly objective phenomena which they have occasionally been represented to be or that they are always humbly accepted as such. It is merely that in the course of a long history they appear to have generally functioned as a screen, tending, if not to hide from common men the harsh conditions of the economic struggle, at least to obscure their proximate cause in human decisions. Thus the market price system, which, with varying circumscription from time to time and from class to class, does leave some area of individual choice and some share of individual responsibility for the actual limitations upon the individual and group use of economic resources, came to establish its superiority over alternative devices for checking and reconciling conflicting human wants and ambitions, which might have been and indeed were tried.

The function of the price system was much less clearly defined and its effectiveness much more dubious in the early stages of the development of the market. It is not necessary to trace in detail the origins of price in primitive trade in order to observe that both in intertribal and in intratribal exchange the quid pro quo very commonly became conventional. Indeed so long as trade remained, as it did for many ages, embedded in a mass of ceremonial observances supercharged with magical significance, there was little room for bargaining. Moreover the extremely restricted variety of articles that figured in this formal gift giving lent itself to the establishment of fixed ratios of exchange. And the fact that a not inconsiderable part of the trade was in the nature of forced exchange contributed to the standardization of its terms after the manner of land rents, priestly fees and other forms of tribute. Under these circumstances the "price system" did not operate primarily to foster a flexible responsiveness between supply and demand. Rather it was a phase of an elaborate and complex system of social organization designed to preserve tradition and discourage experiment under conditions in which the margin of economic surplus was so narrow that group survival depended upon the rigorous repression of risk taking. Nevertheless, customary prices did serve, if somewhat awkwardly and sluggishly, the essential price function of limiting the use of resources to the more im-

portant of their manifold potential applications.

Out of this age long development of trading practises and custom fixed prices there gradually emerged, in classical antiquity and again toward the close of the Middle Ages, markets more secular, more diversified and more extensive in scope. Inevitably there appeared from time to time transactions in new types of goods and in goods from new sources, odd transactions in familiar goods and similar exigencies not contemplated by the customary price structure. And the concept of just price developed partly in response to the need for some extracommercial, non-occasional standard, an absolute formula for guidance in these situations. The ultimate components of a just price were the costs of maintenance of the requisite labor, then the chief factor in production, according to standards of living prescriptively determined for each productive class. So long as most goods were the direct products of a single class of artisans or at most of two or three crafts working in a settled sequence, it was not difficult to give the principle fairly effective application. But with the continued subdivision of industrial processes, the growing diversification of products and the steady expansion of markets the rule of customary prices supplemented by the nebulous principle of just price became less and less adequate.

Still there was no suggestion of relying upon an open market and free competition to fix prices; production and exchange were rigidly restricted by the conservative collective sense of communities still lacking a substantial surplus above the necessary means of subsistence. Rather, in response to the increasingly obvious deficiencies of the traditional price structure and of the mechanism of just price determination there developed piecemeal a system of regulated prices. The beginnings of this system are indistinct and came at different periods in different regions; nor was its course of development everywhere uniform. But in general the era of regulated prices may be stated to have begun with the establishment of the guilds and to have persisted, even if in a moribund condition, into the seventeenth and eighteenth centuries. The responsibility of regulation passed successively from merchant guilds to craft guilds, thence to local authorities and eventually to national governments, although the lines of demarcation are not altogether clear. The regulatory jurisdiction embraced chiefly manufacturing processes and included, in addition to the other

elements, the prices of raw materials, labor and finished products.

The increasing rate of change in the scope and direction of trade relationships, in the technique of manufacture and in the diversification of merchandise following the era of exploration and discovery eventually made this system of regulated prices obsolete. It was a system designed for and peculiarly adapted to the requirements of a static society. A society founded upon status could not long resist the disturbing tendencies set in motion by the opening up of unbounded opportunities for enterprise. Moreover the acquisition of fabulous treasure from piracy and the despoliation of backward peoples overseas, added to the mounting product of the more prosaic but ultimately more significant cumulative advances in industrial efficiency, provided a hitherto unparalleled disposable surplus, which was the *sine qua non* for a social sanction of genuine private adventure in trade and industry. Finally the enormous additions to the European stock of precious metals from across the Atlantic so upset the long prevailing proportion between specie and exchangeable wealth that the maintenance of the traditional price structure became an insuperable task. The regulatory machinery was simply incapable of coping with these powerful forces making for price movements of unprecedented magnitude, frequency and variety. The downfall of the regulated price system marked the dissolution not simply of a moribund price mechanism but of an outgrown social and industrial order.

The circumstances of its lapsing indicated the nature of the price system which was destined to supersede it. As it had fallen into desuetude by virtue of its inflexibility, the succeeding price system was bound, above everything else, to provide for the maximum of flexibility. This it did by securing to everyone the utmost freedom to buy and sell. Such was the meaning of *laissez faire*. Of course this liberty of trade was not introduced suddenly everywhere; nor was it ever realized completely anywhere. By the end of the nineteenth century, however, it represented the dominant ideal of economic policy and the accredited aim of economic statesmanship virtually throughout Christendom. The "goods, wares and merchandise" of commerce were subject in their ebb and flow solely to the dictates of market price. Productive labor was set at one task and deprived of another by the imperious commands of market price; neither artists nor scientists escaped this encompassing

suzerainty. Consumers were offered this and denied that in accordance with the impersonal will of the market as expressed in prices. Investors no longer built mills and factories; they were permitted instead to contribute money funds in exchange for capital shares at a market price which responded to the realized and prospective margin between the market prices of costs and the market prices of products. In a word, everything had its price and the price was the criterion of its economic significance.

The theory which supported this prodigious spread of the price mechanism and the price mentality took for granted a passive or neutral role for money in the composition of the price structure. The exchange interrelationships of goods as expressed in prices were conceived to be basically the product of the interaction of real costs and real utility. While it was recognized that these primary forces were always mediated by individual judgments, the prevalent conception of the rationalistic, utilitarian nature of man justified the assumption that these individual judgments were simply the channels through which the ultimate real forces brought pressure to bear upon prices in the market. The processes of valuation thus abstracted and impersonalized provided an automatic adjustment, as nicely worked out by the marginal analysis, whereby the maximum product was realized at a minimum cost. The pervasive tendency toward equilibrium which issued from this automatic adjustment was admitted to be subject to friction and temporary disturbing influences, but these were readily traceable to perverse twists and anomalous obstructions in the channels of individual judgment or to fortuitous deviations in the course of nature. The theory exempted the price system itself from any share in the responsibility for the failure of a free market economy to realize at all times the maximum satisfaction of human wants. If in practise recurrent dislocations and occasional distress persisted, this was in spite of, not because of, the subservience of productive and consumptive activities to the regimen of prices.

As usual the first breaches in the massive authority of this autonomous price system came from the pressure of practical disillusionment rather than from the thrusts of theoretical inquiry. It was the harsh incidence of an exclusive reliance upon free competition in an open market that led to efforts to amend it and here and there to abandon it. As usual too concern for their interests as producers awakened certain

classes to the shortcomings of the price system appreciably before a concern for their interests as consumers prompted other groups to challenge from a different angle this same economic orthodoxy. In neither case of course was the whole system of price making attacked. Men do not relinquish their faith in a fetish simply because it fails them in some specific quarter. So when working men found that reliance upon the prices set for their labor in an open competitive market was prejudicial to their advancement, they determined to bargain collectively and to sell their labor, not at market prices as mere commodities supposedly were sold, but at "fair" prices; that is, for as much as might be obtainable. Likewise when business men, who by and large had gained most from laissez faire, perceived that market prices for their products were not invariably profitable, they looked for a substitute in fair prices as determined by the sellers; elsewhere, e.g. in the employment of labor, they were quite content that market prices should rule. But collusive agreements did not provide the sole avenue of escape from the verdict of the market. For those who were fortunately situated in the newer industries the patent laws provided a convenient and effective means of blocking out competition, enabling fair prices to be set without fear of contest. A much larger number whose products were quite ordinary articles of commerce found it possible to identify their wares by trademarks or brands and by advertising to create for them a certain distinction, often specious; thereby prices might be set taking full account of the buyers' "education" in the peculiar merits of the advertiser's particular brand.

Finally consumers also became aware that prices were no longer the objective outcome of a multitude of spontaneous forces represented by the independent bids and offers of innumerable individuals operating in pursuit of competitive private interests. The situation did not at first present itself as a chronic disease of the market price system; it appeared rather as a malady peculiar to certain industries. Upon this diagnosis the remedy plainly called for was a specific to be administered ad hoc to each of the ailing as occasion required. Hence isolated treatment was provided for railroads, gas works, electrical plants, telephone systems and numerous lesser public utilities. The rest of the business community was warned to keep away from the afflicted. If other industries not subject to monopoly quarantine showed symptoms of the

same disease, they were placed upon the operating table to be dismembered.

Thus in various directions practical exigencies brought about a considerable departure from the rules of economic conduct prescribed by the market price regime. Resources were not allowed to flow without help or hindrance where prices dictated (trusts, public utility franchises, subsidies, tariffs); methods of production were not permitted to be chosen upon a basis solely of cost price considerations (factory legislation, pure food and drugs laws, health regulation); the distribution of income by the automatic processes of the market was interfered with (collective bargaining, corporate accounts manipulation, rate regulation, activities of trade associations and cartels). In these and other ways the price system was being amended, restricted and annulled in practise some time before its sanctions were questioned in theory.

When eventually theory did undertake to analyze the significance of these developments, the explanation most generally accepted ran in terms of monopolistic tendencies. Certain conditions of modern industrialism were believed to foster monopoly. The most important of these was the diminishing cost tendency in production, which in turn was conceived to spring from the growing importance of fixed costs and of joint costs in productive processes dominated by the machine technique. Some students found a large measure of responsibility also in the conjunction with such technical factors of the legal privileges associated with the pervasive reorganization of business in the corporate form. These accounted for no inconsiderable part of the advantages (diminishing cost) of increasing size and hence for the trend toward monopoly. In the light of these theories the tendency toward monopoly appeared to be inherent in the existing economic order; and since monopoly prices were regarded as arbitrary and the prices set by administrative agencies instituted for their regulation were no less arbitrary and even more inflexible, there was no escape from economic arteriosclerosis. There could be no doubt of the gravity of the consequences; for arbitrary and stereotyped prices have no place in an economic system of which change is the most essential characteristic and which depends for survival upon its capacity to insure constant adaptation to new conditions.

Later studies of monopoly price converged upon the conclusion that if it was not as arbitrary as had been at first supposed it was even more

inflexible. In particular the analysis of actual price movements under monopoly, duopoly and monopolistic competition revealed an extraordinary resistance to price changes. Under the circumstances attention was hopefully directed to the gradual spread of monopoly throughout industry, which, it was expected, would solve the ever more vexatious problem of instability. It was suggested that if monopolistic producers in a nominally competitive era had achieved such power to fix prices and to control markets that they could practically ignore general business disturbances, the extension of the monopolistic tendency might furnish a key to the solution of the business cycle riddle. It was argued further that monopolists, even granting their exactions, were in a better position than a group of independent competitors making estimates at random to adjust productive capacity to potential sales volume at cost indemnifying prices and to provide against untoward changes in demand.

The march of events, however, unremittently aggravated the burden of losses from wide sweeping price fluctuations, thus confounding not alone the theorists who placed the responsibility on the introduction of change resisting elements in the price structure but also those who sought to explain these evils as the consequence of the tardy or arrested development of centralized planning and control within each industry. For experience ever more plainly indicated that the evils of periodic price recession and trade depression were alike too great to be stemmed by arbitrary measures designed to stabilize particular industries or to fix specific prices, and too insidious to be assessed solely or even primarily to the comparatively sporadic and collateral transformations in the structure of competitive industry represented by the cartel and trust movements, public utility development, trade union organization and the like.

In the search for the disrupting force which was making the economical administration of industry under the price system increasingly difficult attention turned therefore to the one element common to all prices, the monetary factor. It had long been recognized and was generally accepted, after Hume at least, that the volume of money in circulation had a direct relation to the level of prices; yet the effort to trace any precise quantitative relationship between the two awaited not only an urgent practical motivation but also more adequate statistical records and a suitable statistical technique. Toward the close of the nineteenth

century the gradual development of all of these prerequisites combined to make feasible the formulation of a definite theory of the relationship between money and prices.

The exponents of the quantity theory professed to find a direct causal sequence between changes in the amount of the circulating medium and changes in the general level of prices. As every specific price is simply an expression of the terms upon which a certain amount of goods or services are exchanged against money or a money equivalent, it was reasoned that the price level in any period must be expressible as an average compounded of the total amount of means of payment used in the settlement of transactions during that period divided by the total volume of goods and services sold. It was further claimed that the division of an index of the average volume of cash and credit means of payment in circulation, multiplied by their velocity or turnover in a given period, by the index of the total volume of trade in that period gave a quotient representing the average change in the general price level relative to the base period. If this quotient corresponded to the actual change in a representative list of prices as measured directly by index numbers based upon market data, the computation was supposed to verify the quantity theory of money. This statistical "proof" is so self-evident that it proves nothing, nor does it clarify the origin or nature of the forces which cause the change.

Exponents of the quantity theory, however, supported their general contention also by propounding reasons independent of the alleged proof. The argument was that the total volume of trade, although it may respond within narrow limits to changes in the general level of prices, does not initiate such changes, but tends rather to arrest them by parallel movements. The average velocity of circulation of the available means of payment, being determined by habit, was regarded as a relatively constant factor. The ratio of credit money to cash money, the technical efficiency of banking remaining unchanged, was declared to be subject to variation only within comparatively narrow limits. Finally, it was contended with special emphasis that the price level itself was a passive factor, being simply a reflection of market conditions, i.e. of the ratio of the supply of goods and services to the supply of money instruments. Thus by a process of elimination the exponents of the quantity theory reached the conclusion that the general level of prices is determined by the

quantity of commodity money in circulation. Fluctuations in this item were believed to be spontaneous and self-generating (gold discoveries, technical progress in ore concentration and the like), making it the independent variable solely responsible for general price movements. Whether valid or not in reference to long time changes in the level of prices, the theory offers no satisfactory explanation of the cyclical downward and upward swings of prices, since there is certainly no corresponding fluctuation in the supply of commodity money. Even if, in accordance with Kondratiev's thesis, it is granted that technological progress in goods production tending to reduce prices sets in motion exploration and research in gold production tending eventually to counteract this price depressing influence and vice versa, the oscillations in prices so induced could work out only over several decades, as Kondratiev himself admits.

Determined as they are to trace cyclical price instability to monetary factors, the quantity theorists commonly fall back upon the conceded variability of the ratio of cash money to credit money or, more specifically, of the ratio of bank reserves to bank deposits. They maintain that prosperity breeds an optimism which is reflected in easy credit, and that in any case a substantial surplus of loanable funds will have tended to accumulate in a preceding period of price recessions. For a time the absorption of this credit in expanding production may readily be effected without disturbing the price level, the volume of trade expanding *pari passu* with the volume of deposit currency. Eventually, however, it is argued, the increasing supply of credit outruns the capacity of the industrial machine to increase its output—since the elasticity of credit under modern banking methods surpasses by far the elasticity of production—whereupon the excess credit finds an outlet in speculation and advancing prices. This process continues until the overextension of the deposit reserve ratio approaches the preestablished legal limits or the limit of safety according to banking tradition. Thereupon credit tightens, goods are dumped on the market, prices decline, collateral is impaired, loans are still further curtailed, and the same sequence of events is repeated until both credit and prices decline to an irreducible minimum. In this way the responsibility for the cyclical fluctuations of trade has been traced to cyclical fluctuations of prices, and the responsibility for these to the peculiar conditions shaping the credit policies of the banks.

The difficulty with this theory is that it involves an oversight of the distinction between production and trade. American writers especially, influenced no doubt by Irving Fisher's formulation of the equation of exchange, have been prone to neglect the confusion of a quantity element and a rate element in the ambiguous factor "volume of trade." If T be taken as a symbol for transactions rather than for trade, which it really must be if a single symbol is to represent the amount of work to be done by money, there is no apparent reason why the shifting of the direction of credit extensions from productive uses to speculative uses should affect the price level. Whether a borrower uses credit to forward the production and distribution of goods or in speculation, simply causing a given quantity of goods to turn over more times than it otherwise would, can make no conceivable difference from the standpoint of the preservation of a balance in the equation of exchange. The volume of trade in a given period may be increased just as well by passing the same quantity of goods through more hands as by passing more goods through the same hands; so long as the transactions that have to be settled increase *pari passu* with the means of settling transactions, no disturbance can result in the general average of prices. It remains to be shown therefore how increased speculation could cause an inflation of prices.

It is sometimes asserted, however, that the speculative use of credit results in accelerating its velocity of circulation; that, as compared with credit used to finance the time consuming operations of actual production and distribution, bank deposit currency employed in purely speculative purchases and sales circulates much more rapidly. Little is known as yet about the actual or comparative velocities of money and credit in the hands of various classes in the community, but even if this contention were valid it would scarcely yield a plausible explanation of cyclical change in the price level. For this amendment to the quantity theory, no less than its original variant, neglects the rate element in the volume of trade. Until some reason has been suggested for supposing that when bank deposit or other currency turns over more times in a given period it does not cause goods turnover to increase correspondingly, it is difficult to see why speculative credit is peculiarly efficacious in bringing about price changes. Some writers have gone even further, contending that a change in the velocity of circulation of means of

payment must produce an equal and simultaneous change in the rate of turnover of goods.

In response to this theory there has developed a school which shifts the onus for short run variability from the quantity to the rate element. The velocity theorists, as this group may be called, hold that the cyclical changes in the velocity of circulation of money are not matched by corresponding changes in the rate of turnover of goods and hence cause price fluctuations. Various reasons are assigned for this divergence in the two rate factors. Thus the "parcels theory," commanding perhaps the largest number of adherents, maintains that during prosperity, with a tendency toward more and more diminutive scales of purchase and sale and proportionately greater frequency of transactions, the efficiency of a given volume of means of payment is increased, without there being necessarily any increase in either the volume or the rate of turnover of goods. Although the parcels theory may not be susceptible to logical attack, its practical validity rests upon the assumption that increasing prosperity involves an increasing *morcellement* of transactions. It is difficult to see concretely what is meant by parceling unless it is simply another term for the familiar trade phrase "hand to mouth buying." And if this be true, the theory makes no appreciable contribution to the explanation of cyclical price fluctuations, for common experience indicates that hand to mouth buying becomes less prevalent as prosperity grows and speculation becomes bolder.

Another form of the velocity theory, recently propounded, would account for an alleged growing discrepancy between the velocity of circulation of money and the rate of turnover of goods during the period of prosperity by an assumed increasing prevalence at such times of the transfer of goods without any corresponding transfer of money, either cash or credit. It sees in the increasing proportion of book and instalment debts to total trade as prosperity waxes an accumulation of "unfilled orders" for the "money trade," as it were. It is conceded that the transaction of trade upon mercantile and retail credit could lead to no disturbance in the equation of exchange affecting prices, if the amount of "money work" carried over into a given period by virtue of deferred settlement of transactions consummated in the preceding period were exactly counterbalanced by the amount of delayed money work carried over into the succeeding period. But the contention?

precisely that this cancellation does not occur as prosperity advances, by reason of the increasing ease with which goods may be obtained upon a simple promise of deferred payment. There is thus built up a backlog of work for money to do, which cannot indefinitely be held in abeyance pending the time when money may be idle. Eventually those who buy on credit accumulate so large a volume of debts that some among them can no longer continue to maintain the demand by further purchases upon this basis; and others still less prudent find that deferred payments promised for a definite date cannot be met out of current income. They are constrained then by anxious creditors to shift their demand from goods to money. At first there may be some effort to get money exactly as they have been getting goods—upon simple promises to repay in the future, by substituting bank credits for book credits. But eventually the debtors are forced to convert goods or services back into money; this tends to increase the value of money and to diminish the value of commodities, thus accounting for the transition from prosperity to depression. While this book credit theory does not lack logic or plausibility, it can scarcely account for the full amplitude of the periodic price swings, particularly in view of the extent to which in recent times immediate settlement by cash or bank credit instruments has made headway in both wholesale and retail trade relative to charges upon open book account. And if the spread of instalment sales since the World War appears to be a tendency working in the opposite direction, it should not be overlooked that a large part of them is financed ultimately by bank credit. Precisely what share of responsibility for giving impulsion to cyclical movements is to be assessed against book and instalment credit it is impossible to ascertain, since sufficiently comprehensive statistical data are lacking.

The foregoing theories of general price instability trace price level changes in the last resort to the peculiarities of operation of an autonomous money and credit mechanism and neglect changes in trade relationships, in the supply and demand for various goods and services. It should be obvious, however, that, since any ratio may be disturbed by a change in either of its two terms, price, which is a ratio of the number of money units to the number of units of a particular good, may be altered just as effectively by a change in its goods term (denominator) as by a change in its money term

(numerator); by inference the same holds true of a price level, which is simply an average of the specific price ratios in all exchanges of goods or services against money in a given period. There would seem to be no inherent reason therefore why only the money term of this ratio should be referred to for causes of changes in the price level. Moreover while the money term is subject only to quantitative variation, the change in the term representing goods may be either quantitative or qualitative. Certainly the forces affecting the readiness to purchase (bids) and the readiness to sell (offers) would be altered with a change in the quality of goods traded; and experience indicates that these qualitative changes in the goods and services sold are neither few nor insignificant. The same circumstance affects the price level ratio. The readiness of buyers to part with the available means of payment is conditioned no less by the qualitative aspect of the total offerings for sale than by their volume. Here, however, the interrelationships of the various kinds of goods and services offered for sale become the major consideration. In other words, the quality of the total productive output of industry is primarily a function of the right proportions of the different varieties of products offered for sale. If, to take a very simple example, the quantity of hose offered for sale is wholly out of line with the number of pairs of shoes put on the market, the output of industry is to that extent unbalanced and the price level, not simply the price of hose or shoes, will be affected accordingly. For as the supply of each commodity constitutes ultimately a part of the demand for all other commodities, an impairment of the purchasing power of the suppliers of a commodity through forces affecting its price adversely cannot fail to react unfavorably upon the demand for and upon the price of other products. It is this ultimate and infeasible interdependence of all the price items making up the price structure which the mechanistic, quantitative theories of price movement are prone to overlook.

The important problem therefore is to determine the right proportions of the different varieties of products making up the total volume of offerings for sale, the standard whereby the various flows of supply may be held to be out of line. This is simply and solely the income distributing disposition of the community. In a free exchange society there can be no appeal from the complexion of demand—perhaps irrational, certainly never predictable—as it appears

in the market; it constitutes what might be termed, to adapt Hayek's phrase, the structure of consumption and saving. It is the capacity of entrepreneurs (or, in any alternative form of society, the directors of production) to match this distribution of demand in the structure of production which measures the "quality" of the aggregate industrial and commercial activities. In other words, the promptness and facility with which goods are exchanged against money and this money is again exchanged against goods, and thereby the price terms upon which these exchanges take place, are a function of the degree of correspondence between the composition of the total supply (volume of production) and the complexion of the aggregate demand.

In the essentials of this thesis there is nothing new. Numerous students have traced the periodic breakdown of prosperity and disorganization of markets to what amounts to misdirected production. Thus A. Spiethoff finds the underlying difficulty in the differential rate of gestation of instrumental goods and of direct consumption goods; Werner Sombart in the differential rhythm of organic and of inorganic processes of production; W. Stanley Jevons and H. L. Moore in meteorological periodicity, which affects agricultural production; Joseph Schumpeter in a lag in invention and discovery, whereby new products are in periodic deficiency. In these as in other explanations which might be cited the root of the evil is found in the development of "bad" relationships among different types of goods from which proceed price disturbances. Theories of this type stand diametrically opposed therefore to all varieties of the quantity theory, which, in whatever other respects they may differ, agree in considering price changes the cause and trade dislocations the effect.

Recently there have been distinct advances toward integrating these contrasting types of price theory. Starting from Knut Wicksell's distinction between the real rate of interest (which balances the demand for investment funds and the supply of savings) and its market rate, a distinction which in slightly varying forms has been emphasized also by Thorstein Veblen, Jean Lescure and Irving Fisher, economists have sought to establish a connection between the credit expansion characteristic of easy money periods and the direction given to production, which would furnish a logical explanation of the movement of prices. Particularly J. M. Keynes in England, Alvin Hansen in the United States

and L. Mises and F. A. Hayek in Austria have been working upon this problem with significant results. Keynes, however, still under the spell of quantitative notions, tends to regard the spread between the rate of investment and the rate of saving as primarily a factor retarding or accelerating the outflow of bank credit and hence affecting the volume of purchasing power and the general level of prices. Hansen, on the other hand, while conceding that the emergence of a discrepancy between these rates is significant in stimulating or curtailing operations in capital goods industries and thus makes them especially susceptible to misdirection, circumspectly treats their resultant price variability as only one of many factors upsetting business calculations and producing an asymmetrical development of the industrial structure.

To the Austrians the fluctuations in the general average of prices arising from a change in the volume of bank credit are less significant than the disturbance in price relationships issuing from the changes in the directions in which bank credit flows. Thus when the rate of interest in the money market is held below the real, or equilibrium, rate, the increase in the proportion of total purchasing power assigned to producers' goods markets and the consequent tendency to make production more roundabout, not only extensively (by the addition of new stages to the productive process) but intensively at every stage, produce changes in the relative prices of various kinds of products and in the relative prices of the same product at different stages of production. It is these changes in relative prices and the misdirected efforts made to frustrate them or to facilitate and take advantage of them which cause stresses and strains in the industrial structure and lead to its recurrent collapse. If the supposed enhancement of the proportion of total purchasing power directed toward producers' goods were the result of increased savings and a decline in the real rate of interest, the borrowers might achieve a readjustment of the relative productive capacities and relative supplies of products in different lines which would approach a new equilibrium representing an approximate adaptation to the changed conditions in the intertemporal distribution of income. But when the enhanced proportion of purchasing power rests upon no more stable a basis than a fictitious redundancy of loanable funds, the chances of a prudent and yet prompt adaptation of the structure of production to the altered price relationships are remote. This is

more and more the case as the increasing command of the mechanical technique tends steadily to enlarge the relative importance of fixed or specific producers' goods to the more fluid forms of instrumental capital.

It may be conceded that the shifts in relative prices are of supreme importance, since they determine directly entrepreneurial decisions in regard to when, how and of what production shall be undertaken. It may be granted also that the significance of these shifts has been neglected by students seeking to formulate a dynamic theory of prices upon a mechanistic model by the use of quantitative methods ill adapted to the discriminative treatment of the multifarious factors involved in the qualitative complexion of the price structure. But it is far from certain that the shifts in relative prices are invariably initiated by the discrepancy between the real rate of interest and that prevailing in the money market. Thus at the beginning of a recovery there are other costs besides capital costs, e.g. labor costs, which are lower in the market than their equilibrium price, as Mitchell has emphasized. Nor has it been convincingly demonstrated that the price shifts always take the form of a general enhancement of the prices of producers' equipment relative to the prices of finished goods. Experience seems to confirm, as Schumpeter contends, that maladjustment is caused not by overexpansion in the production of producers' goods generally, but rather by the unbridled extension of construction in some one industry or comparatively few industries due to the discovery of some exceptionally advantageous new combination of factors or some new basis of appeal for consumer patronage. Moreover this entire thesis rests upon the insecure foundation of the Böhm-Bawerk theory of interest, which is assumed to determine immediately and unqualifiedly not only the prices of capital goods but also the nature of productive processes.

On the whole may it not fairly be concluded that the increasingly speculative (devoted to future ends) character of the industrial process, the persistently irresponsible management of the community's savings and of industry's working capital in the custodianship of the bankers and the cumulatively dynamic character of industrial technique as well as of consumptive taste combine to foredoom a spontaneously directed economic system, administered by reference to price gauges, to alternate spasms of unreckoning enterprise and stupors of bewilder-

ing disorganization? The modern industrial system might be compared to an orchestra with an ever changing personnel (enterprisers), veterans with familiar instruments continually being displaced by recruit musicians with novel contraptions of their own design, practising for a symphony of which the score is being continually altered as the playing proceeds, under the conductorship of several self-appointed maestri (bankers), each wielding his baton in accordance with his individual reading of the score. Occasionally the tempo is advanced concertedly but never evenly, and pandemonium follows every crescendo. Although the economic orchestra is provided with a score in the price system, its composition cannot be ascribed to infallible genius. Of course if simple melody upon familiar themes would suffice to meet the musical aspirations of the audience and a disciplined drill to satisfy the artistic ambitions of the players, there is no good reason why a single conductor should not be selected who, improvising as he went along, might dispense with a score altogether. But pending the realization of these conditions no promising way has yet been suggested for achieving an unbroken economic symphony out of the creative talents of a host of vain Apollos and defiant Pans, each with a baton in his instrument case.

PRICE HISTORY. Not much is known about the history of prices in the ancient world, because of both paucity of data, a difficulty which will never completely be overcome, and lack of trained attention to the subject, an obstacle which is rapidly disappearing.

In early ancient times prices were expressed in terms of weights of the money metals, most frequently copper, lead, gold or silver, and payments were made in rings, bricks or bars of standard weight. Coins first appeared about the seventh century B.C., but prices expressed in ancient coinage terms are difficult to interpret for it is frequently impossible to determine whether coins circulated at their bullion value (or bullion value plus cost of coinage) or at their face value.

In ancient Babylonia two price systems existed side by side, the relatively fixed and traditional temple prices and those of the open market. About 2572-2558 B.C., Manishtusu, son of Sargon, king of the dynasty of Akkad, fixed the price of grain at 300 *silas* (121 liters) for one shekel (8.42 grams of silver). This price seems to have ruled in the market with no great fluctuations for nearly three hundred years. Apparently this remarkable stability was promoted by the temple organization. By the Hammurabi period (about 2100-1758 B.C.) a price increase had resulted so that one shekel bought only 150 to 180 *silas* of grain, and in the second half of the eighteenth century B.C. one shekel bought only 90 *silas* of grain. Later, in the fourteenth and thirteenth centuries B.C., there was a general return to barter economy.

From this time down to 648 B.C., when Ashurbanipal became king of Babylonia, no clear record exists. In emergencies prices for food were extremely high. At one time, during a famine in the eighth dynasty (990-955 B.C.), grain stood at 20 *silas* for a silver shekel. During the period of the Chaldean dynasty (625-538 B.C.) the price of grain was about what it had been in the Hammurabi period, 150 to 180 *silas* per silver shekel; the price of slaves was much higher than formerly and real wages also were apparently much improved. There is some evidence that later, in the period of Greek domination, price fluctuations in Babylonia followed roughly those in Hellenistic Levantine territories.

Fragmentary data indicate that prices in the Greek world moved upward from the time of Solon in the seventh century B.C. A gradual increase of about 50 percent probably occurred in the sixth century; between 480 B.C. and 404 B.C. the rise was possibly about 100 percent. By 330-320 B.C. the price level was about double that of the preceding century as a result of the tremendous treasure brought to Greece by Alexander's conquests, which had somewhat the same effect on the Hellenistic society that Spanish gold and silver from America had upon sixteenth century Europe. Trade was greatly stimulated and, at least for the more fortunately situated, a much higher standard of living was made possible. Especially in the great trading cities the contrast was heightened between the opulence of the few and the extreme poverty of the many. But as trade expanded and money was diffused throughout the greatly enlarged market, the price trend reversed itself. Prices declined

strongly from near the end of the fourth to the middle of the third century. Subsequently, relative stability seems to have obtained until the Roman conquest.

For the early Roman era price data are few and almost impossible of interpretation; even for the empire knowledge of prices remains fragmentary and unsatisfactory. Careful investigations of Egyptian papyri now being conducted promise to throw much light on the picture, although difficulties with weights and measures and coinage changes still constitute a serious stumbling block. Prices in the Roman Empire during the first 180 years of the Christian era appear to have been fairly stable, with possibly a mild downward tendency. This situation obtained despite a progressive debasement of the coinage, which reached 25 percent by 180 A.D. Probably important factors in preventing a price advance were the virtual exhaustion of the rich mines of Laurium, an appreciable drain of the precious metals to the East and the introduction of the use of money into extensive new areas by the Roman conquests.

The troubled years at the end of the second century saw further debasement and sharply rising prices. In the third century, especially the latter half, the silver content of the currency was reduced rapidly and prices were inflated tremendously. Diocletian's price fixing edict of 301 was only one of many similar measures adopted by the emperors in futile attempts to stay the upward rush of prices in terms of a currency which repeated debasement was making increasingly worthless. Inflation continued in the fourth century and the coinage system broke down almost completely. Presently, at least for the territories of the western Mediterranean, there was a return to barter or payments in gold or silver by weight. Without doubt the soaring prices and chaotic currency conditions played a large part in the political unrest and disturbed economic and social conditions in the third and fourth centuries.

There is a wide gap in knowledge of prices after this period, and it is only from about 1200 that their course can once more be traced even in a very general way. Not only did a non-monetary economy prevail for long periods and over wide stretches of western Europe, but even where money was used the scattered prices of which there are records have but little meaning. Transportation difficulties and dangers tended to keep market areas small. It was not until Venice, Genoa and Florence blossomed forth as

commercial cities that a clear cut money economy made its appearance.

Knowledge concerning prices in western Europe from 1200 to recent times has long been dependent upon elaborate compilations by such writers as Georges d'Avenel and Thorold Rogers. From the point of view of modern statistical technique these studies leave much to be desired. They have been modified and supplemented by recent works, especially those of Beveridge, Usher and Hamilton, so that it is now possible to trace with some assurance the general trend of prices in western Europe through the interesting period of the "price revolution." A really detailed and satisfactory history of prices either for Europe or for America cannot, however, be written until the elaborate investigations sponsored by the International Scientific Committee on Price History are completed.

From the middle of the twelfth century to about the last quarter of the fourteenth prices were generally advancing. Indeed Beveridge holds that this epoch may have seen one of the most violent upward movements in English experience. The upward trend was very strong for the first part of the period, then slackened. Thus English wheat prices rose mildly in the first quarter of the fourteenth century, declined in the second and rose again in the third to a point somewhat above that for the first quarter. According to d'Avenel's index for France prices rose gradually from 1200 to 1375; then there began a clearly definable downward trend in western Europe, persisting for about one hundred years. Prices in France fell about 50 percent and English wheat sold at the end of the period for one third to one half of what it had brought at the beginning. Students have accounted for this decline by pointing to the increasing use of money in western Europe, the falling off of European silver production because of technical difficulties, and the loss of precious metals to the East.

From the low point, about 1475, there began that tremendous upward swing known as the price revolution. For forty or fifty years the increase was moderate, then more rapid, until a peak was reached, at least for France and England, about the middle of the seventeenth century. The course of Alsatian prices for this period seems to have been roughly similar to that for France and England. The extent of the price change is indicated roughly by the fact that commodity price indices for both France and

England rose approximately 200 percent, while wheat prices advanced roughly 300 percent in Saxony and even more in France and England. In Spain the general level of prices moved upward with remarkable rapidity during the sixteenth century, the increase amounting to nearly 500 percent and the highest point being reached near the end of the century. The Spanish advance during the sixteenth century was approximately twice as great as that which took place in England and France between 1475 and 1663, and the zenith for the Spanish upward movement was reached about fifty years earlier than for France and England. Of course all commodities were not equally affected: wheat rose much more rapidly than most other agricultural products, money wages went up slowly, while manufacturing and transportation costs—neither is taken sufficiently into account in the price indices for the period—were generally declining after 1500.

The price revolution has usually been ascribed to the great importations of treasure from the New World. Hamilton's studies for Spain, which give for the first time really satisfactory data on the amount of these imports, do indicate a very close relationship between the movement of gold and silver into Spain and the increase in the price level there. A time lag for the price rise in the nearby countries to the north is not unexpected, for it naturally took some time for the gold and silver to be drawn from Spain into western Europe. Moreover prices were carried to a relatively higher level in Spain than elsewhere, not only because of concentration of the precious metals there but also because of a general economic stagnation in that country and a considerable emigration from the peninsula.

The price rise of the sixteenth century has, however, usually been too exclusively attributed to the Spanish imports of gold and silver from the New World. No appreciable amount of treasure was brought in from America before 1500 and only relatively small amounts arrived during the first quarter of the sixteenth century. Yet, as has been seen, prices were moving upward in France and England as early as the final quarter of the previous century. Scholars are now inclined to stress the importance of new supplies from other sources. Between 1450 and 1545 rich new mines were opened in central Europe, gold mines flourished near Salzburg and silver mines in the Tirol, Bohemia and elsewhere. Moreover the Portuguese conquerors

in Africa brought back large quantities of gold, especially from Senegal and Sofala, before the Spanish had begun any considerable importation from America. It must be remembered also that credit transactions were already, at least in the chief commercial centers, beginning to supplement those in money. On the other hand, the growth of foreign commerce in the sixteenth century and the transition over wide areas from a system of feudal dues and self-sufficiency to a money economy made greatly increased supplies of money essential merely to sustain existing prices.

During the seventeenth century European mines gradually ceased production, world output of silver declined and gold production increased slightly. As population and trade were rising rapidly, it is not surprising to find that the upward surge of prices spent itself by about 1660. From this year until about 1745 the price trend in western Europe was mildly downward. Then followed, about 1746 to 1815, another period of advancing prices not only for western Europe but also for America. The secular price trend for wheat in England shows an increase between 1748 and 1814 of about 200 percent, which is probably fairly representative of the general movement of prices for the period. Studies for the United States, based largely on prices at New York, show a general price advance for the same period of about 160 percent. Investigations for other market areas suggest an even greater rise. Although population and industry grew rapidly, the price advance was apparently made possible by augmented production of the precious metals, rapid increase in the use of credit and paper money and the almost continual wars of the time.

Price studies, especially the older ones, typically had for their chief purpose an investigation of the trend of real wages. Recent investigations have thrown doubt on many of their conclusions. Not only are the difficulties of securing satisfactory information on wage payments great, but until recent times price data provided a very unsatisfactory measure of purchasing power because they were limited to quotations for only a small number of crude materials. It has not as a rule been possible to take account of payments for rent, services and finished goods at retail. Moreover too often generalizations have been made on the basis of a single isolated market area or wage rates in one locality have been compared with prices in another.

Recent investigations have, for instance, thrown considerable doubt upon the previously accepted theory that real wages rose greatly after the Black Death and that the fifteenth century was a golden age for English workers. During the price revolution money wages in France and England lagged far behind the rising prices as measured by the available indices, but much further investigation is necessary before satisfactory generalizations can be made concerning the effect on the conditions of the working class. Hamilton's investigations of the price revolution in Spain indicate that wages for landsmen lagged seriously behind the general price level while wages for seamen rose at about the same rate as prices. Finally, the trend of real wages in England during the eighteenth century has been the subject of marked disagreement. Rogers, followed by Marshall, the Webbs and others, has held that the position of the laborer improved greatly; but the Hammonds have found an increasing degradation in the workers' standard of living. Research in prices and wages by localities has led E. W. Gilboy to conclude that the condition of the laborer in the north of England improved in the course of the century but that Gloucestershire showed no advance and possibly a decline in real wages.

Immediately after the Napoleonic epoch prices fell sharply, and a gradual downward trend set in. This was interrupted for a period of from twenty to twenty-five years, in the fifth and sixth decades of the nineteenth century, when prices were strengthened temporarily. From 1814 to 1896 the general level of wholesale prices in England and the United States declined about 60 percent. If adjustment is made for the fact that both countries were off the gold standard in 1814, it may be estimated that gold prices in both countries fell by approximately 50 percent. During the temporary upward movement in the middle of the century wholesale price indices for Germany and England advanced 40 and 50 percent respectively (1847-50 to 1873-74). In the United States, where war and paper money issues played an important role, prices in currency advanced (1843-64) by 157 percent and prices in gold (1843-66) by 65 percent. After the mid-century rise prices resumed their downward movement. That the nadir of this movement was reached by 1895-97 is indicated by wholesale price indices which have been constructed for England, Germany, Belgium, France, Austria-Hungary, Italy, New Zealand and the United States. Wage and price

studies are sufficiently adequate to justify the belief that there was in industrialized countries a general advance in real wages during the nineteenth century. Warren and Pearson's investigations for the United States indicate that the purchasing power of wages in terms of wholesale commodity prices increased between 1840 and 1914 at a compound rate of 1.71 per cent per year.

Production of the precious metals declined until about the middle of the century. With the opening of new sources in California (1848) and Australia (1851) the gold output of the world increased rapidly for a few years, as clearly reflected in the mid-century advance in prices, and then declined gradually until the last decade of the century. After 1870 silver production rose, but the widespread adoption of the gold standard at this time greatly reduced the influence of silver on prices in Europe and America. Credit came rapidly into widespread use during the nineteenth century, but the need for additional means of payment also expanded as industry and commerce made tremendous forward strides.

It is usually assumed that in the nineteenth century the great improvements in transportation did much to bring prices in local markets into closer harmony with national and international price movements. Preliminary studies indicate, however, that during the first half of the century wholesale commodity prices at Boston, Massachusetts, Charleston, South Carolina, and New Orleans, Louisiana, were already in close agreement and that there was no clear tendency for greater concurrence at the end of the period than at the beginning.

The downward movement in prices was clearly reversed in the last decade of the nineteenth century, and a steady upward trend continued until the World War. Various index numbers of wholesale prices, not comparable among themselves, moved as follows:

COUNTRY	DATE OF TURN	PERCENTAGE INCREASE TO 1914
Canada	1897	48
France	1896	44
Germany	1896	42
Great Britain	1896	33
Italy	1897	21
Russia	1896	52*
United States	1896	50

* 1896 to 1912.

That this upward movement in prices, coinciding with the rapid development of gold production in South Africa, proved a stimulant to

industrial development is clearly evidenced by the absence of any prolonged depression during the period. Instead of the long stretches of inactivity, often lasting three or four years, which had occurred in the middle of each of the three previous decades, there were sharp reactions, such as that of 1900 in Germany or that of 1907 throughout the world, with very rapid recovery in each case.

The World War had as its inevitable concomitant a rapid rise in prices. In some countries currency in circulation was greatly increased; in others the expansion was primarily in the banking system. The result was the same in both cases: prices more than doubled in half a dozen years. No past revolution in prices for which records exist was as sudden or as widespread. The price rise was evident first in the belligerent countries but quickly spread to neutral areas. In the United States the price advance was checked in the summer of 1917; prices rose sharply in 1919 and early 1920, when controls were abandoned and a speculative price boom developed. The extent of the price advance in 1920 as compared with the last pre-war year (1913 = 100) is shown by non-comparable wholesale price index numbers as follows:

Canada	244
France	509
Great Britain	307
India	201
Japan	259
Netherlands	292
New Zealand	207
Spain	221
Sweden	359
United States	221

Source: League of Nations, Economic Intelligence Service, *Statistical Year-Book of the League of Nations, 1930/31, 1931, II.A.16* (Geneva 1931) p. 270-72.

The next few years were dominated by the individual currency policies of various countries, and not until the middle of the decade did any degree of order begin to appear. If prices are computed on a gold basis, there was evident a general decline in 1920 and 1921 and then upward or downward drifts as the prices in the various countries sought levels at which some degree of equilibrium could be maintained. By 1928 it appeared superficially that a degree of stability had been reached, but the separate national price levels were so varied that, even allowing for differences arising from the technical character of the indices and for the substantial differences in economic development, the discrepancies had not been cleared away.

The situation is illustrated by the following list of gold indices (with a 1913 or 1914 base) of wholesale prices for 1928 (taken from League of Nations, *Course and Phases of the World Economic Depression*, Publications, 1931.ii.A.21, rev. ed. Geneva 1931, p. 90):

Australia	165
British India	163
Japan	159
Canada	151
Sweden	148
Switzerland	145
Spain	144
United Kingdom	140
Germany	140
United States	140
Italy	134
Austria	130
France	126
South Africa	120
Poland	120
Chile	119

These international differences were a legacy from the hectic days of paper currencies and inflation. The return to a balanced relationship was made difficult by price controls, credit policies and the unsettled character of the various international balances of payments.

Although prices were rising in some few countries during the later years in the decade, in most instances there set in a definite downward drift. This gentle decline turned into a rout in 1929. These price declines were one of the most important manifestations of the depression as well as one of its most significant causes. The character of the decline is indicated by the following wholesale price indices (1926 = 100).

COUNTRY	1929	1932
Australia	98	77
Austria	106	91
Canada	96	67
Denmark	92	72
France	90	62
Germany	102	72
India	95	61
Italy	74	50
Japan	93	67
Netherlands	98	54
Sweden	94	73
Switzerland	98	66
Union of South Africa	94	74
United Kingdom	92	66
United States	95	65

Source: Recomputed from data in League of Nations, Economic Intelligence Service *Statistical Year-Book 1932/33* 933.ii.A.7 (Geneva 1933) p. 266-68.

In recent years there has been increasing realization that while changes in the level of prices matter for those with time contracts,

especially debtors and creditors, business profits depend even more on the internal structure of prices. Price level movements inevitably result in changes in the elements within the price structure, certain prices being much more flexible than others. In its history of American prices during the war, the Price Section of the War Industries Board showed that as the war progressed there was increasing spread among the 1437 commodities studied. More elaborate later studies by Frederick C. Mills relating to price dispersion (the development of spread) and price displacement (the shifting of relative position) indicate that for the United States the internal price structure was very much upset by the war, but that by 1923 some degree of persistent order appears to have been established. This new equilibrium differed in one important respect from the pre-war status. Before the war the price of raw materials, especially of farm products, had been increasing steadily at a rate somewhat more rapid than that for manufactured goods. However, the expansion in production of raw materials during the war created a considerable discrepancy in the other direction. Although raw materials prices strengthened again from 1922 to 1929 while manufactured goods declined, a marked divergence still remained. This is indicated by the following wholesale price indices for the United States (computed from Mills, Frederick C., *Economic Tendencies in the United States*, p. 584):

	RAW MATERIALS	MANUFACTURED GOODS
1901	82	86
1913	100	100
1919	196	206
1922	133	155
1929	141	151

Of course it cannot be assumed that the pre-war relationship represents a "normal." The complication of new items, such as radios, the increased importance of the automobile and similar problems make any comparison somewhat dubious.

The gap between raw material and manufactured prices was again seriously widened by the decline which began in 1929. Raw material commodity prices began to fall heavily late in that year. In the case of many manufactured goods, where production could be controlled with relative ease, there was strong resistance to price reductions. But farm acreage was abandoned only slowly, if at all, and mines were not closed, with the result that production was not adjusted to the reduced demand, and prices fell

rapidly. The collapse was accentuated by the early resistance to readjustment which resulted from the various price control and valorization schemes, applying chiefly to raw materials, established during the post-war period. That the gap between raw material and manufactured goods prices became increasingly wide is indicated by the movements of the Bureau of Labor Statistics index of wholesale prices:

	RAW MATERIALS	FINISHED PRODUCTS
1929	97.5	94.5
1930	84.3	88.0
1931	65.6	77.0
1932	55.1	70.3

The preceding discussion of recent price history has been restricted entirely to the record of wholesale prices chiefly because of the relative adequacy of the data. This record has often been employed as indicative of the entire price structure, other elements being assumed to move in a markedly parallel or related manner. Students are now, however, clearly aware of the fact that wholesale prices are not necessarily typical of all prices or even of the "price level." The following indices (on a 1913 base), collected by F. C. Mills (in National Bureau of Economic Research, *News-Bulletin*, no. 42, New York 1931, p. 4), indicate the divergence among various elements during the outset of the depression:

	JULY 1929	OCTOBER 1930	OCTOBER 1931
Wholesale prices	140	118	98
Cost of living	172	164	149
Retail food prices	158	144	119
Prices received by farmer	140	106	68
Prices paid by farmer	155	144	126
Per capita earnings, manufacturing labor employed	228		182

If other items such as security prices and real estate values were added to the list, the divergence would be even greater.

Another significant feature in the post-war history of prices is the increasing tendency to restrict the market area to national boundaries. Not only did the various nations adopt differing currency and credit policies, but tariffs, quotas, exchange regulations and other forms of trade barriers were hastily erected. The abandonment of the gold standard by most countries under the strain of the depression permitted greater independent fluctuation of prices within the various countries. The result has been a segregation of domestic markets which has quite destroyed the international equilibrium of price

levels. Since most countries are at present off the gold standard and at least one, the United States, is committed to an avowed policy of advancing prices to the 1926 level with stabilization at that point, it is impossible to discuss the future trend of prices.

Any prolonged downward trend of prices has serious social implications. It steadily increases the burden upon the debtor class, particularly the farmer. Even more important, it changes in considerable degree the pattern of the business cycle, as is indicated in the following table of the number of years of prosperity per year of depression (from Thorp, W. L., *Business Annals*, National Bureau of Economic Research, Publications, no. 8, New York 1926, p. 66):

ENGLAND		UNITED STATES	
1790-1815	1.0	1790-1815	2.6
1815-1849	0.9	1815-1849	0.8
1849-1873	3.3	1849-1865	2.9
1873-1896	0.4	1865-1896	0.9
1896-1920	2.7	1896-1920	3.1

In the three periods of rising prices prosperous years were at least three times as numerous, relative to depressed years, as during the two periods of falling prices. The reason for this is not difficult to understand. An underlying upward movement in prices is a persistent urge to recovery, but a declining trend is a continually discouraging factor in the history of business conditions.

PRICE STATISTICS. Records of price changes provide information of central importance concerning the working of a modern business economy. This is true not only with reference to those general changes in the value of money which first engaged the attention of pioneer workers on index numbers of prices; it is equally true of the countless detailed shifts in market conditions which are reflected in variations of the prices of individual commodities and of commodity groups. The history of economic change, in the large and in detail, is written in price quotations.

But it is a history not easily read. The multiplicity of detail and the wide variations which characterize the prices of many types of commodities give these records a baffling com-

plexity which served until fairly recent times to discourage the collection of comprehensive price data. Not until a stimulus was given in the nineteenth century by the issues arising out of apparent changes in the value of gold were price quotations compiled in any systematic fashion. These first compilations—by Tooke and Newmarch and later by Jevons, Sauerbeck and Soetbeer—were relatively meager; only Soetbeer's sample included more than one hundred commodities. With the improvement of index number technique, the recognition of new problems to which price quotations are directly relevant, the evolution of organized markets and the general industrial and business development of the last half century, the recording of price quotations and the attempts at systematic collection and interpretation of such records have been given new stimulus. Today price reporting activities covering the chief markets of the world are carried on by commercial organizations, by news agencies and by numerous governmental departments. Although these records still fall short of the needs of economists, statistics of security and commodity prices represent today the most highly developed branch of current economic reporting. This movement has not only led to more comprehensive and accurate work in the gathering and use of current quotations but has also stimulated painstaking studies of early records by individual scholars and scientific bodies.

The first problem encountered in working with price statistics is concerned with the obtaining of unambiguous basic data. There are several reasons why unequivocal observations in the field of prices are hard to secure. To begin with, existing markets are imperfect. In the perfect market of the economic theorist, in which every buyer and seller is in possession of full knowledge regarding all relevant data and in which free competition obtains, a single price prevails at a given time for a given commodity. Such conditions are most nearly approximated in the highly organized markets for securities and for certain standard commodities. Price records from these markets accurately reflect trading conditions. The retail stores of a given city, on the other hand, do not constitute a single perfect market, and wide variation may be found from store to store in the prices of identical commodities. Again, the wholesale prices of a given commodity at a stated time often show wide regional differences within an area such as that of the United States, differences not ex-

plainable in terms of transportation costs. Under such conditions the representativeness of any single price quotation is open to question. Since such conditions are general today, the degree of representativeness of current price quotations is subject to considerable variation.

Some of the variation between individual prices for apparently the same commodity can be traced to differences in the grade or quality of the commodity or in the terms of sale, which may escape the attention of the compiler or analyst. The modern movement toward the standardization of commodities with respect to quality has enhanced the usefulness of price records through more precise definition of varying grades of the same commodity. But this movement has affected only the major staples. Substantial qualitative differences prevail among many commodities entering into trade today. Quoted prices which reflect these differences, without indicating the variations in quality which account for them, are obviously ambiguous. Since frequent changes of quality are especially pronounced among highly fabricated goods, many commodities of this type are necessarily excluded from the compilations on which current index numbers of prices are based, with the result that complete accuracy in the measurement of average price movements is impossible. The accuracy of price quotations is similarly impaired by variation in the terms of sale, such as discounts, length of period within which payment may be made and concessions of other types often used to modify a basic quoted price.

Price quotations for the same commodity may vary also because of differences in the character of the market in which the prices originate. Thus for some commodities it is important to distinguish between contract prices and open market prices. Iron and steel, for example, are sold to large buyers under term contracts and delivered at the contract price regardless of changes which may occur in open market quotations. When a large part of the actual sales are made at such contract prices, open market quotations may lose much of their significance. In the case of many more commodities it is essential to specify the stage of the marketing process to which stated transactions relate. In the collection of price statistics it is customary to recognize two broad commodity markets—wholesale and retail. While the latter term is reasonably well defined, the designation wholesale markets includes markets covering the en-

tire range of the marketing process from sale by the first producer to purchase by a retail agency. In the instance of a finished manufactured good therefore the "wholesale price" may relate to the manufacturer's price to a jobber or to a wholesaler (in many lines the two functions are not the same), the manufacturer's price to a retailer or the jobber's or wholesaler's price to a retailer. For an identical good these prices might all be different at a given time. To lump them all under the term wholesale price is to introduce into the record a serious element of uncertainty. A classification more accurate than that which merely distinguishes wholesale from retail is needed.

The basic series required in the study of price behavior is therefore the record of actual prices of a certain commodity in a definite market at stated periods of time. Even though averaging may be necessary later, it is desirable that the basic records include not averages of price quotations prevailing at different times or in different markets but simple observations relating to stated times and stated markets. In using such series it is assumed that trade terms are constant, that the parties to the transaction are unchanged, that the commodity has not varied in quality over the period covered and that the market represented is sufficiently homogeneous so that the quotations employed may be taken to represent prices recorded for the same commodity in other transactions in the same market. Deviations from these conditions should be defined explicitly.

For certain types of analysis price statistics derived from market quotations, however perfect, are insufficient, for they necessarily exclude records of the various components of the final selling price of a manufactured good, such as cost of materials and of labor per unit of finished product. In the United States measurements of this type have been derived indirectly from census records of the physical output of important manufacturing industries and parallel records of aggregate cost of materials, aggregate labor cost, aggregate overhead costs plus profits and aggregate value of manufactured products. Such records do not provide unequivocal measurements of changes in the prices of cost goods, since they are influenced by technical production coefficients; but the addition of measurements of this type to currently available price quotations enriches the materials available for the study of price movements.

Price series for individual commodities repre-

sent essentially a record of price change over more or less extended periods. The change is not even in time or uniform for the different commodities. To establish the character and moving forces of this change is one of the important tasks of the student of price behavior. The most obvious type of price change is that between specific dates. Movements of this kind are measured by price relatives on a constant or shifting base, which in combination furnish index numbers defining changes in average prices. These relatives show that the prices of individual commodities differ markedly in degree of variability. Precision has been given to this observation by the distinction of different kinds of variability and by the utilization of methods which make possible exact definition of the degree of variability. The simpler measures of variability are the ratio of the mean deviation to the average, which indicates the amplitude of change, and the ratio of the number of actual changes to the number of possible changes, which is a rough index of the frequency of change.

As with other time series it is customary in analyzing price series to distinguish between long time non-recurrent movements and shorter periodic fluctuations of the cyclical or seasonal type. In regard to long period trends it is to be observed that the results obtained when the movements of individual prices are studied in detail are not in accord with the naïve conception that commodity prices move in the mass in response to changes in the value of the monetary unit. Such study has shown wide diversity of secular movements, with certain commodities declining progressively in reference to the general trend of prices and other commodities showing a sustained advance. That the movement of commodity prices over time is thus radial and dispersive rather than concentrated and compact has an obvious bearing on the character of progressive change in the general economic structure. In connection with cyclical changes recent studies of prices have included in addition to the general measurement of cyclical variability an analysis of the timing, duration and amplitude of those swings in the prices of individual commodities which accompany cycles in general business. In this field in particular the movements of a general price index conceal many of the most significant features of the behavior of individual prices. Here again, although wide variation prevails, there are impressed upon varying movements clear evi-

dences of uniformity involving repetition of patterns of revival and recession.

An important recent innovation in price analysis has been the development of refined methods of defining price and quantity relationships, and the building up of a body of statistics appropriate to the measurement of the sensitivity of prices to changes in physical quantities produced or consumed. The measure used in this connection is the coefficient of price flexibility originated by Henry L. Moore, the analogue on the price side of the coefficient of elasticity of demand. It is defined as the ratio of the relative change in price per unit of commodity to the corresponding relative change in quantity, when the relative changes are infinitesimal.

In the early use of price statistics the purpose was single and simple—to measure average price changes in order that variations in the general purchasing power of money might be defined. For this purpose actual price quotations or price relatives were combined into averages. At first the price index numbers included only a small number of items and the formula employed was that of a simple or weighted arithmetic mean; in the course of time, however, the number of components was considerably increased and the construction of the index greatly refined. In recent years the requirements placed upon the collection of price statistics have been expanded markedly; index numbers have been used to measure not simply changes in the general purchasing power of money but also changes in the average level of wholesale prices, in cost of living, in retail prices, in prices received by farmers, in prices paid by farmers, in prices of goods entering into international trade and in prices of a great many other types which are believed to possess characteristic modes of behavior or to be of exceptional economic interest. The more detailed study of the various sections of the price level has facilitated attempts to construct comprehensive index numbers designed to measure changes in the general level of prices. Thus Carl Snyder's index for the United States includes, in addition to wholesale commodity prices, retail prices, cost of living data, wages, security prices, transportation costs, realty values and farm prices as well as specially compiled indices of changes in the prices of equipment, machinery and hardware. In the main, however, work with price statistics today is directed toward the construction of index numbers of wholesale prices and of living costs

for industrial workers. Such indices, compiled in most cases by official bodies, are now available for almost every country. Many of them appear currently, in a form convenient for reference and comparison, in the *Monthly Bulletin of Statistics* issued by the League of Nations; recent summaries of the methods used in their construction have appeared in the *Monthly Labor Review* (vol. xxxi, 1930, p. 852-68) and in the *International Labour Review* (vol. xxvii, 1933, p. 539-57).

A price index number, whether it relates to all prices or merely to those of a single commodity group, is a series of averages for price distributions at successive dates. As such it measures only the change in the general tendency of the distributions; it fails to reveal the changes in their internal structure and conceals whatever changes may have occurred in the reliability of the index number as a representative value. It is only within the last few years that attention has been centered upon these aspects of changing prices; previously the complex variations in the internal price structure, which are of vast economic significance, were apt to be regarded merely as troublesome obstacles to the calculation of trustworthy averages.

Despite the novelty of this type of research a number of interesting conclusions have been established, provisionally or finally. Thus it has been found that the system of prices as a whole, including prices in various markets for securities, commodities and services, is highly heterogeneous, composed of elements subject to the play of distinctive forces. This heterogeneity materially limits the utility of studies which treat the entire price system as a unit. Even for sections of the price system, frequency distributions of price relatives are of an erratic and unstable character; the precise conditions which give rise to the Gaussian distribution are seldom realized. Interdependence of causal factors affecting the movements of price relatives for different commodities is probably the most important of the elements of instability in such distributions. Type IV of Pearson's classification of frequency distributions predominates. There is some improvement in stability of distribution type and in the efficiency of orthodox descriptive measures when logarithms of price relatives are used in place of relatives in natural form, when weights are employed and when link relatives rather than fixed base relatives are combined. It is a notable fact that stability of type for distributions of fixed base price relatives may be re-

attained after extreme disturbances; that is, the form of order which is due to the play of sheer chance may emerge as conditions of stability are restored in the price system.

In reference to the dispersion of price relatives about the central value it has been found that the dispersion of fixed base relatives tends to increase progressively with the passage of time; over an extended period it becomes so great that index numbers lose much of their significance. Accordingly short period comparisons of price levels are more accurate than are comparisons covering long periods. For a given period of time the dispersion of price relatives tends to be greater the more violent the changes in the general level of prices. Dispersion therefore is a function not of direction of change but rather of degree of change in the price level. There is no definite evidence that measurements of dispersion make possible the forecasting of changes in the general price level.

The other characteristic of internal instability of price relations, price displacement (the degree of shifting in relative position which takes place with the passage of time), is also in part a function of changes in the general price level. The greater the violence of the change in the general level, the greater the degree of internal instability, as reflected in the dispersion of prices and in the shifts in relations among prices. Such internal instability, however, is present even under conditions of stability in the level of prices. Measurements based on American data during the period from 1893 to 1926 indicate that about 40 percent of the internal instability of wholesale prices could be attributed, on the assumption of a causal relation, to fluctuations in the level of wholesale prices; this figure would be distinctly higher during such extreme changes in the price level as occurred between 1929 and 1933.

Detailed statistical study of the price structure thus reveals a system marked by constant internal movement and by wide shifts in the relations among its component elements. There is evidence that over extended periods of time the play of market forces tends to establish internal stability, but over short periods and in general instability is a dominant feature of the prevailing price system. These facts preclude the acceptance of a concept of normal relationship among the prices of commodities and of commodity groups. There are ties, and strong ties, among elements of the price system, but historically these have always been subject to progressive

change with modifications in industrial and distributive methods. In periods of stable growth price relations have changed at fairly regular rates; in periods of severe economic disturbance price relations have been violently altered. But always flux and change, not constancy of relationship, have been the ruling condition within the structure of prices.

PRICHARD, JAMES COWLES (1786–1848), English physician and anthropologist. Prichard's parents were Quakers and, although he later joined the Church of England, his early training in the religion of his parents had a profound effect on his life and thought. In his youth and while practising medicine he lived in Bristol, where he was in touch with men from diverse races, a circumstance which originated and stimulated his interest in anthropology. His main thesis was that there were significant resemblances between man and the other animals and that the different human races are all varieties of a single species. He contended that man possessed an aptitude for physical modification under environmental influence and that mankind was originally dark skinned, white skin being produced through the influence of civilization. He was also keenly interested in the then infant science of Egyptology and preceded Pictet in the conclusion which is now a commonplace that the Celtic languages are part of the Indo-European group.

Prichard had a large medical practise and took a special interest in mental diseases. His theory that there was a moral insanity which might be independent of any impairment of the intellectual functions had wide influence, especially in the field of jurisprudence. In 1845 he became a commissioner in lunacy in London. At the time of his death he was president of the Ethnological Society.

H., *Prichard and Symonds* (London 1891).

PRIESTHOOD. The institution of priesthood may be said to have arisen from the widespread tendency to attribute to certain individuals inherent powers which distinguish them from their surroundings. Such a conception of the priest takes for granted a primitive faith in the existence of a force which, in the words of Codrington, "acts in all kinds of ways for good and evil and which it is of the greatest advantage to possess or control." Thus the priest is above

all else the agent of mana. But while this basic notion of priesthood originated in the most primitive cultures, it may be traced more or less clearly through the entire history of religion. The Chinese *saikong*, for instance, who officiates at sacrificial and exorcistic ceremonies, is believed to be so strongly imbued with *yang*, or male power, that he must be carried to the altar lest he neutralize this power by contact with the female principle, which is inherent in the earth; and the candidate for the priesthood of Diana at Aricia on Lake Nemi had to give evidence of his superior powers by combat with the retiring incumbent of the office. Even among certain modern peoples it is customary on Palm Sunday for one priest to touch another with the twig of a tree symbolizing the staff of life and supposedly imparting strength. Since, as this last usage clearly reveals, the power of the priest may be looked upon as a force which may be transferred or acquired, it is possible to distinguish two major types of priesthood. In one case the special powers are regarded as an innate and natural endowment: a class to which belong all priestly castes in which the principle of heredity prevails. In the other case the eminence of the priest derives rather from some external potency—a touch of the hand, anointing or administration of an intoxicating potion.

As a general rule physical fitness is a prerequisite for the priesthood; there exist, for instance, Babylonian texts which enumerate the infirmities debarring candidates. On the other hand, a physical abnormality, by arousing an impression of the extraordinary, may at times be interpreted as a sign of mana. Thus among the Ojibway Indians deformed creatures were appointed to priestly offices, as were pygmies and albinos among the Kongo tribes. The age requirements for entering the priesthood have varied from early youth—the Roman vestal virgins assumed office at the early age of six or ten and in Japan maidens of ten or twelve served as priestesses—to maturity. Still more important than bodily requirements, however, are the psychic. Especially illuminating in this connection is the etymological resemblance between the Hebrew word for priest (*kōhēn*), and the Arabic word for seer (*kāhin*). By virtue of his clairvoyant powers the visionary meets the qualifications for the priesthood; in Egypt the term prophet remained a designation of the priest.

The integrity of the cult can be preserved only if the natural aptitudes of the potential

priest are supplemented by an appropriate course of training. So difficult is the transition from the profane to the sacred that it usually cannot be accomplished at a single stride but must be prefaced by systematic cultivation of a variety of acts of self-sacrifice, ascetic practises and hygienic ceremonies as well as by the study of sacred texts. Moreover the final bestowal of priesthood is often deferred until the completion of a formal novitiate.

Certain permanent tabus are also associated with the holy state of priesthood, giving added evidence of the basic importance of the mana idea, which conceptually may be considered identical with tabu. Thus among the Maori should a priest while drinking allow water to drip between his fingers, the spot would become tabu and remain so for a length of time varying according to the quantity of water spilled; and should any one follow the priest, he also would fall under the tabu. "Among the Ibo people about Awka, in Southern Nigeria," as Frazer records, "the priest of the Earth has to observe many taboos, for example, he may not see a corpse, and if he meets one on the road he must hide his eyes with his wristlet" (Frazer, J. G., *Golden Bough*, pt. vii, 3rd ed. London 1913, vol. i, p. 4). The Old Testament forbids the priest to have anything to do with a corpse except in case of the death of his close relatives, and similar rules are prescribed at the Asclepion of Kos. Among the widely prevalent tabus associated with food a typical example is furnished by the Egyptian priesthood, who were forbidden to taste fish and even to look upon beans. Bede reports that Anglo-Saxon priests were not allowed to bear arms or to ride except upon a mare, and it was a sign that Christianity had prevailed over paganism when the newly converted high priest sprang upon the stallion of the king and, armed with sword and lance, proceeded to destroy the temple idols and enclosures.

The precept of celibacy, a common form of tabu, grew up doubtless in connection with the concept of mana, the presumption being that intercourse with the weaker sex might involve a diminution of mana. Von Martius reports that "a tribe on the Rio Negro enjoined celibacy upon their shamans because they believed that medicine would prove ineffectual if administered by a married man. And in modern times the medicine men of an Algonquin tribe of the Hudson River displayed such severity in a celibate existence, that they refused to partake

of food prepared by a married woman." Mingled with such ideas is the notion that sexual intercourse may contaminate the cult. But while requirements of priestly celibacy have frequently recurred—indeed even eunuch priests have been found in some regions, particularly in Asia Minor—such restrictions have been far from universal. The Shin Shu priests of Japan were permitted to marry; and in Taoist China and even in ancient Greece the practise was not uncommon. It was only gradually and as the result of bitter contest that celibacy became an established precept in the Roman Catholic church. Originally merely a matter of ecclesiastical discipline, it did not become fixed as an article of faith until the Counter-Reformation.

Throughout the course of religious development there has been a gradual but continuous tendency toward placing the major emphasis on tabus operating in the spiritual and moral spheres. Thus the *Reorganization* of Julian the Apostate (Epistle 89.b) states that "priests ought to keep themselves pure not only from impure or shameful acts, but also from uttering words and hearing speeches of that character . . . let no one who has been consecrated read either Archilochos or Hipponax or anyone else who writes such poems as theirs" (*Works*, tr. by W. C. Wright, Loeb Classical Library, vol. ii, p. 325). In time the tabu came to assume the form of the categorical imperative and faith and prayer to determine fitness for the priesthood.

The power possessed by the priest may be approached either from the supernatural or from the natural point of view, since the religious process itself is essentially a reciprocal interplay between the human and the divine. In general the function of the priest consists in intercession between god and man. The priest of Ishtar, who spoke in the first person in the name of the god, and the ministrant of the Osiris ritual, who assumed the role of Horus, the beloved son of Osiris, illustrate the fact that from one point of view the priest is the representative of the god before man and from another the representative of man, presenting man's gifts and desires before the god. Either view confirms the premise that the distinctive attribute of the priest is the possession of unlimited force. As representative of the god, he transfers to the world the fulness of power which characterizes the superhuman; and the supernatural, in so far as it represents force, must be approached by force from the human side, lest man be destroyed by the im-

fact. This reasoning becomes clearly apparent in the Kaffir religion, which prohibits an invalid from executing his own sacrifices and requires that he seek the mediation of a priest. Not merely in order to guarantee his own safety in the face of the superhuman, however, must the priest be in full vigor, but primarily in order to assure the efficacy of the offering at which he officiates and to exert the maximum influence upon the divinity—perhaps even to bring the latter under his power.

Only in the light of such general observations can the specific historical functions of the priesthood be understood. Because of his endowment with mana there devolves upon the priest the entire range of tasks associated with the sphere of magic and no clear cut line can be drawn between priest, magician and medicine man. Whenever an evil is to be averted, a malady is to be healed, rain and fertility are to be solicited, an enemy is to be expelled or annihilated, the people turn to the incumbent of mana, hoping that by manipulation or by the utterance of a word he will achieve the desired end. The primitive priest is both conjurer and exorcist and the powers against which he arrays himself may be either impersonal forces or personal spirits and demons. He may act on behalf either of an individual or of the surrounding community, but it is to be observed that the larger and more closely integrated the social unit of which he is the representative, the more clearly defined are the spheres of his duties. He becomes increasingly differentiated from the magician, who conducts his magical practises on his own responsibility and incurs the growing contempt of the priest. Gradually, as the priesthood grows richer in experience and better versed in procedures and techniques, its ceremonial rules tend to crystallize. Its success now depends upon the precise utterance of the correct name or word and upon the punctilious performance of the proper ceremonies and sacrifices. In cases where the evil which he must mitigate is thought to be the result of some shortcoming on the part of the victim, the priest must devise an appropriate form of atonement, and in the process there is developed a special type of expiatory priest.

The priest whose distinctive talents lie in the psychic realm is charged chiefly with prophetic functions; looking to the future and to the portents which announce it, he is equipped primarily to chart future policies and at the same time to offer a reasoned analysis of the immediate situation. Where his mantic talents

show signs of flagging, he may have at his disposal various formalized instruments for the transmission of supernatural knowledge: thus he becomes the administrator of the sacred lots, the guardian of the sibylline writings or the mouthpiece of the divine oracle.

Wherever the supernatural is conceived of in personal terms, it devolves upon the priest to become the guardian of the dwelling place of the deity, supervising the affairs of the holy temple and keeping the holy fire aflame on the altar. In many religious cults, particularly in ancient Egypt and in Hinduism, the priest was called upon to devote much of his time to attendance upon the image of the patron deity. As a result sacrifices, singing, music and dancing were all supervised by the temple priest. In order that ceremonial holidays might recur at the proper intervals, some form of accurate calendar had to be developed, and as a result, particularly among the Babylonians and the Chinese, the priests began to plot time from the stars. As community revenues and treasures began to accumulate in the temple, the priest became also the banker.

The intimate connection of religion and law in the early stages of social development, and more particularly the function which the temple fulfilled as community court, rendered the priest a lawyer, pronouncing legal judgments and passing upon the public and private contracts which were entered into in the presence of the temple deity. With the introduction of a fixed system of writing he became historiographer and author of sacred legal codes, guardian of the temple archives and editor, if not composer, of the various prayers and songs connected with the cult. As theologian it was essential for him to bring order and system into the amorphous conglomeration of deities which crowded the primitive pantheon. In the gradual theological transition from confused multiplicity to an all embracing unity—from the countless to the nine, to the three and finally to the one—the priest played, not unnaturally, a dominant role. In order to establish some continuity of tradition which would preserve for posterity the progress made by a single generation, he became an educator. The catechistic form of dialogue which was first developed is illustrated in early Germanic poems, such as *Vafthruthnismál* and *Alvismál*, as well as in the religious texts used in the temple schools of Babylon. Thus the progress of knowledge and science in its manifold aspects during the earlier stages of cultural

development must be credited in large measure to the priestly caste, which sought to bring greater understanding and order into the cult of the temple deity.

The actual historical beginnings of the priesthood cannot be reconstructed with any degree of scientific assurance. Undoubtedly the first priest was a member of the primitive community who happened to give palpable evidence that he possessed the charismatic gift of mana by displaying some form of supernatural power in the presence of the assembled community. But since the regular recurrence of communion with the supernatural necessitated repeated activity rather than sporadic inspiration, the exercise of priestly functions became a special calling or profession. As the possession of the awe inspiring gift of mana came to set off a particular person as an object of special veneration, he tended to become identified with the leader of the primitive group. If it be assumed that the family was the most important unit in the earliest type of group organization, the paterfamilias or the eldest in the family may be considered as the first to have exercised the priestly function. In China and Indonesia and among the Egyptians, the Babylonians and the Indo-Germanic races, the head or the oldest living member of the family was entrusted with numerous priestly functions, particularly the conduct of the sacrificial rites. Although such an arrangement was most natural among those groups which practised ancestor worship and the cult of the dead, it prevailed also under those types of early religion where there was no question of an immediate and necessary connection between the head or eldest member of the family and the object of worship. In this latter, essentially derivative, form of priesthood the priest became merely the representative or agent of the primitive group.

The original group expanded, and the single family developed into a network of families or families united to form larger associations. A sociological unit, the tribe, appeared; at first it was based on community of blood, but by gradually absorbing alien elements blood kinship gave way to a broader integrating principle based on community of social and economic interests. In this process of sociological development, which paralleled the economic transition from the collecting and hunting stages to the agricultural and the pastoral, the functions of the priest became more numerous and specialized. Since primitive agriculture, like the earlier

collecting, was carried on in the main by women, woman came to enjoy a certain economic status, which was reflected in the religious sphere by an increase in the number of goddesses in the tribal pantheon. Although there are numerous instances from Egyptian, Greek and Germanic sources to indicate that the cult of a goddess was frequently carried on by a priest and that of a god by a priestess, it may be assumed that in general an increase in the number of goddesses implied a corresponding increase in the number of priestesses. With the introduction of the pastoral culture, however, and the resulting emphasis on masculine virtues, the number of male deities increased and there was a corresponding rise in the number of male priests. At the same time the accredited priest of the tribe became the chieftain and there resulted a merging of functions which was to exert an enduring influence on later developments.

The question as to whether the priestly or the chiefly elements in this new office were the more important becomes increasingly difficult to answer the further one goes back into cultural history, especially into those periods when there is no genuine distinction between the temporal and the spiritual phases of community life. Since the power of mana operated in all spheres, a thoroughly artificial point of view is represented in the attempt of the Vedic *Śatapatha-Brahmana* to draw a line of demarcation between the priestly and the princely sphere by designating Varuna as the representative of the prince and Mithras as representative of the priest and by putting into the mouth of the former the following invitation: "Turn thou unto me that we may unite: I will place thee foremost. Sped by thee, I will do deeds!" (tr. by J. Eggeling, *The Sacred Books of the East*, vol. xxvi, iv, 1, 4).

When in the natural course of cultural development the tribal chieftain became king or emperor, there began a merging of royal and priestly functions and prerogatives, which may be traced almost uninterruptedly throughout the subsequent centuries. Again and again the king either performed the work of the priest or at least assumed responsibility for seeing that it was performed. Among the Maori of New Zealand the priest kings, known as the *ariki*, constitute the uppermost social layer, and it is they alone who know the sacred tribal chants. In China the offering of the great sacrifice to the heavens was so exclusively the privilege of the emperor that the expression "to sacrifice to

Shang-ti" came to mean "to usurp the power of the Emperor." Similarly in Japan the emperor is the Son of Heaven and as such the highest priest. In Babylon the kings were called "the priests of Anu," the god of heaven, and often the calendar year was calculated from the date when a king was inducted as high priest of Anu or of the moon god Sin. The favorite title of the kings of Assyria was Priest of the God Ashur. In the ancient empire of Egypt the provincial prince ordinarily served as the head priest of the local deity; the priest king Melchizedek illustrates the same merging of functions among the Israelites. It is significant in this connection that the designation for the oldest mythical kings of Persia is *purohita*, which was the name for the household priests attending the kings of India. Further evidence of the original identification of priest and king is to be found in the palace chapels unearthed on the island of Crete. On the other hand, the tendency of the priest to arrogate to himself royal prestige and prerogative is reflected in the Roman term *rex sacrorum* and even in the terminology of the later Roman Catholic church, where according to the *Pontificale romanum* the bishop consecrates the newly installed exorcists as *spirituales imperatores*.

It is clear that with the proliferation of priestly functions on the one side and the progressive increase in the temporal responsibilities of the chieftain or king on the other, the ruler was unable to fulfil his religious duties single handed but had to relegate them to certain specified orders within the expanding community. One of the earliest examples of this development is to be found in the house priest, or *purohita*, of India, appointed by the king and maintained in a relationship which was regarded as akin to marriage. This relationship provoked a tendency, repeatedly manifested during the later history of religious development, for such a specially appointed priestly caste to acquire independent status and to expand its prerogatives and privileges at the expense of the chieftain or the king. The claims of the priest as against the king are voiced in the *Rigveda* (iv: 50, 8) and still more strikingly in the ancient Indian political handbook, *Arthasāstra* of Kautilya, wherein the king is advised to heed the Brahman, "as a student his teacher, a son his father, and a servant his master" (tr. by R. Shamasastri, 3rd ed. Mysore 1929, p. 1). In China the emperor, on a sacrificial holiday, was surrounded by numerous priestly ministers, each of whom was in

charge of some particular office. To be sure, the bureaucratic character of the Chinese priesthood was so rigidly maintained that a priestly caste in the narrow sense of the term never appeared, and in this respect the development in China was in direct contrast to that in India.

Viewed from another angle, the Indian priesthood reveals striking differences from the Roman, which became an integral part of the public life of the state, with *sacerdotes publici*, whether *pontifices* or *Salii* in charge of the *sacra publica*. The Roman priests known as *Salii* are especially interesting in that they indicate the process whereby the priesthood in Rome grew out of tribal cult, which was gradually expanded to include priests from other tribes who became assimilated into a new and less restricted *sodalitas*. This transition from tribal priesthood to priestly *sodalitas* is illustrated also by the priests known as *Luperci*, who did, however, preserve the older tribal designations such as *Luperci fabiani* and *Luperci quintiales*, or priests of the Fabian gens and the Quintian gens.

Such an elaborate priestly organization was unknown in Greece. "Each man is his own priest," declared Isocrates. As Greek cult was in the main an affair of the tribes, the particular tribal priests remained separated, never forming a unified priestly caste. The absence of such a caste, which would have striven to impose uniform dogma, was no doubt primarily responsible for the flexibility and freedom of Greek thought, as compared, for example, with the priestly cultures of the Orient, particularly in Egypt and Babylonia. In Egypt it was the most intimate and trusted servants of the king who were appointed to the leading priestly offices. In the Middle Kingdom at least there was also a lay priesthood, where individuals, in the interests of their own spiritual welfare, assumed priestly functions. But in the new kingdom the priesthood had become so completely professionalized and ambitious that it constituted eventually a serious threat to the power of the state.

In Babylon even in the most remote period a rigidly exclusive priestly caste had already come into being. Having secured a monopoly of all magical lore and practise, the priests exerted a powerful influence on state affairs, in striking contrast to the situation in Assyria, where the king himself exercised a rigid control over the priesthood. In Israel during the period before the Babylonian Captivity the priests were invariably royal officials, so that a dynastic upheaval inevitably involved a turnover in the

personnel of the priestly caste. It was not until the period after the exile that a theocratic community came into being, in which the priesthood was elevated to a position of dominance. Although the *athravans* in Persia did not actually constitute a priestly caste, priestly activity was monopolized by a few families and restricted almost entirely to an institutionalized priesthood. At a very early date in Japan a number of the ceremonial functions which had originally been performed by the emperor were transferred to members of the Nakatomi family, closely related by blood to the emperor. The Shinto priests, however, have never developed into a caste clearly cut off from lay priests. The Germanic tribes were equally far from developing a separate priestly caste. On the other hand, the tremendous influence of the Druids in the political, legal and educational spheres can be explained only by the high degree of organization and exclusiveness which the priesthood had attained among the Celtic peoples.

In considering the economic position of the priest it is essential to determine whether his revenues were of a private or of a public nature. When an individual consulted the priest regarding the future or when, as, for example, in Persia, he visited the priest for purification or medicinal treatment, a small direct payment was the conventional recompense. When the priest performed sacrifices he was usually entitled to keep a portion of the sacrifice for his own uses, even though it were no more than the hide of the sacrificial animal. The custom still prevails in Christian quarters of giving a certain portion of the barbecue or other holiday banquet to the priest. In time, however, custom became fixed in the form of statutory law, which sought primarily to regulate the public payment of the priest. The Old Testament laws, for example, in *Leviticus* vii: 28-34 or in *I Samuel* ii: 12-17, are illuminating from this point of view. It was also a not infrequent practise, as in the "towns of the Levites," to pay the priests with land; elsewhere, particularly in Egypt, the priest derived his livelihood mainly from the rich returns from temple goods. His income could also be supplied by regularly established taxes, such as tithes and first fruits, or by a formal salary, as in the case of the priest of Athene Nike in Athens, who was paid fifty drachmas a year. The Egyptian priest was guaranteed a prescribed amount of bread, beeves, geese and wine. In addition there was frequently incidental income of various kinds, as when the Japanese priest sold portions of the

holy shrine as amulets. Often priests enjoyed special economic privileges, such as exemption from taxation and military service, although at an earlier stage the priest, by reason of his supposedly magical powers, had been of inestimable aid in time of war. In Egypt, at least in the Greek period, it was not unprofitable to belong to the priestly retinue of a large temple. In the Indian *Vedas* the mercenary spirit of the Brahmins is a recurring theme, as, for example, in the myth about the cunning of the priest in getting possession of the cow. The Danish-Norwegian priest became transformed in the course of time into the sacrificial temple owner of Iceland. Yet the poor priest has likewise been a familiar type. Under certain conditions, as prescribed, for instance, in *Deuteronomy* xviii: 1-8, he was forbidden to own land and he became an object of charity, as was the Levite of the Old Testament. Apuleius (*The Golden Ass*, Loeb Classical Library, ch. viii, p. 27-30) drew a striking picture of the mendicant priest of the Syrian goddess. Eventually, in the name of religion, the priest came to place his chief trust in a reward beyond the grave.

During the early period of the Christian church (see RELIGIOUS INSTITUTIONS, section on ROMAN CATHOLIC CHURCH) the revenues of the clergy were derived from the possession of property, which was bound up with its offices, as well as from fees and tithes; in the modern period, primarily as a result of the secularization of church goods, a fixed stipend, derived in the main from ecclesiastical taxes and supplied if need be by state contributions, became more and more firmly established. Under modern capitalistic conditions, the tendency has become progressively more pronounced for the clergy to organize itself into a professional group and to adopt the methods and rhetoric of the other professional groups.

In general it may be said that the priesthood represents the conservative element in religion: a fact which is not to be explained, however, solely on the grounds of priestly self-interest and self-seeking. As supervisor of traditional ceremonial and cult and as defender of existing regulations, the priest has been inevitably an agent of continuity and therefore the antithesis of the prophet. This basically conservative outlook of the priest has not, however, precluded the possibility of extensive changes within the priesthood, which have been brought about in the main through the process of compromise. Particularly noteworthy is the transformation

whereby a number of purely magic and mantic celebrations, all of a predeistic nature, have gradually been replaced by the official cult of a single god, as, for instance, when the Salii were brought together in worship of Mars or when all the mantic practises of Babylonia were concentrated on Ea. At an openly deistic stage, for example, in Babel, sacrifice supersedes soothsaying. And when vestigial customs take on a new significance through allegory, symbolic explanation or actiological legend, such metamorphosis should generally be credited to the priest. As theologian it has devolved upon the priest even to the present day to reconcile the traditional body of dogma with new intellectual theories and data, in order that the interest of the cult which he represents may not become antiquated. Nor should it be forgotten that repeatedly the priesthood as the sole bearer of culture and learning in all spheres of a developing science has opened the way to a broadening of general knowledge.

Above all, however, there have been certain basic transformations in the composition and stratification of the priesthood itself. The emergence of a centralized cult created friction between the priests of the central deity and the priests of the various local deities, perhaps between the urban and the rural priesthood, as in the case of the Deuteronomic reform described in *II Kings* xxiii: 4-25 and *Ezekiel* xliiv: 10-31. There were also many instances in the ancient world, notably among the Semites, of cases where the priests of a particular tribe were themselves members of another tribe which had been victorious in warfare and had imposed its alien cult on the vanquished. With the penetration of new alien cults further antagonisms were engendered, as, for example, in Ptolemaic and post-Ptolemaic Egypt between the hierarchic organization of the Egyptian priesthood and the virtually anarchic autonomy of the Greek priests.

Hierarchic organization in general has been forwarded by the ever more common tendency of the priesthood to break up into classes as a natural result of the continued specialization of function within the organization. An inevitable corollary of this tendency toward class stratification within the priesthood has been rivalry and competition between the different groups. The active resentment of the lower orders against the upper is illustrated most clearly by the claims of the singers and keepers of the portals in postexilic Judaea to a status of equality with the Levites.

In its broader outlines the history of the priesthood reveals a striking tendency toward democratization. Although in the earlier stages of cultural evolution the priest was intimately identified with the chieftain and the king and the priestly office was monopolized by patrician families, as, for example, among the Japanese, the Romans and the Germans, the discriminations against plebeian candidates for the priesthood were gradually relaxed. Thus in Rome the *lex ogulnia* of 300 B.C. reserved five of the nine places in the colleges of the *pontifices* and *augures* for the plebs, while the vestal virgins, who originally could be recruited only from the ranks of patrician maidens, came gradually to be drawn from plebeian families and under the empire even from the freed slave population. The greatest stimulus to this democratic tendency was the concept of the universal priesthood as advocated by the early Christian apostles and as revived at a much later date by Luther; this concept has prevailed in all types of individualistic mysticism as well as in Pietism and certain of the sectarian movements (*see* SECTS). In contrast the Catholic church, since the time of Cyprian, has decreed that each church community must center around a formally ordained priestly office (*see* RELIGIOUS INSTITUTIONS, section on ROMAN CATHOLIC CHURCH).

The gradual transition to a more democratic organization of the priesthood was accompanied by an increasingly marked tendency to secularism and secularization of function, a tendency which has repeatedly manifested itself in the evolution of religion. The priest, who at the outset was the sole guardian of the written word, was at once jurist, medical authority, mathematician, astronomer, historian, philologist, natural scientist, technologist, artist and political theorist. As more and more of these functions came to be taken over by specialized lay groups within the community, the prestige of the priestly caste inevitably suffered. The popularization of writing and printing was a particularly powerful agent in breaking the monopoly of the priest. As society rapidly became more and more secularistic and progressive the priest came to be regarded with disfavor, if not with contempt, as a pillar of reaction blocking the path to intellectual and scientific advancement (*see* SECULARISM). The mounting economic power of the secularistic groups caused a still further intensification of the offensive against the vested interests represented by the priesthood. In eighteenth century Europe, for example, the

champions of the third estate, in their struggles against the economic and social privileges of the first estate, reviled the priest as the deliberate, calculating purveyor of superstition and deception. In the attempt to hold its own against the mounting forces of anticlericalism the priesthood proceeded to reorganize and to consolidate the various agencies charged with the more strictly ceremonial and ministerial functions which it had managed to preserve. Like other social groups in the modern capitalistic system the clergy, Catholic as well as Protestant, developed a professional organization, with professional administrative boards, professional periodicals and bulletins and professional ethics and practises.

PRIESTLEY, JOSEPH (1733-1804), British nonconformist minister and chemist. Priestley, voluminous writer of theological and metaphysical tracts and discoverer of oxygen and other gases in chemistry, was one of the group which widened the political doctrines of Locke and the Revolution of 1688 into the philosophy of the American and French revolutions. He was the son of a Yorkshire clothier and was educated for the ministry and successively held posts in nonconformist pulpits and in the Warrington Academy maintained by the dissenters. In 1772 the earl of Shelburne, famous as the protector of Bentham, Price and others, appointed Priestley

his librarian and literary companion and in 1780 retired him on a pension. In 1791 on the occasion of a dinner organized by the Constitutional Society of Birmingham to celebrate the anniversary of the fall of the Bastille an antirevolutionary mob attacked Priestley's house, destroyed his books and scientific apparatus and for three days wreaked vengeance on the sympathizers with the French Revolution. In 1794 Priestley emigrated to the United States, where he was welcomed both for his political views and for his scientific attainments.

Priestley's nonconformist background, with its lack of authoritative theological doctrine and its political resentment against the Test acts, helps to explain his shifting and somewhat paradoxical theological doctrines as well as his hold stand for political liberty. Educated as a Calvinist, he became a philosophic materialist, pleading for the existence of God on the basis of the argument from design and for the immortality of the soul on the basis of revelation. In his political theory, systematically expressed in his *Essay on . . . the Nature of Political, Civil and Religious Liberty* (London 1768, 2nd ed. 1771) and implicit in his pamphlets on the American situation and the French Revolution, he followed the Whig tradition of Locke but with a pointed contemporary emphasis which made it an instrument of revolutionary change. Accepting the natural rights and social contract doctrines, he insisted that in surrendering natural liberty the members of society obtained in return political liberty—the right to aspire to office and to control the government of the community—and civil liberty, representing that portion of natural liberty not necessary for government and thus reverting to the citizen under a civil form. No state is good unless both political and civil liberty are at their maximum. Priestley justified both types of liberty not only on abstract grounds of natural justice but also on the concrete principle of the "good and happiness of the members, that is the majority of the members of any state." It was on reading these words that the formula of utilitarianism flashed across Bentham's mind, and Priestley is thus a link between the "metaphysical" and utilitarian schools of political theory, which sought substantially the same political objectives although on diametrically opposite philosophic bases. The utilitarian emphasis of Priestley may be explained by his participation in the currents of natural science; perhaps the same explanation will account for his insistence on the idea of

progress, which in the eighteenth century was suggested not by the state of social affairs but by the triumphant march of scientific thought.

PRIMARIES, POLITICAL. Broadly speaking, a primary election is a polling of the members of a particular party in order to select or to initiate the process of selecting the party's nominees for elective offices. Primary elections are indirect if the party members select delegates to nominating conventions, as in the United States throughout the greater part of the nineteenth century, and direct if the party members make the nominations themselves. The indirect primaries have been considered in connection with the convention system, of which they form an integral part (*see* CONVENTION, POLITICAL); the present discussion is confined largely to the direct primary. Although pre-election balloting is not unknown in other countries, the general use of this practise is peculiar to the United States.

Demand for elimination of the evils of the convention system was part of the movement for control of the party processes which reached its height in the United States before the World War. Nominating conventions, instituted by the parties as reform measures, became unrepresentative and subject to "boss" control and were first regulated and later almost eliminated. Early laws concerned the selection of delegates and were optional in form and limited in scope. After 1890 mandatory regulation of a sweeping character transformed the primary into an election conducted by public officers at public expense. So swift was the march of opinion, however, that direct nominations were demanded almost before these regulations were tested. Mandatory, direct primaries applying to all state wide offices date from the Wisconsin law of

1903. The movement spread with such rapidity that by 1917 all but four states had adopted primary laws. Thirty-two of these were mandatory, covered congressional and state offices and surrounded the primary with the safeguards of the general election. The remaining twelve were optional, covered certain state wide offices only or were rudimentary in the sense that the primary was conducted largely by party authorities, under party rules and at party expense. The non-partisan primary, in which voters without regard to party affiliation choose the candidates who are to stand in the final election, gained favor for local and judicial nominations, where division on the existing national party lines was found absurd. Except for this and the survival of the convention for presidential nominations, direct partisan primaries had become by 1917 the dominant form of nomination.

Similar in purpose and fundamentals, direct primaries vary widely in detail. Dates range from April to September, with more than two thirds favoring fall primaries. Names appear upon the ballot as a result of declarations of candidacy by persons seeking nomination or petitions signed by a certain number of eligible voters. Determination of qualifications for voting in the primary is a difficult problem. In the open primary the voter receives the ballots of all parties, either on separate strips or on a single large ballot with a separate column for each party, and decides his party affiliation in the privacy of the voting booth; in the closed form some test of affiliation is applied. The open primary assures secrecy of the ballot but makes possible control by those who are not bona fide members. The trend is strongly toward closed primaries, and only two states now retain the open form. In a number of others the primary is closed in form only, the sole requirement being that the voter ask publicly for the ballot of his party. In most states he must meet some test before he is permitted to vote. Either a test is established by law which the voter must swear he can meet, if challenged, or the voter is required to enrol as a member of his party before the primary and may participate only in the primary of that party. The trend is strongly toward enrolment. Plurality nominations are the rule; but in some states, many of them in the south where nomination is equivalent to election, preferential voting and the "run-off," or second, primary have been instituted to prevent minority nominations. Voters have shown little interest in second choices and preferential voting

survives only in Maryland. Run-off primaries have proved more satisfactory and are used in nine states. The expenditures of candidates in primaries fall within the scope of the corrupt practises acts of the states having such enactments, and seven other states have regulations applying exclusively to primaries.

The power of the states to regulate nominations has been upheld by the courts in sweeping terms. The theory that parties are voluntary associations has given way to the doctrine that they are governmental agencies subject to legal control. This power clearly extends to congressional nominations as well as to nominations for state and local offices. Only the presidency lies outside this control, and here the states may regulate the choice of delegates to national conventions. The jurisdiction of Congress is neither so broad nor so clear. Its control of the election of members of Congress is undisputed, but its power over national conventions and the nomination of members of Congress is questionable. In *Newberry v. United States* [256 U. S. 232 (1921)] a closely divided court left in doubt the fundamental question of the power of Congress over primaries, and it has not been clarified by subsequent decisions. In the meantime Congress has accepted a limited view of its power, the Federal Corrupt Practices Act of 1925 making no attempt to regulate primary expenditures of candidates for senator or representative.

Since the World War the direct primary has been the subject of vigorous attack and has been abandoned for some or all state wide nominations in three states. One other state, Idaho, eliminated it in 1919 only to restore it again in 1931. Certainly the direct primary has not fulfilled the prophecies of its enthusiastic advocates or its bitterest opponents. There has been no revolution in the type of candidate, and machine control has not been eliminated; participation has often been disappointing; and expenditure of large sums, particularly in senatorial primaries, has occasioned concern. Critics urge that lack of deliberation is a fatal weakness in the system and that it destroys party responsibility. Since real party responsibility has never existed in the United States, this cannot fairly be charged to the primary. Those raising this argument apparently mean that it has destroyed leadership, stimulated blocs and opened the way to dictation of nominations by non-party members. Supporters of the direct primary point out that it would be difficult to

prove that it has produced "worse" candidates, that it places a weapon in the hands of the rank and file which has been used with telling effect against corrupt leadership, that participation in decisive contests is gratifyingly high and that limited financial resources have not excluded men like Brookhart of Iowa and Norris of Nebraska. They ask if real deliberation existed under the convention system, if there has not been leadership under the La Follettes in Wisconsin and Hiram Johnson in California and if the "gold bugs" and "silver bugs" of the 1890's were not blocs. They point out that the primary can be closed in fact as well as name and emphasize its importance to women and in one-party states. A strong point in favor of the direct primary is the difficulty of finding a decent and workable substitute. Few would suggest the elimination of all legal control of the nominating process. A regulated convention presents most of the hazards of the direct primary and some others. One alternative which is advocated vigorously is the institution of pre-primary conferences or conventions. In 1932 Massachusetts enacted an initiative measure providing for pre-primary conventions empowered to propose slates of candidates whose names will appear upon the primary ballot as endorsed by those bodies. Whether this will supply leadership and responsibility without sacrificing real control remains to be seen. Although Colorado, Minnesota and South Dakota have used various forms of pre-primary conventions, these have been too different in type, or in operation too short a time, to throw much light upon the probable operation of the Massachusetts statute. Serious students suggest that a really effective nominating system in the United States waits upon fundamental changes, such as the development of responsible government, and cannot be achieved by mere alterations in the mechanism itself.

Some states have extended the idea of direct nominations to the national conventions by providing direct election of delegates, instruction as to the popular preference for president or both. Beginning in Wisconsin in 1905 the movement spread rapidly, and in 1912 optional or mandatory laws were in effect in fifteen states. By 1916 nine states were added to the list. The laws which have been in operation vary widely in detail and particularly in the manner and the extent of control of the action of the delegates. Since 1916 the movement has lost ground, seven states having repealed their laws. The explanation lies partly in technical defects and

partly in the fact that it is impossible for presidential primary states to control the action of the convention as long as the balance of power lies in the hands of delegates not so controlled. The logical solution would be national regulation; but satisfactory legislation is difficult to frame, its constitutionality is doubtful and there is little evidence of popular demand for such action.

The closest parallel to the American primary is found in the "preselection" ballot of the Australian Labour party (see LABOR PARTIES, section on BRITISH DOMINIONS). The party candidates in each locality are selected by the party members in that locality from those who offer themselves for the preselection process. Prospective candidates, on entering the preselection contest, must promise, among other things, not to oppose in the final election the candidate chosen by the preselection ballot.

PRIMITIVE ECONOMICS. See SOCIAL ORGANIZATION; ORGANIZATION, ECONOMIC.

PRIMITIVE LAW. See LAW, section on PRIMITIVE LAW.

PRIMITIVISM. The word primitive, from the post-Augustan Latin *primitivus*, which merely intensified the meaning of *primus*, acquired its

modern connotation in the preromantic seventeenth century along with an entire group of new or renovated English words expressive of new trends in social thought and aesthetic feeling. The added emphasis might be ascribed initially to John Evelyn, who in 1685 praised the Church of England as "of all the Christian professions on the earth, the most primitive, apostolical and excellent"; he elsewhere speaks of "a maiden of primitive life, who has for many years refus'd marriage," thus placing on what had been virtually an indifferent numeral, with its obvious implication of simplicity, uncouthness and even inferiority, the stress of a qualitative superiority. It is likely, however, that such use of the word was already becoming frequent at the time, both in England and on the continent, where Bossuet, exalting *la grandeur primitive et essentielle* of God, employs it in a similar sense. In connection with art, especially painting, the adjective was apparently not current in colloquial English before 1892, and the noun primitivism dates only from the close of the nineteenth century. It was applied chiefly by Irving Babbitt and the American "humanists" as a comprehensive rubric under which any romantic requirements of spontaneity and natural inspiration might be summed up and censured. As a slogan for the defense of traditional beauty, on the other hand, it was officially adopted in opposition to futurism by a literary school in Toulouse, France, which flourished briefly in 1911. It may indeed be suggested that the noun emerged or at least expanded as an antonym of the Italian *futurismo*.

Broadly defined, primitivism is the cult and proposed imitation of the past. More properly, it is the glorification of an earlier stage in the history of a culture—a period either beyond recall or partially restorable or present in some contemporary form as in the case of childhood or the folk mind or savage innocence. This earlier stage is supposed, in contrast to the sophistication and weakness of later ages and periods, to have preserved or still to preserve the secret of an uncorrupted, vigorous, genuine expression of life.

However recent the word, no strain of thought is older. The ancient world, gentile and Jewish, eastern and western, scarcely knew a conception of history not founded primarily on the decline from some primitive perfection and happiness to a sorry decadence, with the more or less dreamy hope of a revival in some messianic future or philosophic utopia. The Biblical his

tory of mankind starts with the loss of Paradise; but the *Iliad* as well, in its very first episode (bk. I: 259-68), compares Agamemnon and Achilles unfavorably with the heroes of Nestor's vanished youth, although a warrior like Hector was still able to accomplish feats impossible to men "such as mortals now are" in the time of the poet (bk. XII: 449). This retrogressive movement of history away from a better age was almost constantly accepted by poets and thinkers more advanced than Homer; and even when the golden age, instead of being placed at the very origins of the race, was moved forward to a definite historic period, this was not the result of a consciousness of greatness in the age itself but rather of a sense of humility in the later generations, which acknowledged the past glory when it had come to appear, in comparison with their own surroundings, somehow primitive. In this light may be understood the primitivistic basis of much of the thinking in the whole course of the history of ideas: the grandeur of the Homeric age made an impression on all classical antiquity; the Attic simplicity and majesty of fifth century art and literature were the ideals to which Aristotle and Alexandrian and Roman critics reverted; the prophets and the psalmist turned to the patriarchal society of primitive Judaism for inspiration; Aristophanes looked back to the spiritual health and the intellectual balance of the Athens of Miltiades, opposing the standards he found there to the degenerate politicians, sophists and aesthetes as he depicted them in the *Knights* and the *Clouds*; Plato, going back still farther, took the simple and self-sufficient original agrarian state as a basis for his far reaching yet reactionary social thought. In Rome, in the later republic and empire, the frugal strength of the early republic was regarded with increasing veneration as luxury, ambition, mercantile corruption and familial disintegration increased. It became the bulwark of the conservatism of men like Cato, Scipio the Elder and the antiquarian Varro, who attempted by their glorification of the primitive Roman cultivator to check the swift pace of social change. The contrast it offered between the self-sufficiency of the early independent farmer and the dispossession of the small farmers in the later republic formed a basis for the revolts of the Gracchi. It inspired the disquietude which Cicero felt for the commonwealth; and, active throughout the civil strife, it was finally embodied in Livy's lofty conception of early Roman glory, which has been subscribed

to by subsequent historians. Even before the coming of the Christian story, which in the freedom of a rural and pastoral idyll made Christ the symbol of the imminent kingdom of God, the revolution of Augustus was interpreted by Augustus himself and by his poets as a restoration, a checking of the otherwise fatal decadence which pushes each generation farther along the course mapped by Horace in the strophe *aetas parentum peior avis*—a resurrection, agricultural and bucolic, of the kingdom of old Saturn (*saturnia regna*), most strikingly believed and piously sung by Vergil.

In the predominantly religious Orient primitivism either bears a relation to any cult of the dead or ancestor worship or is crystallized in general in the theologic myths of the Eden type; in the more social and political Occident it has generally been summarized in the legend of the golden age. A superior state of human life, sometime in the past or somewhere in the unknown, is already more or less dimly adumbrated in Homeric poetry; Hesiod traces quite definitely a downward march from the golden age (in which there is neither toil nor care nor infirmity), through the silver, bronze and heroic, to the iron age (in which there is no surcease from labor and sorrow). From this point on, economic progress, particularly in metallurgy and shipping, is held to be accompanied by moral deterioration—a view traditionally supported, with a few exceptions, not only by poets but by philosophers, as, for example, the stoics. Among the exceptions must be noted the perplexity of Aeschylus poised between the conservative rule of Zeus and the inventions of Prometheus, some judgments of Plato and Cicero, to whom technical achievement was morally neutral, and, above all, the progressive Epicureans and their poet Lucretius. The golden age, when "nymphs and shepherds danced," cherished more and more by the Alexandrian and Roman imagination, developed by Ovid and related to the myth of the flood, was bound increasingly to become something of a fad; and even in antiquity it had occasionally that sensuous and languorous polish to which many a pastoral poem or eclogue or operatic drama in the Renaissance and after was to owe much of its empty glamour. At a higher level, a conclusive representation of Arcadia, the supposed country of happy primitivism, may be read in Goethe's *Faust* (II: 3).

Another element in primitivism besides the distant in time is the distant in place. Not in the

familiar south nor in the Orient, where despotism and corruption were prevalent, but in the unattainable far west and north did the ancient world allow itself to imagine lands and islands of purity and contentment. Such were the Ogygia and Scheria of Homer, the Thules and Hyperboreas and Elysiums, the Islands of the Blest or of the Hesperides: seats of happy mortals or immortals. When the Roman conquerors opened some of the gates of the unknown, this wholly wishful imaginative stream flowed into a channel of greater reality; and the half known Germans—with their seclusion and their tribal freedom protected by inviolable rivers and forests, with their virtue and self-restraint equal to that of the early Romans, their equality and bravery and truth, their noble love for woman and song, their fair skins and blue eyes—provided more or less substantial material for the idealization of the barbarian which has since been ineradicable. It reached its classic height in Tacitus' *Germania* and its most picturesque form in the Byzantine embassy to the camp of Attila, when the historian Priscus, meeting a Greek apostate dressed and behaving like a Scythian, listens, not assenting but curiously complacent, to his lengthy comparison between the simplicity and loyalty of the Huns and the corruption of the Roman Empire.

The magnitude of the catastrophe involved in the fall of the Roman Empire and the vastness of the tradition which was thereby left to be rediscovered made of the Renaissance a unique phenomenon in primitivism. For in a broad sense the whole movement was primitivistic. It embodied a dogmatic appeal to a perished age. By its success in realms beyond the merely archaeologic and stylistic, and by the fanatic fervor which drove even the Roman populace to the spot where an antique maiden supposed to be of a purer and more handsome race had been unearthed, it gave sanction and support to the innumerable subsequent movements calling for a return to some period in the past. The primitivism of the Reformation lay in the demand it made for a return to the primitive Christian church and its evangelical authenticity. Again and again in the history of religious sects the intention of a primitivist restoration appears in the creeds. The word itself is met in Primitive Methodism.

But where the roots are known, it is scarcely useful, and in the present case scarcely possible, to enumerate the branches. Almost no modern revolution, political, social or moral, has lacked

symbols in history or prehistory; almost constantly in the struggle of parties each one has opposed to the adversary an older and more venerable model. In England during the struggle between king and Parliament the cult of primitive Britonism which strengthened the Tudors and Stuarts was opposed by the cult of primitive Saxonism invoked by the parliamentary forces; a similar contrast is found in the political struggles on the continent. In France in the struggle between the monarchy and the aristocracy the cult of Roman imperial administration confronted the thesis of primitive Germanic liberties. The Anglophile Montesquieu, echoing the Puritan and Miltonic apostrophes to primitive Anglo-Saxon freedom, traced French no less than English institutions ultimately to the Germanic forests of Tacitus. The primitivism of Montesquieu, given a more democratic emphasis by certain of his contemporaries, opened the way for the rival cults of the Frankish and the Germanic which existed alongside the more widely prevalent Greco-Roman archæology during the French Revolution, as well as for the invocation of the *âme gauloise* by the democrats and historians of the nineteenth century. The Germans themselves, on the other hand, seeking the highest embodiment of their nation's past glory and under the spell of the legitimist and anti-Napoleonic Restoration, shifted their model from the tribal Teutonic innocence to the Holy Empire in the Middle (not at all dark) Ages, where the mediævalism of the Schlegels and of Novalis had found artistic genius and depth of belief, discovering in Christendom the ideal unity of Europe.

Since primitivism can be put to such pragmatic uses in nationalistic movements and in the warfare of classes, the period or historical episode toward which any given movement will direct its primitivistic thought may be located, by deduction, from the inherent character of the movement. French literary monarchism finds a thrill in the crusades. Italian Fascism, which is in this connection a late offspring of the Italian Renaissance, looks back to the Roman Empire; its stress, it will be noted, is not on the glory of the Roman republic but, largely in consequence of German historiography, on Caesarism. Thus also Kemalism lays stress on the purity of Turkish stock and Hitlerism on Aryan purity. Socialism and communism, although Marx and Engels made something of the theory of a "primitive tribal society, holding land in common ownership," dismissed early the sug-

gestions of primitivism and turned their energies into reconstruction for the future rather than longing for the past. As a rule also democracies throughout the nineteenth century did not include primitivism in their political doctrine.

To go backward, as a real or illusive short cut for going forward, led in the field of spiritual and artistic experience to cyclical adventures. The evangelical fondness for children and the feeble (whence also the sacredness of the idiot, heralded by Goethe and Wordsworth long before Dostoevsky), the growing pantheistic and scientific feeling for nature, enhanced by the attractive vistas revealed by explorers and travelers in elemental, uncultured worlds, gave expression to the eulogies of primitive life and of the noble savage or of the uncorrupted Chinese or of the harmless American native; and they resulted in the elevation of the naïve and child-like, even of the childish, to the pinnacle of the human faculties, especially in poetry and art. This idea of poetry as sheer spontaneity, broached by Vico, swept all the romantic generations: Homer, the early Greeks, the German and Gaelic bards, Shakespeare, were children; the folk mind was richer and fuller than any savant's brain. Herder, Hölderlin, the young Goethe, Schiller, are among the originators of this trend. In art, under a new spell already evoked in Wackenroder, the mature classics and the standards of the Renaissance were superseded by the pious and candid masters, called, in the strict acceptance of the word, Italian primitives. Toward a similar achievement the whole of Ruskin's life was directed, not merely his momentary but momentous alliance with the pre-Raphaelites. It was the forerunner of the successive vogues of archaism, of Egyptian, far eastern and Negro art, of the Malayan pilgrimage of Gauguin and of the Sunday painting of a *douanier* Rousseau. In the wider field of philosophic conceptions of life there is, from the social and individual primitivism of Jean-Jacques Pousseau to Nietzsche's blond beast, if not a single step at least a single leap, as also from the dream of a brief return to the idea of the "eternal return." Freud, in a similar manner although with opposite aim, found hidden away in the psychic life the primitive, or unconscious, in ceaseless strife against the censure of civilization and law.

The place which in the fabulous geography of the ancients belonged to the hidden north and to the western islands has shifted in modern times to the New World shores of Prévost and

Chateaubriand, to the oceanic solitudes of Defoe and Bernardin de Saint-Pierre, to India, Japan, Africa and, more recently, to the Wild West and to the sweet South Sea Islands—Samoa, Tahiti, Marquesas and Bali, the "last paradise." There have arisen new mythologies and cosmogonies, if not encouraged at least unchecked by the upheaval and drift of modern science. In this atmosphere anthropology has flourished, with its search for essential human nature and the uncorrupted primitive cultures. The most impressive of all such new myths has been that of Atlantis, which about 1882 took form around some pages of Plato (*Timaios* and *Kritias*) and then steadily grew: an Anywhere and a Nowhere, a land of innocence and also of mysterious wisdom, where, as with the Greeks, Latins, Celts and Teutons, who in a kind of antiquarian poetry tried to trace the genealogy and origin of their tribes, men may be deemed to seek a common fatherland of happiness.

Psychologically the foundation of any primitivism lies in the individual's regret for his vanished youth and in the praise that the elders, seeking to bolster their prestige, bestow on "the good old days." This may account also for the precedence usually accorded in such conceptions to the pastoral and agricultural ages, when the paternal authority was strongest. To this may be added what psychoanalysis calls the mother complex, the fundamental longing for origins. Historically it might seem admissible that men attained somewhere, at some time in the past, a long moment of quiet and self-content, oblivious of the past and careless of the future, lying "in green pastures, beside still waters." This may have been true in pastoral, agricultural, peaceful societies, between the late neolithic and bronze ages. In philosophic terms the primitive contains the ultimate, the *proton* and the *teleion*; the seed is in itself fulfilment. In terms of its social effectiveness primitivism, regardless of its permanent drawbacks, can probably function as a temporary integrating force in periods of change and disintegration.

PRIMOGENITURE. Legally and socially the concept of primogeniture centers around two distinct nuclei: one the preference given to the eldest born, male and in some cases female, of the children succeeding to the rights of their father, mother or parents; the other the particular objective which has thereby been sought in the more modern developments of both government and private property, namely, the prevention of a division, by family succession, of

public or private rights in the soil or other important economic objects. The factor of preference may be rooted in or accompanied by primitive religious or mystical conceptions attaching to the idea of first fruits and their special value generally or of the first born as transmitter of the life of a family and as invested with the right and the duty, as in India or China, to offer sacrifices to the spirits or to worship the memory of his ancestors. But even these mystical conceptions acquire considerable realism from the natural preference accorded to age in the simple situations of human life, whether in blood relationship or in other social groups. The first born in this respect is only a subcategory in a general tendency to patriarchal organization; such organization is of course strongest in primitive society but obtains to some degree even in the most complicated and mechanized structures of modern political and economic life. On the other hand, even the marked emphasis on human equality which characterizes rationalist or democratic thinking would not exclude acknowledgment of the added strength given to the preference of the eldest in all cases where it may serve the unity of social force and will as against the exaggerated disintegration which threatens to weaken or destroy them.

The concept of primogeniture thus affords a prominent instance of the cyclical rather than the linear progress of important social institutions, by virtue of the manifold and changing ends they may come to fulfil. The two ends served by primogeniture have been separated as often as they have been united, and frequently the more primitive stage has been the separating force and the more developed and rationalized stage the unifying. In the monarchical set up of the Germanic tribes of the early Middle Ages succession to the throne depended not upon primogeniture but upon the choice of the fittest or in other respects most distinguished of the members of a dynasty. In the much more powerful and arbitrary monarchies of the ancient East succession was determined by primogeniture precisely for this reason. The necessity of preserving a mediaeval peasant holding intact for generations was often satisfied by the rule, enforced conventionally or by the will of landlords, of the so-called minorat (also called borough English and ultimogeniture), whereby undivided succession was reserved to the youngest son or daughter; behind this custom, it may be surmised, was the expectation that the older children would succeed in gaining their own

livelihood during the lifetime of the father. On the large scale aristocratic estates undivided succession has been upheld principally by the device of primogeniture. It is thus clear that, far from being invariably a primitive institution destroyed by the movement toward more equalitarian arrangements, the combination of undivided inheritance with the privileges of the first born has frequently been a later development conditioned by the growing importance and complication of the objects to be attained.

There are three principal aspects of primogeniture which have occupied the minds of political thinkers and social critics. It has furnished the classical method of succession in the modern European monarchy, thus providing its adversaries with an added reason for attacking what they believed to be an irrational and fortuitous method of transmitting power. In the wake of this modern monarchy it has served the great landholding families of Europe, first of the highest aristocracy and then also of minor ranks, in preserving their social position through the undivided inheritance of their lands and consequently has been attacked by the liberal opposition to artificial social and economic monopoly. Finally, it has been a hotly debated point in the field of peasant proprietorship, especially in Germany, where the Roman and French ideas of the free division of real property, whether intestate or by testament, came into conflict with the older systems of "closed" inheritance.

These three chief applications of the same device, on three different levels of social stratification, developed historically in relation to each other but by no means in the same direction. On the three levels of feudal society—king, lords and tenants—the evolution of primogeniture was neither parallel nor always dictated by identical interests.

Feudal tenures in their early development were offices or tenancies at will. The interests of the feudal lord, first in the knight tenure which was the basis of military service and afterward in the other free tenures, demanded the undivided continuance of the estates and their succession through primogeniture, both to insure the fulfilment of the feudal services and to prevent the feudal tenures from taking on the character of property. The tenants, however, tried to assist this transformation of tenure into property by wilful divisions of the inheritance. In their own capacity as feudal tenants to the king the lords and commoners in England who made and upheld the statute *De donis condi-*

tionalibus of 1285 used the entailing of fiefs and estates to their heirs, mostly by primogeniture, to combat any individual tendencies among them to alienate or encumber the land and also to preclude the possibility of forfeiture to the crown for political offenses. The influence of primogeniture and indivisible succession on one level of society could be employed to injure as well as to benefit the interests of the other social levels. A powerful monarchy, operating on the basis of primogeniture, allied itself according to circumstances with the privileged aristocracy or with the rest of the nation against the aristocracy. In their turn the nobility and gentry, who had secured their own property by the statute of 1285, could afford to allow, by the statute *Quia emptores* of 1290, free sale of their tenants' lands, provided the purchaser became their new direct tenant; and, as Stubbs has indicated, the villein too profited by the new rule because "he was no longer in dread of the multiplication of middle men placed between himself and the chief lord, each trying to prove himself entitled to a share in the produce of the land and the profit of the villein's labour; whilst in the court rolls which recorded the fact of his villenage he knew he had the title-deeds of his little estate, and that the custom of the manor fettered the arbitrary will of the lord."

The use of primogeniture to enforce the indivisibility or to prevent the division of the land, viewed as the basis of certain economic and social positions, seems to spring from two different sources. One has been the importance of such positions to society at large or at least to groups wider than those immediately interested in them. Thus monarchical primogeniture turned out to be a fundamental source of centralized governmental power and a check to the dynastic struggles for the throne. Primogeniture for great private estates served as a prop not only for the aristocracy but also for the stability of the social and economic order generally. The worst period of feudalism in the southern Italian latifundia was the nineteenth century, when under the rule of the Napoleonic law of succession the great landowning families became, as it were, landholding joint stock companies engaged in purely financial exploitation through farmers and subfarmers, whereas previously the rule of primogeniture had required the owner to fulfil at least to some extent the position of a responsible landlord. Finally, the question of the annihilation of a substantial peasant farming class through the abolition of

legal or voluntary undivided inheritance and the consequent diminution of the size of the peasant holding loomed large as a social problem toward the end of the nineteenth and the beginning of the twentieth century on the European continent and especially in Germany. The predominance of economic liberalism, as, for example, in the German Civil Code, enhanced for a time the arguments against peasant primogeniture arising from considerations of individual justice as well as of economic progress; but the new *Erbhofrecht* introduced by the advent to power of the German National Socialists in 1933 marks a departure in its recognition of the predominance of the social over the individualist viewpoint.

Primogeniture has become strengthened also through the threat of excessive subdivision of public and private rights in the soil. Here too it is noteworthy that the development of an industrial and money economy, while promoting individualist opposition to primogeniture, served also as a compensation for many of the unfavorable consequences of the system. Monarchical primogeniture, despite its clear advantages for political government, could hardly have prevented the disintegration of territories into ever smaller fractions if money economy had not furnished the means of providing for younger children by appanage, just as officials had come to be remunerated in money instead of land. The plea traditionally advanced for the English law of entail—that it aided capitalism by forcing younger sons into trade—is perhaps biased to the extent that under other conditions primogeniture in landed estates failed to lead to the same result; but at the same time primogeniture has been undeniably bound up everywhere with the progress of capitalist and credit methods, although one of its chief aims used to be, while privileging the first born, to prevent him from encumbering the estate by credit transactions during his lifetime. Similarly the healthy functioning of all laws and customs of primogeniture for peasant farms must depend to a large extent upon the possibility that younger children will find means of livelihood other than those afforded simply by intermarriage or by dependent labor on the farm; that is, upon the possibility either of colonization or of increasing absorption within industry.

The attack on primogeniture was most fierce under the influence of the liberal individualism and the rationalist egalitarianism of the eighteenth and nineteenth centuries; these democratic strains were aided, in the sphere of eco-

nomic organization, by the rise to dominance of movable capital. In France the revolutionary legislation carried even further the historical tendency toward the parceling out of the land into the *morcellement*, or small holding, although Napoleon was not slow to perceive the political importance of using the majorat to build up a landholding aristocracy loyal to himself. In the United States the Jeffersonian influence was distinctly unfavorable to primogeniture; where partible succession had not become customary, primogeniture was abolished by state legislation before the end of the eighteenth century. In England the struggle over primogeniture did not reach a decisive conclusion until the land legislation of 1925; throughout the nineteenth century the liberals seeking reforms in the law of real property concentrated their attack on primogeniture, and an elaborate array of argument was built up on each side. But behind the feudal and reactionary traits which were the target of liberalism and individualism there can now be discerned those which have repeatedly made primogeniture an appropriate combination of the individualistic idea of property in land and the social idea of the responsibilities of this property toward collective groups, from the state down to the family. The dissolution of fideicommissum provided for by the Weimar constitution and by most of the constitutions of the individual German states has led to the formation of voluntary associations of families for the joint administration of their formerly undivided estates and also special legal provision for the upkeep of larger tracts of undivided property where its division would harm the public interest; as, for example, in the administration of forests, vineyards, diked lands and the like. And the reform of the English land law in 1925, while breaking up the old law of entail for testamentary as well as for intestate succession, has extended the right of voluntary entail even to personal property.

PRINCE, MORTON (1854-1929), American psychiatrist. Prince taught at Tufts College and at Harvard University and had wide repute as a practising physician. He occupies a distinguished place as a pioneer in the introduction of psychological concepts and techniques into the study of functional nervous disorders. His formulation was catholic; he recognized the neurological basis of the typical psychoneuroses—hysteria, neurasthenia, psychasthenia, psychopathic personalities; these temperamental trends to response inherent in the nervous system he called neurograms. The form and development of the symptoms of psychoneuroses he held to be derived from the total psychic life of the patient, especially from his subconscious. Prince's pivotal concepts were dissociation and the subconscious. He contended that integration, the normal condition of the personality, takes place on several levels; that there are degrees of coherence in even the most consistent personality; and that some persons are peculiarly disposed to marked dissociation. While adopting James' term "fringe" to characterize the supporting mechanisms in the conscious stream, he further postulated a coconscious which may develop a parallel, alternating, rival yet well organized sys-

tem of urges, expressions, competencies and controls; and an unconscious which may become submerged and detached even to the point of complete amnesia.

The clue to Prince's psychotherapy was in the restoration of lapsed segments of ideas and experience to a new synthesis involving a deep integration process. He relied upon hypnosis as an instrument of exploration. In common with Freud he recognized emotional conflict as the motive source; but his psychiatric experience failed to confirm the set orders of complexes, their infantile origin or their saturated sexual tone. Prince likewise regarded Freud's unconscious as a false derivation and rejected the transfer technique completely, holding that the surgeon reconstructing a dismembered psyche should be as objective as an orthopaedist. Prince's influence in psychiatry has been considerable, although his theories have been questioned to such an extent that even the conflicting personalities which he described have been regarded as products of the psychiatrist's own suggestion. In 1906 Prince founded the *Journal of Abnormal and Social Psychology*, which he edited until his death.

PRINCE-SMITH, JOHN (1809-74), German free trader. Prince-Smith was born in England but in 1830 removed to Germany, where he was engaged as teacher of languages at the *Gymnasium* in Elbing. Early in his career he began to take a keen interest in current economic and political problems and in 1846 settled in Berlin, where he devoted himself entirely to publicistic activity. From 1861 to 1866 he was a member of the Prussian Diet and in 1871-73 was elected to the Reichstag.

Prince-Smith was the leading spokesman of the Manchester school in Germany. His views lacked originality and represented mainly a forceful reassertion of Bastiat's principle of complete harmony between the interests of the individual and those of society and of Bastiat's conviction that unqualified freedom of enterprise in internal and foreign trade serves the best interests of all classes of people. Influenced

also by Carey's optimistic outlook on economic development, he rejected the law of diminishing returns from land, the Ricardian concept of rent and the Malthusian law of population. He opposed all forms of social legislation and held that mass poverty, which he believed is due to the disproportion between the wage fund and the supply of labor, can be remedied only by furthering the process of capital accumulation, thereby increasing the funds available for wage payments. His admission of an excess of employable but unemployed population over available funds implies a considerable concession to the Malthusian theory, which he had rejected, since he thus affirms the existence of the very problem which can be explained only by the Malthusian doctrine or by that of Karl Marx. Prince-Smith was most indefatigable in propagating the gospel of free trade. He was responsible for the formation of numerous free trade societies and in 1858 he founded with Schulze-Delitzsch and others the Kongress Deutscher Volkswirte, the rallying point of German free traders. He was the co-editor of the *Vierteljahrsschrift für Volkswirtschaft, Politik und Kulturgeschichte*.

PRINS, ADOLPHE (1845-1919), Belgian criminologist and publicist. Prins was professor of penal law and procedure at the University of Brussels from 1879 to 1919, and from 1883 to 1917 he held the post of inspector general of prisons. He exercised great influence upon the criminal legislation of Belgium. He was one of those responsible for the organization of children's courts and the enactment of the law of 1912 for the protection of childhood. With van Hamel and Liszt, Prins founded in 1889 the important Union Internationale de Droit Pénal.

For many years Prins was one of the undisputed leaders of the movement for penal law reform in Belgium. An opponent of the traditional theories of the classical school and particularly of the principle of repression, he did not, however, accept all the ideas of the Italian school of criminal anthropology. He rejected especially the theory of the born criminal, emphasizing rather the social causes of criminality. He classified delinquents into three major

groups: the occasional delinquent, who commits the infraction under the pressure of external circumstances; the habitual delinquent, whose personality is the principal cause; and the abnormal delinquent, the criminal who acts under the influence of a more or less serious mental defect but who is not actually demented. Prins believed that punishment should be individualized to make possible the adequate treatment of the various classes of delinquents.

As a publicist Prins wrote several critical studies of democracy in which he argued that political organization as it grew out of the French Revolution had culminated in an excessive individualism. Set against the omnipotent and centralizing state was a welter of individuals, all free and equal but in actual fact manipulated by political parties and groups. In order to realize democracy society must be organized along the lines of the mediaeval state. It is true that interest groups form spontaneously; but by according these groups representation and a degree of participation the state can become truly organic.

PRINTING AND PUBLISHING. Documentation by writing facilitated more effective communication of knowledge and its cumulative transmission. Printing greatly enhanced this achievement, significant for the development of culture, by making possible the economical multiplication of texts on a large scale, thus permitting an expansion of the range of influence of published works. The full possibilities of printing as an agency in the dissemination of knowledge and propaganda were not immediately grasped either in China, where printing first developed, or in Europe. It was conceived of primarily as an efficacious manner of avoiding errors in transcription, which were inevitable even in the work of the most skilful scribes, and thus as a device for standardizing texts. Its

effects as a revolutionary ferment among the masses, augmenting their power of participation in intellectual and political life, were in most countries not anticipated. Printing cannot be regarded as in itself the force which disrupted the authoritarianism of the Middle Ages in Europe; the bulk of the books which the printing presses produced during their first fifty years were mediaeval classics, tracts on theology and liturgy, texts of Roman law and the scientific works of the twelfth century. Furthermore the prices of books were in the beginning prohibitive for any but the wealthy ruling classes. The times were propitious, however, for a wider use of printing; economic, social, political and religious changes were hastening the collapse of feudalism and stimulating the intellectual renaissance, in which printing came to play a significant role. It was when the leaders of the Reformation availed themselves of the printing press to extend the influence of their doctrines among groups previously apathetic to the abuses of the church, by printing cheap books and pamphlets with propagandistic intent, that printing became a menace to existing authority.

Large scale book publishing existed prior to the development of printing. In ancient Alexandria under the Ptolemies staffs of trained scribes prepared for sale large editions of the classics and skilled slaves manned the book publishing industry at Rome, which was controlled by strict censorship under some of the emperors. In the Middle Ages manuscripts were prepared in monastic scriptoria by organized corps of copyists, whose work in particular monasteries can be identified through localized styles or schools of calligraphy and by distinctive decorations, initials, borders and illuminations. As the production of books became more elaborate during the twelfth and thirteenth centuries, the work became departmentalized and specialized skills of lay illuminators and rubricators became differentiated from those of the calligraphers. In Paris during the fourteenth century production and sale of books were carefully controlled by the university authorities primarily to prevent expression of heretical opinion. Comparable control prevailed at the Italian and English universities, while in German cities, such as Cologne, publishing was under ecclesiastical jurisdiction.

Printing flourished in China long before its appearance in Europe. Seals had already been cut for impressions in ancient Babylonia and Egypt and textiles had been printed probably

first in India. The earliest extant wooden block for printing on paper is a Buddhist Sanskrit charm written in Chinese characters in 770; the advanced technique of the oldest surviving printed book, which dates from 868, indicates that it is the product of a long development. Large scale printing of the Confucian classics under Fêng Tao by scholars organized into a national academy was a potent factor in stimulating the renaissance of the Sung dynasty, during which thrived both public and private printing of secular as well as religious works. The quantity and scope of printed literature increased after the conquest of China in the thirteenth century by the Mongols, who published the ancient Chinese classics in their own language as well as in the original.

Movable type made of earthenware was invented in China between 1041 and 1049; the casting of tin into type followed shortly after and by 1314 a typesetting machine using wooden type was being employed. During the following century the type mold and metal type were invented in China and were used extensively in Korea a half century before the invention of printing in Europe. Alphabetic type and the printing press, however, were European innovations. In the Far East, because of the non-alphabetic character of the script, printing from metal type demanded large capital and was therefore carried on almost exclusively by governments; for private and commercial purposes block printing was more practical. Type printing, which had practically ceased by the nineteenth century, when it was reintroduced from the West, has as yet made little progress except for large presses in metropolitan centers. Block printing is now being replaced in the smaller printing offices, not by type but by lithography.

The diffusion of the Chinese invention of printing into Europe has not yet been traced with certainty as has the introduction of paper, upon which the success of printing depends. Block printing in its passage westward spread by way of Turkestan, where Turfan was a great Buddhist printing center in the thirteenth and fourteenth centuries; in this period Egypt also printed from blocks. Paper money, first printed in China in the tenth century, was issued at Tabriz, Persia, in 1204 in Chinese and Arabic and was brought to the attention of Europeans by Marco Polo and later by other European travelers. The accurate description of Chinese block printing in Arabic and Persian by Rashid-eddin about 1307 makes probable the hypothe-

sis, although no documentary evidence has been found to substantiate the claim, that the block printing which began in Europe at the end of the fourteenth century and which developed in Italy, Germany and Holland had its origins in the Far East. No reliable evidence of any nature has been uncovered to prove that the typography of China or Korea influenced that of Europe.

The diffusion of block printing westward was checked by the refusal of the Islamic world to adopt the innovation. The antagonism of Moslems to printing persisted, especially in reference to the publication of the Koran, which has never been printed in any Islamic country except by lithography. Islamic calligraphers, however, developed high skill, and excellent artistic texts were produced on a large scale in the scriptoria of Cordova and other important cultural centers. When in 1727 permission was given for the erection of a printing press in Constantinople with the proviso that the Koran should not be printed, the publication of the first book aroused such opposition that printing was practically abandoned in Islam for about a century. In India, where the sacred hymns of the *Veda* were memorized and transmitted orally, the Brahman caste successfully resisted the introduction of printing until late in the sixteenth century, when the first printing press was set up at Goa by the Portuguese.

Although printing may have been invented at Haarlem (by an unknown prototypographer usually identified as Coster) prior to Gutenberg's epoch making work in the second quarter of the fifteenth century in Mainz, Germany was the first European country in which the printed book became a rival of the manuscript; and it was the Germans who were responsible for the diffusion of printing over Europe. Six towns produced nearly two thirds of the output of the German presses up to the end of the fifteenth century, the German output being about one third of the 30,000 incunabula of all Europe. Three of these were university towns which published in Latin: Leipsic did not specialize; Cologne was a center for printing works primarily in theology; and Basel, at its zenith at the time of Erasmus, was known for the printing of humanistic works. Nuremberg printed books in Latin mainly for export to the north and east; Augsburg, in the vernacular for the enlightened burgher; and Strasbourg, in both the vernacular and Latin. When printed books and pamphlets became the medium through which the religious controversies were waged during the Reforma-

tion, Wittenberg, the home of Luther and Melancthon, became the chief printing center. It remained preeminent to the end of the sixteenth century; then Frankfort took the lead until after the 'Thirty Years' War in the seventeenth century, when it was gradually superseded by the book fair at Leipsic. As early as 1496 the archbishop of Mainz set severe penalties for the printing, publishing, buying and selling of books translated from the Greek or Latin or any other language before the written translation had been approved by a committee of the faculty of the University of Mainz. Regulation of the organization of the printing trade and the production and distribution of published works became general in the sixteenth century. In Leipsic printers were forbidden to print Protestant literature for about two decades; in 1527 the printer Hans Hergot was beheaded there for publishing a prohibited pamphlet. Both Nuremberg and Augsburg were headquarters of clandestine presses evading ecclesiastical control. During this period the printers were organized in corporations or guilds, which existed until the nineteenth century.

Brought to Italy by Germans about 1464, printing played an important role in the Renaissance. Rome, Florence, Bologna, Milan and especially Venice became centers of book commerce in ancient literature; by the end of the century 73 Italian cities had presses which had produced over 4100 editions primarily in the classics. Gothic forms of printing had been used by the early German publishers; but as the center of printing shifted to Italy, types were influenced by the dominating interest of the calligraphers in an aesthetic based on ancient patterns. The Gothic letter was superseded by the Roman through the work of the brothers da Spira and of Jenson. These pioneer printers did not invent new letter forms but standardized and adapted the existing humanist miniscule, a survival of the old Carolinian miniscule, to the needs of type founding and printing. They sought faithfully to reproduce by mechanical processes the work of the humanist Italian calligraphers, but in spite of the excellence of their work the bibliophiles of Florence regarded it as so inferior to the manuscript productions as to be unworthy of inclusion in their libraries. Modern book publishing methods may be said to date from 1501 when Aldo Manuzio introduced books of small format. It took nearly a century, however, before printed books could shake off the influence of the manuscript and

develop their own traditions. It was this slow transition from the manuscript to the book which mitigated the opposition of the calligraphers to printing, for they were employed for many years to supplement the work of the printing press in initialing and illuminating the texts.

In the early years of the sixteenth century Italy's primacy was lost to France, where printing had been brought by traveling German craftsmen, who first used Italian type but later returned to Gothic. The Estiennes, de Colines and Tory introduced into France the innovations of Aldus and cheapened the cost of the Greek and Latin classics to create a wider reading public and make printing more profitable. Garamond in Paris, Froben in Basel, de Tournes in Lyons and later Plantin in Antwerp attained eminence as printers, the last named not only as a craftsman but as a publisher. The modern type faces of Grandjean, printer to Louis XIV, were copied by French type founders, especially by Fournier, with sufficient variation to escape the royal decree against counterfeiting the new type. The type created by Didot was widely used in France until the French Revolution, when the types of Baskerville of Birmingham copied by Bodoni of Parma were popularized and the old face with its ornaments and decorations was abandoned. English printing, which had been begun in 1477 by Caxton, did not display high technical craftsmanship until the eighteenth century, in the work of Caslon and Baskerville. There then followed throughout the world a period during which there was a decline in craftsmanship in the printing industry, which was dominated by commercial publishers concerned with profits rather than with aesthetic standards. It was primarily the work of the Kermiscott Press, founded by William Morris, which led throughout Europe to a return to types designed after those of the early printers and which resulted in a marked improvement in the appearance of the printed book. The arts and crafts movement to improve printing initiated by Morris, whose romanticism reflected the interest in mediaevalism stimulated by the Oxford movement, has succeeded by virtue of the example set by its product rather than through its philosophy. Its glorification of the handicraft system at the expense of machine production has been largely abandoned with the recognition that machine methods can produce works of high artistic merit and are far more adaptable to the large scale production which must be carried on if books are to be more than col-

lectors' items. Although recent printing styles continue to be retrospective, especially in the United States, many experiments are being made with new type faces and new techniques.

In France the regulations pertaining to the scribe and his manuscript, whereby the University of Paris had been given the right to license and control production and sales, were in 1474 made applicable to the printer and his book. The rules which governed the relation between master printer, journeymen and apprentices, their tasks and privileges were derived from the ancient Corporation du Livre. When the government intervened in the struggle between master printers and journeymen over requisite qualifications, number of apprentices and working conditions and wages, which had led to a series of strikes in Lyons and Paris in the period 1539-72, it extended its control over the industry and the powers of granting the privilege to publish passed from the university to the state. In 1618 a code of corporate regulations was approved by royal edict and the Communauté des Imprimeurs, Libraires et Relieurs was established in Paris; later its jurisdiction was extended throughout France and it prevailed until abolished by the revolution. Because they were not recognized as belonging to any special trade, type founders were not admitted to the corporation, nor could they become members of the association of printers and publishers, the Confrérie de Saint-Jean l'Évangéliste. When royal typographical workshops were set up in 1640 and 1670, the sale of new and secondhand typographical material was regulated to curb the publication of political pamphlets by clandestine printing offices. After the revolution the copyright law of 1793 abrogated existing privileges and the printing of books and pamphlets increased greatly. Under the First Empire printers were again limited and controlled by a licensing system, which was enforced with modifications until the establishment of the republic in 1870.

Printing in the Netherlands in the sixteenth century was concerned largely with the publication of reformed Bibles and of controversial books and pamphlets for and against the Reformation mostly for export to Denmark, Spain, Portugal and England. In an attempt to prevent the spread of Lutheranism Charles V and Philip II sought to regulate the industry by drastic edicts; the printers van Liesvelt and van Berghen were beheaded and others were banished, imprisoned or fined. In the seventeenth and eighteenth centuries Dutch and Belgian printers

produced for the French market typographical counterfeits as a means of evading French governmental control; works by Rousseau, Boileau, Molière, La Fontaine, Voltaire and others were published on a large scale.

It is estimated that from 1476 to 1535 two thirds of all printers, binders and stationers in England were aliens who were encouraged to settle there by the privileges granted them in 1484. There followed persistent manifestations of ill feeling against foreign craftsmen, sometimes leading to sanguinary conflict; in 1534 privileges involving free trade in books were finally annulled. The ensuing monopoly of book publishing by the Stationers' Company, which although dating from 1403 did not obtain its charter until 1557, led to the practise of pirating by unlicensed printers. In 1586 an order of the Star Chamber restricted the number of presses, confined them to London and Oxford and Cambridge universities and placed them under the control of the ecclesiastical commissioners; the ruling was made more drastic in 1637. Following the abolition of the Star Chamber by the Long Parliament there was a short period of unlicensed printing of books and pamphlets which, after a remonstrance of the Stationers' Company, an ordinance of 1643 sought to prevent. It was as an attack upon this reactionary ordinance that Milton's *Areopagitica* was written. After the Restoration the newly established royal office of Surveyor of the Imprimery and Printing Presses, which took over the administrative powers of the Stationers' Company, again reduced the number of printing presses and drastically reenforced the clauses of the Star Chamber decrees. In 1693 the licensing act lapsed, leaving literary property without any statutory protection until the passage of the Copyright Act under Queen Anne in 1709, which gave the author definite property rights and power to bargain with the booksellers. Printing in the New England colonies, introduced first in Cambridge in 1639, reflected the conditions in the mother country; licensing was maintained until about 1720.

During the late eighteenth and the nineteenth century the demand for books rose throughout the western world as a consequence of the social and economic effects of the industrial revolution and particularly as an aspect of the changing status of the middle class. In England the monopoly of a few publishers in the book trade was broken and reprints of the popular classics appeared. Censorship through

licensing ceased throughout Europe except in war periods. The introduction of the power press and the machine manufacture of paper decreased production costs and made possible a vast increase in quantity production, which was further augmented by the technological changes in the last decades of the nineteenth century and the beginning of the twentieth. With the introduction of machinery came the disintegration of the guilds. Books circulated more widely through circulating libraries and new trade channels and by means of the sale of publishers' remainders and secondhand books. Patronage as a means of financing the publication of books gradually declined and payment of authors by royalty became the general practise.

The United States, England, Germany and the Soviet Union are now the most important countries in printing and publishing. The printing industry in the United States in 1929 paid one twentieth of all manufacturing wages and ranked seventh in the total value added by manufacture. Book and job printing made up 31 percent of the total value of the output, while newspaper and periodical printing comprised 56 percent; 41 percent of all workers were employed and 40 percent of all wages were paid in book and job printing, 33.1 percent and 40 percent respectively in newspaper and periodical printing (Table 1).

Commercial printing is centered in New York City, which produces 24 percent of the output, and in Chicago, which manufactures 16 percent; the remaining 60 percent is widely diffused. no other city printing more than 4 percent of the total and only 12 as much as 1 percent. Because of the many small units producing for local consumption the number of establishments in publishing and printing and allied industries exceeds that of any other industry in the United States; in 1929 these totaled 27,522, a decline of 6225 as compared with 1919. The major portion of the production, however, is concentrated in a few large plants in book and job printing and in the newspaper and periodical branches of the industry (Table 11).

According to United States corporation income tax returns the net income of printing and publishing corporations increased from \$97,477,000 for 8429 corporations reporting in 1921 to \$223,080,000 for 11,170 corporations in 1929 (Table III). In the latter year the total gross sales reported were \$2,639,700,000 and the total net profit minus taxes was \$218,800,000; 10,069 corporations reported a total net capital invest-

ment of \$2,113,000,000. A comparative analysis of the 1925 corporation income tax returns of the leading industries in the United States indicated that the printing and publishing industry ranked second in the percentage of corporations showing a profit, which totaled 65.7 percent, and also second in terms of the percentage of gross profits on sales, which totaled 28 percent; the percentage of successful firms reporting profits of \$10,000 or more in that year was 70.3 percent.

Within the last fifty years the new machinery which has been introduced into the composing room, the pressroom and the bindery has revolutionized the industry. The linotype and related machines practically supplanted straight

matter typesetting by hand between 1886 and 1903. Although the linotype operator sets about four times as rapidly as does the hand operator, there appears to have been relatively slight immediate displacement of labor both in the United States and in Europe, because the technical character of the linotype required for its most successful operation the skill of the superseded handicraftsman and also because the market for printing was expanding. Composition by monotype and preparation of the form by photographic processes largely eliminate type composition and thus are affecting employment.

Cylinder presses were first installed in the pressrooms of the United States in 1882, modern rotary presses in 1890 and automatic press feeding attachments in 1899. By 1913 less than 4 percent of platen and cylinder presses used in commercial printing in the United States were mechanically fed; by 1921 the proportion had mounted to 66 percent. The installation of automatic feeding attachments and self-feeding job and small cylinder presses has continued rapidly; in 1929, 44,000 out of 64,000 presses sold were automatically fed. The effects of this mechanization are revealed in the United States census statistics, which show that while value added by manufacture in book and job printing rose more than 760 percent from 1899 to 1929, only 120.1 percent more workers were employed. In newspaper and periodical printing the results are even more striking; the value added by manufacture increased 679.4 percent between 1899 and 1929, while the number of workers increased only 34.2 percent (Table 1). The productivity of labor per man hour in newspaper printing increased 264 percent from 1896 to 1926. In 53 commercial printing plants studied in New York City, while there was a 7.9 percent increase in employment of skilled pressmen in 1929 as compared with 1924, there was 5.7 percent net displacement of unskilled or semiskilled press assistants; although the relative number of men employed increased slightly on the old models, it declined on the new ones. The bindery has likewise been mechanized by the installation of automatic processes for folding, gathering and covering books and magazines.

Modern printing machinery led to the departmentalization of the printing industry, which in turn resulted in the specialization of craft unions in the United States. The International Typographical Union, which took permanent form through a combination of local organizations in 1852 and which later affiliated with the

American Federation of Labor, included compositors and pressroom workers. The pressmen had broken away from the compositors by 1889 and had founded their own international organization, the International Printing Pressmen, which in 1896 expanded to include the press feeders and became the International Printing Pressmen and Assistants' Union. Technological changes have not affected the membership of the unions adversely; in New York, where between 1913 and 1929 hand feeding was reduced from 75 percent to 15 percent of all press feeding, the membership of the press feeders', or assistants', locals remained practically stationary and membership of the highly skilled pressmen actually rose 33 percent. The recognition, however, that the mechanical inventions are displacing the assistants while bringing more work to the skilled pressmen has intensified the traditional conflict between these two groups. The competition between them largely over apprenticeship practise dates back to the beginnings of printing, and overt manifestations of it have appeared in practically every country in which printing has flourished. It has repeatedly been the practise of master printers to attempt to undercut the wages and working standards of the journeymen by employing "two-thirders" or "half-way journeymen," who have not fulfilled their apprenticeship. The apprenticeship problem has been aggravated in most countries by the problem of absorption of the learners who become journeymen; the latter have sought to restrict their number to the minimum. The linotype practically solved the problem of oversupply among the compositors by making apprentices less profitable for the employers. But in the pressroom more manual feeders than skilled pressmen are still necessary to operate the presses and the avenues of promotion are consequently clogged. In New York City a man must serve five years as an assistant in order to be eligible for selection as an apprentice, and in order to become a journeyman pressman he must serve four additional years as an apprentice. In 1929 there were but 140 apprentice pressmen in the assistants' union of over 2500 members; only 5 percent of the members could anticipate becoming pressmen in four years and most of them had no prospects of such advance. There is a conflict of interest therefore between the feeders and the pressmen, which appears in all negotiations between the employers and the unions.

The leading trade association in the commercial and periodical branches of the printing indus-

try is the United Typothetae of America, which comprises 3500 large firms in the United States and Canada, representing more than half of the total volume of production. It was formed in 1887 by the union of several local employers' organizations to combat the demand of the press-room workers for a 9-hour day. Although it regards as its main functions the development of standard trade practises and the control of prices, it has repeatedly served as the representative of the master printers in negotiations with employees over working conditions, a function usually performed by local organizations of closed shop employers, such as the Printers' League in New York City and the Franklin Association in Chicago.

In New York City, where 85 percent of book and job printing production is in closed shops, wages are higher, the work week is shorter and the complement of men required to run the presses larger than in Chicago, where only 40 percent of the production is in closed shops and union organization is weak because of the open shop opposition of the employers. In Chicago in 1924 non-union shops were paying their cylinder pressmen \$48 and the assistants \$40 for a 48-hour week, while in the New York union shops the scale for cylinder pressmen was \$53 and for assistants \$42.50 for a 44-hour week. In 1929 the Chicago non-union scales had remained the same, while the New York union rates had been raised to \$56 for cylinder pressmen and \$45.50 for assistants; and the wages of Chicago union compositors, who controlled 75 to 80 percent of production, increased with a shorter work week. Federal census reports indicate that although wages in New York are higher, the industry there derives greater value output per man at a lower unit wage cost than in Chicago. Wage scales have been drastically reduced since the economic crisis which began in 1929, and unemployment and part time employment have further lowered the income of the workers. In the spring of 1932 approximately 20 percent of the pressmen and press assistants in New York City were receiving unemployment benefits from their unions and only about 2100 out of 3500 pressmen members of the union were averaging as much as 3 days' work a week.

Although a few large publishing houses in the United States have their own printing plants, the majority contract for the printing of their publications with outside firms. The number of books manufactured in 1931 according to the United States Census of Manufactures totaled

154,235,000, which represented a decrease of 34.5 percent as compared with 1929. Textbooks for school use made up by far the largest category, ranging from 65,000,000 to about 84,000,000 in the last three biennial censuses; the three other major classifications were fiction, juvenile and religion and philosophy, in the order named. The number of pamphlets manufactured in 1931 totaled 215,300,000, compared with about 200,000,000 in 1929 and 251,000,000 in 1927. Between 1925 and 1930, 10 percent of the 172 to 217 publishing houses in the United States issued yearly 48 to 50 percent of the titles and 10 leading houses published 33 to 37 percent of the titles. In 1930-31 approximately 48 percent of total trade sales of books were through general bookstores, 29 percent through department stores, 7 percent through circulating libraries, 5 percent through drug stores and 11 percent through other outlets. Three leading wholesalers did 24.1 percent of the total book business; 25 largest accounts, not including wholesalers, 25.14 percent. Retail book outlets are concentrated in the larger communities. In 1931-32, 27.6 percent of the total number of bookstores listed by the National Association of Book Publishers were located in 41 cities with over 200,000 inhabitants, while two thirds of all the counties of the United States and nearly one half of the urban communities with a population between 5000 and 100,000 are without book outlets, leaving 32 percent of the total population of the United States without direct access to a bookstore. Direct mail selling has been carried on successfully by certain companies, but there are few organized direct mail departments in trade book publishing houses and as a method of book distribution of general trade books it has not proved satisfactory. Controversies as to whether rental libraries—a large percentage of which have been established by wholesalers—and book clubs cut off retail sales through bookstores have agitated the trade; in the United States such libraries appear not to have had the substantial influence attributed to them in England. In 1929, 2720 bookstores showed net sales of \$116,371,021. The average profit of booksellers reported in that year was 2 percent; good stores are estimated to have yielded 5.5 percent and at least one half of the bookstores showed losses.

There are many cultural bases for the present chaotic condition of the book trade in the United States, among them the book illiteracy of the American middle class, which may be ascribed

in part to a faulty educational system and in part to the commercial preoccupation of that class; the stress and strain of industrial life upon workers, which gives them insufficient leisure and equanimity to devote to the reading of books; and the increasing appeal and availability of competing diversions, such as the radio and the cinema. The book industry, producing as it does under competitive conditions for the realization of immediate profits rather than as an educational agency with a planned program, has failed to take advantage even of its existing markets. The findings of the economic survey undertaken by the National Association of Book Publishers in 1930-31 characterized the industry as very disorganized, with management methods anarchic, wastes high and methods for promoting reading and book buying utterly inadequate.

In the United Kingdom census figures in 1930 showed 2493 printing establishments, other than newspaper and periodical, employing about 163,000 wage earners, whose output had a value added to manufacture of £36,000,000. The influence of new machinery on production is indicated by the increase in the net output per wage earner from £88 in 1907 to £222 in 1930. In the 600 establishments printing newspapers and periodicals employing a total of about 69,000 wage earners, whose products had a value added to manufacture of £35,600,000, the average net output per wage earner increased from £190 in 1907 to £518 in 1930. The average weekly rates of wages of hand compositors and jobbing workers increased from £1.15.8 in 1914 to £4.13.3 in 1920 and then declined to £3.13.10 in 1930. Unemployment statistics reported to the League of Nations indicate that 11.1 percent of 284,770 insured workers in the printing industry were unemployed in March, 1933. A total of 165,000 workers belong to craft unions affiliated with the National Printing and Kindred Trades Federation, the leading unions of which are the National Union of Printing, Bookbinding and Paper Workers, with a membership of 70,000, and the Typographical Association with 31,000 members.

Book production increased markedly in Germany during the nineteenth century and the beginning of the twentieth, but declined with the economic crisis following the World War from a total of 28,000 in 1913 to 24,000 in 1931. The number of printing plants, which had grown from 2253 in 1873 to more than 5000 in 1897 and over 8600 in 1913, declined to about 8200

in 1924. The number of insured workers employed in printing increased from 80,000 in 1893 to 186,000 in 1913 and then declined to 166,000 in 1924 and further in 1933 to 138,000; of these 37.3 percent were totally unemployed and 18.2 percent only partially employed in March of that year. Although there are many small units, the industry is highly concentrated: large plants employing over 50 persons, although comprising 8.1 percent of the printing plants in 1924, employed 60.6 percent of the wage earners; the medium sized plants, which constituted 25 percent of the plants, employed 27 percent of the wage earners; and the small units, although making up 66.9 percent of the plants, employed only 12.4 percent. Before the liquidation of such unions by the Nazis the German workers were organized into the Verband der Deutschen Buchdrucker, which in 1924 had a membership of about 60,000. The employers negotiated agreements on working conditions with the union through the Deutscher Buchdruckerverein, which had 5000 members in 1919. Book distribution in all its phases, including price control, has been under the supervision of the Börsenverein der Deutschen Buchhändler, which includes nearly every publisher and bookseller in Germany and which has served as a model for the organization of the book trade of other European countries and especially of Norway and Sweden.

The post-revolutionary cultural changes in the Soviet Union have led to an increase in printing and publishing comparable to that following the rise of the middle class in the eighteenth and nineteenth centuries but unprecedented in extent. The proletariat and peasantry are participating actively in cultural life and consequently the size of the market for books, periodicals and newspapers has multiplied. The publishing houses in the U.S.S.R. have issued over 376,000 book titles in the past fifteen years; in 1931 they published about 54,000 new titles in over 830,000,000 copies; about one third of the titles and one fourth of the annual aggregate circulation are published in 83 languages of the national minority peoples. All state publishing concerns were coordinated in 1931 in the Book and Magazine Publishing Combine (Ogiz), whose books are distributed through agencies connected with Knigacenter. The workers are organized into the Printers Trade Union, which in 1932 included 34,000 members of all crafts in one industrial organization; an additional 6000 workers on factory newspapers belong to the

industrial unions of their factories. Production of books, pamphlets, periodicals and newspapers is continuing to mount as illiteracy, very high in czarist Russia, is being wiped out; its more rapid acceleration has been retarded only by the acute paper shortage.

PRISON DISCIPLINE. *See* PENAL INSTITUTIONS.

PRISON LABOR. It has been customary in most civilizations for the state to utilize, directly or indirectly, the labor of convicted offenders. The motive has been mainly, although not exclusively, one of economy or profit. Generally speaking, there has never been much dispute over the fact that a long period of idle detention not only is costly to the state but involves physical and mental degeneration for the prisoner. Such objections as have been raised within the last century have been based upon the condition and nature of the work involved and its effect on free industry, rather than upon a denial of the value of work as a necessary element in a sane penological program. The type of work chosen and the conditions under which prisoners have labored not only have varied with the incidence of the motive of state economy but have been much influenced by existing economic and social institutions and concepts. Thus labor may be introduced as a punitive factor in addition to detention, as a mitigating factor in punishment or as part of the program for the social and economic rehabilitation of the prisoners. So long as the religious and social attitude prevailed that responsibility for his crime lay solely with the offender, the profit seeking motive of the state found no check in social forces. This attitude also led at various times, when opportunities for profitable utilization of convict labor did not exist, to the adoption of unproductive types of labor purely punitive in purpose. The emphasis on rehabilitation is a development of the comparatively recent humanitarian movement and has but faintly influenced prison administration up to the present time, since its coincidence with a rapidly developing industrial society has heightened the profit possibilities in prison labor.

In the civilizations of antiquity, and in fact up to the twelfth century A.D., the institution of slavery afforded a convenient method for disposing of captives of war or offenders against the civil and military law and provided a conveniently large army of forced labor. In many primitive societies as well as in semicolonial countries and the backward regions of modern industrial countries enslavement of convicts survives, either as unmitigated slavery or as peonage or some other form of forced labor. After the abolition of formal slavery in Europe the ranks of the convicts were still looked to as furnishing the supply for those tasks, such as labor in the galleys of ships, for which free labor could not be as easily or as cheaply recruited. In the period of the commercial revolution Queen Elizabeth of England is reported to have appointed a commission to arrange that criminals be sent to the galleys, and the authorities of seventeenth century French courts were asked not to mutilate or kill convicted offenders as the galley needed them to fill out their crews. It was the development of sailing ships rather than reform in penological methods which led to the dying out of the institution of convict galley labor. The state then began to utilize convict labor in the rather broad programs of public works and road building begun in the eighteenth century. This practise is still common in many countries. France kept the former galley slaves for a time on hulks and in barracks, using the able bodied for work about the harbors, building docks and the like. This was done in England too; the docks constructed at Chatham and the land reclamation program of Dartmoor owed much to the utilization of convict labor. In the shift from maritime to land occupations, however, the need of adequate housing raised new problems of economy for the state. To meet this housing problem as well as to help supply the labor needed in its colonies England like Spain resorted in the beginning of the seventeenth century to the method of penal transportation. Until the War of Independence the American colonies absorbed much convict labor. Thereafter between 1787 and 1867 thousands of English convicts were shipped to the largely vacant lands of Australia, but this method of relieving the problem presented by the overflowing population of the English prisons was put to an end by the protests of free labor in Australia. During the first part of the nineteenth century England also resorted in the case of some offenders to the introduction of the tread-

wheel and the crank, horrible devices, wholly unproductive, which were used only to make prison life unbearable.

The development of industrialism in the late eighteenth and in the nineteenth century vitally affected prison as well as free labor. On the one hand, economic changes increased the numbers of dependents in public institutions, not only in almshouses and workhouses but, under the severe penal code of the time, in prisons as well; on the other hand, there came an increased demand for cheap labor. As a result both in Europe and in the United States during the nineteenth century a method for hiring out prison labor known as the contract system came into vogue. Under this system the state, although it retained physical control of the prisoners, hired them out at so much per head to private contractors, for manufacture within the prison walls of products which were then thrown on the open market. This system was profitable for the prison authorities, on whom no demand was made for economic efficiency, and to the contractors, who under the spur of the profit incentive introduced efficient methods of production and, in comparison with free industry, enjoyed the advantage of cheap labor over whose conditions of work there were no restrictions. The contract system of prison labor was not always confined to goods for the open market but was often used by private entrepreneurs who had received contracts for government construction. In the nineteenth century under this system of contract labor cruelty to prisoners, wastefulness from the point of view of vocational training, profiteering by state and by private interests, were rampant. The rise in Europe of a strong labor movement, whose objection to competition with labor producing under such circumstances was supported by entrepreneurs in free industry, and the development of a humanitarian spirit which called attention to the abuses of the contract system resulted in its rapid abolition in most countries of Europe. Free industry also demanded the abolition of all systems of production for the open market, including the "state account" method, since state controlled production which eliminates the profit of the contractor is even more of a menace than prison labor, from the point of view of cut-throat competition. Except in Belgium, France, Germany and Italy, European prison labor is now almost entirely confined to production for the needs of the prisoners themselves and of the state and its institutions and subdivisions. The restriction

on prison made goods in the open market has in recent years taken on international scope, and in Europe the importation of such goods is prohibited in all but the above mentioned countries.

With these restrictions effected on the products of prison labor, increasing attention and priority have been given by prison authorities in several European countries to the problem of vocational and social rehabilitation and to the classification of prisoners for work on the basis of mental and physical capability. The substitution of agricultural for manufacturing and construction occupations has been stressed. In the Scandinavian countries and more recently in Italy there has been a development of the penal farm, where the prisoners, who are carefully selected, are allowed a high degree of freedom. There is gradually being built up a special code for prison labor with respect to hours and wages; in practically all countries except England the prisoner receives a wage. In Italy and the Soviet Union he has a legal right to wages and can resort to the courts for their collection; in Poland, Germany and France he has a legal right to amounts accredited to him. In several European countries and in three states in the United States (New Hampshire, Maryland and Wisconsin) the prisoner also has a right to compensation for occupational injuries sustained while at work. Detailed provisions are often made for disposal of wages credited to the account of the prisoner, to be paid to him or to his dependents on release.

Perhaps the most unusual experiment in prison labor at present is being made in the Soviet Union. The concept of labor as compulsory for all able bodied persons is of course extended to convict labor as well. For all but political prisoners and "class enemies," who are still subject to the czarist method of penal transportation and its hardships, and certain isolated types of criminals there are two methods of labor: the first providing labor reformatories and penal colonies where emphasis is placed on vocational training; the second involving no element of detention whatever, beyond working hours, with the worker paid the same wage as free labor, less 25 percent to the penal authorities for maintenance and other costs. In order to avoid arbitrary rulings by individual prison authorities the Commissariat of Labor fixes wages. In fact the same labor code obtains for prison labor as for free labor. Prisoners are entitled to membership in trade unions and are encouraged through "socialist competition" to

attain efficiency. Although in one trade at least, that of brickmaking, 50 percent of the production is by convict labor, there is apparently no conflict with free labor. Account must be taken, however, of the existence of state ownership and centralized authority and of the fact that, in contrast to other countries, there is a shortage rather than a surplus of labor in the Soviet Union. These factors eliminate many of the difficult problems affecting prison labor in other countries.

The problem is perhaps most complicated in the United States. This is due in part to its large penal population, to the variation in the penal code and in labor legislation from state to state and even within state boundaries and to the great differences between states in the form and degree of social and economic development; in the southern states racial differences add another complicating factor. The system of production for the open market is more widespread in the United States than in Europe, but the contract system has declined to a large extent. In 1867, when Wines and Dwight made their study, the contract system prevailed in all but three prisons in the United States, whereas in 1928 it was illegal in seventeen out of forty-eight state institutions and in all federal prisons. Where contract labor is legal, legislation curtailing hours or providing that goods be marked "prison made" restricts the market for its products. Public control of prison labor was the rule in thirty-three states in 1923, as contrasted with four in 1885. The proportion of prison manufactured goods to the total volume of manufactured goods in the United States declined from 0.54 percent in 1886 to 0.15 percent in 1923. This comparatively insignificant proportion, however, does not take account of the fact that in certain branches, notably in the manufacture of work shirts and iron hollow ware, prison products hold a strong if not predominant position. The weakness of organized labor in these branches may account for the persistence of the prison products. The disposal of prison goods within a limited area often causes a serious local condition. The manning of coal mines by convict labor and, in southern states, the frequent use of convicts as strike breakers were eliminated with the rising strength of unionism in the first part of the twentieth century. The decline of production for the open market has been largely due to the efforts of organized free labor and of manufacturers in free industry who have advocated the restriction of prison labor to state use.

This would of course permit not only the manufacture of prison clothing, machinery and food but also the erection of buildings for state institutions, state printing and the like. Even in this field, however, the powerful building and printing trade unions have raised objections. Through the enactment of the Hawes-Cooper Act of 1929, to go into effect in 1934, the pressure of free industry has also secured federal control over the products which enter interstate commerce. This act gives each individual state the same power to control within its borders the marketing of goods produced in other areas which it chooses to exercise over goods produced in its own penal and correctional institutions. If sustained this legislation will tend to bring about an extension of the state use system. Six states (Illinois, Maine, Pennsylvania, Massachusetts, New Jersey and New York) have already passed legislation supplementary to this federal law. Federal legislation (Tariff Act of 1930) barring the importation of foreign products based on prison or forced labor has also been enacted.

According to an estimate of ninety-eight state and federal prisons made in 1927-28, only 18 percent of the prison labor productively employed was for state use; 20 percent was labor under the contract system; 29 percent was on goods produced for the open market under the state account system; 14 percent was on public works and ways; and the balance was either state managed or unclassified. These percentages varied by regions: thus of contract labor for state institutions 10 percent was in the east, 6 percent in the west, 22 percent in the midwest and 26 percent in the south; state use varied from 63 percent in the east to less than 1 percent in the south; of prison labor for public works and ways 1 percent was in the east, 3 percent in the midwest and 28 percent in the south.

It has been pointed out that in protecting its own interests free industry may be seriously hampering the rehabilitation program, which of necessity involves productive labor for prisoners. According to figures for 1929 only 58 percent of the 117,443 prisoners in state and federal prisons are productively employed. Of the balance 29 percent are engaged in institutional work, 11 percent are not working and 2 percent are unaccounted for. This percentage of productively employed has been steadily decreasing from about 73.5 percent in 1885, and it does not reveal the actual extent of idleness because it disregards overmanning of machines, short hours and staggering of work jobs, particularly in the

institutions of the northern states. The percentage varies for regions: in the midwest 53 percent are productively employed, in the west 52 percent and in the east 45 percent. The southern states show 78 percent productively employed; but this high percentage, with its subsequent low maintenance costs, is secured at a terrible price to society and to the individual prisoner.

Granted the evil effects of idleness, figures of productive employment are no indication of the soundness of prison labor systems unless they are more concerned than they have been in the past with the welfare of the prisoners. Moreover even from the point of view of profitability, which according to one student has been the principal concern of prison administrators in the United States, these systems are open to considerable criticism. A careful accounting survey of prisons which have shown an apparent profit would disclose the fact that the cost of building maintenance and other items had not been taken into consideration. Certain difficulties are of course inherent in any system of prison labor. Few existing local jails were built with any thought of working prisoners; and unless the inmates are worked on roads, as they are in the south, they will probably be idle until the jails are supplanted by industrial farm institutions. Unsuitable plant construction also hinders work in some state prisons and penitentiaries. Many officials in charge of the labor of prisoners are appointed on a political basis rather than because of their capacities. Finally, under the best of conditions the state as employer can classify and train its workers only within the very marked mental and physical limitations of the prison inmates and with reference to certain disciplinary problems which the private employer need not encounter.

Thus from the point of view of the prisoner and of society as a whole most of the systems of prison labor in the United States are unsatisfactory. Wastefulness in methods of production, because of antiquated techniques or machinery not used in private industry, and training in branches which are not open to the prisoners after release (such as shirt making, in which men prisoners are employed although it is predominantly a woman's trade in free industry) are especially characteristic of non-contract systems. From the point of view of the prisoner the chain gang systems under direct public control, which still obtain in certain southern states, are no improvement over contract systems. Not only is the work in most prison industries and con-

vict occupations unproductive, vocationally useless or conducted under inhumane conditions, but in the vast majority of cases no provision is made for payment to the prisoner so that after release his chances for rehabilitation may be somewhat enhanced. In the ninety-eight state and federal institutions studied only 46 percent of the prisoners productively employed received some sort of wage; in the institutions of ten states workers received no compensation at all; and payment was reported by local institutions in only six states and the District of Columbia. The abuses which arise from rearrest for vagrancy of released prisoners discharged penniless from southern road camps have resulted in a condition which amounts to peonage. Indignation of the public and of organized labor rightfully aroused over these conditions in recent years has, however, overlooked the very serious effects which too drastic and sudden restrictions on production for the open market may impose on prison administrators and on prisoners in the form of idleness and unproductive labor. It has been suggested that one effect which the operation of the Hawes-Cooper Act may have will be the development of penal farm colonies mainly for state use. In the United States the penal farm colony is at present largely restricted to the southern states, where commercial crops are cultivated and where training, housing and general reformatory conditions are not to be compared with the model farm colonies of the Scandinavian countries. In the wide discussion of the problem which has followed recent legislation and agitation it has been made clear that any program of prison labor must attempt to balance the needs of the prisoners for productive work, the financial problems of the state and prison authorities, the legitimate interests of free labor and free industry and the interests of society as a whole. The experience of other countries suggests that considerable progress can be made along these lines.

PRISON REFORM. See PENAL INSTITUTIONS.

PRISONERS OF WAR. Only in comparatively recent times has any degree of humane treatment been meted out to prisoners of war. In the Greek and Roman civilizations, as in primitive societies, wars of extermination were fought in which no prisoners were taken. According to Tacitus, Germanicus urged the Roman legions to exterminate their enemies. In addition the more humane policy of ransoming or of exchanging prisoners was often applied. Grotius refers to the ransoming of prisoners among the Greeks; while the Treaty of Nicias of 421 B.C. provided for exchange. In his history of Rome Livy refers to conventions for exchange during the Punic Wars. The normal fate of prisoners among the Romans, however, was slavery.

A great step forward occurred when self-interest prompted captors to enslave prisoners rather than kill them. This practise finally became so general that, according to Grotius (*De jure belli ac pacis*, bk. iii, ch. vii), the early law of nations recognized it and gave captors the power of life and death over them. During the later Middle Ages, partly through the influence of the early church, ransom was substituted for the sale of prisoners. Isolated cases of enslavement occurred, however, and prisoners were also frequently treated as criminals.

When armies consisted of feudal levies, captives were considered the property of the captor,

who was entitled to the ransom price. Gradually prisoners of importance were taken over by the sovereigns and liberated by ransom at a scale of prices which became rather definitely fixed by custom. With the establishment of modern armies all prisoners were regarded as belonging to the sovereign, and during the seventeenth century they were ransomed at prices fixed by cartels at the commencement of the war or during its continuance. The last such cartel seems to have been that between England and France in 1780.

As the ransoming of prisoners became obsolete, its place was taken by the practise of exchange. Prisoners might be exchanged either during the continuance of a war or after its termination. The necessity, however, of applying the principle of equality has led to many difficulties in the exchange of prisoners. The agreement for exchange made in 1777 between General George Washington and Sir William Howe resulted in controversy. Negotiations for exchange were entered into in 1810 between England and France but without success. From the American Civil War to the World War there was no exchange of prisoners on any considerable scale before the termination of hostilities.

Another practise has been the parole of prisoners of war. Its history is rather obscure. Isolated instances of parole may be traced in ancient times. A German writer has attempted to show that it was a general Germanic practise. At any rate it became fairly well established in the eighteenth century. Since parole may sometimes be more advantageous to the captor than to the captive, a prisoner of war is under no obligation to accept it. Indeed the acceptance of parole has been forbidden at times by the municipal law of various countries.

The modern view of the proper treatment of prisoners of war was established during the eighteenth century, chiefly through the influence of Montesquieu and Rousseau, and given currency by the classic treatise of Vattel. Montesquieu, attacking the right of captors to kill prisoners (*Esprit des lois*, bk. xv, ch. ii), said: "War gives no other right over prisoners than to disable them from doing any further harm by securing their persons." Rousseau completed the theoretical foundation for the modern view when he declared: "War is . . . a relation between state and state in which individuals are enemies only accidentally" and can be killed only "while they are bearing arms; but as soon as they lay them down and surrender . . . they become once

more merely men whose life no one has any right to take" (*Contrat social*, bk. i, ch. iv).

The first practical application of the modern view that prisoners were to be treated humanely is found in the Treaty of Amity and Commerce of 1785 between the United States and Prussia. The French National Assembly decreed in May, 1792, that prisoners were under the protection of the nation and later that no money would be accepted for captives, indicating that exchange should be on a basis of liberty and equality. Theory, however, was in advance of practise, for during the wars from 1793 to 1815 treatment of prisoners reflected standards of earlier days.

During the nineteenth century the modern view gained acceptance. It was supported in 1842 by Daniel Webster as secretary of state; and it received official recognition in the first attempt made in 1863 by Francis Lieber, at the request of President Lincoln, to systematize international rules of land warfare. The American Civil War tested these rules; and although the policy outlined by both sides for the treatment of prisoners was humane, the actual practise left much to be desired. Likewise in the Franco-Prussian War treatment of prisoners was not in accordance with modern theory, because of popular bitterness on both sides.

The laws and customs regarding prisoners of war were finally codified at the First Hague Conference of 1899 and accepted by practically all the nations. They were changed somewhat at the Second Hague Conference of 1907 but only the former convention became legally binding. According to the Hague rules (arts. 4-20) prisoners were declared to be in the power of the government instead of the captor; they were to be humanely treated; they might be interned in a town, fortress or camp but could be confined only as an indispensable measure of safety. They might be employed under reasonable conditions in work having no direct military connection. Except where there were special agreements, the government was to maintain them, providing food, quarters and clothing of a standard equal to that of its own troops. Certain duties were imposed upon prisoners; they were expected, for example, to give their true name and rank when captured. It was stipulated that no prisoner who escaped should be punished upon subsequent recapture. The parole of prisoners was regulated but not the exchange. Moreover countries holding prisoners of war were required to establish information bureaus to answer inquiries concerning them. It was also

for the first time made the duty of belligerents to grant facilities to relief societies desirous of aiding their prisoners of war.

These rules were scrupulously respected during the Russo-Japanese War, but in the World War, although they were binding on all the belligerents, the numbers of prisoners involved made it much more difficult to abide by them fully. By August, 1916, the Central Powers held 2,678,000 prisoners, the Allies 1,695,000. The difficulty was increased by the policy of some of the belligerents of interning the entire alien enemy population.

At first the belligerents created bureaus of information concerning prisoners, as prescribed by the Hague rules. The regulations governing the treatment of prisoners also indicated an intention to respect these rules. Officers and men were separated, and the preferential treatment of the former seems to have been satisfactory on both sides. Provision of food, clothing and shelter seems also to have been reasonably satisfactory in France and Great Britain, and in Germany early in the war; later some German camps became overcrowded, improperly heated and unsanitary. Epidemics broke out, and under pressure of the economic blockade rations were reduced until prisoners became dependent largely upon food sent from home. Prisoners were set to work by both sides at various kinds of labor receiving only a few cents a day, and the Allies charged Germany with violating the Hague rules in using prisoners in industries having a military connection.

Accusations of inhumane treatment on both sides led to a revival of the old practise of adopting reprisals against prisoners. England segregated and punished German submarine crews, and Germany sent some British officers to a reprisal camp. France reduced the meat and bread ration of German prisoners in reprisal for a similar reduction by Germany. The latter also at various times sent French prisoners to reprisal camps for alleged maltreatment of German prisoners by France. Reprisals, however, usually consisted only in reduction of rations, deprivation of privileges or more disagreeable work.

Nevertheless, the World War gave rise to some promising new developments in the treatment of prisoners. By agreement the belligerents allowed representatives of neutral governments to inspect their prison camps and also by agreement interned the sick and wounded in neutral countries. In March, 1918, Switzerland was

caring for 26,000 prisoners under this plan. Numerous other agreements were made between the belligerents for the exchange of various classes of prisoners.

The demobilization of the millions still held at the close of the war was especially difficult because of the disorganized state of Europe. Article 10 of the Armistice Agreement required the defeated nations to release the prisoners of the Allied and Associated Powers. These were quickly repatriated. The latter powers retained prisoners of the Central Powers until the peace treaties were signed.

More difficult was the handling of 250,000 Russian prisoners released by Germany, most of whom were barred from Russia, and of an equal number of the forces of the Central Powers captured by Russia. The collapse of the governmental system in Russia made it impossible to repatriate or adequately to care for these men, thousands of whom died from disease and exposure. The Red Cross, both the national organizations and the International Committee, which throughout the war rendered invaluable aid in tending prisoners, took up the cause of these men.

In February, 1920, the Supreme Council of the Peace Conference referred the problem to the League of Nations. The Council appointed Fridtjof Nansen of Norway to supervise the repatriation work. By September, 1922, when his task was completed, Nansen, with the cooperation of the International Red Cross and other relief agencies and of the interested governments, had repatriated to and from Russia 400,000 prisoners.

Since 1918 the cause of prisoners of war has received the attention of the International Red Cross, which at its tenth conference in 1921 adopted a proposed code to improve their treatment. The most important step, however, was taken at Geneva in 1929, when forty-seven nations signed a new convention to protect future prisoners; this became effective June 19, 1931. Based upon the experience of the World War, it is more detailed than the Hague regulations; its provisions extend not only to land but to naval and air forces, while a particularly great advance is marked by its prohibition of reprisals.

PRISONS. See PENAL INSTITUTIONS.

PRIVATEERING. A privateer was a vessel which, although privately owned and operated, was commissioned by a belligerent government to attack and seize enemy shipping. It was distinguished from a regular warship by its private control and from a pirate by its official license. It was often difficult, however, to draw absolute distinctions between warships, privateers and pirates, particularly in the centuries before the rise of national navies.

Licensed privateering dates back at least to the thirteenth century, when it appeared in two separate forms. In 1295 the English lieutenant of Gascony gave a Bayonne merchant authority to "mark, retain and appropriate" Portuguese property to the value of £700 in compensation for his loss of a ship and goods at Portuguese hands. This practise of licensed private reprisal gradually passed into abeyance with the rise of maritime police power, but its name survived in the letters of marque and reprisal, as privateering commissions were called. The more persistent form of privateering was in existence even earlier. Thus in 1243 during hostilities with France Henry III of England had granted licenses to two of his subjects "to annoy our enemies by sea or land, wheresoever they are able, so that they share with us half of all their

gain." This annoying of enemies became the great function of privateering.

In the later Middle Ages, before regular national navies were developed, an armed sea force could be recruited only from private sources. The Cinque Ports were leaders in this activity; frequently, however, they lapsed into virtual piracy, plundering neutrals as well as enemy ships and harrying the channel in peace as well as in war. Privateering remained extremely irregular until the latter part of the seventeenth century. Drake, Hawkins and the other Elizabethan "sea dogs," like the contemporary Dutch "sea beggars," had semi-official sanction, although the Spaniards considered them pirates. Some of the French and English filibusters, or buccaneers, on the Spanish Main had commissions from colonial governors, while the Barbary corsairs in their chronic war on Christian commerce were licensed by their governments.

The great period of regulated privateering practically coincided with the "Second Hundred Years' War," as the six Anglo-French conflicts between 1689 and 1815 have been called. The privateers became auxiliaries to or substitutes for the regular navies which were then developing and devoted themselves to the *guerre de course* or commerce destroying. Since the English had both the best navy and the richest commerce, they had to resort to privateering to a lesser extent than did the French and, later, the Americans. The activity of the French began with the crushing defeat of their high fleet at La Hogue in 1692. Jean Bart, Duguay-Trouin and the other French corsairs are said to have made 4200 prizes before peace was signed at Ryswick in 1697. France continued to prey upon commerce with considerable success down to the time of Surcouf in the Napoleonic period. By that time the Americans had also begun to attack British commerce. From minimum figures based on actual records it seems that some 1150 American privateers took about 600 prizes during the American Revolution, while some 500 American privateers took about 1350 prizes during the War of 1812. During these wars there were numerous British privateers, from Liverpool in particular, but their work was overshadowed by that of the royal navy.

The strategic importance of privateering is disputed by historians. It is claimed that England was more than once brought to terms by the inroads on her commerce. Others argue that regular cruisers under governmental control, even if fewer in number, were much more

effective. The navy ordinarily received little cooperation from the privateers, which were designed rather to run away from anything which did not offer reasonable prospects of easy capture. In squadrons, such as that commanded by Jean Bart, they might have constituted an effective naval force; but ordinarily they hunted alone or in pairs, dodging unprofitable contests with enemy warships. They might annoy the enemy, but they could seldom if ever secure such command of the seas as to permit freedom of movement for their compatriots. "It is not the taking of individual ships or convoys, be they few or many, that strikes down the money power of a nation," wrote Mahan, "it is the possession of that overbearing power on the sea which drives the enemy's flag from it, or allows it to appear only as a fugitive" (*The Influence of Sea Power upon History*, Boston 1890, p. 138). Such power, Mahan adds, could be exercised only by great navies. Like modern submarine warfare, however, privateering at least offered the weaker contestant a chance to injure the enemy at relatively small cost. On the other hand, it affected recruiting for the regular army and navy by luring thousands with its superior possibilities of safety, freedom and profit, so that France finally limited the number of sailors who might engage in such activity.

From the economic standpoint the gains from privateering were tempting but dubious. In England a part had gone to the lord high admiral and the warden of the Cinque Ports, but an act of 1708 (6 Anne, c. 13) not only gave the entire prize money to the owners, officers and crew of the privateer but added a bounty. France and the United States later granted similarly favorable terms. Yet privateering remained essentially a lottery. An occasional lucky corsair might sell his prizes for two or three millions, but hundreds of others drew blanks, while many more barely made expenses. It is said that of the more than 500 American privateers in the War of 1812 over 200 never took a prize and relatively few made any substantial profit.

As early as the fourteenth century efforts were made to control privateering. It was required that prizes should be condemned in the admiralty courts, which had become established in both England and France. The licensing generally had to be in the name of the sovereign, although blank commissions were frequently entrusted to distant subordinates, who did not always use adequate discretion. The long prevalence of semipiracy indicates the early ineffec-

tiveness of official control. The indiscriminate plundering of neutrals by privateers often led their governments into embarrassing situations, and finally most of the maritime nations required the posting of a bond for good behavior before they would grant letters of marque. By treaty as well as by municipal law neutral subjects were sometimes forbidden to accept privateering commissions from belligerent powers. As early as 1675 a convention prohibiting the employment of privateers was signed between Sweden and the United Provinces, and this was followed by a similar convention between the United States and Prussia in 1785. There were also various customary rules of international law regulating the right of visit and search by privateers. During the period from 1689 to 1815 most of the British, American and French privateers apparently behaved fairly well, but occasionally the inherent lawlessness of the system resulted in glaring excesses.

By the middle of the nineteenth century a marked reaction against privateering was evident. The agitation against the seizure of private property at sea, the evident strategic and economic shortcomings of the system, the changes in naval architecture which further differentiated warship from merchantman and the excesses of the ill controlled privateers in the Greek and South American wars of independence all accelerated the movement. When the question of a general maritime code came up for discussion at the close of the Crimean War in 1856, the British demanded the abolition of privateering as compensation for abandoning some of their old claims against neutral rights. The abolition of privateering was the first of the four points of the Declaration of Paris (*q.v.*), which received the adherence of nearly all maritime states except Spain, Mexico and the United States. Secretary of State Marcy proposed an amendment excepting all private property from capture at sea, but this was unacceptable to other powers. At the outbreak of the Civil War England ignored the offer of the North to adhere to the Declaration. Jefferson Davis issued a number of letters of marque to the last privateers in the world's history. These vessels, not to be confused with the *Alabama*, the *Florida* and other members of the Confederate navy, made a few captures but were rendered ineffectual by the northern blockade, and some of the privateersmen were tried for piracy in the north. In 1870 Prussia organized a volunteer fleet; but this, like the Russian experiment in

1878, was under governmental control, as have been the auxiliary cruisers used since then by various powers. These converted merchantmen, the modern counterparts of the privateer, have many of its advantages without most of its faults.

PRIVILEGE, PARLIAMENTARY. *See* IMMUNITY, POLITICAL.

PRIZE. Prize law is that part of international law which concerns the capture of private property by a belligerent at sea during war. A ship or cargo is said to be "good prize" when it has been lawfully captured by a belligerent. Prize law for five centuries has involved proceedings in a prize court and has thus been subject to more judicial development than most branches of international law. The operation of prize law involves three stages: capture of a vessel at sea, bringing the vessel into port and

proceedings by the captor for condemnation in a prize court. The first stage is as old as history but the second two have been added only in modern times. Although prize courts have existed since at least the fourteenth century, their proper functioning depends upon a measure of state control and the existence of state regulated naval forces, which are not to be found until much later. Piracy and privateering were barely distinguishable for a long period, and the result of a capture of a ship at sea was usually plunder for the benefit of the captors.

The impetus toward establishing the second two stages of prize law came from the desire of sovereigns to share in the profits of prizes and to avoid the complaints and demands for damages, which became frequent as early as the opening of the fourteenth century. Edward III of England was bombarded with such complaints from Flemings, Normans, Bretons, Frenchmen, Spaniards, Portuguese, Catalans and Genoese and felt compelled to pay many of the claimants out of his own pocket. It seems to have been this situation which brought the Court of the Admiral into existence in England about the middle of the fourteenth century, although there were no separate sessions of the Admiralty in prize cases until three hundred years later. It was also during the fourteenth century that the admiral in France was given concurrent jurisdiction in prize cases; his jurisdiction became exclusive by 1500. As early as the fifteenth century prize court procedure, substantially along the lines of its later development, had already been evolved. The emphasis was upon safeguarding the prize from spoliation in order to avoid international claims and to preserve the droits of the king and the admiral. The problem of adjudication was at first quite simple, involving merely the determination whether the property belonged to an enemy and should therefore be condemned, or whether it belonged to a friend or ally and should therefore be released. The complicated rules for the protection of neutral rights developed later (*see* NEUTRALITY). By the seventeenth century this procedure was formulated elaborately in national regulations and in international treaties. It became and has remained customary to allocate a share of the proceeds of the prize or prize money to the officers and crew of the capturing vessel. Japan, however, abolished this practise in its own navy.

The first stage in the application of prize law involves the capture at sea, which rests upon the

belligerent right of visit and search. Traditionally this was merely the examination of the ship's papers and the questioning of those on board. A gunshot summoned the vessel to stop. The visiting vessel was to stay just within gun range, sending a small boat with an officer and two or three men aboard the visited vessel. If the papers were in order and no cause for suspicion appeared the vessel was allowed to proceed. Otherwise it was conducted into a belligerent port or sent in under a prize crew. In the Napoleonic wars and the World War England required all neutral vessels bound for European ports to touch at an English port for examination. One of the excuses for this practise during the World War was the difficulty under modern conditions of examining cargoes at sea. This explanation had no historical justification since the traditional rules strictly forbade any breaking of bulk at sea. In modern times it is agreed that in certain cases prizes may be sent temporarily into neutral ports (Hague convention XIII of 1907, arts. 21-23). Since the nineteenth century at least there has developed a practise of destroying prizes when captured subject to the removal of the ship's papers, passengers and crew. Prize court proceedings are then held on the basis of the ship's papers. With regard to enemy merchant vessels, title to which passes to the captor upon the capture, this practise is not open to objection. With regard to neutral prizes it causes much difficulty. German practise during the World War in sinking merchant vessels by submarines, which were usually unable either to bring the vessel into port or to furnish a prize crew, aroused much controversy, largely, however, because of failure to provide in all cases for the safety of the persons on board. Another exception to the duty of the captor to bring a prize into port is furnished by the practise of exacting a bill of ransom secured by an officer of the captured vessel, who is held as hostage. This was common in the sixteenth and seventeenth centuries but has been forbidden by statute in Great Britain since 1782 and has rarely been used in recent times (see Senior, W., "Ransom Bills" in *Law Quarterly Review*, vol. xxxiv, 1918, p. 49-62).

After the vessel is brought into port, it will be proceeded against for condemnation by the prize court. Prize courts may be established only in belligerent, not in neutral countries. Neutral and even enemy claimants of ship or cargo are usually represented before the court by counsel. From the earliest times it has been usual to

examine the officers and crew of both the captured and capturing vessel upon standing interrogatories with a view to eliciting all possible information regarding the voyage of the captured vessel, its ownership and the ownership and destination of its cargo and the circumstances of the capture. Traditionally the rule was that the vessel must be condemned "out of her own mouth"; that is, solely upon the evidence of the papers and the testimony of those on board. The burden of proof was therefore upon the captor. Under the ancient British practise the prize court could call upon the claimants for further proof in case of suspicious circumstances, inadequate ship's papers and for similar reasons. From an early date, however, both the English and French prize courts indulged in certain presumptions, regarding enemy destination and the like, which had the effect of shifting the burden of proof on to the claimants. The Declaration of London (*q.v.*) admitted the propriety of certain presumptions, but these were so extended during the World War that it became practically impossible for a neutral claimant to secure the release of his ship or cargo. The British prize courts argued largely from statistics regarding importations into the European neutral countries. Both the British and German prize courts imposed on the neutral claimant the frequently impossible task of proving the ultimate consumer of his goods, even though they had meanwhile passed through a process of manufacture in the neutral country of immediate destination. If the prize court condemns the vessel, the title of the former owner is divested and a purchaser obtains title good against all the world. If the court finds there is no cause for condemnation, the vessel is released. If in addition it holds that there was no probable cause for the capture, damages and costs will be awarded to the neutral claimant.

Prize courts are supposed to apply international law but are nevertheless in all countries creatures of national law and bound thereby. In the seventeenth, the eighteenth and the early nineteenth century the British Prize Court enjoyed a well merited reputation for impartiality. Sir William Scott (later Lord Stowell) is the best known figure, although his predecessor in the seventeenth century, Sir Leoline Jenkins, is also outstanding. Justice Story in the United States has also had wide influence. In Great Britain, the United States and Portugal certain of the ordinary law courts are vested with jurisdiction to hear prize cases both in first

instance and on appeal. In most other countries, at least of Europe and Asia, special tribunals are constituted for prize courts of first instance. Generally they are composed of jurists and representatives of the executive departments and mercantile interests. In many countries the appellate prize courts have a larger proportion of jurists. In Belgium, France, Italy and Siam appeals lie to one of the ordinary higher courts.

As early as the seventeenth century there were numerous cases in which prize cases were referred to international tribunals, usually a board of commissioners composed of an equal number of persons from both of the two states concerned. A similar procedure was followed with notable success under article 7 of the Jay Treaty of 1794 between the United States and Great Britain. The British-American claims commission established under the Treaty of Washington of 1871 reviewed a number of prize cases which had been decided by the Supreme Court of the United States and reached different conclusions in six of them. Realizing that prize courts may at times be unable to decide in accordance with international law because of controlling national laws or decrees, and still more because of national divergences of opinion regarding such international rules as those relating to contraband, the states represented at the Second Hague Peace Conference of 1907 adopted a draft convention for the establishment of an international prize court. This court would have had jurisdiction to examine cases previously decided by national prize courts. The jurisdiction of the international court could have been invoked by a neutral government, by one of its citizens or by a citizen of a belligerent state. In order to secure agreement upon the law to be administered by the international court the British government summoned a conference in London in 1908. There was little disposition to accept the *International Prize Court Convention* until such agreement had been reached. The conference drew up in 1909 an elaborate code or compilation, since known as the Declaration of London. Because of opposition in the British Parliament the convention embodying these rules was never ratified. As a result the *International Prize Court Convention* failed to receive the necessary ratifications, and the court has never come into existence. The need for such a tribunal was abundantly demonstrated during the World War.

PROBABILITY. The theory of probability began in the seventeenth century as a method for calculating chances in gambling games. In the course of the centuries it has developed into a science which sets mathematically far reaching problems, requires philosophic formulations and counterformulations and exercises an increasing influence upon physics, biology and, last but not least, the social sciences.

Blaise Pascal (1623-62) and Pierre de Fermat (1601-65) were the first to investigate the problem of the division of stakes in games of chance. Huygens worked out problems of a similar nature. The Dutch stadholder Jan de Witt and the English astronomer Halley made applications to social statistics, and Halley published the first mortality tables. The new science first attained a high peak in the famous *Ars coniectandi* of Jacob Bernoulli (1654-1705). This work in addition to giving the classical definition of mathematical probability presented a fundamental special case of the "law of large numbers." It also directed attention to social statistical applications.

During the eighteenth century great minds like de Moivre, Daniel Bernoulli, d'Alembert, Euler, Lagrange, Thomas Bayes, Laplace and Gauss occupied themselves more or less intensively with the new science. Thomas Bayes provided in 1763 the highly original conception of a division rule, known as Bayes' rule. Finally, Pierre Simon de Laplace produced a unified and masterly treatment of the whole subject in his *Théorie analytique des probabilités* (1812). This work contained, besides other mathematical developments, the most important of the theorems

on limit values in probability calculation; it also formulated more precisely the bearing of probability theory on mathematics, physics and the natural sciences, statistics, philosophy and sociology.

With the death of Laplace the high peak of development was passed. Despite important individual contributions (Poisson's theorem of large numbers, Gauss' theory of errors) the period which followed was one in which classical probability lost touch with empirical and scientific problems and as a result became more or less mummified. Countercurrents soon made their appearance. Side by side with mathematical theory, which made further progress, particularly in France and Russia, there developed a theory of statistics; this arose out of the needs for applications of probability, particularly in such important social fields as the handling of statistical records, the study of population and the theory of insurance. It was founded on the labors of Quetelet (1869) and Lexis (1875) and was developed by the psychologist Fechner as a theory of random samples as well as by the astronomers Thiele and Bruns and by the biologists Galton and Pearson. In England and Scandinavia particularly, but also in other countries, there developed the idea and profession of the "actuary"; that is to say, of a statistician trained in economics and mathematics and expert in population and insurance theory. The classical formulation of the probability concept continued to be used, without anyone being able to ground it in reality. In an effort to make explicit the logical basis underlying the concrete applications R. von Mises at length succeeded in establishing a new formulation for the calculation of probability, which was not only consistent in itself but which at the same time provided a mathematical and empirical theory of statistical phenomena in the physical and social sciences.

FOUNDATIONS AND FUNDAMENTAL OPERATIONS. Bernoulli and Laplace defined the probability of an event as the quotient of the number of cases favorable to the event divided by the total number of cases that are "equally possible." A number of difficulties are involved in this definition. First, the "equal possibility" definition contains a *petitio principii*, inasmuch as different "degrees of possibility" cannot be distinguished from one another. Moreover the term "equally possible" means nothing more than "equally probable," so that at best one has merely reduced the general concept of probability to the special but still unclarified concept

of equal probability. Second, oftentimes it is impossible to find equally possible cases; for a loaded die it is meaningless to talk of six equally probable faces, but none the less there exists a definite probability for the throw of, say, a 6. Almost all the probabilities dealt with in social statistics, for example, the probabilities of death and survival, are of this type. If the probability of death is set in a certain context at the figure 0.0088, it does not mean that there are a priori 1000 equally possible cases of which 8.8 are favorable to the event of death or 10,000 with 88 favorable! It is much more true to say that in such a situation an "empirical" or "statistical" or "a posteriori" probability is usually introduced ad hoc, and the theorems developed on the basis of the classical definition are simply taken over. A third difficulty is that the conception of an a priori fixed and equal probability does not stand up under a close epistemological criticism.

The fundamental ideas of the empirical theory of probability (the frequency theory) may be stated as follows: (1) There is only one probability concept, regardless of whether it is to be applied, with greater or lesser approximation, to games of chance, to social statistics or to biological and physical phenomena; the object of probability theory is the mass occurrence, the statistical phenomenon. (2) Probability is a number measuring relative frequency and is arrived at in the following way: in a mass phenomenon, that is to say, a definite and precisely formulated grouping in which individual events repeat themselves (for example, the group formed by the repeated or n -time throws of a good or even loaded die) we watch out for a certain distinguishing characteristic and note each time that it appears. This characteristic may be whether a 6 is thrown or not; in the case of the life terms of a large number (n) of 30-year old men the distinguishing characteristic is the fact whether death occurs before the thirty-first birthday or not. If the characteristic appears in an observed

series n , times, then the fraction $\frac{n_1}{n}$ is called

the relative frequency of the characteristic within that series. Now it is a fact of experience that in such statistical phenomena the fractions $\frac{n_1}{n}$, when n is allowed to increase indefinitely, approach closer and closer to one another. This was first fully demonstrated by Poisson in the introduction of his work of 1837. It may therefore be set up as a postulate that the series of

the numbers $\frac{n_1}{n}$ converges, when n is increased, upon a definite limit. To this a second postulate must be added, to the effect that this limit value should remain unchanged when we deal, instead of with the whole series, with the sequence represented by an arbitrarily chosen sampling. Thus in a game of dice it may be decided to count only every second throw or in the establishment of mortality probability to consider only those men whose numbers on their insurance policies are primes. In making this sample selection no use must be made of course of the observed characteristic itself or for that matter of any other property of the individual phenomenon. This second postulate serves to characterize the irregularity and randomness of the mass phenomena with which statistics is concerned. A mass phenomenon that satisfies both postulates

is called a collective, and the $\lim_{n \rightarrow \infty} \frac{n_1}{n} = p$ is

the probability of the appearance of an observed characteristic within the collective. This explanation applies of course to the simplest case, that of a one-dimensional alternative, but it may be extended to more complex cases. The important point to be emphasized is that a statement of probability is significant only in reference to a defined collective; it is meaningless without a repeatable process and is certainly inapplicable to a single individual. (3) The aggregate of probability values within a collective is called its distribution. In the alternative considered above there were only two possible values for the characteristic (yes or no, 0 or 1); in general the characteristic, and correspondingly the probability, may have: (a) a finite or infinite number of discrete values or (b) a continuously varying value. By introducing multidimensional manifolds for the characteristic we may thus arrive at a general distribution concept under which are subsumed as special cases (a) arithmetical and (b) geometrical probabilities. Collectives and the distributions within them are the primary facts, the starting points in every probability problem. The task in every probability calculation is to develop from the given collectives, with the help of certain "operations," new collectives with new distributions.

These essential operations correspond to the addition, multiplication and division of probabilities under the classical probability theory, now to be explained. The simplest of these operations, "sampling," already explained in

connection with the second postulate, results in a new collective with the same distribution as the original collective. Another operation is that of "mixture." Suppose the original collective is that represented by the throwing of a single die, with characteristics x_1, \dots, x_6 (the six numbers on the faces). It is required to find the probability, w' , of throwing an even number. From the definitions given above the answer is as follows: $w' = w_2 + w_4 + w_6$. Thus from the original collective a new collective is formed with the same elements but with a new characteristic, x' (even number), which represents the amalgamation of several of the old characteristics. The usual inexact rendering of this "Rule of the Probability of Either Or" leads to paradoxes, since one does not watch out—and without the clear idea of a collective one cannot watch out—that only probabilities within the same collective are to be added together. A very special form of mixture brings us back to the classical definition of probability. If one considers the special case of an original collective with precisely n different characteristics possess-

ing equal probabilities, $w = \frac{1}{n}$, then one may take a number m of the characteristic to form a single characteristic in a new collective and thus arrive at the probability for the new characteristic, $w' = w + w + \dots + w = \frac{1}{n} \cdot m$, a result which may be denoted as the quotient of m , the cases favorable to the new characteristic, divided by the total, n , of all possible cases. This, it should be noted, is an exactly demonstrable theorem but scarcely a definition.

"Combination" is still a third operation, creating out of two original collectives a new collective. Suppose, for example, that the original collectives are represented by two games with a single die each, and the final collective has for its element a single throw of both dice and for characteristic the count on the face of both dice. It can be demonstrated that in such a combination—at least when we are dealing with so-called independent probabilities—we must multiply together the original probabilities in order to get the probability for the characteristic in the combination. The detailed establishment of this principle and its limitations depend on such questions as to when the combination of series elements from two collectives leads to a new collective and when it does not.

The fourth operation is "division," which

may be illustrated as follows: in a game with a single die and with probabilities w_1, \dots, w_6 , a throw has given an even number; we want to know what is the probability, w'_2 , that this number should be a 2. The equation set up is then

$w'_2 = \frac{w_2}{w_2 + w_4 + w_6}$. (For the sake of clarity w_2 is used to denote the "a priori" probability of a 2 and w'_2 the "a posteriori" probability for the same throw.) Here the new group of characteristics represents a certain portion of the original characteristics, and likewise the elements of the derived collective comprise only a part of the elements of the old collective.

It is evident that without precise notions like collective, characteristic and the like these operations cannot be accurately explained. The rules of calculation corresponding to these operations are indeed included in the famous ten principles of Laplace in the opening pages of his *Essai philosophique*, but there they are scarcely demonstrated—they are merely introduced by means of examples, and thus the way is left open for all sorts of difficulties.

THE FUNDAMENTAL PRINCIPLES. In the center of probability theory we find certain classical problems, which are as interesting mathematically as they are important practically in the applications of probability. These problems, or rather groups of problems, link together the names of Bernoulli and Bayes and stand in a dual or complementary relationship to one another. In the Bernoulli problem one starts with an urn containing black and white balls or tablets labeled 0 and 1. Let the probability of drawing a 0 be called p and that of drawing a 1 be $q = 1 - p$; n drawings are made and after each drawing the tablet is put back, so that the probabilities p, q are restored. It is required to determine the probability, $w_n(x)$, of getting in n drawings precisely x ones and $n - x$ zeros, or, in short, the probability of drawing the sum x . The answer is found by means of Newton's binomial formula (as applied to a general term):

$$(1) \quad w_n(x) = \binom{n}{x} q^x p^{n-x}.$$

$w_n(x)$, which is an arithmetical probability, is known under the name of "Bernoulli distribution"; it is $\neq 0$ for the integral values of $x = 0, 1, \dots, n$. The mean or mathematical expectation, a , and the standard deviation, s^2 , in any arithmetical distribution $v(x)$, are:

$$a = \sum x v(x) \quad \text{and} \quad s^2 = \sum (x - a)^2 v(x);$$

if the distribution is geometrical the summation signs are replaced by integrals. For $w_n(x)$ the value of the mean is $a_n = nq$, the standard deviation $s_n^2 = npq$.

Laplace brought this solution of the Bernoullian problem to a very lucid form by carrying through the passage to a limit with indefinitely increasing values of n . Under this form the probabilities p and q remain constant, but a_n and s_n^2 grow with n to infinity. Hence to avoid this difficulty a change of parameters is made and a new variable,

$$(2) \quad u = \frac{x - a_n}{\sqrt{2} s_n},$$

is introduced. Under the new variable there is obtained at the limit the characteristic equation of the Gaussian bell shaped curve:

$$(3) \quad w_n(x) = \frac{1}{\sqrt{2} s_n} e^{-u^2}.$$

From (3) it follows that the probability $w_n(y)$ of a result not deviating more than y from the mean is

$$(4) \quad w_n(y) = \theta\left(\frac{y}{\sqrt{2} s_n}\right).$$

Calculation on this formula is simplified by the use of the Gaussian integral, $\theta(u) = \frac{2}{\sqrt{\pi}} \int_0^u e^{-x^2} dx$.

for which precise tables of values have been computed, thus sparing us the tiresome calculation and summation of many individual w_n values.

A quite different passage to the limit was carried through by Poisson. He also starts out by making n in (1) increase to infinity, but at the same time he lets q decrease indefinitely, so that a_n approaches a fixed value, a , and at the same time s_n also remains finite. This much simpler passage to a limit leads, without any transformation of parameters, to the formula

$$(5) \quad w_n(x) = \frac{a^x}{x!} e^{-a},$$

which is called, on account of the smallness of q , the probability of rare occurrences. It allows, for example, to estimate the probability that in a certain year there should be $x = 0, 1, 2, \dots$ child suicides, the value of a being taken from the appropriate statistical records.

These formulae and transformations, centering about the Bernoulli problem, are matched by somewhat analogous ones drawn from the

second great group of problems, the Bayes group. Suppose there is a set of urns, each one containing zeros and ones in various mixture relationships, z (that is to say, mixture relationships z_1, z_2, \dots). In n drawings made from any single one of the urns, the lots being put back after each drawing, a one has been drawn n_1 times. What is the probability $w_n(z)$ that the urn from which the drawings have been made should possess, in regard to the drawing of a one, exactly the probability, z , or, in other words, that the urn should be governed by a mixture relationship exactly equal to z ? In answering this question use is made of the a priori probability $v(z)$ for selecting among the many urns available for trials precisely that one in which the proportion of ones is z . If for the sake of convenience we reckon $v(z)$ as a continuous probability, then $w_n(z)$ becomes also a continuous probability, as follows:

$$(1') \quad w_n(z) = k_n v(z) z^{n_1} (1-z)^{n-n_1},$$

where

$$\frac{1}{k_n} = \int_0^1 v(z) z^{n_1} (1-z)^{n-n_1} dz.$$

Laplace transformed this formula too by a passage to the limit, in which with n increasing to infinity, $n_1 = n\alpha$ also increased indefinitely, so that $\frac{n_1}{n} = \alpha$ remained constant. He introduced

$$(2') \quad u = (z - \alpha) \sqrt{\frac{n}{2\alpha(1-\alpha)}}$$

as a new variable; there results

$$(3') \quad w_n(z) = \sqrt{\frac{n}{2\alpha(1-\alpha)\pi}} e^{-\frac{n(z-\alpha)^2}{2\alpha(1-\alpha)}}$$

as the probability of inferring the existence of the mixture relationship z . As in the case of (3) $w_n(z)$ follows the Gaussian curve when n becomes sufficiently large.

Analogous to (5) we have, with n held constant, the probability of an inference in the case of a rare occurrence, as follows:

$$(5') \quad w_n(z) = \frac{n}{n_1!} (nz)^{n_1} e^{-nz}.$$

The limit formulae (2'), (3') and (5'), it will be observed, have become independent of the a priori probability introduced in (1').

The formulae given above for the Bernoulli and Bayes problem groups have been generalized to a far reaching extent. Thus it has been seen that the first problem group took up (a) cases where at each drawing there was not

merely a single alternative with the probabilities p, q but an arbitrary (m valued) arithmetical or even geometrical distribution; and (b) cases where in addition the distribution changed after each drawing. But in the generalized problem of the Bayes type, while the n drawings are made from the same urn, the urn contains not merely zeros and ones but an unknown k -dimensional distribution, z_1, \dots, z_k , formed by the k discrete characters a_1, a_2, \dots, a_k . In n drawings the observed result for each of the k characters

$$is \alpha_k = \frac{n_k}{n} \quad (k=1, \dots, k) \text{ and } \sum_1 \alpha_k = 1.$$

From this observed result a conclusion is made as to the unknown probabilities z_k or as to their mean value $z = \sum_k \alpha_k z_k$. These generalized results, which in both problem groups lead to Gaussian laws under the Laplacian passage to a limit, are rightly called the fundamental principles of the probability calculus.

THE LAWS OF LARGE NUMBERS. As a special consequence of the Laplacian limit transformations, the formulae for the Bernoulli and Bayes problem groups give rise each one to a famous theorem. These two theorems represent generalized corollaries drawn from the fundamental principles and are called the first and second laws of large numbers. The Bernoulli theorem, or the first law, considers the relative frequency

$$z = \frac{x}{n} \text{ of the event of drawing } x \text{ ones in}$$

trials. Formulated for a single alternative with the constant fundamental probabilities $p=q=\frac{1}{2}$ it reads: the probability that the relative

frequency $\frac{x}{n}$ of the event should deviate from

$\frac{1}{2}$ by less than ϵ , no matter how small ϵ is approaches, with indefinitely increasing n , ever closer to 1. The theorem thus affords some very definite information concerning the arrangement of results in a series of trials, such as that of head-tail throws in a game that is indefinitely prolonged. It says, namely, that in every series of throws that is sufficiently long the relative frequency approaches the fundamental probability. An entire series of n throws is to be regarded here as an element of a collective. The bearing of the theorem may be stated thus: If one carries through an indefinite number of repetitions of series of n throws each, always using the same coin, then in almost all these series the relative frequency, z , will lie indefinitely close to $\frac{1}{2}$, the difference from $\frac{1}{2}$ being made as small as we wish by increasing the

value of n . If this arrangement within the minor series did not exist it would invalidate all statistics, which always has to deal with mere minor series and samples, never with the major or total series that constitutes a complete collective. There exist number series which satisfy the first postulate but which none the less fail to satisfy all the conditions of the Bernoullian theorem. An example of such a series (naturally it is not an "irregular" one) is the following:

0, 1, 0, 0, 1, 1, 0, 0, 0, 1, 1, 1, . . . , 0, 0, . . . , 0,
m-times
 1, 1, . . . , 1,
m-times

It may be shown that a limit of the relative frequency of a one exists here and is equal to $\frac{1}{2}$. But when the total series is tested by means of partial series of arbitrary length, for example, series containing $n = 1000$ individual items, it is possible to proceed so far along into the total series, say, to the region where $m = 10^{20}$, that one would get pure successions of zeros, in which case the relative frequency of a one in an individual series would be equal to 0; or else pure successions of ones, with the relative frequency of a one in an individual series equal to 1. In the total series illustrated above there does not exist that condition of adjustment within the individual series which the Bernoullian theorem provides; in this, however, there is no contradiction, for the Bernoullian theorem presupposes not only the first postulate as regards the existence of a limit but also the second postulate as regards irregularity or randomness, while the number series above is obviously not irregular. In real occurrences the Bernoullian theorem is satisfied empirically to a far reaching extent; even in relatively small series there is manifest the adjustment of serial relative frequencies around the fundamental probability.

Within the framework of the Laplacian theory of equal possibility no proper explanation of the Bernoullian theorem can be had. The expression, the probability of an occurrence is near 1, means on the Laplacian theory that among the equally possible cases almost all are favorable. Contrast this with the facts about the throws of a coin. For every 1000 throws of a coin there are 2^{1000} equally possible combinations of head and tail successions, for example, 1000 times head in succession; or the first 999 times head, then once tail; and so on. Among these 2^{1000} possibilities there are from a com-

binatorial point of view very few which provide either extremely many zeros or extremely many

ones; on the other hand, there are $\binom{1000}{500}$ cases

alone where there are definitely 500 ones and 500 zeros and a still larger number whose count of ones stands between 490 and 510. The theorem on this basis would provide only an arithmetical formulation to the effect that with an increasing n the combinations where heads come

in approximately $\frac{n}{2}$ times become increasingly dominant numerically: it would say nothing about the expected average run of actual happening in a sample group of sets of 1000 throws.

The Bayes theorem follows from considerations similar to those which govern the Bernoullian theorem. It may be stated thus: If in n trials a relative frequency of $\frac{1}{2}$ has manifested itself for a certain event, then with increasing n the probability approaches 1 that the unknown fundamental probability governing a trial deviates less than ϵ from $\frac{1}{2}$. Inasmuch as the fundamental probability is unknown, one has to represent to oneself this sort of situation. There are many urns with black and white balls in various mixture relationships, z , or many coins with various probabilities, z , for throwing head. The following phenomenon then forms the element of the collective in which the probability approaches 1: a coin is selected blindly, thrown n times, and there is noted down the observed relative frequency, $\frac{n_1}{n} = \alpha_1$, for the throw of head;

then another coin is selected blindly, the trial is repeated again n times and the relative frequency, $\frac{n_2}{n} = \alpha_2$, is noted down; and so on *ad in-*

finitum. If one considers then those of the series where the observed relative frequency is exactly $\frac{1}{2}$, it may be said that in nearly all of them the blindly selected coin must have been nearly "sound"; that is to say, that its unknown fundamental probability (for head or tail) differed very little from $\frac{1}{2}$. The Bayes theorem, which has been generalized much further, is applicable here when one draws a conclusion from the observed frequencies, which are approximately equal in most of the series of trials, to the existence of the unknown fundamental probability. Incidentally the Bayes theorem too would lose all reference to real occurrence if one attempted to formulate it rigorously on the basis of the equal possibility definition.

THEORY OF ERRORS. When one attempts several times to measure the same magnitude with every attainable precision and each time a somewhat different result is obtained, the supposition arises that the magnitude to be measured possesses an unknown "true value" but that the measurements are affected by "errors." These errors of observation are manifestly caused by a very large number of small independent causes: for example, in the measurement of a physical magnitude, by inexact yardstick rulings, temperature influences, misreadings due to the personal equation and so on. Every such source of error causes—so it is supposed—a small elementary error in the measurement result; through the summation (as a first approximation) of these elementary errors there may be said to arise the visible error of observation. If one adds the further hypothesis that each one of the individual elementary errors possesses a distribution, either arithmetical or geometrical, then the finally visible results may be said to form a collective with a corresponding total distribution. In accordance with the formula of Bernoulli and Laplace such a collective approaches the Gaussian law the more closely the greater the number of terms to be summed; that is to say, the larger the number of elementary errors. It follows that the probability of a certain observation result, x , or of a certain "error," $x - a$, is:

$$(6) \quad w(x-a) = \frac{h}{\pi} e^{-h^2(x-a)^2},$$

where a and h are any constants, as yet completely undetermined. Only the form of the function is established as the Gaussian law.

Since, in accordance with the above hypothesis, the observation results form a collective, there exists a limit for the average of these results when the measurements are repeated indefinitely. This limit is the unknown "true value." Since one does not know this value, it is inferred from the knowledge of the measurement results x_1, x_2, \dots, x_n with the aid of the Bayes formula and theorem. Some of the individuals in the x_i may be alike, so that there appear only k really distinct items, a_1, \dots, a_k , each one with the relative frequency, $\frac{n_1}{n} = \alpha_1$,

$$\dots, \frac{n_k}{n} = \alpha_k \text{ and } \sum_{k=1}^k \alpha_k = 1.$$

In place of $\alpha = 1 \cdot \alpha_1 + 0 \cdot \alpha_2$ in (3') there now appears the average of n observations,

$$(7) \quad \alpha = \frac{x_1 + x_2 + \dots + x_n}{n} = a_1 \alpha_1 + a_2 \alpha_2 + \dots + a_k \alpha_k,$$

and their mean square of deviation

$$(8) \quad \sigma^2 = \frac{(x_1 - \alpha)^2 + (x_2 - \alpha)^2 + \dots + (x_n - \alpha)^2}{n} \\ = (a_1 - \alpha)^2 \alpha_1 + (a_2 - \alpha)^2 \alpha_2 + \dots + (a_k - \alpha)^2 \alpha_k$$

appears in place of $\alpha_1(1 - \alpha)^2 + \alpha_2 \alpha^2 = \alpha(1 - \alpha)$. Then, analogously with (3'), the "inference probability," $w_n(x)$, that the unknown expected value of the collective should have precisely the value x , becomes:

$$(9) \quad w_n(x) = \sqrt{\frac{n}{2\pi\sigma}} e^{-\frac{n(x-\alpha)^2}{2\sigma^2}}$$

This is the probability of the true value, x . In this case a and σ^2 are calculated by (7) and (8) from the observations x_1, x_2, \dots, x_n .

Thus while the Bernoulli principle provides, by means of the hypothesis of elementary errors, only the form of the probability $w(x-a)$ of an error $x-a$, with the constants a and h undetermined, the Bayes principle, when used with the additional supposition of a very large number, n , of observations, yields the probability, $w_n(x) = v(x; x_1, \dots, x_n)$ of a true value x , which has, in accordance with (9), fully determined constants deducible from the observations x_i . It will be observed that (9) conforms also to the so-called Gaussian "hypothesis of the arithmetic mean," at least for very large values of n . Gauss had postulated that even with an arbitrary value of n (for example, $n=2$ or 3) the probability v should reach its maximum for $x=\alpha$, and this we find actually satisfied in (9).

The theory of errors has been applied not only to actual errors of observation but also in many fields of biological and social statistics, where it is not so much a question of errors of observations as of fluctuations of results. Thus if one measures as a characteristic the statures of adult men, it may be supposed that variations in heredity, education, care and upbringing have been acting as sources of error and producing elementary errors. Then the fundamental principles may be applied just as above. One must, however, be on guard against forcing the validity of the Gaussian law too far and assuming that the fluctuations which appear in any field must follow a Gaussian law, with any observed deviation from that law having to be explained as due to the small number of observations.

STATISTICS. Next to the theory of errors, statistics is the most important field of application for probability. On statistics depends among

other things the extremely important practical field of insurance. The task of mathematical statistics is not the collection and tabulation of statistical data but rather the ordering, elaboration and interpretation of that material. The function of introducing order into statistical material is performed by "descriptive" statistics. Here probability does not come in at all. Descriptive statistics is much more a "natural history of distributions."

"Explanatory," or theoretical, statistics seeks to explain the meaning behind statistical tabulations by bringing these tabulations into relationship with probability theory. In other words, it sets itself the task of regarding the observations as elements of a collective or somehow reducing them to one or more collectives. It develops procedures which investigate the legitimacy of such a reduction or transition from statistical series to underlying collectives.

In descriptive statistics an empirical or frequency distribution is formed when, after observing in a list of individuals certain characteristics x_1, x_2, \dots, x_n , one may assign to every one of the different characteristics, a_k ($k=1, 2, \dots, k$), the relative number, $\frac{n_k}{n} = \alpha_k$, of individuals to whom this characteristic belongs (in special cases k may even vary to infinity). The frequency distribution thus obtained is a series of discrete values $\frac{n_k}{n}$, whose sum is 1; it is similar to the distribution discussed in connection with the Bayes principle in the theory of errors. The average, α , and the mean square deviation, σ^2 , of a frequency distribution are defined in a manner analogous to the mean or mathematical expectation and to the standard deviation of a probability distribution; σ^2 characterizes the greater or lesser concentration of values around the average, α . Another statistical measure is the median, or central, value. This is that value for the character which is the most central (or the arithmetic mean of the two most central values), when all the x_i have been set down in the order of magnitude, each one as often as it has been observed. The mode is that character value or values for which the frequency distribution reaches a (relative) maximum.

In a manner formally identical with that for a theoretical distribution there may also be introduced the higher moments of a frequency distribution,

$$(10) \quad M_r = \sum (a - \alpha)^r \alpha_k \quad (r=1, 2, \dots).$$

The moments are here referred to the average so that $M_1=0$ and $M_2=\sigma^2$, but they may also be referred to the zero point or to any other point deemed convenient (the so-called provisional center). Skewness, ρ , and kurtosis, ϵ , of a distribution are numbers which depend on the third and fourth moments exactly as α and σ^2 depend on the first and second moments. They are defined as follows:

$$(11) \quad \rho = \frac{M_3}{\sigma^3}, \quad \epsilon = \frac{M_4}{\sigma^4} - 3.$$

In the same way still higher statistical characteristics, corresponding, for example, to the fifth and sixth moments and further, may be defined.

In order fully to characterize the deviation of a distribution from a Gaussian distribution with the same α and σ^2 the empirical distribution is developed into a series whose first member is precisely the Gaussian distribution. Such a series is called the Bruns series; in its coefficients are represented successively the higher moments of the empirical distribution (10). Similarly one may study the deviation of an arithmetical distribution from the Poisson ψ function $\frac{\alpha^x}{x!} e^{-\alpha}$

with the same α as in the given distribution; this may be investigated through the introduction of the Charlier series, whose first member is the Poisson function. For the description of an empirical distribution the seven types of curves given by Pearson are also of service (see FREQUENCY DISTRIBUTION).

Theoretical statistics, as has been said, passes from pure description into interpretative analysis. Thus for an empirical distribution with characteristics a_1, a_2, \dots, a_k , which have appeared in n observations with the relative frequencies $\frac{n_1}{n}, \frac{n_2}{n}, \dots, \frac{n_k}{n}$, the hypothesis is formed that the distribution is the result of n -fold observations in the same collective, in which there are p_k given probabilities for an a_k ($k=1, \dots, k$). The magnitude,

$$(12) \quad \chi^2 = \sum_{k=1}^k \frac{n}{p_k} \left(\frac{n_k}{n} - p_k \right)^2,$$

is then compared with the expectation $E(\chi^2)$, which is $(k-1)$ and is therefore independent of the p_k . The dispersion of χ^2 , which is a controlling factor for the expected deviation of χ^2 from $(k-1)$, becomes for large n equal to $2(k-1)$.

The most familiar part of theoretical statistics is the Lexis dispersion theory. This treats of

statistical findings where the individual results represent observations on the basis of single alternatives. For example, in a series of births in $n = 20$ provinces the number of male births for every m births is given as x_r ($r = 1, \dots, m$). It is assumed that there exists an unknown probability, p , for every male birth, and the expected values for the average, α , and for the mean square deviation, σ^2 , may then be calculated as follows:

$$(13) \quad E(\alpha) = mp, \quad E(\sigma^2) = \frac{n-1}{n} mp(1-p).$$

If for the unknown expected value mp the observed average, α , is substituted, $E(\sigma^2)$ then becomes $\frac{n-1}{n} \alpha \left(1 - \frac{\alpha}{m}\right)$. This magnitude must be equal to σ^2 if the assumption as to the fundamental collective is to be justified. Properly speaking this result as well as the derivation here given is not entirely accurate. For the Lexis theory aims to treat the above statistics of male births in two ways: on the one hand as n sets with the characteristics x_r , and on the other as mn individual observations, each with the character 0 or 1; the confrontation of the group results with the individual result permits of the comparison of the magnitudes

$$(14) \quad \frac{n}{n-1} \sigma^2$$

and

$$(15) \quad \frac{mn}{mn-1} \alpha \left(1 - \frac{\alpha}{m}\right).$$

It will be observed that with large m or n (14) is practically identical with σ^2 and (15) with the transformation of $E(\sigma^2)$ above.

Since Lexis a statistical series is spoken of as possessing supernormal, normal or subnormal dispersion when (14) is larger than, equal to or smaller than (15). The quotient of (14) by (15) is called the Lexis number L , or the square of the divergence quotient. For $L > 1$ the dispersion is supernormal and so on.

In the case of the male births it was assumed that for all nm observations the same fundamental probability p existed. If, however, it is assumed that the probability of a male birth varied from one case to the next (p_1, p_2, \dots, p_m) within each group of m births observed in the n provinces or over n years, then it may be shown that the magnitudes appearing in place of the expressions (14) and (15) are not equal to one another, but always indicate subnormal dispersion. If there is subnormal dispersion, say,

in a series of male births, then we may suppose that there is present in the observed population a certain race mixture which produces the varying p_1, p_2, \dots, p_m .

If, on the other hand, the probability remains constant within the groups but fluctuates from group to group ($\bar{p}_1, \dots, \bar{p}_n$), then supernormal dispersion results. In social statistics this is the more frequent and typical case. The establishment of the proper hypotheses regarding the observed social material can be carried still further, even within the framework of the Lexis theory.

CORRELATION THEORY. This theory deals with specific problems in multidimensional distributions $v(x, y)$. It investigates particularly the so-called "stochastic connection" of variables with the limiting cases of "stochastic independence" and "functional relationship." It is divided into a descriptive and a theoretical section. In the first are embraced the definitions and the discussion of the various correlation numbers (e.g. coefficient of correlation, contingency coefficient), regression lines and the like. The theory of probability first comes in when there have been observed n pairs of x, y , and we suppose that they result from n -fold observation in a certain collective. The assumption is then verified by calculating the expected means and dispersions of the various correlation measures, etc.

The theory of correlation is today applied by trained economists for the purpose of establishing and clarifying economic relationships. In this connection the problem of the "covariation of time series" has assumed of late a certain role of importance.

PHILOSOPHIC BEARING OF PROBABILITY. It is permissible to conclude with a few remarks of a general nature. The history of the natural sciences demonstrates that the principle of causality has undergone transformations in accordance with the development of science. It is like a receptacle which is filled from time to time with new content. Thus Galileo's law of inertia announced the certainly extraordinary and strange fact that only a change of velocity and not a change of place requires a causal force. Yet later this law of inertia was regarded as logically necessary, as a corollary of the principle of sufficient reason; and such interpretations are today generally accepted. At the present time the statistical explanation of phenomena is regarded as opposed to the causal explanation; but with the ever deeper penetration of statistical interpretations into the natural sciences the

causality principle will end by accommodating itself to the changed ideas, and the statistical explanation will be regarded as also a causal one. This does not mean, naturally, that the difference between the interpretations—as represented in physics, for example, in the opposition between “the physics of differential equations” and “statistical physics”—will be in any way diminished. Only we must not say that the first is causal and the second anticausal.

In physics statistics makes possible the transition from atomic elementary bodies to macroscopic phenomena. In like manner we may picture—with Philipp Frank—the relationship between macroscopic sociological phenomena and the atomic, or “micro,” processes; that is to say, the processes in the single individual. Thus density and temperature, as average relations, determine the macro-state of a gas, which in turn may reflect a very great number of different micro-conditions. None the less one may make inferences from one macro-state to further macro-states without any knowledge of the micro-conditions. Of course all this can be done only in so far as we can tell what takes place in the great mass of cases or, in other words, what takes place statistically. Similarly the laws governing sociological conditions are laws which are expressed solely in sociological terms (macro-magnitudes) and permit inferences (statistical ones) as to future sociological conditions. Thus the materialistic interpretation of history studies economic conditions as the macroscopic phenomena from which the future states may be approximately predicted, without having to refer back at all to the single individuals, the micro-conditions.

If we take the viewpoint that through the demonstration of the merely statistical nature of scientific laws the rigorous determinism of phenomena has been undermined, we might look forward to obtaining a solution of the famous problem of the freedom of the will. What is the status of this question? A naturalistic interpretation, uninfluenced by our wishes, leads to the sober conclusion that most of the acts of men are produced by the interaction of external force—in the farthest sense of the word—and the inner nature of man. This inner nature we experience as an element of freedom in contrast to external coercion. But even this internal element is determined and statistically so through the thousand individual drives which constitute our ego. Thus it appears that what expresses the personal side of our acts is a statistical macro-

result of psychophysical micro-conditions, over which we certainly do not at any moment have any “free” command.

On the other hand, statistical laws certainly do not exercise any external force on the individuals. If a certain man commits suicide, his act may be determined by his individual nature (from within) and by his individual fortune (from without). But he is not put to death by the statistical law which says that in Germany every year so and so many men end their lives by suicide. For individuals there are no statistics. And for statistics there are no individuals.

PROBATION AND PAROLE. The legal basis of probation rests on the power of the court to suspend conditionally the imposition or the execution of a sentence. Its aim is to substitute for imprisonment or some other penalty a form of penal treatment which it is assumed will be best able to achieve the reformation of the offender and in some states his civil rehabilitation. Where the system is most highly de-

veloped, probation is granted only after careful investigation and the probationer is subjected to supervision by public or private organizations or by individuals who are appointed to give him friendly assistance in achieving the purpose of the law. Elsewhere probation amounts to little more than a judicial warning fortified by a threat of later punishment should the probationer within a certain period of time commit another offense.

The origin of probation and its greatest development are to be found in Anglo-Saxon countries. Courts of England for centuries suspended judgment on occasion under the common law and released the defendant on his recognizance and bound him over to his sureties, who guaranteed to produce him for sentence upon the order of the court. During the first half of the nineteenth century this procedure was used increasingly to save youthful or petty offenders from the degrading effects of imprisonment or merely as a warning where a penalty seemed unnecessary. Records of the American colonies furnish similar instances of this common law practise, and Massachusetts in 1836 gave it statutory recognition in so far as it applied to petty offenders in the lower courts. In 1869 that state created a form of probation for juvenile delinquents which entailed investigation and supervision by a state agent. In 1878 the mayor of Boston was empowered to appoint a probation officer for the courts of criminal jurisdiction in Suffolk county, which power was extended to other communities in the state in 1880 and was transferred to the judiciary in 1891. Probation was not legislated elsewhere in the United States until 1898 when Vermont adopted probation upon the suspension of the execution of the sentence, and Rhode Island adopted for offenders under the age of thirteen the principles of the Massachusetts act of 1869. Probation legislation then made rapid progress with the growth of the juvenile court movement. By 1933 all of the states of the United States except Wyoming had juvenile probation laws and all but thirteen had adult probation laws. A federal probation act was passed in 1925. In many states judicial authority denies to the courts the right to suspend the imposition or the execution of a sentence, while in others this right is granted by statute or the weight of decisions. In a few states probation may be imposed as a condition for the adjournment of a case prior to conviction.

In England probation under common law

usage was extended by statute to certain serious crimes in 1861 and was further extended and modified by acts of 1879 and 1887. In 1876 the practise began of using police court "missionaries" employed by private organizations as aids in supervision; in 1907 the Probation of Offenders Act adopted the American plan of public salaried probation officers. In England and in some of her colonies or dominions courts of summary jurisdiction grant probation prior to, higher courts after, conviction.

In countries other than those mentioned probation has been introduced chiefly in connection with juvenile courts. The legislation for adults has usually been patterned on the Belgian and French laws of 1888 and 1891, regulating the suspension of the execution of certain sentences. In Germany since 1895 the same results have been attained by the use of conditional pardons. Public salaried probation officers are not employed for adults outside of the United States and the British Empire. Supervision is ordered for a relatively small percentage of those conditionally sentenced and is exercised as a rule by private persons or societies, which in a few states, notably Holland, are heavily supported by the government and under rigid state control.

Except in a few states of the United States where discretion is largely left to the courts, legislatures have placed rigid limitations on the use of probation or its continental equivalent, the conditional sentence. They can be granted ordinarily only to youthful defendants, to first offenders, to those who have committed certain specified crimes or classes of crimes or to those threatened by penalties of certain types or severity. The defendant is not only required to refrain from committing crimes during his period of probation but he is also frequently ordered by the court to follow certain modes of life or to fulfil special conditions, such as the payment of fines or of costs and restitution or the serving of a brief jail sentence; the latter condition, specified in some American statutes, obviously defeats the purpose of probation. If the probation period, which is now generally limited by statute, expires without incident leading to a revocation, the probationer is usually discharged and in some states his conviction is erased.

The value of probation as an efficacious method of reclaiming an offender is directly proportionate to the care exercised by the courts in selecting probationers and the skill and judgment shown in their supervision. The pro-

nation officers to whom these tasks are entrusted become therefore the important factors in the process. Under ideal conditions probation officers should be well qualified for their tasks, not overloaded with duties preventing them from doing efficient work and should be subject to supervision by a central state coordinating agency. There exists, however, a great gap between this ideal and practise in all countries. Four American states administer all probation work; state supervision of good quality exists in seven others; in nine more supervision is mediocre; and it is entirely absent in the rest. Many states have no probation officers or depend upon volunteers. Political appointments are common; standards of selection are low and training is almost non-existent. It is not uncommon to find an officer with five hundred or more probationers under his supervision at the same time. Probation of any effective sort is therefore limited to a few localities and is generally better administered for juveniles than for adults; local and national agencies are, however, endeavoring to raise its level of achievement.

There are no national statistics of probation in the United States, and because of the imperfections or the lack of uniformity in judicial statistics comparative data on the use of probation are difficult to obtain and to interpret. In 1931 the percentages of sentences suspended with or without probation, compared with convictions in courts of general criminal jurisdiction, were in Delaware 22.5, in Iowa 17.4, in Maryland 34.9, in New Jersey 41.1, in Ohio 28.9 and in Rhode Island 50.5. The 1931 Quarter Session and Special Sessions courts of New Jersey respectively used probation in 32.2 and 31.2 percent of the convictions. In 1930, of those convicted of major offenses in New York state 24.3 percent were placed on probation; in the same year the magistrates of New York City used probation in 1.3 percent of the convictions they recorded. In 1930-31 the superior courts of Massachusetts used probation in 21.9 percent of the cases, and in 1929 Wisconsin applied it to 11.8 percent of the adults convicted. Wide variations are found among the courts of any given state as well as among states; in New Jersey in 1931, for example, the range in the percentage of convictions followed by probation in different counties extended from zero to fifty. A similar situation is found in other countries; in 1929 the English courts of assizes and quarter sessions issued probation orders for 10.9 percent of those convicted, while courts of summary

jurisdiction employed them for only 2.7 percent. The percentage for Scotland in 1931 was 2.8 Austria and Holland respectively in 1930 granted conditional sentences to 19 and 8.1 percent of those convicted. In France this percentage was 16.8 in 1927, in Bulgaria 42.2 in 1928, in Sweden 1.4 in 1928 and in Finland 1.1 in 1929.

Parole is a term commonly used in the United States to designate conditional release granted to a prisoner who has served a part of his sentence in a penal institution. The problems of parole are similar to those of probation. Early in the history of imprisonment it was felt that good conduct and evidence of reform on the part of prisoners should be rewarded by a shortening of the prison term. Later it was regarded as desirable that instead of absolute discharge in such instances, the prisoner be released conditionally prior to the expiration of his sentence. Such procedure, it was believed, would improve institutional discipline and also serve as incentive to continued good behavior after release, since this privilege could be revoked for cause and the prisoner reincarcerated. Still later it was realized that during the period of conditional release the prisoner might be given positive aid and supervision by the state or the community interested in his reestablishment as a law abiding member. Conditional release made its first appearance in the ticket-of-leave system used in the Australian penal colonies. It was greatly improved by Maconochie at Norfolk Island, who combined it with a mark system; it was given a more firm legal status by the Penal Servitude acts of 1853 and 1857 and brought into common use in England in connection with the graded system of prison administration elaborated by Jebb and Crofton. As a part of this system it came to be best known outside Great Britain. France as early as 1832 tried a plan of provisional release for the young prisoners of the Roquette in Paris and extended it to all juvenile prisoners in 1850 and to adults in 1885. In 1862 Saxony introduced conditional release and most states have since adopted it in some form or other. In Soviet Russia it is found either in its conventional form or as a conditional transformation of the imprisonment into another and milder penalty. In the United States its introduction was preceded by the conditional pardon, which is still the only form of conditional release in two states, and it was greatly delayed by the widespread adoption of commutation laws. In 1869 parole was introduced in the law creating the

Elmira Reformatory, and was later adopted wherever similar institutions were established. Ohio through a law of 1884 became the first American state to extend parole to prisoners in state prisons; parole laws are now found in forty-five states of the union and in the federal code.

The practise of parole is not, however, uniformly on a high level. Adequate standards for the selection of prisoners for parole or for their supervision are mostly lacking and an automatism governs its application. The great mobility of the American population and the resultant cost and ineffectiveness of institutional supervision over paroled persons have led fourteen states to entrust this function to state agencies; five states and the federal government have full time salaried parole boards. Some state governments have taken complete charge of both the selection and the supervision of paroled persons; in other states these functions are shared by the state government and the institution. Like probation, parole is not freely granted, although many authorities believe that all prisoners released from penal institutions should be given temporary supervision and assistance by the state. Under their indeterminate sentence laws some states have relatively few restrictions; otherwise the conditions for receiving parole, those imposed on the paroled persons during parole and the elements of good parole administration are comparable with corresponding factors in probation. The supervision of persons paroled from county or municipal institutions is in fact frequently exercised by the local probation department, and paroled persons from federal institutions are supervised by the probation officers of the federal courts. In 1932 Rhode Island centralized supervision of probationers and persons on parole in a state bureau under the Public Welfare Commission. Fourteen states still lack parole officers and in each of thirteen others there is only one officer.

In Europe the supervision of those conditionally released is sometimes exercised by the police, sometimes by private aid societies, which in some states are subsidized and in a measure regulated by the government. A few states have created temporary homes or asylums for discharged prisoners in addition to those provided by private organizations.

In 1931, of the 68,596 prisoners discharged from the federal prisons and reformatories for adults and similar institutions in forty-four American states 50.9 percent were released on

parole. A special inquiry by the Bureau of the Census and covering nearly half of the paroled persons from forty-five institutions in eighteen scattered states showed that 66.1 percent were put under the supervision of salaried parole officers and 13.4 percent under public or private agencies or persons; 15.8 percent were to be supervised by correspondence alone and 4.7 percent were placed under no supervision of any kind. Considering the fact that many of the states reporting supervision by a parole officer fall within the group having but a single officer in the whole state, it must be assumed that really effective supervision was secured in but a small percentage of the parole releases. The length of time spent on parole by those discharged from parole in 1931 in the eighteen states mentioned varied greatly; more than one third had been on parole less than a year and only one third over fourteen months.

The states vary widely in their use of parole; in 1930, for instance, Texas paroled only 4 percent of its discharges, while Washington paroled 91.5 percent. Conditional releases are most sparingly used abroad: in 1927 Italy released only 20 prisoners; Prussia in 1929-30 none; France in 1928 released conditionally 8.7 percent of those leaving her central prisons; and in 1931 in the Irish Free State, Sweden and Finland respectively 2.2, 0.8 and 1.8 percent of the discharges were conditional.

Probation and parole have frequently been defended on the basis of their avowed reformatory influences, and it has often been contended that 80 percent or more of the probationers and the paroled persons do not return to crime. Recently these optimistic claims have been rudely shaken, particularly by studies of paroled persons carried on in the United States. The damaging conclusions of these studies do not involve a denial of the inherent importance of probation and parole. They rather prove that the success of these modern and rational departures in penal treatment is dependent on the degree to which the state is willing to improve their administration.

PROCEDURE, LEGAL

Introduction. The term "procedure" is comparatively a late comer into the Anglo-American legal vocabulary. Borrowed from the French, which in turn had derived it from the terminology of the mediaeval Italian jurists, it was rarely used as an English term of art until its nineteenth century domestication chiefly, it is fair to assume, through the writings of Jeremy Bentham. It found its first official recognition in the title of the New York Code of Procedure of 1848, to which was speedily added its like recognition in the name of the English Common Law Procedure Act of 1852. It has thus come to serve as a unitary designation for what the legal profession had previously been content to deal with under the separate heads of "pleading,"

"practise" and "evidence." Accordingly, in its principal sense, it signifies the sum of the rules that define and regulate the nature, modality and progression of the steps in a proceeding before a court of justice or other tribunal vested by law with decisory power. The general body of the law in prescribing rights and duties regulates ends; procedure regulates the means of attaining these ends through designated channels—a distinction which gives rise to Bentham's contraposition of substantive and adjective law.

That phase of legal evolution which caused the field of criminal law to be marked off from the civil (*see* CRIMINAL LAW) was attended with a corresponding variation of procedure. To this is owed the existence, distinct from civil procedure, of the body of rules which we know as criminal procedure (*see* PROSECUTION).

Before emergence of the distinction between criminal and civil wrongs, the procedure for all cases is one that corresponds to the idea later associated generally with civil procedure, in that it contemplates a controversy and provides a means for its determination. And the existence of a controversy presupposes a willingness to contend and an expression of that willingness. In other words, the determination, according to the primitive conception, could come about only by the concurrence of the parties in submitting the cause for decision. A further stage in the evolution provides for the case of the recalcitrant defendant: if he will not join in the controversy, the community applies measures of coercion even to the threat of death or exclusion from the communal life. It is this view of the primitive lawsuit, as pointed out by Sir Henry Maine, in clothing it with the sanction of his great authority, that explains the picturesque ritual of the Roman *litis contestatio* in the *legis actio* period. It serves to account also for the continued existence of that same *litiscontestatio*, under other forms, in the subsequent history of procedure. And, if we turn to English law, it illuminates the background of the *peine forte et dure*, and tells us why, in civil litigation, down to the eighteenth century, no suit could proceed until the defendant had appeared either voluntarily or as the result of prescribed coercive measures. With this notion of a controversy as its kernel, primitive procedure developed under religious influences. "The law of procedure," says Kohler, "is divine and ecclesiastical before it becomes secular." The solution of the controversy is for the gods and the procedure is directed toward bringing about their interposi-

tion. Of necessity it is ritualistic, like other approaches to the gods. Thus it is that the outstanding feature of primitive procedure is its formalism. Only by a rigidly defined mode of speech and conduct may the litigants invoke decision, and every deviation from the prescribed mode is fatal. Human agency has prepared the way for decision, but the decision itself is the voice of divinity speaking through the outcome of oath or ordeal. The passing of the administration of justice from the hands of the priesthood does not signify that decision ceases to be regarded as divine: the Germanic procedure of the Middle Ages exhibits to us a secular justice proceeding on the basis of a judgment of God. Even more slowly diminishes the attendant formalism. For, after the idea of divine arbitrament has disappeared, the human instinct to follow the beaten path comes to reinforce the influence of origin and keep the form in existence. Not until a late day is the stage attained at which procedural form is seen in its true perspective and enlightened opinion can recognize such elements of it as are necessary safeguards against arbitrary adjudication and reject the surviving residues which the evolution of institutions has deprived of all meaning.

Against the dim background of antecedent history flares the procedure of the Athenian democracy. As we see this in the fourth century B.C., it is a system in which rationalism has distinctly taken the upper hand of formalism: only in its application to homicide and certain other acts still regarded as sacrilegious does the primitive order live on. In many respects it anticipates later invention. Its use of written complaint and answer, its recognition, in the *paragraphe* and *diamarturia*, of defenses going to the admissibility of the action as distinguished from defenses on the merits, its preparatory hearing (*anakrasis*), with reduction of the evidence to writing and the assembling of a written record, its concession, centuries in advance of the Roman law and more than two thousand years in advance of the English law, of the plaintiff's right to a judgment by default for want of the defendant's appearance, all bespeak its precocity. Its effectiveness in preparing causes for trial and decision, however, was impaired by the circumstance that, according to the Greek conception, law was a matter to be proved in the same way as fact, and neutralized by the mode of decision itself. For, although the preparation was under the supervision of the magistrates, the decisory organ in all but the

most minor of causes was a numerous popular body (see COURTS) confined to the adoption or rejection of concrete proposals advanced by the parties for disposition of the case, and at all times open to be swayed by emotional and demagogic appeal, if by nothing worse. It is not strange, therefore, that the Athenian administration of justice was never a satisfactory one. The contributions of Greece to civilization extended only in the slightest degree to the field of law, for Greek law never attained the closeness of texture that was later characteristic of the Roman. And, while the Athenian procedure in its technique far surpassed Greek law in general, it was not destined, any more than the latter, to have aught but a minor influence on future institutions.

The Roman Civil Procedure. It is the civil procedure of the Roman law that affords to the later development its tangible point of departure. The Roman system, as it comes to light, still wears the marks of its sacerdotal origin. It is in essence, however, a system of state-supervised private arbitration. Like the Athenian procedure, it exhibits a division of function between the magistracy and a popular judiciary. But, as opposed to the democratic idealism of the Greeks, the Roman practicality is already evident in the fact that for most cases the decisory power is entrusted to a single citizen-trier. In this first historical period—that of the *legis actiones*—the plaintiff must find warrant for his claim in some rule of written law: hence the name *legis actio*, or statutory action. Whether the statute has opened such an avenue to him is determined by the praetor, before whom the parties initially appear. The claim must be stated in the very words of the statute. Gaius, in a frequently cited passage, tells of the plaintiff who, complaining that the defendant had cut his vines, failed because of using the word “vines,” when the Twelve Tables, which gave the action, used the general word “trees.” If the action is admissible and the defendant does not expressly or by silence admit his liability, the praetor allows the *litis contestatio*. This is a ritual, consisting of assertion and counterassertion, with interposition by the magistrate, all in a traditional cast of words. Its full form has come down to us only as it occurred in the *legis actio sacramento in rem*: here it symbolizes the manual seizure by the parties of the thing in dispute and the intervention of the pacificatory power of the state—affording thus what Sir Henry Maine speaks of as a “dramatiza-

tion of the origin of justice"—and concludes by the defendant's acceptance of the plaintiff's challenge to wager a sum of money, the *sacramentum*, upon the outcome. The *sacramentum* is a relic of the religious era; its exact significance, however, is disputed. The office of the *litiscontestation*, in thus satisfying the continuing notion of a voluntary submission to arbitrament, is to evidence the existence of a recognized legal controversy and to signify the willingness of the parties to contend. Its accomplishment is attested by witnesses; from this circumstance comes the term *contestatio*, which literally means a collective attestation (*con* + *testatio*)—a fact which incidentally gives us the interesting etymology of the English word "contest." Once the *litiscontestation* has been effected, the first stage of the suit—the *jus*—comes to an end by the praetor sending the cause for trial to the organ of decision. This, in the typical case, is the *judex*, chosen by the parties from a list of qualified citizens and appointed by the praetor. Before the designated trier there has place the second stage of the suit, at which evidence and argument are heard and judgment is rendered. In contradistinction to the *jus*, or first stage of the suit, this second stage is commonly spoken of as the *judicium*, although recent usage, perhaps more accurately, would refer to it as the proceeding *apud judicem*.

Except for residual fragments, the mode of proceeding just outlined went out of use in the first century B.C., when revolt against its archaic formalism, on the one hand, and the social need of bursting the cramping bonds of the statutory actions, on the other, caused it to be superseded by the procedure *per formulas*. Adhering to the old division of function between magistrate and *judex*, the reformed procedure dispensed with all ritual and had its central feature in the *formula*, or written command, addressed by the praetor to the *judex* for the governance of the latter in the decision of the cause. But no longer need the plaintiff find warrant for his action in the statutory law: the praetor, through his edict, is recognizing new rights of action in ever increasing measure, and is otherwise building up alongside the *jus civile* a new body of law, the *ius honorarium*, to which the term praetorian equity is commonly applied. If, therefore, the proceeding *in jure* discloses that there is present a controverted claim, such as the law, either statutory or praetorian, will notice, and that no obstacle exists to its trial, the praetor grants to the plaintiff an appropriate *formula*. The highly

organized anatomy of the *formula* cannot here be reviewed. It is to be noted, however, that, in its simplest form, it expresses a command hinging upon a single condition: in essence the praetor is saying to the *judex*: "If X is shown, condemn the defendant, if not absolve him." But frequently the defendant alleges before the praetor a fact not inconsistent with a *prima facie* right in the plaintiff, which nevertheless would prevent that right from being effectuated. The typical situation of the kind is where to a claim under the statutory law a defense not recognized by that law is given by the praetorian law. Where this manner of defensive allegation is present it is necessarily reflected in the terms of the *formula*: in essence the praetor is now saying to the *judex*, "If X is shown, then if Y is not shown, condemn the defendant, otherwise absolve him." Since this further condition is looked upon as something subtracted or excepted from the principal condition, it is known as an *exceptio*. By transference the name comes to be applied to the defensive right itself thus involved. Exceptions are classed as dilatory or peremptory, according as their intrinsic nature is to defer or defeat enforcement of the claim—a distinction, however, which, owing to the rule of consumption (*see* JUDGMENTS), was not reflected in their practical consequences. On the same principle which regulates the relation of the *exceptio* to the claim, the *exceptio* may be succeeded by a *replicatio*, the replication by a *duplicatio* and so on, with corresponding adaptation of the terms of the *formula*. In this mode of proceeding, the old ritualistic *litiscontestation* has disappeared, but as the law had long attached to the fact of *litiscontestation* various important substantive effects, notably that of consuming the right of action and transforming it into a right to judgment, it was necessary that the essence of the thing be preserved. Accordingly, the fact of *litiscontestation* is deemed accomplished in the acceptance of the *formula* by both parties. The *judicium* of the new procedure is in substance the same as that of the old, except that it now moves within the strict lines laid down by the *formula*.

But the formulary procedure, in its turn, was destined to be displaced. After the establishment of the Empire, the gradual acceptance of the idea that all judicial power resided in the emperor meant the disappearance of the citizen *judex*. Hence came about also disappearance of the distinction between *jus* and *judicium*. The suit was now to be dealt with throughout its course

by a single judicial official acting as delegate of the imperial authority, and the *formula* could have no place in the machinery of justice. For the new order of things a pattern of procedure was already at hand, since alongside the formulary procedure there had already grown up an exercise of judicial power by the magistrate in certain special cases—the so-called *cognitiones extraordinariae*. The shift from the formulary system, like most changes of the kind, did not occur all at once, but was rendered complete by a constitution of 342 A.D. On the basis of the *cognitiones extraordinariae*, therefore, rested the procedure of the third period of the Roman system. In its developed form it becomes the Justinianian libellary procedure. Here we encounter a written complaint, the *libellus conventionis*, with which the proceeding is opened. On the part of the defendant there is a *libellus contradictionis*, which seems to have been a preliminary declaration of defense in general terms. Affirmative defenses take over the name of exceptions, either dilatory or peremptory. The allegations proper come at the hearing, which begins with the oral *narratio* of the plaintiff, followed by the oral *contradictio* of the defendant, in which latter is included any exception relied upon. Dilatory exceptions must be presented before defense on the merits and are now restricted to their natural operation, owing to the disappearance of procedural consumption. The legislation of the emperors has also stripped away much of the other substantive importance of *litiscontestatio*, but the idea is still preserved for certain purposes, and the fact of *litiscontestatio* is now transferred to a point in the proceeding which, under the more usual view, strongly opposed, however, especially in the recent work of Collinet, may be taken as the conclusion of the *contradictio* on the merits. The procedure thus established was simple and flexible and one to which the later development was largely indebted.

The Germanic Procedure. In the Roman procedure, as indeed in the ordinary procedure of the Athenians, the effort of the parties, with some qualification in a circumscribed use of the probatory oath, is directed toward persuading the court, through evidence and argument, of the truth of their respective pretensions; and decision of the cause is a result of the application of the rule of law to the facts procedurally established. Quite otherwise is the case in the Germanic procedure. Here is all dominant the primitive notion of divine decision, invoked by

appeal to oath or ordeal. These are means of proof, but only in the sense that their successful outcome signalizes divine approval of the proving party's allegation; from its very nature this proof is one-sided, admitting of no proof in opposition. The oath is that of the party alone, or that of the party supported by a prescribed number of oath-helpers, or it is the oath of witnesses; the ordeal assumes many forms, including that of trial by battle. The judicial tribunal is an assemblage of the freemen of the community, presided over, after the advent of monarchy, by a representative of the king. Before this assembly, the plaintiff, in the presence of his adversary, states his claim, not in terms of fact but in terms of the conclusion which he himself has drawn from the facts; if, for example, the case is that of an ordinary debt, he makes no reference to the facts out of which it has originated. The contesting defendant is entitled, under certain circumstances, including that of the ineptness of the plaintiff's allegation, to refuse to answer; otherwise he makes answer, and this he must do by denying the plaintiff's allegation word for word. Thereupon the cause is ready for the only decision on the merits that the court can give, determining, that is to say, which of the parties shall have the right to prove, what he shall prove and which of the means of proof he shall use. The judgment expressing this decision (*see* JUDGMENTS) comes about as a result of a proposal advanced by a committee of judgment-finders, accepted by the assembly as a whole, and formally sanctioned by pronouncement on the part of the presiding officer as delegate of the sovereign authority. The making of proof is in obedience to the judgment. If oath has been appointed, party or witnesses swear not to facts but to the allegation of the proving party precisely as formulated; oath-helpers swear that the supported oath is "clean and unperjured." Its taking is governed by the utmost formalism. Any imperfection of expression, any deviation from the prescribed bodily posture, causes it to fail: the oath is then said to have "burst." Only when it is formally faultless is it successful, for only then can it be seen to have met approval of the supernal decisory power. A similar extreme of formalism pervades the ordeal. The latter has the specific name of "judgment of God" (*Gottesurtheil*, *judicium Dei*), but the outcome of every proof is a judgment of God in this sense. On these principles, characteristic of Germanic justice in general, are based the procedure of the Franks

and that of the Anglo-Saxons. With some intervening development, they inhere in the procedure, documented in the thirteenth century *Sachsenspiegel*, which prevails in Germany until the close of the Middle Ages.

The Romano-Canonical Civil Procedure. Consequent upon the subjugation of the Western Empire by the northern invaders, in the fourth and fifth centuries, the Germanic law encountered the Roman, under conditions which entailed a process of fusion. Particularly significant was this process among the Lombards. For out of it grew that procedural development which, centering in the revived study of the long obscured Roman law principles, and fostered especially by the law school at Bologna, came to flower in the twelfth and thirteenth centuries and gave to the world a new system. The church, on the one hand, and the city-states of mediaeval Italy, on the other, were the theaters of its application. This system, or rather congeries of systems responding to a uniform set of principles, we speak of as the "Romano-canonical." It was modeled basically upon the Roman libellary system, but in its details exhibits the influx of Germanic ideas. The proceeding commences with a complaint to the judge which soon becomes a written *libellus*. The litiscontestation, through misunderstanding of the Roman sources, is placed again upon a formal basis, and consists in a general denial, before the judge, of the plaintiff's right, in set phraseology. Affirmative defenses come by way of *exceptio*; of dilatory exceptions the greater number, those now classed as *declinatory*, are lost if not presented before litiscontestation. Most striking feature of this system, however, is its mode of proceeding by *positions*—the parent of modern discovery. After litiscontestation, the plaintiff is entitled to advance a series of positions, that is to say, propositions representing respectively the several elements of fact constituting his ground of action. To each of these the defendant, under sanction of oath, is required to answer Yes or No. Failure to answer, it becomes settled, is equivalent to admission. In the same way the defendant is entitled to propound positions and to receive answers from the plaintiff in respect of his *exceptio*. The obvious advantage of this device is that of economizing in the field of proof. Undoubtedly Germanic influence has contributed to its invention, as also in some measure at least to the establishment of the arithmetical proof system here in use (*see EVIDENCE*) by which the prevailing spirit of

scholasticism sought to tie the hands of the judge. The tendency in this procedure was to discourage orality of proceeding: in particular testimonial evidence was not taken in open court, but by means of written deposition obtained by secret examination. Notable was the extreme deliberation of its processes in general, moving as they did through a succession of stated *termini*, appointed for the respective steps. This failure to satisfy the demands of expedition, especially insistent in the commercial cities of Italy, gave rise there to a simplified form—the *cognitio summaria*—which, among other modifications of the *sollemnis ordo*, omitted the formal litiscontestation and abolished the stated terms. The *cognitio summaria*, translated into the church courts, attained definitive recognition in a papal constitution of 1306—the standard-setting *Clementina saxepe*.

The Modern Continental Development. Conquering with its Roman inheritance of intellectual proof the formalistic methods of the Germanic peoples, the Romano-canonical law of procedure spread abroad from Italy. In northern France, by a process beginning in the twelfth century, the Italian principles gradually united, under the influence of the church, with the Frankish institutions of feudal justice, to create the procedure of the royal courts, which, with extension of the royal dominion and growth of the monarchical power, ultimately became the procedure of all France. Its definite characteristics were assumed in the fourteenth century. It retained in large measure the Germanic orality of proceeding, although in the matter of witness-proof it followed the written system of the canonists. As developed by interim usage and legislation it was comprehensively regulated by the *Ordonnance civile* of 1667, and, with but little material change from that regulation became the procedure of the existing code—the *Code de procédure civile* of 1806. In Germany reception of the Italian principles was longer deferred. Their presence as a factor of any strength dates only from the establishment of the Imperial Chamber of Justice in 1495, whose system—the so-called "cameral procedure"—as originally instituted, closely followed their lines. It was not long, however, before they had achieved supremacy over the now anachronistic native institutions in the several territories; here an important influence was the resort of German law students to Italian and French universities. The resultant fusion of the new principles with the old yielded the system known as the German

common law procedure (*gemeiner Prozess*). Like the Romano-canonical, this, in its final development, was essentially a written system. Foremost of its characteristics, however, was its adaptation of the Germanic proof-judgment to the new manner of proof. After the questions in controversy had been disclosed by the written allegations of the parties, a judgment, that is to say, was rendered specifying the facts to be proved, regulating the burden of proof and fixing the time of proof; and this judgment controlled with the force of *res judicata* the adduction of evidence by both sides in the further stage of the cause. The common law system was the procedural norm in most of the German states, when, soon after the opening of the nineteenth century the events of war introduced the Rhine provinces to the French procedure. The foreign system was viewed with such favor that it strongly influenced subsequent procedural legislation in various of the states, and, finally, after the establishment of the German Empire, was drawn upon in important degree for the principles which entered into the national code of civil procedure—the *Zivilprozessordnung* of 1877. That code took over the French orality of allegation and debate; in addition it sought, but with little success, to bring about the taking of witness-proof in open court. In many respects, however, it pushed orality to an undue extreme—a fault which has been measurably remedied by later amendment. The revision of the *Zivilprozessordnung* now in force dates from 1924. Austria, as part of the Holy Roman Empire, shared in the German reception of the Italian procedure and in the attendant fusion of judiciary institutions. Its civil procedure was defined by the Josephine Code of 1781, supplemented by the West Galician Code of 1796, in a manner exhibiting significant variances from the common law system: in particular, no room was given to the binding proof-judgment. This regulation continued to govern generally until adoption of the *Zivilprozessordnung* of 1895, which is still in force. The last mentioned code was an epoch making piece of legislation. It made use of certain simplifications which had been introduced for petty causes in 1873, availed itself of what was best in the contemporary German procedure, suppressing the latter's exaggerations of orality, and in other ways constructed a system whose practical excellence is conceded on all hands. The Scandinavian countries, too, by a yielding to the German example, albeit in less than its full

measure, received the Italian principles, and the sixteenth century saw here the beginnings of the modern procedure. This is now regulated in Denmark by the *Lov om Rettens Pleje* of 1916, which went into force three years later, and in Norway by the *Lov om Rettergangsmaaten for Tvistemaal*, adopted in 1915, but not effective until 1927. In both these codes is manifest the influence of the Austrian Code of 1895. The Swedish system, on the other hand, which obtains also in Finland, continues to be governed by the *Rättegångsbalk*, the procedural part of the general code of 1734. In Spain, where the Germanic procedure of the Visigothic kingdom had centuries before given place to Roman notions of proof, the Romano-canonical ideas had no difficulty in effecting an entrance early in their career. The result is seen in the procedural provisions of the *Siete partidas*, compiled in the thirteenth century and given the force of law in the fourteenth. From the basis there laid the present day civil procedure, governed by the *Ley de enjuiciamiento civil* of 1881, has not very widely departed.

Until the Napoleonic occupation, the various Italian states maintained in different versions the native Romano-canonical institutions. But Italy, like Germany, underwent the incursion of the French procedure. Here, too, the invading principles struck root: their influence told in the formation of the later state systems, and, though not leading to orality of allegation, is decidedly present in the existing national code—the *Codice di procedura civile*—which dates from 1865. This influence, however, was not limited to Germany and Italy. The domination of France in the Napoleonic era implanted its procedure elsewhere in western Europe, notably in Holland, where it displaced the cognate but independent civil procedure of the Roman Dutch law. And, by a purely pacific extension in times nearer our own day, the French principles came to shape the procedure in various countries whose domestic institutions were insufficiently developed, including Greece, Rumania, imperial Russia, Turkey and Egypt. Indirectly they contributed to the Japanese system, which is directly modeled on the German, but they attain to immediate expression in the recent procedural legislation of China. Nor remains exempt from the same influence the Polish Code of 1932 which, designed to apply in territories formerly governed by the Russian, German and Austrian systems, has drawn upon each, in the formation of a national procedure.

Standing apart from the general continental current is the Soviet Russian Code of 1923. This, while prescribing a written complaint and oral and public proceedings, is, in keeping with the ruling political theory, characterized by provision for a wide measure of state interference with the activity of the private parties in the conduct of the cause and by a cutting loose from sundry rules in other systems deemed more or less essential to a well ordered procedure.

The Anglo-American Development. At the time of the Norman Conquest the procedure of England was the Germanic procedure of the Anglo-Saxons. What the Normans brought with them was a Germanic procedure also, but a procedure which had profited from contact with the superior judicial institutions of the Franks and, in particular, had made acquaintance with the Frankish inquest. Outgrowth of the employment of community witnesses, common to all the Germanic peoples—witnesses, that is to say, who by reason of their situation in respect of neighborhood knowledge, could speak, through their formal oaths, to a particular allegation—the inquest, in its evolution into the modern jury, was to impart to English procedure its distinctive lineaments. The imported procedure, installed as the method of royal justice in the Curia Regis, undergoes marked development in the course of the twelfth and thirteenth centuries. For one thing, the use of the inquest so multiplies that by the beginning of the fourteenth century it has relegated the surviving formalistic modes of trial to a subordinate station; for another, the procedure in general is being subjected to the influence of the Romano-canonical principles. Meanwhile, there have sprung from the Curia Regis the three superior courts, the King's Bench, the Common Pleas and the Exchequer, and the justice of the king is becoming the justice of the realm. From the use of the *original writ*, evidencing for the particular case the royal authority to sue in the king's court, arise the common law forms of action, which, after exhaustion of the limited power of increase conferred in 1285, by the Statute of Westminster II, constitute, like the Roman *legis actiones*, a rigidly partitioned field of remedial law with even more rigid boundaries. And, under the joint influence of the inquest and the Romano-canonical principles, the mode of allegation has begun to take on a character of its own. The plaintiff's oral complaint goes by the Roman name of *narratio* or the Norman-French one of *counte* or *tale*. To defensive allegations,

also oral, the equally Roman name of *exceptio* is loosely applied. The Germanic word for word denial—known here as the *thwert ut nay*—still appears, but in general is restricted to the case where the defense is a direct negation. The Germanic right, under proper circumstances, of refusal to answer gives rise, on the one hand, to the right to pray judgment as to the legal sufficiency of adversary averment, yielding the earliest form of the English demurrer; on the other, merging hazily with the Romano-canonical idea of dilatory defenses, it effects a certain distinction between dilatory and peremptory exceptions. But always allegation and counter-allegation, as those of the old Germanic system, are directed toward producing directly the theme of decision: in case of trial by inquest, the theme to which the jury, by their *verdictum*, will speak.

Thus are laid the foundations of the English common law procedure. In the later development, the jury, which in the fourteenth century has still the unmistakable character of a group of witnesses, gradually puts off this character until, by the end of the seventeenth century (although some vestige of the old character does not disappear until later), it has become essentially what it is today, a body of impartial triers of fact on the basis of judicial evidence. To this growth of jury trial, rather than to Romano-canonical influence, is the English law indebted for the idea of logical proof. And, by the same token, it is this factor that operates to build up in the same law an organization of evidentiary rules whose counterpart is to be found in no other system. Alongside trial by jury there linger the older methods, but these gradually fall into disuse. Nevertheless, the Germanic trial by oath, known in England as *wager of law*, is not altogether a negligible thing as late as the seventeenth century, and, indeed, an English court feels obliged to concede its admissibility as recently as 1824; it is formally abolished, however, in 1833. Conspicuous is the development in the field of allegation: the more or less inchoate rules of the previous period become transformed into that well ordered system which we know as common law pleading. Under this system, as we see it at the beginning of the nineteenth century, the allegations are written; this change has supervened about three centuries before. The plaintiff's complaint has now long been termed the *declaration*, the defendant's allegation the *plea*. On the basis of the early distinction between exceptions, pleas are classed as dilatory and

peremptory. The plea, if need be, is followed by the *replication*, the replication by the *rejoinder*; further pleadings not uncommon are the *sur-rejoinder*, *rebutter* and *surrebutter*. The old challenge to the legal sufficiency of the opposing allegation has taken the shape of a written objection in point of law—the definitive form of the *demurrer*. The whole machinery of allegation has long been responding to settled principles. A demurrer is interposable against any of the factual pleadings; when so interposed there is an issue of law for the decision of the court, which decision may dispose of the whole case. Otherwise, the object is to produce an issue of fact—a formula to which the verdict of the jury will affirmatively or negatively subscribe; its relationship to the Germanic oath-formula created by mutual allegation is readily apparent. In the production of this issue two central principles concur. First, the responsive allegations (except those of the dilatory plea) must be either by way of traverse or by way of confession and avoidance. The traverse is the Germanic word for word denial, shortened to a denial *modo et forma*; the pleading by way of confession and avoidance represents a fusion of the Romano-canonical idea of *exceptio, replicatio*, etc. with the Germanic notion that whatever is not denied stands admitted. In the second place, the responsive allegations must be single: the traverse must be the denial of a single proposition of fact; the pleading in confession and avoidance may advance but one answer to the opposing allegation. Accordingly, if the plea to the declaration is a traverse, an issue is at once arrived at, requiring for completion only a formal joinder. If, however, the plea is by way of confession and avoidance, a replication is called for, which in turn is either by way of traverse or by way of confession and avoidance; if the latter, a rejoinder is required from the defendant, which in its turn observes the same rule; and so the process continues, eliminating the uncontested allegations, until the issue is reached. The interesting feature of the system is its production of this issue by the automatic operation of the pleadings themselves without any selective activity on the part of the court. The requirement of singleness, however, is materially abridged by the broad scope given in certain forms of action to a stereotyped plea of traverse known as the *general issue*. It becomes further affected in 1705, when growing recognition of its hardship upon the defendant brings about the statutory right to plead a plurality of peremptory pleas, with re-

sulting multiplication of the issues to be passed upon by the jury. Such are the main lines upon which, subsidiarily regulated by a complex of technical rules, moves the system of common pleading in its classic form.

In the fourteenth century the limitations of the common law method of judicature and, in particular, the crystallization of its scheme of writs had brought into existence the Court of Chancery (see EQUITY). Since those who guided its earliest destinies were ecclesiastics, trained in the canon law, and since, moreover, its very character as a "court of conscience" demanded more searching instrumentalities for elicitation of the truth than were afforded by the common law processes, it was bound to develop a form of procedure distinct from that of the common law courts. For this, naturally enough, it levied extensive contribution upon the procedure of the English ecclesiastical courts, yielding thus to the mediaeval Italian principles a much greater influence than they had exercised upon the common law procedure, but it also borrowed in no inconsiderable measure from the common law procedure itself. At first loose and variable, the chancery, or equity, procedure attains to a well defined system in the seventeenth century, taking on substantially the form which it was to wear for the next two centuries. Here there is no original writ, no forms of action. The suit is commenced by the exhibition, i.e. the filing, of the *bill of complaint*, whereupon there issues the writ of *subpoena* requiring the defendant's appearance. The word "bill" is simply a truncated form of "libellus"; the bill in fact corresponds to the Romano-canonical *libellus*. But it does not stop here: it becomes an essential part of the mechanism of discovery, whereby evidence is sought to be obtained from the defendant to aid the plaintiff in proving his case. Specifically, it incorporates, by its so-called charging part, what are essentially the *positions* propounded by the plaintiff in the Romano-canonical system. Thus the libel and positions, separate in that system, are here combined in a single document. From the common law procedure is borrowed the *demurrer*, but this is available against no pleading other than the bill. From the same source comes the *plea*, utilized when the defense is reducible to a single ground and particularly for the purpose of limiting the defendant's duty of making discovery. If the defendant cannot protect himself by demurrer or plea, he must file an answer under oath, wherein he sets forth his defense, concurrently giving the discovery

sought by the bill. The answer, therefore, always contains the analogue of the defendant's responses to the Romano-canonical positions; in so far as it sets forth an affirmative defense, it represents a combination of the Romano-canonical *exceptio* with these responses. Plea or answer is followed by *replication*, beyond which in the later development the pleadings do not go; and the replication is no more than a formal denial, signaling, under common law influence, the joinder of issues. In this procedure, 'there is no jury to share the decisory function of the judge; the chancellor sometimes causes an issue of fact to be formulated and sent to a common law court for trial by jury, but the verdict of the jury is advisory only, never binding upon him. The Romano-canonical influence extends to the method of taking testimonial evidence. As opposed to the *viva voce* hearing of witnesses, characteristic of the common law tribunals, all testimonial evidence, with but the slightest of exception, is privately taken down in writing by examiners or commissioners. What comes before the court, therefore, are the written depositions of the witnesses, resulting from written interrogatories of the parties—depositions which are not seen by either party until opened pursuant to formal order of publication.

The opening of the nineteenth century sees these divergent systems existing side by side, in both England and America. But the common law system of pleading in the course of its development had become invested with an atmosphere of artificial refinement; too frequently pursuit of its intricacies obscured the end that it was intended to serve, and cases were won or lost on questions of pleading without ever reaching the merits. So difficult, indeed, was its administration, that in England the drafting of pleadings had become the province of specialists: of the activities of the "special pleader under the bar" a glimpse may be had in Samuel Warren's novel, *Ten Thousand a Year*. Moreover, despite the admirable logic of its basic principles, it was a system essentially adapted to a simpler order of society and was proving inadequate to meet the demands of the times. The chancery procedure, on its part, had become cumbersome and expensive: its dilatory character in England, later to be the burden of Dickens' *Bleak House*, has given to literature the case of Jarndyce v. Jarndyce. Conditions in general were ripening for radical change—a change, however, in which America was to take the lead.

In England, an initial attempt at improvement produced, for the common law courts, the Hilary Rules of 1834, but the net effect of these was to add to the difficulties of the pleading system. Better success attended the Common Law Procedure acts of 1852, 1854 and 1860, which had substantial effect in the direction of simplification. The equity procedure was also the subject of attention. Various rules of court and statutes, in particular the Chancery Practice Amendment Act of 1852, contributed materially to its betterment. But sweeping reform was demanded and this came with adoption of the Judicature acts of 1873 and 1875, which, consolidating the principal courts of the kingdom, removed the partition between law and equity and provided, as far as possible, for a uniform procedure in legal and equitable causes. This procedure, as regulated by the Rules of 1883, with subsequent amendments, contemplates in general the commencement of suit by the issuance of a *writ of summons*. The declaration or chancery bill is replaced by a *statement of claim*, the plea or answer by a *defense*. Under certain circumstances there may be a *reply*, and later pleadings are possible but not usual. The demurrer has been abolished: instead, the party includes his *objection in point of law* in the defense or reply. The system retains the common law principle of admission by the absence of denial (and to denial is here equated a statement of non-admission) but the technical apparatus of common law pleading has been entirely discarded. Discovery may be had in both legal and equitable causes, not as in the chancery system, but by the use of written interrogatories quite as separate from the pleadings as were the Romano-canonical positions. There is general application of the common law method of oral examination of witnesses in open court. An outstanding feature of this procedure is the part played by the subordinate judicial official known as the "master," who, on *summons for directions*, regulates, for each case, the course of the preliminary steps, even to determining whether there shall be pleadings at all. Advantageous as this feature would seem, it apparently has not always proved to be in the interest of expedition, since by certain amendments to the Rules in 1932, there has been established the so-called "New Procedure," which, for certain cases, has transferred the hearing of summons for directions from the master to the judge.

Notable among early American efforts at

reform is the Georgia Judiciary Act of 1799, which, carrying out certain legislative expressions of even earlier date, sought to elide the distinctions between the common law forms of action and to set aside the complications of common law pleading—an effort, however, which was largely frustrated, in part by the crudity of the relative provisions, in part by the conservative attitude of the courts. In 1848, however, came the New York Code of Procedure. This boldly centered itself in what a quarter century later was to constitute the core of the English reform; namely, the breaking down of the procedural distinctions between law and equity. It provided that, apart from certain special proceedings, there should be but one form of action to be known as a “civil action,” and established a uniform system of pleading. The suit was to be begun by *complaint*, a copy of which, with a summons, was to be served upon the defendant. The defensive allegations of fact were to be contained in an *answer*, which, if necessary, was to be followed by a *reply* from the plaintiff. All these pleadings were to be upon oath (a requirement later modified), and, by an application of the common law principle, allegations not controverted were to be taken as admitted. Place was given to the *demurrer*, restricted, however, in its application, to defined grounds of substance. Discovery was provided for by the new method of *oral examination* of the opposite party. *Viva voce* hearing of the witnesses in open court was made the rule for all cases. Into the procedure for common law causes, in its phases other than pleading, was introduced a considerable measure of that flexibility which had hitherto prevailed in equity. Redundancies were eliminated on every hand and, in general, the lines laid down of a system which, although characterized by less liberality and adaptability to the individual case than the methods of the future English Rules, represented a momentous contribution to procedural progress. This legislation was speedily copied by other states, beginning with Missouri in 1849, until its provisions, with more or less variation, found widespread adoption. Thus was established what goes by the generic name of “code procedure.” The codes so enacted have since undergone frequent modification, but in general preserve the original basis. The New York Code of 1848, after frequent amendments, was succeeded by the Code of 1876, whose regulation of detail was such as to produce a host of new technicalities, and which, in turn, gave way

to the Civil Practice Act of 1920. Of the codes in general it may be said that, apart from faults due to the hurried production of the New York archetype, two factors have operated to their disadvantage. In the first place, the early administration of the code provisions fell to judges trained in the old order, many of whom failed to exhibit that sympathy with the new principles essential to their complete success; and from the unfortunate interpretations of this period, the subsequent course of decision has found it difficult to free itself. And, in the second place, the constitutional provisions preserving the right of jury trial, as it existed at common law, have very seriously fettered the courts in administering law and equity in the same suit. For their existence involves the constant necessity of distinguishing between common law and equity questions in order to determine the method of trial. On this account, the code procedure, broadly speaking, falls short of achieving the highest degree of efficiency. The states whose procedure is thus based upon the principles of the New York Code of 1848 represent a majority of the American jurisdictions. Elsewhere there is generally retained in some form the separate administration of law and equity, under methods of procedure representing various gradations between mere modification of the two old systems and the outright system of the codes. Not so, however, in Louisiana and Texas: in the one case, the civil law basis of its legal system, in the other, the peculiar growth of its procedural institutions, not uninfluenced by civil law ideas, has excluded the separation in question and invested the procedure with an individual character. The later state reforms, it should be added, have been disposed to take suggestions from the English Rules. The New York Civil Practice Act of 1920 has been thus influenced; such also has been the case in other jurisdictions, particularly New Jersey, Michigan and Illinois. In the federal courts, along with a separate administration of law and equity, slightly modified, the double form of procedure continues to prevail. For common law causes these courts, under the Conformity Act of 1872, apply in the main the procedure of the state wherein they are sitting. Equity causes, on the other hand, are under the governance of rules prescribed by the Supreme Court, in pursuance of statutory authority. Down to the Rules of 1912, the procedure obtaining was a modified version of the classic English chancery system, but these rules introduced revolutionary changes

influenced by both the codes and the English Rules. Under this new system, the suit is still commenced by *bill*, but the bill has ceased to be a part of the mechanism of discovery and represents merely a statement of facts and a prayer for relief. The plea has been abolished, as has also the demurrer; the substance of the latter, however, is still present under the name of *motion to dismiss*. The defendant may present his legal objection to the bill either by that motion or by incorporating it in his *answer*, the normal function of which is the presentation of the factual defense. The answer, performing no office of discovery, is not upon oath; to it is applied the principle of admission by failure to deny. Discovery is obtained, as under the English Rules, by means of written interrogatories, separate from the pleadings and proposable by either party. Hitherto, there had prevailed a modification of the old chancery system of deposition-evidence, but there came now a belated introduction of open-court hearing of witnesses, as in common law causes.

Besides aiding to shape the procedure of common law and equity causes, the mediaeval Italian principles had a yet further influence upon the Anglo-American system. By reason of the fact that the English ecclesiastical courts exercised a limited jurisdiction in the matter of wills and administration of decedents' estates, as well as in matrimonial causes, down to the middle of the nineteenth century, their rules of proceeding have left certain traces upon the modern procedure applicable in these fields. But more definite has been this influence in the field of Admiralty (*see* MARITIME LAW). The early English admiralty procedure was in effect a summary form of the Romano-canonical, and while the later development has more and more approximated the procedure in admiralty causes to that obtaining in civil causes generally, its Romano-canonical origins are still reflected. This is true even in England, where admiralty causes for the most part are governed by the ordinary rules, but it is particularly true in the case of the American admiralty procedure, which still constitutes a separate system.

Though lying outside the Anglo-American development the civil procedure of Scotland exhibits certain contacts with that development, principally at two points; namely, in its early history, when it was acquainted with the original writ and the Norman inquest, and in the first quarter of the nineteenth century, when the reintroduction of civil jury trial brought with it

a large measure of the English law of evidence. Between these times, however, the procedure had acquired an independent form, in which, due to the pre-Reformation influence of the church and to the resort of Scottish law students to continental universities, the Latin element was predominant. As a result, the Scottish procedure has not had to contend with forms of action or the separation of law and equity. Of its distinctive system of written pleadings a material constituent is the use of the *plea in law* by which is identified the legal theory of action or defense—a device well deserving the attention of Anglo-American reform. Interesting from the historical standpoint is the order allowing proof in non-jury cases, in which is plainly seen a reminiscence of the old Germanic proof-judgment.

The Procedural Relation. What we have had occasion to speak of in the foregoing survey as the *cause* is in essence a particular jural relation existing between party and party, on the one hand, and parties and court, on the other, a relation which is instituted, shaped, made to progress and terminated through the cooperation of the court and the parties. This idea of the cause as a jural relation entered definitely into procedural science through the work of Bülow, *Die Lehre von den Prozesseinreden und die Prozessvoraussetzungen*. It has its inspiration in the *judicium* of the Roman formulary period. Although assailed by various writers and, particularly, in the recent work of Goldschmidt, it continues to find general acceptance in the scientific treatment of procedure on the continent. To the perfect existence of the relation certain conditions are always necessary: foremost of these are jurisdiction of the court over subject matter and parties and procedural capacity of the parties. A defense which goes to one of these preconditions is a very different thing from a defense which goes to the merits of the plaintiff's claim. Thus the conception at once affords a key for distinguishing defense-objections by their nature belonging *in limine* from true defenses to the action. But it is of much wider import. As expressed by Rosenberg, "its significance lies in the fact that it renders possible a unitary conception of the action-proceeding, consisting as it does of numerous separate acts and legal situations." The relation may be single or multiple: it is single when it involves a single demand by a single plaintiff against a single defendant, multiple, when there is plurality of demands or of parties. Hence

systems of procedure must regulate the *joinder of actions and the joinder of parties*. The plurality may exist from the outset; on the other hand, it may supervene in the course of the proceeding, as by *amendment*, by *consolidation of causes*, by *intervention* of a third party, by *counterclaim* on the part of the defendant. Starting point of the relation in the Roman formulary system was the *litiscontestatio*; for modern procedure it is the notification to the defendant requiring his appearance, in Anglo-American terminology, the *service of process*. In the Roman formulary system, the preconditions of the cause had already been verified before the relation came into existence; in the procedure of today the relation comes into existence subject to be defeated by the later appearing defect of these preconditions. The principal factors shaping the content of the relation are the allegations and proof. Here most systems have been governed by the principle of party presentation (*Verhandlungsmaxime*), under which the shaping is the work of the parties: the court is there to take the case, as the parties present it, enforcing the rules of presentation, but otherwise limiting its activity to passing on the case thus presented. In contrast stands the principle of judicial investigation (*Untersuchungsmaxime*) which makes the court an active, initiating agency in the shaping. Such, indeed, is the principle generally characterizing the continental criminal procedure. It is the principle, too, adopted for civil litigation by the Soviet Russian Code of 1923. Apart from this instance, however, the principle has never attained to ascendancy in civil procedure, with one outstanding exception. That was its domination of the system inaugurated in Prussia under Frederick the Great, the signal failure of which has sufficiently demonstrated that any wholesale application of this principle is not in the best interests of civil justice. Nevertheless, outside of the ancient Germanic procedure, elements of it are everywhere present; an example is the right of the English or American judge to call a witness of his own volition. As the relation is a progressing one, there must be regulation of the power of impulsion. Here, again, we have two contrasting principles. Under the one—the principle of party-prosecution (*Parteibetrieb*)—it is the parties who urge forward the cause, under the other—the principle of judicial prosecution (*Offizialbetrieb*)—it is the court. No system, perhaps, except the ancient Germanic, exhibits an unalloyed application of the former principle; elsewhere the question is as to the

predominance of the one principle or the other. The Roman imperial procedure, the Romano-canonical procedure, the procedure of the German common law all show the preponderant influence of the court in this regard, while in modern procedure it is generally the case that the balance lies in the opposite direction. If the procedural relation is defeated for lack or defect of a precondition, that defeat is registered by judgment: representative of such a judgment is the *absolutio ab instantia* of the Romano-canonical system or the *quod breve cassetur* of the English common law. Otherwise, unless sooner ended by voluntary act or conduct of the plaintiff (here the Anglo-American law speaks of a judgment of non-suit or dismissal) it proceeds to its normal termination, which occurs by judgment on the merits.

Tendencies of Procedural Reform. Because of the very nature of procedure its development manifests more conspicuously than that of any other field of law a constant and conscious striving for improvement. As in the case of all legal development, the direction of this striving veers from time to time in obedience to the prevailing political and social influences. Hence it is only natural that the variously conceived relation of the state to the individual should be reflected in the rules of civil procedure. Yet generalization in this regard is not to be pressed too far; otherwise it would be difficult to explain why revolutionary France, after a brief period of procedural nihilism, went back to the civil procedure of Louis XIV. Moreover, while different systems will thus emphasize differently the interest of the state and the private interest, there is general agreement that both interests are subserved when the obtaining methods are accurate on the one hand, and expeditious and inexpensive on the other. And, even as to the methods themselves the effect of this difference in emphasis tends to grow less and less. Highly significant is the circumstance that the changes undergone by Anglo-American civil procedure in the course of the past century have given it closer likeness to the corresponding institutions of the continent, while those which the continental systems have experienced in the same period represent in considerable measure—here is to be especially noted the spread of orality and publicity—the taking on of aspects traditionally familiar to the Anglo-American. This process is bound to continue, especially aided on our side by the gradually diminishing incidence of civil jury trial. Both on the continent and in the

Anglo-American jurisdictions the march in general is towards simplicity and flexibility. In both provinces reliance is being placed upon a heightening of the authority of the judge. Judicial discretion, within guarded limits, is dislodging set rules. The principle of party presentation is being more and more tempered by special applications of the opposite principle; the values of the principle of judicial prosecution, properly restricted, are encountering a new appreciation; as a factor of flexibility, the power of the court to regulate the course of the particular proceeding—the directive power—is being constantly enhanced. This drift, conspicuously evidenced on the one side by the English Rules of 1883 and, on the other, by the influential Austrian Code of 1895, finds continued manifestation in the more recent American reforms, as it does in the later continental codes. As to the mechanics of procedural reform, there exists at present material divergence between Anglo-American and continental ideas. The continental solution is that the rules of procedure should be prescribed by the legislator, under the advice and assistance of experts. This view, indeed, is the traditional one in our own system, and, it must be admitted, the one still commonly applied in American practice. But in England and America the courts have always possessed the inherent power to prescribe their own rules within a vaguely defined area. The existence of this power has led in America to the contention that it is a plenary one and that in enacting procedural rules the legislature is in reality usurping the province of the judiciary. The dominant American view, however, is converted to the principle of the English Judicature Acts. Conceding that the power in general belongs to the legislature, it would have the latter restrict itself to laying down the basic lines of the procedural scheme, while delegating the working out of detail to an expert rule making body, either the highest court in the particular judicial system or a composite group such as the English Rules Committee, or the Judicial Council, as it exists in a number of American jurisdictions. The advantage of this method lies not only in its immediate utilization of expert knowledge, but also in the facility which it affords for keeping abreast of new conditions, without the necessity of setting in motion the clanking machinery of legislation.

The Literature of Civil Procedure. The history of the literature of civil procedure exhibits two great movements in which science takes pre-

cedence over merely practical application of placidly accepted rules. The first—marking, indeed, the beginning of a separate literature of the subject in any sense—is that which, as both product and agency of the renascence of Roman law in northern Italy, was to systematize and clothe with conquering attributes the Romano-canonical principles. From the closing years of the twelfth century, through the thirteenth and well into the fourteenth, it proceeds, fed by the activities of the jurists, ecclesiastical and secular, attached to the Italian universities. Of the numerous writers who effectively contributed to the development of procedure in this period there stand out prominently Pillius, Tancred, Gratia, Durantis, Bartolus and Baldus. At the head of the resultant productions must be placed the *Speculum judiciale* of Guilielmus Durantis, dating from the second half of the thirteenth century—incomparably the richest repository of the Romano-canonical procedural learning. After the fourteenth century, a few only of the writings originating in Italy had any wide influence; among these the best known, perhaps, is the *Speculum aureum* of the Neapolitan Robertus Maranta, published in 1540. But, with the transplantation of the Italian principles in Germany, the same movement found there an access of vigor in the sixteenth century works of Mynsinger and of Gaill, which, though primarily addressed to the procedure of the Imperial Chamber of Justice, attained more than domestic repute. The second great movement is the German one of the nineteenth century. This took its rise in the coming to ascendancy of the historical school of jurisprudence, founded by Savigny. Research into Germanic and Roman origins infused new life into procedural thought and, beginning with the first quarter of that century, there poured forth for the next fifty years a stream of writings illuminating, from the new standpoint, a myriad facets of procedure. Here the names of Bethmann-Hollweg, Bayer, Wetzell, Briegleb, Planck, Bülow, Kohler and Wach by no means exhaust the list of authors whose works are now ranked as classic. The later activity in Germany has built upon the foundations thus laid, as has also that in Austria and Hungary. In the latter regard are to be noted the figures of Franz Klein, principal architect of the Austrian Code of 1895, and of Alexander Plósz, who bore a similar relation to the Hungarian Code of 1911. Among systematic treatises relating to the present day procedure special mention is deserved by those of Hellwig and

Rosenberg, for Germany—Rosenberg's work embracing the reforms of 1924—and those of Pollak and Sperl, for Austria. As Italy, in a past day, had given procedural science to Germany, so the German movement of the nineteenth century, in turn, communicated a new impetus and direction to Italian studies in the field. Largely because of this the last fifty years have seen a new blooming of Italian procedural science. Its evidences appear in the writings of Mattiolo and Mortara, but more especially in the contributions of Lessona and of a younger generation, represented by Chiovenda, Carnelutti, Menestrina and Calamandrei. The *Principii* of Chiovenda furnishes an admirable exposition of the existing Italian system.

Elsewhere the literature has generally followed local trends with emphasis on the practise. In France the development of procedure owes much to the *Stilus curie parlamenti* of du Breuil, a masterly presentation of the practise of the Parlement of Paris, which appeared in the fourteenth century. Of procedural significance is also the approximately contemporary *Somme rural* of Bouteiller. Not French but Flemish was the practical jurist Damhouder, who wrote in the sixteenth century; his influence, nevertheless, reached the French procedure, besides extending into Holland and even Germany. In the same century is to be underlined the French work of Imbert, in the next, less heavily, that of Lange, while in the eighteenth special importance attaches to the short treatise of Pothier, and to Pigeau's work on the procedure of the Châtelet. In present day literature, the treatise of Garsonnet and Cézair-Bru shares first place with that of Glasson, Tissier and Morel. As regards Spain, apart from the seventeenth century *Labyrinthus creditorum* of Salgado de Somoza, a work of international renown in the field of bankruptcy procedure, mention should be made of the *Curia philipica* of Hevia Bolaños and the *Librería de escribanos* of Febrero, published in the seventeenth and eighteenth centuries, respectively: these are of special interest in America because of the influence their procedural chapters exercised upon the formation of the system of civil procedure in Louisiana. Modern Spain, like France, has kept aloof from the current of scientific thought in the procedural field, but, if one is to judge by the treatise of Miguel y Romero, published in 1931, is beginning to give evidence of a change in attitude. In the northern countries, the particularistic tendency has long been tempered by

the influence of the German literature: the later writings, especially those of Hagerup and Skeie in Norway, Kallenberg in Sweden, Munch-Petersen in Denmark and Wrede in Finland respond to the discipline of modern German and Austrian procedural science.

The literature of Anglo-American civil procedure goes back to the initial monuments of English legal literature in general; namely, the book written in the twelfth century under the name of Glanvill and Bracton's great treatise of the following century. This was the period of the early relationship of English procedure to the Romano-canonical teachings. These teachings are patent in Bracton, present there, indeed, in much fuller measure than was ever translated into practise. Except for that early relationship, Anglo-American procedure has been unaffected by the two continental movements, and its literature, accordingly, has followed a course of its own. Down to the description contained in the third book of Blackstone's *Commentaries* (1768) it consists in the main of barren tractates, digests of decided cases and collections of forms, all for practical guidance in the conduct of litigation. Among their number major importance is to be accorded to the source book of original writs, known as the *Natura Brevium*, which, first issued in the fourteenth century, was in 1534 published in revised form as Fitzherbert's *New Natura Brevium*. Particular notice is also merited by Theolall's *Digest of Original Writs* (1579) and Ever's *Doctrina Placitandi* (1677). Of exceptional character is the *Forum Romanum* of Chief Baron Gilbert, addressed to the chancery procedure, and first published in 1756, thirty years after the author's death. The better order of procedural writing, of which this book was a precursor, definitely set in toward the commencement of the nineteenth century. The common law procedure, apart from pleading, was dealt with in a number of works, including the well known *Practice* of Tidd (1790-94). The practical treatment of common law pleading reached its apogee in the work of Joseph Chitty (1809)—a book whose influence in the formative stages of American legal development has been only second, perhaps, to that of Blackstone's *Commentaries*—while a reasoned exposition of the controlling principles found place in the classic manual of Henry John Stephen (1824). On the equity side, the rules of pleading were treated in the works of John Mitford (Lord Redesdale) (1780) and others, followed by the American work of Joseph Story (1838), and

those of chancery procedure as a whole in the extensive treatise of Daniell (1837-41). In pronounced contrast to this purely professional body of writing is the posthumously published *Principles of Judicial Procedure* of Jeremy Bentham (1843), which, envisaging the subject in its larger aspects and from his common standpoint of utility, embodies the author's suggestions for a properly constructed system of "natural" as opposed to "technical" procedure. Bentham's writings in general, influential as they have been in the betterment of the positive law of procedure, did not alter materially the main current of Anglo-American procedural literature. In its subsequent course this has shown constant improvement in method, but a continuing emphasis upon practise, to the neglect of basic theory. Outside of the field of evidence, where the practical and theoretical find happy marriage in the superlative achievement of Wigmore, it cannot be regarded as possessing anything like the scientific character ascribable to the corresponding literature of Germany or Italy. There has thus been slighted a source of aid which the Anglo-American system, comparatively excellent as it is, needs to have at command. In the repair of this deficiency lies a task of more than ordinary moment, for it is precisely the cultivation of procedural science that will afford the surest guide to future direction in the improvement of our judiciary institutions.

C. von, *Geschichte des römischen Rechts im Mittelalter*, 7 vols. (2nd ed. Heidelberg 1834-51); Schulte, J. F. von, *Die Geschichte der Quellen und Literatur des canonischen Rechts von Gratian bis auf Papst Gregor IX*, 3 vols. (Stuttgart 1875-1880) vols. i-ii; Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910); Holdsworth, W. S., *Sources and Literature of English Law* (Oxford 1925); Winfield, P. H., *The Chief Sources of English Legal History* (Cambridge, Mass. 1925).

PROCEDURE, PARLIAMENTARY. Every deliberative assembly must operate under certain recognized procedural rules regulating its organization, its day to day functioning and its adjournment. Such rules, originally devel-

oped to prevent hasty action and insure adequate and orderly deliberation, have more and more been converted into means of permitting the effective utilization of the limited time available. In countries with written constitutions, certain fundamental procedural requirements are generally included in the constitution; this has probably been carried furthest in the state constitutions in the United States and in the German constitution of 1919. It is a general principle of representative democracy that, aside from these more or less limited constitutional requirements, assemblies shall control their own internal organization and rules of procedure. This is done by means of standing orders and rules adopted by the body, precedents set by the speaker or other agency entrusted with the decision of questions of order and usages developed by the assembly in the course of its history. To these must be added the customary procedure of the party groups in the assembly, such as, for example, the caucus (*q.v.*).

Many external features of similarity might suggest that procedure in the various democratic assemblies is practically uniform. Everywhere bills are introduced, they are discussed by committees and debated on the floor, amendments are proposed and voted on and a final vote is taken on the amended measure. To a considerable extent this similarity is imposed by the nature of the task at hand. To some degree, however, it is traceable to the fact that procedure in a great many parliaments developed out of that in the British Parliament, the Mother of Parliaments. The general lines of procedure in the House of Commons were already largely settled by the end of the seventeenth century. The conscious imitation of British procedure is most apparent in the legislatures of the British dominions; many of these parliaments have specifically stated in their standing orders that all points not otherwise covered shall be regulated by the rules and precedents of the British House of Commons. In the United States the colonial assemblies set out to copy the procedure in the Commons. The influence of the House of Commons was exerted most directly upon Congress through the *Manual of Parliamentary Practice* which Thomas Jefferson as vice president drew up to govern the procedure of the Senate over which he presided. Jefferson simply restated the current English practise, drawing freely upon *Huttsell's Precedents*. The *Manual* was adopted by the House of Representatives in 1837; it still regulates the procedure in both houses except

as subsequently modified. English procedure furthermore exerted a strong influence on the continent, particularly in France and Germany, largely as a result of Dumont's *Tactique des assemblées législatives* (2 vols., Geneva 1816), which disseminated Jeremy Bentham's ideas. One example of the ubiquity of the English rules is the requirement that all bills must have three readings; originating at a time and for reasons obscured in the distant past, this rule appears in Anglo-Saxon countries, in many continental legislatures and in Japan.

Developments which have taken place since the original adoption of the English practise have, however, produced such significant changes in the functioning of parliaments that their actual operations have become quite different from the English model. The principal variation is in the use made of committees (*see* COMMITTEES, LEGISLATIVE). In the House of Commons the function of the standing committees is limited. A general discussion of the principles of the bill takes place on the floor of the House before it is sent to the committee, which can amend it only in terms of the general subject matter already decided on and, as a general rule, in points which are not controversial. In addition the most important bills do not go to a standing committee at all but are considered by the House as a Committee of the Whole. In the United States, on the other hand, the power of the committees is so great that it has frequently been stated that the real legislation is accomplished by them. They can kill a bill, amend, revise or rewrite it in any way or even introduce an entirely new bill. Bills go to committee before any discussion has taken place on them; the vast majority of them die in committee. In France too the power of the legislative commissions is very great. Not only do they have considerable power to amend the bill while it is in committee but the debate in the full house, which follows the report by the commission's *rapporteur*, is directed by the reporter and the president of the commission rather than by the member who originally introduced the proposal. Almost all amendments must go to the commission for consideration and report before they can be debated on the floor. In Germany before 1933 the Reichstag committees had large powers of amendment, but they received bills in many cases after the full house had debated the general principles, and their guidance of the measure ended with their report. The insistence by the British Parliament that all controversial points shall be decided on

the floor of the House may in some measure account for the fact that, although the tendency to delegate details to administrative officials or bodies has been greater in England than in the United States, the total hours of sittings for the three years 1927-28, 1928-29 and 1929-30 averaged over 50 percent more per year for the House of Commons than for the House of Representatives.

Another important procedural variation centers about the role of the speaker. In all countries party strength determines his original election. But in the Commons, once elected, he divests himself of party character and becomes a completely impartial moderator of the proceedings. He takes no part in party activities, never speaks on the floor of the House and only rarely in Committee of the Whole. He has a casting vote but uses it only to continue discussion of the measure. Regardless of changes in party control of the House he continues to be reelected until he resigns or dies; his constituency is, as a general rule, not contested by the opposing party in a general election. In the House of Representatives, to take the other extreme type, the speaker is not only a partisan but one of the principal leaders of the majority party. Before 1910 he was, next to the president, the most powerful political figure in the country, occupying a position similar to that of a premier under a cabinet form of government. His strength developed principally from his power to appoint committees in an assembly in which committees predominantly determine legislation and the political future of the individual members. Furthermore as ex officio chairman of the powerful Committee on Rules and as the person who selected the other members of the committee he was able to control the order of business. A third source of power was his right arbitrarily to recognize or refuse to recognize members. Even after the "revolution of 1910" stripped him of his power over committees and his membership in the Committee on Rules and limited in certain ways his right of recognition, he remained an important party leader. At present he introduces bills, takes part in debate and votes on occasion, even when the vote is not tied. The president of the French Chamber occupies a position between these two extremes. He continues to take part in politics, occasionally speaking from the floor and even voting; his recognized duty in the Chamber, however, is to function as an impartial moderator rather than as a party leader. The position of the president

of the Reichstag under the Weimar constitution was somewhat similar, although he was perhaps more active in behalf of his party. In Japan the speaker of the House of Representatives functions as a partisan, although he is less a leader than an agent of his party. Even the dominion parliaments have not adopted in toto the British model of a speaker completely above and beyond politics and the strife of the chamber.

Procedures differ further as to the agency which controls the allocation and distribution of time. Such control is imperative if the more pressing measures are not to be lost in a flood of legislative proposals or dammed up by unlimited discussion and obstruction (*see* OBSTRUCTION, PARLIAMENTARY). In England the time table is under the direct control of the government. In the United States it is in the hands of the majority party, which exercises its control by means of a "Steering Committee," differently constituted in each house but in general including the leading party members. Party control in the House is perhaps more effective than in any other representative assembly; in the Senate, however, control is not so easily maintained, largely because of the greater difficulty in effecting closure (*q.v.*) of debate. On the continent the multiparty system makes impossible control of the order of business by a single party and in both the Chamber of Deputies and the Reichstag representatives of all parties share in the determination of the time table. The *Ältestenrat*, however, which was charged with this function in the Reichstag, had no effective means of enforcing the order agreed upon. The French Senate still employs the procedure, also in use in the Chamber before 1911, of having the president set the program, subject to approval by the house; this arrangement works better in the orderly Senate than it did in the notoriously turbulent Chamber.

Another difference arises from the classification of bills in certain assemblies. The English and dominion parliaments have separate procedures for public bills and so-called private bills (bills of private and municipal corporations, not to be confused with private members' bills); in addition terminological and procedural distinctions are made between government bills and private members' bills. In France and Germany government bills (*projets*, *Vorlagen*) are distinguished terminologically from private members' bills (*propositions*, *Anträge*); there are also procedural differences regarding the introduction of the bills and the former enjoys actual,

although little formal, procedural priority. In the United States, where cabinet members do not participate in the assemblies, even to the extent of answering questions or interpellations (*q.v.*), there are theoretically no government bills; all bills are introduced by individual members and go to committee in the usual way. Even money bills, which in most countries receive separate treatment (*see* BUDGET), are subject only to the requirement that they must be introduced in the House. However, effective party control of the committees and of Congress makes the great majority of bills passed in fact party bills rather than individual bills. The extent to which the American system can, where executive and Congress are controlled by the same party, be converted into one in which "government" bills have precedence was strikingly demonstrated by the manner in which President Franklin D. Roosevelt pushed through an amazingly complex and far reaching legislative program within a few months after he assumed office in March, 1933.

In all countries the fact that procedural rules and practise have increasingly circumscribed the function of the private member has given rise to considerable complaint. Most of the witnesses who testified before the Select Committee on Procedure on Public Business of the House of Commons in 1930 and 1931 declared that the prestige of Parliament was declining because the government was curtailing the rights of private members and was converting them into voting machines who, without participating in or even hearing the debate, rush into the chamber at the cry of "division" to march obediently into the lobby indicated by the whip's thumb.

Quite clearly the prestige of parliaments has declined. This is not merely another expression of the chronic complaint to which MacDonagh refers when he remarks that "there has hardly ever been a time when it has not been asserted . . . that the authority of Parliament and the esteem in which it has been held have sadly declined." Lord Bryce, making allowance for this persistent criticism, nevertheless felt that the disparagement of legislatures had become too general to be disregarded. Since he wrote, antiparlamentarism has made even greater progress. Its rapid development in many countries, the emasculation of parliaments under dictatorships and the practically complete abolition of the parliamentary function in Germany and Italy testify eloquently to the danger which threatens representative democracy.

Parliamentary procedure must shoulder some of the responsibility for this development, not primarily, however, because it has limited individual rights but because, in the words of Sir Oswald Moseley, young English fascist leader, it has rendered Parliament incapable of "delivering the goods." The increasing tasks of government, the immense broadening of the scope of governmental activity as the state has more and more accepted the burden of social service, have rendered inadequate the outworn procedure devised at a time when Parliament was afraid of king and government, when the aim was to forestall rather than to aid legislation.

Procedural changes tending to expedite action might bolster parliamentary prestige somewhat. Valuable time might be saved, for example, by more modern means of voting; by abrogation of the custom, derived from a period when printing was more difficult than now, of having bills read aloud in full; by further if flexible limitation of debate; and by modification of the "unanimous consent" principle, which facilitates individual obstruction. Such modifications would be in line with the constant tendency to revitalize and modernize procedure. Since the broad procedural changes which followed the Reform Act of 1832, no fewer than twenty select committees of the House of Commons have inquired into procedure on public bills alone. Reforms, piecemeal and on occasion more general, have also been common in the United States and in France.

Procedural changes alone, however, can touch only a small part of the problem. Even the simplest procedure operating in assemblies with 615 members, as in the British Commons or as in the French Chamber, or 435 members, as in the House in the United States, must inevitably consume time. It is more important to relieve parliaments of some of their burdens, especially of the task of legislating on minute details, for which such large assemblies are obviously unfitted. Parliamentary function should rather be confined to stating broad general principles, leaving details to the proper administrative officials. Furthermore such matters as private bills for the relief of various individuals, which clutter up the calendar of Congress, or bills to secure divorces, which still come before the Canadian Parliament from Catholic Quebec, can with profit be shifted to judicial bodies. Only if the scope of parliamentary functions is curtailed can procedural changes be of any avail.

PRODUCERS' COOPERATION. The term producers' cooperation is commonly understood as applying to enterprises for the production of goods or services based on common ownership and management by a group of workers who by voluntary, non-political action have adopted this means of eliminating the employer-employee relationship with its concomitant of wage labor. In so far as self-employment is the dominating aim of such enterprises, there is a certain similarity between them and the associations of handicraftsmen which arose during the period of the commercial revolution, and which still exist in rural communities in Europe and Asia. In the latter, however, cooperation is usually limited to credit and marketing, the members being always independent producers, whereas in the former production itself is carried on cooperatively by the group and profits are distributed equally. While it is true that in the producers' cooperatives among handicraftsmen and artisans in the Soviet Union an increasing proportion, perhaps as large as 40 percent, represents collective groups of urban workers rather than rural handicraftsmen working independently, the character of the Soviet cooperative movement excludes it from discussion of the type to be found in capitalistic countries.

At the present time producers' cooperatives are not concerned with abolishing the profit system as based on the private ownership of the means of production or the sale of products in a competitive market, but merely seek to extend the range of participation in ownership and management. Originally, however, the movement for producers' cooperation grew out of programs of social reformers, pre-Marxian socialists and trade unions as a substitute for individual private ownership. Assuming that such cooperation was capable of extension by voluntary association to all of production and exchange, they envisaged the elimination of the capitalistic profit system. This ideal was expressed by Robert Owen, who regarded producers' cooperation as a step toward socialization and who in 1834 induced the organized British building workers to found the short lived Grand National Guild of Builders. In France similar concepts were put forth by Philippe Buchez, and the producers' cooperatives which were established as early as 1831 were dominated by such aims. Despite certain similarities these early experiments are not to be confused with the communistic colonies deriv-

ing from Fourier and Owen, which were attempts at a self-sufficient society, based primarily upon agriculture and secondarily upon industry. Moreover their voluntary nature distinguishes them from Blanc's attempt in 1848 to institute cooperative workshops under state sponsorship and from Lassalle's program for state financed cooperative workshops. The spread of the producers' cooperative movement in France in the 1840's served as the inspiration for the English Christian Socialists, whose attempts at producers' cooperation ended in failure in 1854. In fact in every country the voluntary cooperation of producers preceded other forms of cooperative organization; even the founders of consumers' cooperation, the Rochdale Pioneers, began their first venture as a producers' cooperative. The idea had particular appeal for skilled workers who had been deprived of employment by business depressions or by employers' resistance to or attacks upon trade unionism, and who regarded producers' cooperatives as substitutes both for wage labor and for unsuccessful strikes. The movement thus emerged, although not always with its full idealistic implications, in various countries and from time to time. It reappeared in England in the early 1880's, but one section split off to agitate for the more limited objective of labor copartnership. In the United States, although the Philadelphia carpenters had entered upon a cooperative venture as early as 1791, the movement did not receive its real impetus until the depression of 1847 and, after the hiatus caused by the Civil War, again in 1866-67. In the latter period small groups of workers in most of the important trades attempted to set up cooperative workshops. The most ambitious project was that established as a result of a protracted and unsuccessful strike by the Molders' International Union, then the strongest trade union in the country, under the leadership of W. H. Sylvius. Declaring that the principal goal of labor was to find a way of escaping the wage system, the union in 1868 changed its name to Iron Molders' International Cooperative and Protective Union and so amended its constitution as to make it practically impossible for any of its locals to strike. The last mass effort at producers' cooperation in the United States occurred when the Knights of Labor dominated the labor movement. Although it rose to ascendancy at the very time that large scale production was becoming firmly entrenched, its leaders, who were middle class in ideology, attempted to place

greater stress on producers' cooperation than on any other of the numerous activities of this all inclusive labor organization. For a short period, from 1883 to 1886, there ensued a feverish outcropping of producers' cooperatives, particularly in the industrial areas of the east and middle west and especially in the shoe, mining and cooperage trades, which accounted for half of the societies in existence. A contemporary survey listed the number of producers' cooperative societies in 1884 as 135. Complete statistical data are not available, but undoubtedly the movement was widespread until its collapse in the 1890's. This same period witnessed a revival of the French producers' cooperative societies, which had declined after the Revolution of 1848 and revived temporarily in the 1860's. In Italy unsuccessful strikes in the period from 1880 to 1902 led the organized workers in various industries to form cooperative enterprises as a substitute for strikes, and some of these have survived to the present day.

Nevertheless, despite its ambitious aims and the sponsorship by militant trade union bodies, the dominating ideal of producers' cooperation, self-employment, was essentially non-proletarian in character and a reversion to the middle class ideology of the pre-industrial capitalistic areas. It gained currency before large scale industry had obtained a position of dominance and before workers had been forced into the realization of their position in the industrial system. But as industry developed more and more into large scale production, the producers' cooperative ventures declined both in numbers and in their hold on the imagination of the workers. The launching of cooperatives required larger funds than workers could raise from their own savings and those of relatives or friends or from friendly labor organizations and other sympathetic sources. In contrast to consumers' cooperative societies, which at first were outnumbered by producers' cooperatives in most countries, the latter tended to become closed associations, incapable of expanding in scope and of recruiting any appreciable number of new members, because of capital requirements and the necessity of skill in both production and marketing and because additional membership threatened to reduce the share of the original group in such profits as were made. The few successful producers' cooperatives tended to become in effect partnerships of a group of individuals, resorting to hired workers in case of need for labor power and to share-

holders who were not themselves workers in the enterprise when they required additional capital. By 1890 therefore the movement had spent itself in the United States and had been replaced in importance in Great Britain by the consumers' cooperatives, which now embarked on their own productive ventures. In Germany the producers' cooperative enterprises initiated by such unions as the tobacco workers under the guidance of Elm had been peacefully absorbed by the consumers' cooperative movement.

At the beginning of the twentieth century only France and Italy had a producers' cooperative movement of any magnitude. Here two factors operated in favor of its survival. Both were predominantly countries of small scale industry, despite the early rise of industrialism in France, and in both it was possible for producers' cooperation to exist side by side with more or less similar capitalistic enterprises. It is significant to note that this economic development explains partially the dominance of revolutionary syndicalism in both countries until the period following the World War. It is highly probable, however, that even with favorable economic conditions producers' cooperation would not have made such headway in France and Italy without the paternalistic attitude of both governments which subsidized the movement by providing credit and markets. In both countries the largest number of societies with the greatest volume of business are those which have received contracts for materials or for construction work from governmental authorities.

In France, following a rather zigzag development in the 1840's and 1860's, producers' cooperation became revitalized in 1882. In 1884 was formed the *Chambre Consultative des Associations Ouvrières de Production*, a national organization to coordinate the isolated societies, which might otherwise fall by the wayside or become closed corporations or partnerships. Although it has never succeeded in obtaining the affiliation of all the local producers' cooperative societies, it has nevertheless been the pivotal point of the movement; and since 1900 its declaration that all members must join the appropriate trade unions has operated to intensify the working class character of these cooperatives, despite an increasing tendency in some to include non-workers as shareholders and to employ hired labor. Producers' cooperatives were stressed but never developed by the *bourses du travail* under syndicalist leadership.

Even more important, however, was the impetus given by the favorable legislation of 1884 which enabled public authorities to subsidize cooperative ventures and, when awarding contracts, to give preference to producers' cooperatives. Since then the movement has enjoyed the continuous and active support of the parties of the *hourgeois* left as well as of the right and has been considered a special protégé of the Socialist party. The rehabilitation projects in the devastated regions and more recently the nation wide housing program have stimulated considerably the growth of these societies. The strength of the French movement is shown by the following figures: as compared with 81 societies reported for 1892 there were 246 in 1899, 362 in 1907, 476 in 1913, 529 in 1921 and 603 in 1929. Full records for all these societies are not obtainable but are more readily available for those associated with the *Chambre*, whose member societies increased from 40 in 1891 to 280 in 1928 and to 340 in 1931; the membership of these affiliated societies rose from 16,000 in 1928 to 23,000 in 1931. The increase in value of business of the reporting societies, not all of which are affiliated with the *Chambre*, is indicated by the following figures:

YEAR	NUMBER OF SOCIETIES	VOLUME OF BUSINESS IN 1000 FRANCS
1907	297	50,359
1913	438	71,309
1921	379	199,525
1928	350	324,200
1930	356	386,772

The industrial distribution of these societies for 1930 is shown in the accompanying table.

In Italy there has always been a distinction between the cooperative labor societies in the field of public works and construction and the producers' cooperative societies. The former are cooperative contracting societies of manual workers which undertake the performance of specific contracts. The first of these was organized as early as 1883 in the district of Ravenna. In the pre-war period such societies received 85 percent of the contracts awarded by the public works department of that district, while their proportion for the country as a whole was 15 percent. This preference in government contracts was brought about through the interest of political leaders of all parties, especially Luzzatti, Padolini and Gamba, and through the legislation of 1889 modeled on the French enactments, which permitted a large amount of credit (subsequently raised to five times the original sum)

to be extended to these societies and exempted them from the necessity of competitive bidding. Such governmental favoritism was justified on the ground that the work was executed more efficiently and without interruption by strikes. Prior to the advent of the Fascist regime these societies were federated into a number of organizations which differed in religious or political outlook. In 1921, however, they were coordinated into the Federazione Italiana dei Consorzi e delle Cooperative Edili (Italian Federation of Building Cooperative Societies), which in turn constituted part of the more comprehensive federation of all cooperative societies. As in pre-war times, the members of these societies were required to join their respective trade unions; limitations were placed upon shareholding, distribution of profits and the like. The second type was the cooperative for industrial production, which developed largely under the auspices of trade unions and as a result of struggles with employers in the glass blowing, printing, baking and tailoring industries. Particularly significant was the growth of a centralized glass blowing cooperative founded in 1902, which by 1911 was supplying the major portion of the national output of flasks and wine bottles. A struggle with the capitalist trust led to its defeat; but it was replaced, with the aid of the cooperative bank of Milan, by four autonomous societies, which ultimately united.

The strength of these two forms of producers'

cooperatives is shown by the fact that out of a total of 19,510 cooperative societies in existence in 1921, 7643 were productive and labor societies as compared with 6481 consumers' societies. The membership of the former was reported in 1923 to be over 100,000; in 1932 the national federation of productive and labor cooperative societies reported 1146 societies, 107,000 members and capital reserves of 130,000,000 lire, with an annual business of 1,000,000,000 lire. Many of the cooperative labor societies have their own kilns and building materials works and have developed a highly efficient technical staff.

It is interesting that the revival of producers' cooperation outside of these two countries in the post-war period likewise took place in the construction industry and as a result of favorable governmental action. The building guilds which developed under trade union and labor party sponsorship in England and in Germany shortly after the war depended on contracts from public authorities; this was true as well of the building guild of the General Federation of Jewish Labor in Palestine, which from 1922 to 1927 depended in large part on contracts awarded in public works and building projects of the Jewish national bodies and the mandatory government. In all three countries, however, the building guild movement had practically disappeared by 1927.

The incidence of producers' cooperatives throughout the world is indicated by the statistics in *The International Labor Directory* for

1929, which lists 237 federated societies in 39 countries, not including the Soviet Union, with a total of 7043 for member societies in 1928 and an aggregate membership of 1,782,768. Whether these societies are truly producers' cooperatives is difficult to ascertain. Perhaps a better estimate can be gained from the figures of the International Cooperative Alliance, in which considerable discussion has taken place concerning the admission of such groups and from which the modified form of English labor copartnership had been excluded. The Alliance figures, which do not include Italy or the Soviet Union, show for 1928 720 societies in 29 countries with a total membership of 70,509, and in 1931 1131 societies with a membership of about 134,000. Only two of the national organizations, however, consist exclusively of producers' cooperatives: the French *Chambre Consultative des Associations Ouvrières de Production* and the Cooperative Productive Federation of Great Britain; the former in 1931 claimed 380 societies with 25,000 members, the latter, which in Great Britain is affiliated also with the Cooperative Union, 42 societies with 15,187 members. Of the total business done in 1931, £10,136,353, the British societies alone accounted for more than half the amount, £5,714,810. The decline of the movement in the United States is indicated by the fact that whereas in 1925 there existed 40 producers' cooperative societies, only 20 remained in 1929. Eleven of these reported transactions amounting to \$3,847,666 and a profit of \$153,370. Of the 1405 shareholders only 421 were workers in the enterprises, which also employed 236 non-shareholders.

It would seem therefore that if producers' cooperatives depend upon their member capital and must compete in the open market, they have very limited possibilities under modern economic conditions. In so far as producers' cooperation has a future it must rely upon support either from the government or from some other agency and must be assured marketing preference against its capitalistic competitors.

PRODUCTION

THEORY. Definition of the Term. The use of the term production in economic science, no less than in everyday speech, is not free from ambiguity. Broadly speaking, two main usages may be distinguished. Either it denotes certain activities or it denotes the result of those activities. Thus it may be said that production is resumed or that the volume of production has increased. Clearly the second of these senses is derived from the first and for purposes of analysis must be subordinated to it.

But to decide the question of logical priority is not to solve the problem of limitation. What kind of activities must be designated as production or productive activity? What kinds of activity contemplated in economics are not of this order?

In the writings of certain of the classical economists, notably Adam Smith, Ricardo and John Stuart Mill, the habit was adopted of reserving the term production for the description of such activities as resulted in the manufacture of useful material objects. The habit was itself an adaptation of an earlier physiocratic usage which reserved the term for agricultural and extractive industry. Thus the labor of a shoemaker would be described as productive, and the labor of a shoeblack as unproductive.

There were, no doubt, profound reasons, often overlooked in subsequent analysis, which led the classical economists to regard a distinction between these two kinds of activity as desirable. But it is questionable whether the use

of this particular terminology was at all a happy one. The end of all activity with an economic aspect is the satisfaction of wants. Economic goods are both material and immaterial. It is not materiality, it is scarcity in relation to alternative uses, which constitutes an economic good. To designate as "productive" only those activities which involve the transformation or the movement of material objects may have served as a signpost for important propositions in the theory of capital, but it seems out of harmony with the main conception of an economic good and, as experience shows, is very liable to lead to confusion. As Senior pointed out, there is really no difference in kind between the labor of the shoemaker and that of the shoeblack: "A shoemaker alters leather, and thread, and wax into a pair of shoes. A shoeblack alters a dirty pair of shoes into a clean pair" (*Political Economy*, London 1850, p. 51). Each act involves the use of scarce resources to increase the opportunities of consumption. Since the time of the classical economists therefore this usage of the term has tended to disappear from scientific discussion, although it continues to appear in political controversy. Labor is no longer classified as productive or unproductive by reference to its relation to material objects.

But this is not to say that productive activity is coterminous with economic activity as a whole. This does not follow either from the most general conception of the economic or from the usages of contemporary economic theory. Production, in the sense in which it has been employed above—the use of scarce resources to increase opportunities of consumption—clearly includes distribution, in the sense in which this word is used in the phrase "distributive trades." But it does not include consumption—the using up of economic goods. And since whether an activity is productive or not depends essentially upon its relation to consumption, the theory of production, although it no doubt covers the most intricate and important forms of economic activity, must necessarily be subsequent to, and in a sense dependent upon, a theory which explains the activities of consumption; that is, in the last analysis, the subjective theory of value. If therefore a formal definition of production is desired, it may be defined as activity directed to increasing the number of scarce economic goods of the first order; it must always be remembered that economic goods may be material as well as immaterial, and that an exact definition of an economic good includes not merely a description

of its technical, physical properties but also a space index, a time index and an index of its legal availability.

This definition harmonizes perfectly with the abstractions of an isolated economy. The behavior of the isolated individual, disposing of given goods and time available for consumption, is clearly a matter which falls within the scope of economic analysis. Indeed it is in this connection that some of the most important propositions of the science may be most clearly exhibited. But these propositions are not propositions of the theory of production; they are propositions of the theory of value. Only when the stocks of goods and the time devoted to consumption are variable, when the isolated individual is assumed to be able to use time and energy to increase their number, do his activities become subject to the propositions of the theory of production. The distinction is perfectly clear too in the case of an isolated collectivist economy. Only when the phenomena of an exchange economy are under discussion does it seem at first sight to become blurred. For the activity of exchange of given goods of given space and time index is usually treated under the heading of the theory of value; whereas, in so far as it increases the availability of goods of the first order to the economic subjects who value them (and it may be assumed that this is the reason for exchange), it falls under the heading of production. Further consideration, however, suggests that this difficulty is not important. The activities of exchange are productive, in the sense that, by changing the legal availability of different goods, they enable individuals to satisfy more fully their respective preferences. But since they leave unchanged the physical characteristics and the space and time indices of the goods concerned, it is clear that they involve none of the more characteristic problems of productive activity. In Paretian terms, the technical obstacles are only the fixity of the physical stocks. Intricate explanation is needed only on the subjective side. It is therefore found convenient to treat them in close juxtaposition to the elementary theory of valuation, the heading "theory of production" being reserved for the cases where the technical obstacles are more conspicuous and themselves demand analysis. The divergence here from the strict implications of the fundamental conception which is to be found in modern works on analytical economics is merely one of expository emphasis and convenience. In no way does it imply any suggestion that mar-

keting operations and so forth are not to be regarded as productive activity.

Nature of the Theory. If this definition is to be accepted as valid, it follows that a theory of production will consist of generalizations relating to the tendencies exhibited by such activities in different kinds of circumstances. This indeed has been the content of the theory from the earliest days of scientific economics. But the mode in which it has been stated and the significance which has been attached to its propositions have undergone certain modifications.

The main analysis of the classical economists, as it appears in the works of Ricardo and his school, is an analysis of the equilibrium conditions and the tendencies to variation of a society based upon private property and free exchange. It included therefore an analysis of productive activity in the sense in which it has been defined above, and many of the most important propositions of the modern theory of production derive, with little modification, from the generalizations it embodies. But the emphasis was slightly different. The avowed object of this central body of theory was the explanation of value and distribution—the prices of goods of the first order and the prices of factors of production. In so far as the quantities of the goods and factors and their disposition between different uses were considered, they were regarded as subsidiary to this main end. In so far as production was treated explicitly, it was treated more in terms of a discussion of the conditions which make the end-product of productive activity greater or less, rather than in terms of a discussion of the interrelationship of a system of activities. Adam Smith's *Wealth of Nations* discussed the causes affecting the size of the annual product. Book I of John Stuart Mill's *Principles of Political Economy* was addressed to a similar problem. The substance of such a theory, as it is to be found in the latter, consists of remarks concerning the causes of the technical qualities of the factors of production and their increase and diminution, taken in isolation, and a few generalizations upon such matters of organization as the size of the business unit, peasant proprietorship versus the landlord system and so on.

Such a usage had certain obvious advantages for purposes of popular instruction; and some at least of the generalizations it embodied, such as the law of diminishing returns, have permanent scientific value. Nevertheless, it was subject to two grave disadvantages. It tended to a

confusion of the technical and the economic, and it operated with a concept—the aggregate of production—which was incapable of precise definition without the introduction of arbitrary valuations.

At first sight the concept of a change in the volume of production seems to be a matter which is free from ambiguity. If coal is being produced, for instance, changes in the volume of production are to be conceived as changes in the number of physical units produced per hour, per day, per year, or whatever unit of time is chosen. Apparently nothing could be more simple. Reflection, however, suggests that this simplicity is delusive. As soon as more than one commodity is produced, there exist all the difficulties of the summation of heterogeneous quantities. How can it be decided whether 100 tons of coal plus 100 quarters of wheat is a magnitude greater or less than 150 tons of coal plus 50 quarters of wheat?

In the individual economy such comparisons can be conceived on the basis of valuation. A collection of this sort is greater or less than another according to the preferences of the individual concerned. (Even here difficulties arise in comparing "production" rather than "utility" if a sacrifice of leisure or of present consumption is involved.) But such a basis is not sufficient for "social computations," at any rate not in the typical instance. If a given change in productive power enables all individuals in society to move up their respective "hills of preference" (to use Pareto's useful term), i.e. enables them to occupy positions which, with tastes unchanged, they would have occupied before had the external conditions permitted, well and good: "production" has increased. But suppose the more probable case in which some move up and some move down. How can a balance be struck? Only by assigning to the different individuals an arbitrary valuation on the basis of which their experiences may be summated. All men are equal; therefore a change which benefits the majority is an increase in production. Members of this caste (or race) are ten times more capable of enjoyment than members of that; therefore a change which reduces their incomes by one will have to be compensated by an increase of more than ten in the incomes of others. A Nazi or a Brahman will choose one method of counting; a western liberal, another. There is no scientific method of deciding between them.

Now, for many practical purposes such difficulties may be surmounted by the device of

index numbers. Nothing that is said here with regard to the impossibility of an exact "measurement" of production should be construed as a denial of the usefulness of such methods. But on close examination all these devices prove to involve, in one form or another, this arbitrary element which has been indicated. For the practical or interpretive purposes for which they were designed such an assignation of value is fully justified. But it is not given in any scientific sense. An analysis which depends upon it for positive rather than hypothetical statement is not *wertfrei* in Max Weber's sense. It involves judgments of value rather than judgments of existence.

For these reasons in the systematic treatment of the subject in recent years the habit of generalizing about production in terms of propositions concerning aggregates has tended to fall into desuetude, and attention is directed more and more to the relations between particular items in such aggregates. The question is asked, for instance, not how increases in labor supply affect the volume of production as a whole, but rather how they affect the price of labor, the quantity of labor devoted to this line of production and that, what will be the effect on the rate of interest and so on. Production and distribution are treated simultaneously as part of the more general problem of economic relationships, once production, in the sense of upward variations in the supply of goods of the first order, is assumed to be possible. In this, as has been suggested above, there is no real break with classical tradition. It is simply an extension of the methods used by the classical economists in the analysis of value and distribution. Nor is it a denial of the usefulness or indeed of the necessity of a subsequent judgment of the significance of such conclusions in terms of whatever system of valuation happens to prevail in the society at large. It is only a recognition of the fact—acknowledged surely by all except those who "think with their blood"—that, in the solution of the problems of life and action, there is obvious advantage in separating out those elements which are capable of proof and verification—the scientific problems—from those which are not of this order.

Production and Technology. The conditions for the existence of an economic good are of a twofold nature. What constitute an object as a good are subjective valuations. What constitute such good as an economic good (i.e. a scarce good with alternative uses) are technical facts—

qualities of material nature and of men considered as part of nature. It might seem therefore that the part of the theory of value which deals with valuation of given goods would be primarily psychological; and that the theory of production, which deals with activities modifying the number of such goods, would be primarily technical in nature.

As a description of the emphasis of the theories such a description is not erroneous. The complications of the simple theory of value certainly lie in the sphere of the psychological; the complications of the theory of production, in the sphere of the technical, if that term be used in its widest sense. But as a description of their content and necessary ingredient it may be very misleading. The theory of valuation necessarily involves a technical assumption—the assumption, namely, of the nature and quantities of the goods which are given; the theory of production necessarily involves psychological assumptions—the assumptions, namely, of the valuations given to goods of the first order, whose increase or diminution the technical conditions make possible. And to infer that the theory of production is to be based upon technology, however wide an interpretation is put upon that term, is a very dangerous fallacy. The economic problem of production is not the technical problem of production. The economic theory of production is not a summation of the various technologies—even if industrial psychology, scientific management and the like be included under technology—it is something which is entirely different in nature.

This indeed follows quite clearly from the very conception of the economic. If there is only one end—one want to be satisfied—then the problem of activity is entirely technical. Or if there are many wants but the means for satisfying them are completely specialized, again the problems of satisfying them are technical problems. But as soon as the means are capable of various uses, then a problem which is not technical—an economic problem—arises. A knowledge of technology makes it possible to say how means may be used within particular branches of production; but it does nothing to suggest how they are to be distributed between the different branches. The technical optimum is achieved when production takes place with the greatest physical efficiency regardless of cost. The economic optimum is achieved when the marginal gain in each line is equated to what is sacrificed at the margin in any other. So long as

means of production are scarce—i.e. so long as the use of a unit in one line involves perceptible sacrifice in any other—so long must the technical optimum and the economic optimum be different. Only when all means of production are free goods are the technical optimum and the economic optimum identical—i.e. at precisely that point when the economic problem of production ceases to exist.

Hence both in theoretical and in descriptive economics it is of the first importance that technological and economic issues should be rigidly distinguished. A knowledge of the technique of particular industries and of the technical potentialities of particular factors of production is indeed important: it provides a rough indication of the numerical values to be assigned to what, in pure theory, are known as the technical coefficients. But it is not in itself a solution of any economic problem. And exclusive concentration on the acquisition of such knowledge, such as is often to be found in works on economic history and the economics of particular industries, is not only inadequate but often positively misleading. It is highly questionable whether economists by themselves can ever “solve” the economic problem; it is quite certain that engineers, management experts and so on by themselves never will. The business of a theory of production is not the summation of the technologies. It is the study of a system of relations in which, in its most abstract form, the subject matter of the technologies appears merely as one set of terms in a whole series of equations.

Content of the Theory. In the theory of production three divisions, or stages, of investigation may conveniently be distinguished. The first is the theory of equilibrium. In this section, analysis is confined to an exact description of the relationships which must exist between various “economic quantities,” given different assumptions regarding tastes, and the technical and legal organization of production, if the system described is to remain in a stationary condition. (No assumption is made that this condition is necessarily achieved in any existing economic system or that the tendencies operative would necessarily achieve it if undisturbed. The sole purpose of the inquiry is to illuminate, by contrast, certain problems of movement.) Apart from the obvious subdivisions based on the various possibilities of market control and legal institutions (monopoly, duopoly, various kinds of competition and so on) it is customary to divide this part of the theory with a view to

exhibiting, by successive approximations, the specific influence of various technical conditions. Thus, as a first approximation, there may be considered equilibrium with one competing mobile factor of production. This enables attention to be concentrated on the technical substitution relationships implied in primitive form in the labor theory of value and, in a more developed form, in the doctrine of opportunity costs. The possibility that production may involve different factors of production for different products is next introduced. Under this heading may conveniently be exhibited the doctrine of non-competing groups and many of the propositions of international trade theory. Then joint production—production in which different factors are combined in the production of each ultimate product—may be considered. Here the theory of marginal productivity is appropriate. Finally, account is taken of the time element in production. Here the theory of capital, the productivity of “roundabout methods of production” and similar matters are discussed.

The second main stage has sometimes been called the theory of comparative statics. Here the object of attention is the comparison of different states of equilibrium, given certain differences in the fundamental data assumed. Thus two different positions of equilibrium may be compared, given small differences in the ultimate supply of a certain kind of labor. The differences in equilibrium due to differences of technical knowledge of different kinds, differences in tax systems and so forth may be compared. Many of the best established propositions of analytical economics have chief relevance in this connection.

Finally, the actual movement of different “economic quantities” in response to change, the ultimate goal and the *raison d'être* of the earlier stages of inquiry, is investigated. Here is the genuine economic dynamics: not the tedious discussion of causes of change in the fundamental data—so often associated with that term but clearly, in the last analysis, outside the sphere of strict economic analysis—but investigation of the actual tendencies to movement in a system, once an absence of equilibrium is assumed. Here are at home not only deliberate theories of industrial fluctuation but also theories of risk, profit and uncertainty, and much of what is most interesting and intricate in the theories of monopoly and the theory of money and banking.

As is to be expected in a branch of knowledge

where systematic thought is not yet two hundred years old, these various divisions of inquiry are in very different stages of completion. Broadly speaking, the main foundations of the theory of equilibrium have been laid. Implicit in much of the work of the classical economists, its explicit statement is the chief achievement of the last quarter of the nineteenth century and the years before the World War. The foundations laid by Walras, Pareto, Böhm-Bawerk, Wicksell and their followers may be extended and refined, particularly perhaps in the sphere of capital theory; but they are not likely to be superseded. The theory of comparative statics has not been so well systematized. In certain respects, however, it is the most thoroughly worked field of economic science. The classical system, although implicitly assuming a theory of equilibrium, the "famous fiction" of the stationary state, was explicitly most concerned with problems of variation; and many of its propositions, which are crude and inadequate if judged as equilibrium theory, are substantially accurate within their universe of discourse if judged as comparative statics. The main work here still to be done is probably as much a work of reformulation as of new discovery.

In the final section—the theory of fluctuation proper—the position is different. Here any discussion of subject matter must necessarily be in the nature of a program, rather than of recapitulation. This is not to say that at present there is no knowledge of these matters. Clearly, valuable work has been done on particular problems. But so far—as is only natural—much of the work done in this field has been fragmentary and unsystematic. Propositions have been developed out of harmony with the necessary implications of equilibrium theory, or the propositions of equilibrium theory have been uncritically carried over into fields in which they were no longer applicable without modification. Only in the theory of money has a systematic body of knowledge, appropriate to the interpretation of the actual course of change, been developed; and even here a certain absence of relation to the phenomena of "real" economics has deprived the work which has been done of its full measure of usefulness. Hence it is probable that, in the future, it is in this field that the most significant developments of the theory of production will take place.

See: VALUE; COST; DIMINISHING RETURNS; INCREASING RETURNS; STATICS AND DYNAMICS; ECONOMICS.

STATISTICS. Despite the importance of production in the economic process production statistics in the proper sense of the term represent a recent development. One reason for this is that information valuable for the guidance and regulation of production could more easily be obtained by indirect methods from other branches of economic statistics which were begun earlier and made more satisfactory progress. Reports on area under cultivation and occupational censuses cover important factors of production and furnish basic data for estimates of productive capacity and output in agriculture and industry. Statistics of foreign trade and freight shipments, which trace the interlocal movement of goods, afford an insight into the activity and interrelations of economic regions. Daily car loading reports, for example, have proved to be one of the best indices of general productive activity. The fact that these types of statistics, which have only an indirect bearing on production, developed earlier than production statistics proper is to be explained partly in terms of administrative requirements. Thus while commercial and tariff policies made possible and necessary the collection of data on foreign trade, there was no comparable regulation of general production. Again mercantilist policies in the precapitalist period as well as increasing government supervision of production in the current stage of capitalism served as powerful stimuli for the development of production statistics.

In no country, however, have production statistics attained an appreciable degree of perfection, largely because of obstacles encountered in the compilation of data. Prominent among such technical difficulties are those due to the variety of finished goods and multiplicity of different grades and qualities, the large and varying number of stages into which the production of a single consumer's good is divided, the presence of many small establishments in certain industries, the reluctance of many producers to divulge vital figures and the difficulty of verifying those returns that are submitted. Ideally production statistics should cover not merely output but also productive factors, such as labor, equipment and raw material supply, as well as important items of cost; this type of information must be gathered for all branches of production and the collection should be repeated at frequent intervals in order to yield a fairly detailed picture of movement in the system. Such statistics—detailed, extensive in

scope and for frequently recurring dates—are practically impossible to obtain under conditions prevailing at present in capitalist countries. The existing statistics usually have the virtue of one of these attributes to the exclusion of the others. When detailed they do not cover many industries, nor are they sufficiently frequent; production censuses which aim at an exhaustive enumeration are not undertaken often enough and their results do not throw much light upon the special problems of each industry; and current production statistics available on a monthly or even a weekly basis measure only the most important aspects of a more or less representative sample.

Modern economic statistics had their inception in the period of mercantilism. The seventeenth or eighteenth century ruler, bent upon promoting the military power or economic welfare of his state, was obviously in need of some quantitative data as to national resources. In the principalities of central Europe governmental stimulation of production first assumed the form of effective exploitation of the public domain and of organization by the fisc of industrial establishments. Thus periodic reports from crown farms constitute the prototype of modern agricultural statistics. In Brandenburg, for instance, statistics of agricultural production can be traced back to the Great Elector Frederick William, who launched a deliberate agrarian policy to repair the ravages of the 'Thirty Years' War. Such domanial statistics furnished the basis for the subsequent development of country wide reports on area under cultivation and crops; later information was added as to disposal of the crop in seeding, consumption on the farm and commercial sale, which is basic to any attempt to coordinate the production of surplus areas and of bumper years with the consumption requirements of deficit regions and years of crop failure. Statistics of mining and manufacturing passed through a similar evolution. They also began with reports by establishments under the immediate control of the ruler and were subsequently extended to include important branches of production in private hands. It was essential to ascertain the extent to which the needs of the army could be supplied at home, which of the imported goods were indispensable and what could possibly be exported. All mercantilist countries had therefore statistics of mine and foundry output and some also of the production of cloth. In Prussia, for instance, by the end of the eighteenth century data were regularly col-

lected for no less than 58 industries. These were intended for administrative use and regarded as a military secret. With the advent of *laissez faire* collection of data on manufacturing was generally abandoned (Sweden offers a notable exception in this respect), while agricultural, mining and metallurgical statistics were continued as before.

In the field of agriculture production statistics are most comprehensive and regular for cereals and fibrous plants, and for obvious reasons. In nearly every country the problems of cereal production are the object of unremitting attention on the part of the economic departments of the government. And there is no other branch of production for which it is so easy to measure or, to be more precise, to estimate output. Here the number of products is limited and grading is standardized. The fundamental factor of production—area under cultivation—can scarcely escape observation and offers a reliable basis for estimating output. Reports on the prospective and actual harvest can easily be arranged for at the successive stages in the maturing of the crop. The national differences in procedure, apart from those due to peculiarities of statistical organization, are less important in this field than for any other type of economic statistics. Considerable progress has therefore been achieved in international coordination, as may be gathered from the publications of the International Institute of Agriculture. For other branches of farming, such as truck gardening, fruit cultivation, cattle and poultry raising and the like, production statistics encounter greater difficulties and accordingly are subject to many gaps and inconsistencies. Although the aggregate value of these farm products is now far in excess of that of agricultural staples, their statistical coverage is much less comprehensive and regular.

Like the statistics of cereal crops, mining statistics date back to the period of domanial economy and in the course of two centuries have been perfected both methodologically and administratively. As in the case of agricultural staples, the number of mine products is limited and there is no danger of double counting. State inspection assures a fuller response to statistical schedules and facilitates a check upon the accuracy of returns. There arise nevertheless several technical problems which obtrude particularly in international comparisons. Certain difficulties are due to differences in the quality of products, such as the thermal efficiency of

coal or the metallic content of ore. For purposes of uniformity a reduction to standard units (calories, metallic value) is often attempted, but the basis of such computations may be either the theoretical or the commercially practicable ratio of useful content. Another question concerns the stage of the process at which statistical observation is to be undertaken: the product may be measured in its raw state or after it is prepared for shipment or processing. Data on mining are collected not only by government bodies but also by private organizations, such as trade associations and cartels. Private statistics may cover, in addition to matters of general interest, special aspects of the industry not included in official statistics. Thus the semi-official coal syndicates in Germany collect extensive data on sales and shipments which disclose the geographical and industrial distribution of the demand for coal.

Only a few of the branches of manufacturing statistics survived from the mercantilist period through the age of industrial *laissez faire*. Of these the statistics of iron and steel, for which annual data were regularly collected in some countries, represent probably the most important instance. As a rule the statistics of fabrication were reestablished only with the advent of economic nationalism and interventionism. In Germany, for instance, modern statistics of manufacturing were resumed only in preparation for the tariff of 1902. It is significant in this connection that Germany presents the best example of what has been designated above as detailed production statistics limited to a few important industries—coal, metallurgy and metal products, textiles, leather, automobile, certain chemicals and some luxury trades—and neglecting the rest. Since the original purpose of such statistics was to aid in the negotiation and formulation of commercial treaties, much stress was laid on information about the consumption of raw materials and semifinished goods, both domestic and imported, while the enumeration of finished goods was so subdivided that the results could be compared and combined with the statistics of imports and exports. Such co-ordination, however, could not be achieved fully, for the logical classification in trade statistics is according to the character of the commodity, whereas the divisions in production statistics naturally follow industrial lines. The more such statistics were extended to cover finished goods the greater was the significance attached to values as contrasted with physical quantities;

certain issues were raised thereby, such as those of cost price as against selling price and of values to be imputed to goods manufactured for stock or for use in other departments of the same enterprise.

As the interest of the public and the government shifted to questions of composition and changes in aggregate production, attempts were made to use the statistics of individual industries as the basis for a general estimate. This was facilitated by the availability of data on the more important cost factors and on value added by manufacture. It is difficult to state whether the inaccuracies of such estimates are much greater than those which are practically unavoidable in general production censuses. It is certain, however, that since the estimates were based on a combination of statistics for industries with occupational censuses, they were vitiated by two important types of error. The first is that due to the fact that the statistical data were gathered at different times; this lack of temporal concurrence may make considerable difference in periods of rapid change in business conditions. The second type of error arises from the utilization of figures for productivity per worker in industries covered by production statistics in an attempt to estimate the output of industries of similar technical structure for which only occupational data are available. Such extrapolation is not entirely justified, because the methods of calculating industrial personnel in occupational censuses and in the statistics for individual industries are not always the same: whereas the former present a picture of occupational distribution for a single day, in the latter the number of workers for the industry is given as the average for the year, an average which is often computed by dividing the number of working days through the year by the total number of men days. While such procedure makes possible a thorough study of labor efficiency, it impairs comparability with the figures of occupational censuses.

In addition to these statistics intended to serve the needs of commercial policy and of domestic regulation of industry, certain data on manufacturing are collected also as a by-product of indirect taxation. In some countries tax authorities gather statistics for all commodities impost on which is paid by the producers—alcoholic beverages, tobacco and tobacco products, sugar, matches and the like. Statistics assembled by trade associations of manufacturers also acquire increasing importance as

these organizations tend to embrace a growing proportion of industrialists. Their value, however, is limited by the fact that not all enterprises are represented and that the number of outsiders varies. For certain industries this defect is remedied to some extent by expert estimates for the business as a whole which are prepared by such organizations or commercial research bureaus. In many instances private statistics are not given out, but of late their publication in the United States and more recently in Germany has been encouraged by government and other public agencies. Occasionally official investigating bodies (the Federal Trade Commission in the United States, the Ausschuss zur Untersuchung der Erzeugungs- und Absatzbedingungen der deutschen Wirtschaft in Germany) are authorized to make obligatory the publication of such information.

While the detailed statistics of individual industries are the offspring of enlightened absolutism, the general census of production is the creation of democracy. Such a census was first carried out in the United States in 1850 and was meant to enlighten public opinion about the results of the economic policies pursued by the government. In contrast to the continental custom therefore the material gathered was intended from the start for public consumption. On the other hand, the purpose of the census was the collection not of detailed data but of aggregate figures illustrating industrial growth and the evolution of major industrial divisions. Such information, however, was much too general for the more practical needs of the government; hence important industries were covered in somewhat greater detail than others within the framework of the general census. Profiting by American experience, Great Britain and the British dominions later introduced censuses similar in character. While in certain countries of northern Europe production statistics are available for all branches of industry, they are not obtained by the census method; in some they represent an extension of individual industry statistics from the major to the minor lines, in others they developed from tax statistics.

The production census raises a number of special problems. To begin with, the ostensible purpose of the census, a complete coverage of all types of production, is really unattainable. Thus the area enumerated is limited to agriculture and manufacturing and within the latter the very small establishments are excluded. Although in theory the lines of demarcation between enter-

prises included and excluded are drawn quite sharply, in practice the distinction presents many difficulties; furthermore it impairs the intercensal comparability of the figures. More important is the question of dividing manufacturing into industries and branches. For the most part a conventional classification is used which corresponds roughly to the existing differentiation into crafts, trades and lines of business. It combines arbitrarily several logically disparate criteria, such as the type of raw material employed, the character of the production process and the use to which the products are put. Thus comparison between periods of time or between countries is made difficult and sometimes misleading. The development of gigantic industrial combinations, which extend over several branches of production, gives added importance to a precise definition of the unit of observation. The general practice is to regard a geographically isolated production unit with an independent system of bookkeeping records as an individual entity irrespective of its technical, managerial or financial affiliation with other plants. The economic significance of the size of establishment characteristic is obviously reduced thereby.

A problem entirely peculiar to the census method is that involved in the combination of totals for the various branches of economic activity into a single grand total. The desirability of obtaining such an aggregate shifts the emphasis from physical quantity to value figures. Now gross values are of no particular use for this purpose. Adding them would imply multiple counting; the value of a machine, for instance, includes also some of the value product of the rolling mill, the foundry, the ore mine and the coal mine. Moreover such figures offer a misleading index of the relative importance of individual industries; they would necessarily exaggerate the importance of the jewelry industry because it happens to use an expensive raw material and underestimate that of the chemical industry because of the low value of its basic substances. These faults are avoided when net value figures are used, a practice which assumes that only such portion of the value of its output is to be credited to the industry as is directly traceable to the activity of the factors of production operative in it. The proceeds of its sales are, as it were, divided into two parts: that paid out to other industries as compensation for their services, in the form of raw materials, equipment, supplies and the like; and that returned to employees as wages and salaries, to capital in-

vestors as interest disbursements, to equity owners in the form of profits and to the government by way of tax payments. The second part constitutes value added by manufacture at this stage of production; it is an item in production statistics which constitutes a basic datum for certain types of computation of national income.

If the use of net value figures settles certain difficulties, it also creates a host of new problems. These center about the deduction of items from gross value to obtain the net. Obviously the cost of raw materials and semifinished goods used up in the production process constitutes the most important deduction. Furthermore there must be deducted the payments to subsidiary industries for services rendered on a contract basis (e.g. dyeing of cloth in a textile factory which contracts this process out). The expenditures for the maintenance of plant and equipment must be dealt with in a similar fashion. The deduction of maintenance and repair items has been attempted only once (in the Netherlands) and not altogether successfully. Granted that the difficulty of ascertaining these figures justifies the practise of disregarding them in arriving at net values, this defect of net value data must be taken into account in evaluating the general results. On a somewhat different plane are bank fees, insurance premiums and similar service charges. In a sense they represent payments to other industries for services rendered and as such are subject to deduction. Here again technical difficulties intervene and make this procedure impracticable. In this case, however, no double counting is involved, because financial institutions are not covered in production censuses. Nevertheless, it should be borne in mind that manufacturing is credited with certain values which are really attributable to such service industries as finance, advertising, the legal profession and the like.

Production censuses offer certain promising opportunities for the future. Thus the ascertainment of production costs can be made helpful not merely in computing value added; if carried somewhat further than at present, it would become a most important tool in the analysis of the entire production process. An itemized schedule of costs which specifies not merely the expenditures on raw materials, salaries and wages but also debt service payments, depreciation charges, taxes and similar items would provide the information, now lacking, which is necessary for an adequate judgment of the effectiveness and incidence of many economic policies. The future

may also see a subdivision of manufactured goods based on other criteria than those used at present. The current classification of products in virtually all types of production statistics is oriented primarily upon the nomenclature of trade statistics. This is because governmental intervention in production for many years utilized almost exclusively the instrumentality of the tariff. If a new economic epoch is approaching or has already begun in which governments will resort to other means of regulating production, statistics must be reoriented in order to be of service under the new conditions. For production censuses this reorientation must be carried out with a view to an active policy of cyclical stabilization. Thus a finer distinction must be drawn between producer and consumer goods. At present, for example, the products of the textile industry are regarded as final consumer goods, when in fact many of them are used as producer goods. Again more detailed information is necessary as to plants and equipment, a factor for which statistical observation is as yet confined to a small number of industries and even here is far from thorough; this constitutes probably one of the most urgent current tasks of production statistics. Finally, despite the difficult logical problem involved, actual production should be compared with existing capacity.

Should all these improvements materialize, an important disadvantage will continue to inhere in production censuses. They require so much time and effort that it is impossible to undertake them at frequent intervals. Although in the United States the Census of Manufactures is now taken every two years and in some other countries annually, the results obtained are not sufficiently current to serve the needs of an active policy of regulation and stabilization. For this purpose all industrial countries, and particularly the United States, have resorted increasingly to current production statistics. These neglect all details and do not aim at an extensive coverage. Their important features are simplicity and rapidity of preparation: they are compiled on a monthly or weekly basis and are made available very shortly after the expiration of the period to which they relate. Generally they consist of such production series as may be considered representative of a larger area than they actually cover. Thus the figures for the steel industry are usually assumed to reflect the situation in all industries manufacturing means of production. In many cases the subject of

current observation is not productive activity itself but correlative phenomena which are more responsive to changing conditions and anticipate the probable future course of production, such as orders, inquiries from buyers, changes in stocks on hand, demand for freight cars, building permits issued, industrial consumption of electric power and the like. For the purpose of controlling cyclical fluctuations the current comparison of industrial activity with existing capacity, such as the monthly ratios published in Germany, is also of considerable value.

The general bearing of these and other current series may be obscured by certain movements of a special character, such as seasonal oscillations; a test in each case should determine whether eliminating them by statistical manipulation is advisable or not. If these series are to be combined into an index of production for a particularly significant industrial group or for manufacturing as a whole, the problem of proper weighting must first be solved. Census figures which indicate the relative economic importance of the various industries may furnish the requisite weights. But the inferences based on them become increasingly unreliable as the census material becomes dated; where it is apparent that important structural changes have occurred after the census date, the weighting may have to be altered even before new census data become available. On the basis of national production indices attempts have been made by the League of Nations, the German Institut für Konjunkturforschung and other bodies to compile international estimates. The comparison of such international series with the index of world trade suggests interesting conclusions.

The combination of the three types of production statistics—the detailed statistics of individual industries, the comprehensive production census and the current production indices—should satisfy all the requirements set forth above as the ideal of production statistics. Such data, detailed, extensive and always current, are really essential in an era of complete and many sided governmental intervention upon which some countries already have entered while others are about to follow. Indeed attempts to utilize the three types in combination are being made in the United States and prepared for in Germany. But even the complete success of such experiments in those countries which are statistically most advanced will still leave unanswered many questions bearing on the production process, particularly those relating to plant and equip-

ment and to production costs. Nevertheless, it may be hoped that just as mercantilism gave the initial impetus to production statistics, intensive social control of all economic activities will bring them to a high state of perfection.

PRODUCTION, METHODS OF MEASUREMENT.

See PRODUCTION, section on STATISTICS.

PROFESSIONAL ETHICS. The immediate objective of professional service is the welfare of the client or patient, and any realistic as well as justifiable system of professional ethics should be similarly oriented. The major problems of professional ethics arise when this objective fails

of attainment or when it is incompatible with the public interest, as in keeping inviolate confidential communications, or with the interests of the practitioner, as in subordinating fees to the proper performance of services. Professional men have also at times sacrificed the welfare of client or patient to the professional etiquette allegedly due one's colleagues, and have swallowed the camel of inefficient services while straining at the gnat of punctilious advertising standards. The professional man may at times wonder whether the client's interests should be conserved to the detriment of society, as in Shaw's play *The Doctor's Dilemma*; more frequently, however, he cannot consider the broader social or moral factors but like Socrates' navigator must confine himself to the immediate objective.

Most of the professions now have drawn up codes of ethics, declaring their ideals or standards of behavior. Some have established practise committees, the chief function of which is to clarify doubtful points which arise in actual cases; some of these groups of cases have been published, with comments or decisions. In cases of legal ethics which are called to the attention of the courts penalties are imposed, e.g. disbarment, suspension from practise, fine or censure; but in most professional cases ethics remains the "domain of the unenforceable," the sanctions for proper behavior being the desire for professional prestige or esteem, tabus, publicity and the educational effect of clarifying and interpreting case situations. Professional ethics may be distinguished from law not only with reference to the different sanctions employed but also by the fact that legal sanctions apply to all people within a territorial district, whereas in professional ethics the incidence is on the members of particular functional groups. Professional ethics is to be distinguished, on the other hand, from general morality, which is relatively more personal and individualistic and is emotionally more highly colored.

Historically considered, professional ethics may be said to revert to the social principles of the mediaeval guilds, although the Hippocratic code of medicine antedated these and continuity with them would be difficult to establish. In any case the ethics of the various professions constitutes the social philosophy of pluralistic pragmatism so characteristic of mediaeval life. In keeping with this pluralistic implication the concept of professional ethics and the rules and practical behavior derived therefrom vary among

the different countries and professions. Continental Europe exhibits little of the strictly defined concept of professional ethics. In Germany and Austria, where the doctrine of social integration has been developed by Otto von Gierke and Eugen Ehrlich, Max Weber and Ernst Troeltsch, the lawyer is governed by statutory regulations and even his function is to some extent shared by the business man through the representation of merchants in courts which try commercial cases; in these countries the engineer, the teacher and the doctor are also governed in large measure by statutory regulations, and the residual professional autonomy and behavior are by no means so explicitly formulated as they are in the United States. In the Latin countries the Roman law has appropriated most of the social regulations and sanctions except the strictly economic; in France *déontologie*, a term derived from the Greek concept of ethical practise as distinguished from theory, has become incorporated into the civil law, while even in Italy, where the basis of governmental representation is functional and not territorial, the regulations of professional behavior are subjected to legal administration.

The development of professional ethics in Great Britain has been relatively more independent and has had a more direct influence on the United States. The separation of legal practitioners into barristers and solicitors has enabled the former to establish professional standards on a very high plane; the confusion of these two functions in the United States has provided the basis for a large part of the unethical conduct of the lawyer, namely, the mingling of the client's money with his own. In medicine the independence of the Scottish practitioner has been even more pronounced than that of the English; both have a code, the latter tracing back to Percival's Code, written over a century ago. In engineering the British practitioner has followed the example of the lawyer—the functions of the architect and consulting engineer have been separated from those of the contractor and construction engineer, thereby establishing exceptionally strict ethical standards for the former. Accounting has achieved a professional status in England and Scotland superior to that reached in any other country. So also has the college teacher in these two countries maintained the principles of academic freedom and integrity more successfully than elsewhere, with the exception of Germany before the advent of the Hitler regime.

Nowhere, however, have standards of professional ethics been formulated in codes so extensively as in the United States. The "canons of legal ethics" were formulated in 1908 and reached their present form by supplements in 1928; the "canons of judicial ethics" were adopted in 1924; various state bar association codes had previously been in existence. The "principles of medical ethics" were adopted in 1912. Engineering codes of ethics were drawn up by the various functional groups from 1911 to 1927. The code of the National Education Association was adopted in 1929; it represented largely a unification of various state codes already in existence. This making of codes has served to formulate general principles which are themselves significant even though the codes have fallen into disuse or have functioned, as in the case of law or medicine, by virtue of certain carefully selected sanctions or of committees which were given jurisdiction over doubtful or obvious cases. Thus the codes represent merely a phase in the development of professional ethics.

In the legal profession the more acute ethical problems arise from undue zeal in securing or even instigating business, as in "ambulance chasing," champerty, maintenance and contingent fees. The broader ethical problems arise from combining Lord Erskine's rule that a lawyer cannot refuse a case brought to him with Lord Brougham's rule that a lawyer is justified in pleading his client's case in the face of what he knows to be incriminating evidence; and from the trickery and chicanery by which lawyers, especially corporation counsels, fail to distinguish for the client between the avoidance of the law and its evasion. Legal practitioners have in the main served their clients faithfully and well but they have not, perhaps, been so fully conscious of their larger obligations to the state, especially such as would reduce the breeding of unnecessary litigation.

Many ethical problems of the medical profession center about the enthusiasm of certain schools for quack cures, which prevent accurate diagnosis and adequate treatment. In the United States the doctor is professionally prohibited from patenting cures or other results of medical research as well as from endorsing advertised commodities—a rule which does not obtain in Europe. The doctor still too scrupulously observes the etiquette of silence regarding his colleagues' activities and other matters which the modern scientific spirit would air by frank

discussion or experiment. The honoring of confidential communications from patients may also at times present a serious ethical problem for the doctor. With regard to the larger ethical tendencies within the profession the concentration in the cities of recent specialized, or laboratory, graduates of medical schools, thus leaving many of the rural districts uncared for, is a trend which is not only socially unbalanced but also conducive to the practise of fee splitting. Older practitioners are alarmed at the increasingly mercenary attitude evident in the profession. It is demoralizing within the ranks, and together with uneconomical hospital administration it contributes to the increasing burden of medical cost which is imposed on the community. Medical ethics as well as medical services has thus far developed along highly individualistic lines. The most effective ethical changes would seem to depend on the reorganization of medical services on some more economical group basis.

The engineering codes and practises in England and the United States follow in the main those of the other professions. What is peculiar to the engineer is that in a universe of transient solar energy and disintegrating materials economic use is his chief professional purpose; hence his major ethical problem is what to do about colleagues who engage in construction which is not only dangerous to life but also unconscionably wasteful economically. Further ethical problems arise in connection with conflicting interests in furnishing materials and in securing contracts. Architects and consulting engineers are professionally forbidden to have such conflicting interests and have in the main safeguarded their independence. In the United States, partly because of this close connection with the contracting business and with the handling of commodities, the engineering profession is not so well defined as is law or medicine or teaching, and there is little control through licensing or through professional educational requirements or standards.

The ministry is particularly difficult to study as a professional organization, not so much because of its sectarian cleavages as because of the inevitable confusion of ethical problems with religious and moral considerations. In the teaching profession the major ethical problems deal with academic freedom and tenure.

A number of other social groups have approximated the status of the older professions. Some, such as dentists and nurses, are rapidly

developing a professional consciousness. Others, such as journalists, pharmacists, accountants and bankers, have difficulty in distinguishing between their professional aspect, with its emphasis on services, and their business aspect, with its emphasis on profits. Certain newer business groups, such as purchasing agents, trade association executives and investment and insurance counsel, closely approach the professional ideal. But the movement for investing business and finance as a whole with professional standards has been regarded as anomalous in view of the fact that their motivation is dominantly pecuniary.

The professions exert their greatest socio-ethical effectiveness by limiting the number of their members, developing standards of training and defining their distinctive functions. Inter-professional problems also arise, however, in the case of jurisdictional disputes, such as contract practise in medicine and the performance of legal services by trust companies. The ethical rules and regulations of the professions are likely to suffer from overformalization and often they lack a sense of relative values; but they are effective agencies, not only for intensively developing certain essential social services at the same time that they assert certain functional prerogatives, especially in the spirit of *noblesse oblige*, but also for protecting individual members of a profession from the social uniformities of amateurism and democracy. Into the point of view of general ethical theory, so largely concerned with the relation of the individual to the world, professional ethics has introduced two factors which have traditionally been too little emphasized: the fiduciary relationship of the professional man to his client and the relations of groups as groups to each other and to society.

PROFESSIONALISM. See PROFESSIONS; PROFESSIONAL ETHICS.

PROFESSIONS. Writing of England at the close of the seventeenth century Addison spoke of the "three great professions of Divinity, Law and Physick." The term "profession" was not new in his day. It was employed several times by Bacon; the earliest instance of its use recorded by the *Oxford English Dictionary* dates from 1541. But there is no corresponding term in any language of the ancient world. Nevertheless, every society has had its priesthood; many early communities knew the lawyer and the physician while even the most primitive accorded a special position to the medicine man. Is it then the case that these vocations assumed certain characteristics in mediaeval times which they lacked before? A brief examination of the facts may throw light on this point.

In Greece the lawyer was not a specially trained advocate practising before a specially trained judge who decided the case according to law; he was the litigant's friend speaking on his behalf before the litigant's peers, who decided the issue on all the merits of the case as they saw them. Again the physician, though in some cases more of a specialist, did not receive any formal training; at the best he was the pupil of some eminent practitioner. In the Roman Empire the position of the lawyer was much the same as in Greece; the physician on the other hand was generally a slave attached to a rich man's household, while the accountant, the architect and the engineer were usually salaried administrators in the employment of the state. It appears that in ancient times there were no training schools where those who followed the vocations which we call professions received instruction, that the practitioners seldom or never formed distinct social groups, and that they were not infrequently in a dependent position. Moreover they did not form vocational associations of the kind familiar to us.

Passing over that epoch of social disintegration that we know as the Dark Ages and coming to mediaeval times we find that many of those

doing work now called professional were in the ranks of the priesthood while others were organized in guilds. The explanation of this state of things is to be sought in the wave of association which spread over Europe during the twelfth and thirteenth centuries, and found its typical expression in the formation of guilds and of universities. The universities in origin were no more than guilds of teachers and students, but because mediaeval culture was essentially religious they came under the dominance of the church and all their members were required to take at least minor orders. The organization of the universities was fairly uniform; typically there was the Faculty of Arts and the three superior Faculties of Theology, Law and Medicine. The courses of instruction were lengthy, and the graduates who had received this prolonged formal training constituted a class of learned persons. All were ecclesiastics, at least in name; some specialized in law, some in medicine, while others not less learned, though their learning was less specialized, passed on to an ecclesiastical career or to a life of teaching or administration. The universities of mediaeval Europe were in fact training schools for work of a kind that we now class as professional. Bacon indeed complained of this: "Among so many great foundations of colleges in Europe," he says, "I find it strange that they are all dedicated to professions, and none left free to arts and sciences at large."

Thus the principal difference between the situation in ancient and mediaeval times was that in the latter the teachers, administrators, lawyers and physicians had received prolonged formal training and constituted a class apart; and it is this characteristic, the possession of an intellectual technique acquired by special training, which can be applied to some sphere of everyday life, that forms the distinguishing mark of a profession. This is well brought out by the *Oxford English Dictionary*, which defines a profession as "a vocation in which a professed knowledge of some department of learning or science is used in its application to the affairs of others or in the practice of an art founded upon it." Thus professionalism emerged with the rise of the universities and was at first co-extensive with the church. An attempt must now be made to trace its subsequent evolution.

So long as the church maintained its pre-dominance, the various professions for which the universities trained did not become clearly distinct since all professional men were ec-

clesiastics. As the culture of the Middle Ages slowly shed its religious character, the professions formerly within the church emerged out of it. As they did so, they became organized; thus the Royal College of Physicians of London was founded in 1518. The process of secularization did not necessarily involve a severance of the link with the universities because the universities also became gradually secularized. Thus in England from the sixteenth century onwards it ceased to be obligatory upon students to take orders, and generally speaking therefore physicians and lawyers continued to be trained in universities and after graduation joined their own professional organizations. But the process of evolution was not parallel in all European countries. In England, for instance, the common law had early replaced the civil and canon law for practical purposes. The universities trained only for the latter, and when the latter ceased to be of practical importance the English universities ceased to be training grounds for lawyers. The common lawyers were secular from the beginning and were organized in the Inns of Court, in effect both a legal guild and a legal university. Thus in England the lawyers evolved neither out of the church nor out of the university, and there was recruitment to the ranks of the professions from what was in all essential points a guild.

Addition to the ranks of the professions from the guilds took place in all countries though it was only in England that the lawyers entered by this route. Surgeons and apothecaries were everywhere organized in guilds from an early date. In the sixteenth and seventeenth centuries, because of the expansion of the market and other causes, the trading guilds declined; later they either died out entirely or were abolished. But the guilds of surgeons and apothecaries were not ordinary trading guilds and did not suffer the common fate. As knowledge increased and as surgeons and apothecaries became more learned, their guilds rose in status. In England the surgeons' guilds became the Royal College of Surgeons, and thus it came about that there were in the English medical world of the eighteenth century three professional associations, the two Royal Colleges and the Society of Apothecaries, two of which were derived from guilds while one was founded in the sixteenth century as an organization of graduates in medicine.

In this manner those vocations existing in the mediaeval world which we now recognize as

professions had attained an independent status and organization by the eighteenth century. Between the Renaissance and the industrial revolution others appeared alongside them. The recognition of accountants was for long confined to Italy, where the rapid development of commerce prompted the invention of double entry bookkeeping and the formation of colleges of accountants which refused admission to those who failed to bring satisfactory evidence of training. Architects arose when tradition in architecture was abandoned and its place taken by "styles" whose proper rendering demanded strict adherence to rules which had to be studied. But the demand for architects' services came almost wholly from the limited class of princes and nobles with the consequence that the architect himself became in most instances the dependent of a great household. Not until this tie was severed in the nineteenth century did the possessors of this technique begin to associate with one another or become conscious of membership of a common group; and not until then did public opinion accord them full professional rank. The *chirurgien dentiste* was heard of in France in the seventeenth century, and in the following century the English tooth drawer had so far risen in the world that he was able to discard his unrefined Anglo-Saxon title for the politer Latin equivalent.

Before the opening of the nineteenth century the recognition of new professions was an extremely slow process; but during the last hundred and fifty years professions have multiplied apace. For an explanation we must look primarily to the mechanical revolution and the progress of science which gave rise to engineers, chemists and physicists, and to the consequential social revolution which brought a demand for intellectual specialists to handle the new and complicated machinery, both material and institutional: actuaries, surveyors, realtors, secretaries, patent attorneys and accountants (virtually unknown in Anglo-Saxon countries before the middle of the nineteenth century). Supplementary causes are the throwing off of dependence, as, for instance, by public administrators, who over the greater part of the world have been freed from their dependence upon the patronage of ministers or the suffrages of electors, and the further recession of the church, because of which the teachers have gained a group consciousness. We have therefore the present situation in the western world where the day to day functioning of society so largely

depends upon the professions. We recognize a profession as a vocation founded upon prolonged and specialized intellectual training which enables a particular service to be rendered. But this recognition may be hindered by dependence, which militates against group consciousness since it is only under the stimulus of the latter that the practitioners associate together and become a profession in the full sense of the word.

In speaking of the later phases of the evolution of the professions nothing has been said about training and licensing. The mediaeval universities may be said to have both trained and licensed, since the degree was a certificate of competence which in the cases of law and medicine usually conveyed certain exclusive rights of practise not only in the church but also in law and medicine. Similarly those guilds which evolved into professional bodies often gave training and always attempted to secure exclusive rights of practise for their members. Generally speaking, reservation of functions to the qualified was the objective of the mediaeval bodies, universities or guilds, concerned with training. Since that time the tendency has been for the state to undertake both the conferment of licenses and training. But state regulation has not withdrawn the professions from the universities, since it is commonly laid down that the training shall take place in universities. State regulation varies from country to country, first in regard to the number of professions regulated and secondly in regard to the privileges accorded to the qualified. Among western countries complete prohibition of practise by the unqualified is seen in its most extreme form in France, where not only lawyers, doctors and dentists, but also architects, engineers and chemists, are debarred from practise unless they are in possession of a legal diploma. In Germany, outside the legal profession, and in England, outside the legal and dental professions, the legally qualified members of any profession have generally only minor privileges, such as protection of title. Of the United States and the British dominions it is difficult to generalize because of the great number of separate legislatures having sovereign powers in this matter; but, speaking very broadly, it would be true to say that these countries occupy a position midway between that of France on the one hand and that of Germany and England on the other.

The stages by which the state has come to assume its present role have differed in different

countries. In Prussia during the early years of the eighteenth century state examinations were instituted for lawyers and physicians alongside the university examinations. Since the former alone carried privileges, university examinations gradually lapsed. In this fashion there grew up the present German system under which the state requires attendance at a university and the passing of a state examination. The state confers upon successful candidates the exclusive right to certain professional designations but otherwise leaves practise free. In France the mediaeval system remained unchanged in law, though so far as training was concerned it had long ceased to work in practise, until the universities were swept away by the revolution. For a few years there was entire freedom of practise; but the consequent abuses were so great that professional functions were soon reserved to those who passed the tests of the new professional schools. Out of these professional schools the modern French universities were constituted. Thus we have the modern French system under which the universities confer the right to practise though, since the universities are so closely controlled by the state, there is in effect direct state control of the professions. In England the ancient forms have been more fully preserved. The Inns of Court, autonomous professional bodies, retain their right to license barristers. The universities, which are independent of the state, retain the right to license doctors, though in the performance of this function they are supervised by the General Medical Council which was set up by Parliament in 1858. So far as the state has intervened in England, the tendency has been to employ statutory boards, of which the General Medical Council is the best example. This council consists of representatives of the universities, of the registered practitioners, of certain medical corporations and of nominees of the crown; it does not itself examine but it exercises an overriding authority over the universities in respect of their examining and licensing functions. In England many professions are left unregulated by the state. Under these circumstances the associations of practitioners define minimum qualifications for membership and either test the qualifications of candidates by their own examinations, as in the case of accountants, or accept certain university degrees as evidence of qualifications, as is usually the case among engineers. They then attempt to persuade the public to give their exclusive patronage to their members who have

been tested for competence and hallmarked in this manner.

In the United States, so far as it is possible to generalize, the situation is similar to that in continental countries in that admission is in the hands of state boards of examiners. But these boards in many cases recognize university degrees as admitting to the professions they control, and to the extent that a proportion of American universities are independent of direct state authority there is an approach to the English system. The professional associations also are enabled to play an important though unofficial part through their efforts to secure uniformity of requirements as between one state and another. Among the British dominions, though generalization is equally difficult, Canada on the whole tends to follow the United States in placing control in the hands of state boards, while Australia and more especially New Zealand have shown a disposition to adopt the English model of semi-autonomous controlling authorities.

In all civilized countries the state regulates the practise of law and medicine. The reason for this is that the practitioners of law and medicine render services which are either vital or fiduciary in a high degree and which may be required at a moment's notice by any member of the public however ignorant. Therefore, if the competent practitioners were not clearly distinguished, the mass of the public would fall into the hands of quacks when their most fundamental needs were at stake. Some states have gone further than others in the direction of control, regulating professions whose services are not vital or fiduciary in a high degree and are not normally required by the man in the street. It is not necessary to discuss the merits of these variations in policy, but it is necessary to point out that state regulation profoundly affects professional activities. Where professions are not regulated, the professional associations set up their own tests of competence. They go further; they recognize that because their work consists in the application of specialized knowledge which members of the public do not possess, their clients are entitled to expect from them a higher standard of integrity and fair dealing than is required in the ordinary transactions of life, and they desire that the practitioners whom they hallmark shall be not only competent but also honorable. Therefore they elaborate ethical codes and exclude from membership those who offend. But state regulation implies that the

state takes upon itself to say who is to be admitted to practise and it cannot therefore allow others to say who ought to be excluded. Thus in state regulated professions the professional associations are virtually limited to the two remaining functions of such associations; namely, protective activities and intervention in questions of public policy. The scope for activity in relation to ethics is further narrowed by another modern development; namely, the relative increase in the number of salaried practitioners who serve a single client, usually a corporation, and not numerous individual clients. The need for ethical rules is obviously much greater in the case of the free lance practitioner than in the case of the salaried man.

Thus protective activities have come to assume a large place in the program of professional associations, and we find the use of collective bargaining, the boycott and the blacklist and other weapons elaborated by trade unions. But it should be remembered that the desire for high qualifications and good conduct remains even though the control of the mechanism for reaching these ends has been assumed by the state. In the promotion of public policies relating to the professions the associations have become increasingly active of late years. Thus medical associations propose improvement in the public health services and architects interest themselves in town and regional planning legislation. In fact the entrance of professional associations into questions of public policy, whether on their own initiative or by invitation of the government, is one of the most hopeful means of bringing the expert into the service of democracy—perhaps the most important problem in the realm of political organization today.

It remains to say something about the extension of professionalism. The suggestion is sometimes made that business should be professionalized. The suggestion is misconceived. All those attributes which characterize a profession are a natural, in fact an inevitable, growth round the application of an intellectual technique to the ordinary business of life. In other words, if and when there evolves an intellectual technique of business management to be acquired only by specialized intellectual training, there will grow up a profession of business. There is some evidence that such a technique is now in process of elaboration; the probable outcome of these tendencies, however, is beyond the scope of this discussion. If no such technique evolves there will be no professionalization of business. But it

is important to point out that the element of trade and profit is no longer the chief impediment in the way of business becoming a profession. The risks and the gains of business are falling more and more to the separate class of shareholders who do not actively participate in business operations, while most of those engaged in actual management are employees who have an interest in the financial prosperity of the concern only to the extent that if it failed their jobs would come to an end. Their position is not very different from that of the employee of the state.

Apart from the possibility of the growth of a profession of business management there can be no doubt that with the progress of science and the increasing complexity of social organization new intellectual techniques will evolve round which new professions will grow up. In other words, there will be a considerable extension of professionalism outwards. But will there also be an extension downwards? Those who are not in business and do not belong to a recognized profession are engaged either in intellectual routine occupations or in manual labor. Among them vocational organization has already gained a firm hold. But these vocational organizations do not now exhibit the characteristics of professional associations because they are not engaged in preserving and applying an elaborate technique. In fact they are at present largely devoted to protective aims. This need not be permanent. Social and industrial changes are rapid; the "laborer" is becoming a figure of the past. It may be that even if all men do not come to be trained in some elaborate technique, everyone will belong to a vocational association upon which will be devolved a responsibility for the good conduct of some aspect of social or industrial organization. In this manner there may be an extension of the professional attitude downwards as well as outwards.

PROFIT. Perhaps no term or concept in economic discussion is used with a more bewildering variety of well established meanings than profit. In popular economic usage it is generally associated loosely with either a percentage return on turnover—a "mark-up" of merchandise—or a percentage rate of return on capital. Again, it may mean a gross or a net profit and there are many possible stages between an immediate gross return and an ultimate net return, whether computed on the outlay in a particular transaction or on an investment supposed to be continuously maintained. The question as to what deductions must be made from gross profit to arrive at net profit has so many and such highly controversial answers that the tendency in accounting practise has been to abandon the term profit and to use such expressions as operating revenue or income available for dividends, which if not much less ambiguous in themselves are more amenable to definition according to purpose.

The point most in controversy in this connection leads directly into the theory of profit as regards its relation to other forms of income. The question is whether funds borrowed at a contractual rate, and the interest on them, should be included in calculating the rate of profit or kept entirely separate. This ties up with the question whether profit is properly a return on capital at all, and hence with the general problem of distribution: what are the kinds of income to be recognized and what is the base with which each kind is associated.

Modern distribution theory developed out of the treatment of the subject by the classical economists, who viewed the problem as one of the division of the social income among the three socio-economic classes—landlords, laborers and

business men or the moneyed class. The share of this last group was called profit. The process of division as they envisaged it took place in two stages: there was first a separation between rent and a kind of gross income of the capitalist, as the business man was then more or less correctly called; subsequently the latter fund was divided between the capitalist and the laboring classes. Wages were supposed to be determined independently, the final share of the capitalist being left as a residuum. The most important commentary on this classical scheme of distribution is the negative statement that it failed completely to "implement" the process of distribution through any discussion of the actual workings of competitive (or monopolistic) principles of price fixing. Fruitful treatment of the distribution problem as a problem in the pricing of productive services, in exchange for which individuals receive their incomes in a competitive economic society, came about gradually as a result of the new treatment of value introduced by the utility theorists.

The classical economists, from Adam Smith onward, had recognized interest as a form of income more or less distinct from profit. Its place in their scheme, however, was quite subordinate. This was in line with the facts of the economic situation in their day, when capital was typically employed in business by its owner, lending at interest for productive purposes being relatively unimportant. In particular the limited liability company, which is the chief borrower at interest in the modern business world, had achieved little development and was assumed to have no large possibilities for the future. All the classical writers recognized at least three elements in the income of the capitalist entrepreneur: one a payment for the bare use of the capital (equal to the interest rate); a second element representing payment for the entrepreneur's activities as manager; and a third connected in a rather vague way with the carrying of the risks or hazards of the enterprise. This distinction was made in an especially clear fashion by J. S. Mill, who called the second element earnings of management. Mill did not discuss any possibility of separating the three elements and continued to use the term profit for the total income of the capitalist entrepreneur. In contrast with the English school, the expositors of the classical system in France, beginning with J. B. Say, insisted from the start on a separation between profit and interest and the treatment of profit as a species of wage. As early as 1852 a French writer, Courcelle-Seneuil, ad-

vocated treating profit not as a wage but as due to the assumption of risk.

The view more generally accepted at the present time, particularly among American economists, that profit is a unique form of income not reducible to remuneration for either capital or labor of any kind, was early developed by German writers. As early as 1826, Thünen (*Der isolirte Staat*, Hamburg) defined profit as the residue after deduction of all three payments, interest, insurance for risk, and wages of management. An elaborate analysis of profit was made by H. von Mangoldt in 1855 (*Die Lehre vom Unternehmergeinn*, Leipsic), recognizing the elements of payment for wages of management and for risk in actual profits, but defining profit as a surplus above all costs. But the idea of "pure" profit, as an excess in the income of a business as a whole in comparison with the income of the productive factors used in it, really worked its way into economic thought as a result of the efforts of John Bates Clark.

The classical writers had included several divergent elements in the concept of profits and had drawn a very loose and questionable distinction between land and capital—in spite of the important role which rent played in their scheme of distribution. Marx and later socialists, in taking over and developing the classical economics, seemed justified in dropping this distinction; by merging land with capital they obtained a concept of profit as including all non-labor income. Another impulse in this direction was the view, also abundantly represented in the orthodox economists, that labor is the real producer of all wealth and all other income a deduction from what is naturally the remuneration of the laborer. Thus the socialistic view of profit is one of labor exploitation.

The labor theories of value and of production rest in the first place on a confusion between ethical and economic or scientific explanatory principles. It is obvious that no identification of labor income with ethical income and other incomes with unethical income can be defended; all income represents a mixture of a more or less accurate evaluation of services in the broad sense with force and fraud. Since violence and fraud belong to the sphere of criminology, economic analysis of profit must center around the notion of a more or less accurate evaluation of services. In the perfectly competitive relations of abstract price theory, all services are assumed to be valued correctly and precisely. Under these conditions the entire produce in the form of income would

be divided exactly among the various claimants—workers of various sorts and owners of property of various sorts, including the different equities in and claims against tangible property created by financial relationships and ownership of monopoly privileges, such as patents and goodwill. If all payments for personal services are called wages, and all property services are paid for in the primary or natural form of rent, as understood in the business world, only these two forms of income will exist. Interest and rent are differentiated only by the form of equity which the recipient holds in the same concrete source of income and can therefore in such theory be identified. In the idealized society of equilibrium theory, there would be no occasion for assigning the distinctive name of profit to any type of return.

In actual society, however, there is still a third type of ownership besides those involving interest and rent claims—that of the entrepreneur who owns the enterprise itself as distinguished from the productive agencies employed in it. As the classical economists held, profit as a distinct type of income is, to begin with and roughly speaking, the income of the owner of the business. This may include elements due to personal and property services. Even superficially the situation is complicated by the fact that under modern conditions the owner is typically a corporation, and the ownership of the corporation itself is commonly divided up among several forms of equity. Moreover the corporate entrepreneur typically owns outright some of the property used in the enterprise, hires or leases other property for a rental and borrows at interest against part of the assets which it owns directly. As in the case of most general concepts, the definition of profit might run toward either of two extremes. It might strive for the closest possible conformity to empirical fact and general usage or for rigorous differentiation of a theoretically distinct form of income. In a general way the use of the term in British economic literature follows the first of these leads; thus Marshall treats of "profits of capital and business power." In the United States usage in the literature of economic theory has tended toward the other pole: it is a common practise among economists to use the expression pure profit and make it refer to the income of the business after deduction of wages and rent or interest at competitive rates for all the human and property services employed in the enterprise, including both those actually paid for in the market and a virtual

wage or interest or rent for the services furnished by the owner himself.

If this second procedure is followed through to its logical end, the result is a definition of profit as the difference between any income as it actually is and what it would be in the theoretical position of general equilibrium of the economic system as a whole. In the case of the owner of the business this difference is the entire income, since under perfect equilibrium the owner as such would have no functions and receive no income. It is evident that in this highly theoretical sense every income, with accidental exceptions, contains an element of profit. This element may be positive or negative in any case. In no case is it possible to determine objectively and accurately the amount of the profit element in an income, since this would involve an accurate determination of every detail of the position of equilibrium corresponding to the given conditions of the society at the given moment.

A compromise position between the realistic and the theoretical extremes starts out from the distinction between contractual and non-contractual income; that is, between the payment for services on a pecuniary basis arranged in advance and the residual income left to the owner of the business after all such payments are made. If the business is a private enterprise, in contrast with a corporation, this residuum will be recognized as containing elements of both interest and wages, since the owner will usually employ both property and labor of his own in the activity. If the enterprise is a corporation, the owners (common stockholders) do not normally furnish an appreciable amount of personal service unless they are also definitely employed by the corporation at a stipulated remuneration. Consequently the wages of management element hardly enters into the profit of a corporation. It must be recognized, however, that the stipulated remuneration or wages of management of corporation officials, whether stockholders or not, is at best most inaccurately adjusted by market competition to the true value of the service rendered, and hence is likely to be largely profit in the analytical sense. Notoriously too officials' salaries in many actual cases represent in large measure a distribution of the revenue alternative in form to stockholders' dividends; the difference is a matter of internal politics of corporations rather than of economic theory. Thus the compromise position is like the realistic, but with recognition of a need for further analysis which can be carried through only in the form of rough estimates.

Either theory, and any theory which recognizes profit as a distinct income at all, must oppose it to all other income, grouped together in a common relationship to profit; profit is either residual income as against contractual payments or a theoretical difference between actual income and the hypothetical level corresponding to general economic equilibrium. In both views the theoretical explanation of profit is the same, if the possibility of a theoretical explanation of any income is admitted. It is of course possible, verbally at least, to deny the relevance of all analysis in terms of price forces and their tendencies and to hold that only a historical explanation in terms of all the conditions at work at any time and place has relevance. It is doubtful, however, whether any writers securing recognition by economists really mean to deny all meaning to statements regarding general conditions which set limits somewhere to fixation of economic magnitudes by more particular, special and accidental circumstances. A sweeping denial of the validity of price mechanics would imply denial of the existence of profit in a theoretical sense, because a divergence between actual costs and prices and theoretical costs and prices would be denied; profit would then have to be defined empirically as the income of the enterprise after costs actually incurred have been met, which is a form of the residual conception of profit.

A theory of profit is inherently a theory of aberrations of actual economic conditions from the theoretical consequences or tendencies of the more general price forces which tend to eliminate them, a theory of the imperfections of competition, supplementary to the theory of perfect competition, defined in a sense which excludes profit. As the conception of perfect competition is admittedly somewhat arbitrary (as well as actually questioned with regard to its usefulness), a brief sketch of profit theory itself may begin with elimination by definition of certain boundary issues. The most important of these are included in the concept of monopoly, which should certainly be dealt with separately under such a caption as monopoly revenue or monopoly income, although economic as well as business usage often calls this profit. The concept of monopoly is here to be taken in the broadest sense, including income from patents, franchises, goodwill and every such source legally recognized as property.

Attempts to present a theory of profit thus restricted in meaning have taken two main di-

rections. The first centers in the effort to identify a peculiar form of service of which profit is the remuneration, a service which can be rendered only by the owner of an enterprise and cannot be paid for in the form of a wage or salary. Since the ordinary managerial activities are in fact frequently hired on a salary basis, there is left the service of "risk bearing" as the basis for such a theory. But again many of the risks of business are familiarly covered, at least in part, by insurance or other organization devices involving the insurance principle, reducing risk by grouping of cases or by applying the law of large numbers. Consequently this line of theory was early forced to specify a peculiar form of uninsurable risk. F. B. Hawley has been perhaps the best known proponent of such a theory in the United States. Among European economists, the importance of the element of risk bearing was recognized by von Mangoldt and later by Mithoff and Diehl among others; more recently a theory of uninsurable risk has been developed by del Vecchio. Discussion of the risk theory, notably by J. B. Clark and his followers, brought about recognition of the fact that the business manager not merely bears risk but estimates risks and selects those to be borne. In fact every detail of business policy both involves the selection and rejection of risks and vitally affects the amount of the risk itself. Thus the risk theory tends to revert to an examination of the functions of management and the nature of business ability, a problem which clearly ties up at the same time with the nature of the risks which cannot be insured and with that of the activities which no one can be hired to perform for anyone else. The conception of profit as remuneration for a unique form of rare human qualities has been advocated recently by Maurice Dobb, although without clear differentiation from wages of management or from Francis A. Walker's rent theory of profit, which was really a wage theory.

J. B. Clark developed the main alternative to a risk theory, one which connects profit with economic change, or in the language which his usage seems to have established, economic dynamics. Profit is emphasized as the lure which induces business men to make improvements in any direction and is depicted as a temporary income as regards any particular improvement, one which is eliminated by competition through transfer to the purchasers of products and to the owners of the labor and capital used in making them. Walras and Cassel also explained profit as

resulting from friction in the working of the competitive system. Cassel's theory, like those of Gide, Weber and Alfred Marshall might also be termed a rent theory of profit. More recently Schumpeter, Amonn and Oppenheimer in particular have developed theories of profit as due to the dynamic character of society.

A view of profit combining the conceptions of risk, of economic change and of the role of business ability has been elaborated by F. H. Knight. It begins by pointing out that uninsurable risk is in fact associated chiefly with economic change. When a change results from conscious innovation, the risk affects in different ways both the innovator himself and other competing enterprises. The risk itself is conceived of as error in decisions, sharply contrasted both with chance in gambling devices and with the hazards covered by insurance. It is pointed out that if the manager were completely and accurately informed on every matter connected with his decisions he would never incur losses, and if all competitors were so informed he would have no opportunity to make gains. The connection of profit with change is simply the fact that decisions of a managerial sort either produce changes or involve adaptations to change or both. In a world free from progressive change, no managerial decisions would be called for; fluctuations would cancel out and could be covered by insurance. Moreover changes which could be predicted indefinitely in advance by everyone affected would not give rise to managerial problems or error or profit; many changes, such as the steady growth of population and capital, are fairly predictable and to a corresponding extent do not occasion imperfect competition or profit. This view is a theory of profit only in an indirect sense, as indicating the limits of the theory which explains other incomes and of general principles in determining them. It serves to point out the directions in which price theory is to be supplemented; namely, through a study of the nature of economic changes and of the activity of the human mind, individually and socially, in producing and reacting to change.

Any study of profits must recognize discrepancies between contractual costs and income in both directions; and the explanation of gains and losses will culminate in the question whether profit is on the whole positive or negative. It is possible only to indicate the nature of the issue and certain theoretical presumptions in favor of one answer or the other. In a competitive enterprise economy profit is the difference between

the prices paid for productive services and the prices received for products. This formulation assumes a stationary economy, with net saving and investment absent, but may easily be expanded to include the phenomena of growth through investment. If there is on the whole a positive net profit it is because enterprises compete cautiously and do not raise the values of productive services on the average to their full theoretical level; if, on the other hand, enterprises or their managers are rash and overcompete, the prices of productive services will be raised above their theoretical values and profit will be negative. The difference, in case of a negative profit, would be made up from income in the form of wages or of rent or interest accruing to the profit receivers either at the same time at which net losses were incurred or at some other time.

It has been commonly assumed that risk is irksome and that in consequence profit must on the whole be positive. The phenomena of gambling and speculation, where every participant must know that the activity involves a net loss—often large—to the group engaging in it, make any such simple general assertion untenable. On the other hand, the existence of insurance proves that some risks are irksome to some people. The difficulty in reasoning abstractly about profit is that the character of the risk is not known and is moreover peculiarly affected by a human element. The investor-manager is essentially betting upon himself and his ability to meet situations; and other investors almost certainly judge ventures by the management much more than by any direct knowledge of objective conditions. Thus any assertion can be made regarding aggregate net profit, and appropriately rationalized.

Similar reasoning points to negative results from statistical studies of profit. Classifications of ventures with regard to the real risk involved are not much more defensible from the standpoint of objective accuracy if made at any subsequent time than if made when the ventures are initiated—and only those already finally liquidated can be classified even with respect to outcome. Data on investment and return are limited and questionable, even currently, and highly so for any considerable distance into the past. In order that any conclusion may be proved, data which are not exhaustive must be representative, and obtainable data are certainly open to doubt because of various sorts of bias.

Available figures on profit have been brought

together by various students, commonly with a view to disproving an alleged theory of a tendency of profits toward a normal level or toward zero after deduction of normal costs. A number of detailed statistical studies were undertaken in Hungary and Germany between 1900 and 1914, the most important work being that of József Kőrösy and Ewald Moll. In all these studies generalizations as to rates of profit over a period of years, or even in any one year, were affected not only by lack of relevant data but by difficulties of classifying logically the various possible types of return upon capital and goods—a difficulty which has never been overcome satisfactorily.

Similar statistical investigation was not developed in the United States until the abnormal profits of the war years and the increasing concentration of industry directed attention toward the importance of such empirical investigation, although earlier experiments with rate regulation had raised the question of normal and fair rates of profit. Among the best known recent studies are those of David Friday, Foster and Catchings, Horace Secrist, Lawrence Sloan, William L. Crum, and those made for the National Bureau of Economic Research by R. C. Epstein. The figures compiled in these various studies show a wide scatter and erratic variation, as would be expected. The reasoning to any negation of price theory is not easy to grasp, since general theory creates no presumption for any particular form of distribution of behavior. It is true that if conditions remained unchanged and transfer of investment were free, competitive theory would call for an approximation of extreme rates of return toward a norm with the passing of time. Secrist's figures reveal such a tendency, while Epstein's later and fuller data from corporation income tax returns, when plotted as a percentage on reported investment, do so only for half the eleven-year period studied. Theory does not call, however, for any particular rate of return on investment; even if investment were known, conditions do not remain constant and transfer of investment is not free. In actual fact the period of relative constancy in the distribution of rates (1924-29) is now known to have been the time of greatest speculation and inflation, even though it was not characterized by a rise in general commodity prices. The assumption that such profit conditions would continue was largely responsible for what happened in the years following 1929. What the figures prove is that a boom can create enormous prof-

its, on paper and for the time being. Even what would have happened if the legal owners of the profits reported, the holders of common stock of corporations, had secured them and elected to spend them for consumption purposes is itself a matter for speculation.

If it is possible to speak of conclusions indicated by the factual studies, they follow the lines that would be expected from theory or substantiate commonly accepted assumptions. It is none the less an important fact that modern business conditions create enormous amounts of "profit" in the loose sense of the word, although of course they also create enormous incomes from personal services and from property even within what would be called the normal market values of such services. Likewise such conditions create losses which are a problem on their own account. Devices aimed at secure accumulation increase the possible size of other incomes, while uncertainty makes for occasional large profits along with correspondingly large losses. Sloan's figures of the profits of 455 large corporations show an amazing range in the rate of return (from 15 to 181 percent) even for this exceptionally prosperous group. It is to be kept in mind that no objective line can ever be drawn between profit in the theoretical sense and other incomes, and this is especially important with reference to monopoly revenue, itself a broad and rather loose conception. Modern business devices may make it possible to prolong the temporary gains of a quasi-monopolistic sort coming from successful innovations, which play the chief role in J. B. Clark's theory of profit. This observation applies also, and perhaps especially, to the temporary legal monopoly created by patents and trademarks. Certainly modern world wide market organization tends to a greater concentration of the gains from lucky hits in articles of fashion or other new commodities which enjoy a successful run.

The great and overpowering problem, however, in connection with profit, as in economics generally, is that of changes in price levels and in business conditions, generally referred to as the business cycle. As already observed, it is the fact that such changes are not correctly anticipated, in addition to the fact of their occurrence, which makes them a source of gains and losses. Changes in the general price level and in speculative conditions have more than once since the outbreak of the World War transferred a very considerable fraction of the national wealth out of one set of hands and into another set, not merely without regard to desert or justice, but in a way de-

moralizing to the motivation of normal economic life.

The modern economic order is built around the concept of enterprise, the correlate of which in income is profit, and is often referred to as the profit system. Economic life necessarily involves much uncertainty or risk, in the loose sense, due to the vicissitudes of nature. Not all of this could theoretically be covered by insurance, and for much more insurance is impracticable. Enterprise economy adds to this the far greater uncertainty associated with the almost universal production of goods in anticipation of the wishes of consumers. This latter uncertainty would not be present in a social system controlled by consumers where production went forward only upon responsible orders in advance from consumers or consumer groups. In many cases, however—one may think of the railroads—such a system would be impossible unless the entire population were organized as a consumer unit, presumably through the agency of the state. The only apparent alternative to the whole population acting through the state as a single producer is a system in which the productive decisions are made and its risks assumed by "volunteers." In such an organization the role of entrepreneur appeals to many motives, inevitably including those of the gambler and those of the would be leader. Some of the motives or motive elements are undoubtedly of the sort conventionally called immoral, and opponents of the system as a whole plausibly stigmatize as such "the" profit motive itself, although all or nearly all the motives which ever operate in human life—the noblest as well as the basest—may enter into productive enterprise.

In connection with criticism of the economic system on social and ethical grounds, it remains to be observed that the notions of fair return and of profiteering need to be associated with careful analysis. Regarding monopoly gain there has been virtually no difference of opinion, and the only problem has to do with practicable methods of prevention. Fair rent and interest raise a different set of problems and should be tied up with a question of fair or necessary remuneration for personal services at both the higher and the lower ends of the scale. As concerns fair profit, in the strict sense, it must be kept in mind that there is serious doubt whether profit on the whole is actually positive or negative. Profit in one set of ventures is associated with loss in another set, unless and in so far as, there is a biased error one way or the other in the judgment of

those who direct business enterprise. A positive aggregate net profit above all losses means a bias on the side of caution, while a preponderance of the spirit of adventure will entail net loss on the whole. Both in abstract ethics and from the standpoint of social interest in adequate motivation, a proposal to reduce high profits raises the question of using the proceeds to reduce losses. It raises the question; it does not answer it, and no simple categorical answer can be given. Both profit and loss arise in many cases from circumstances entirely apart from human foresight, and the question then is one of justice rather than of incentive, but the further question of the political feasibility of any proposed action also looms large. In other cases considerations too complex even to be listed here enter into the issue as to what might be done to secure a wiser direction of the use of productive resources and a more equitable distribution of the results than is afforded by individual competitive choice. Finally, in any judgment of "the profit system," full weight must be given to questions of the moral value of different motives, of the qualities of personality and of human relationships which go with different types of economic constitution and the like, as well as to more strictly economic issues of efficiency or even justice.

PROFIT SHARING was defined by the International Congress on Profit Sharing, held at Paris in 1889, as an "agreement freely entered into, by which the employees receive a share, fixed in advance, of the profits." The congress interpreted this to include both legally binding agreements and those in which there was no other than a moral obligation; emphasis was upon the necessity of determining in advance the method of sharing profits. This definition has received general adherence in European discussion. In the United States bonus systems and employee stock ownership arrangements have sometimes been referred to as methods of profit sharing; but neither bonus nor stock ownership plans imply any necessary relation to profits. A more frequent erroneous use of terminology in the United States is the inclusion of those arrangements in which the sharing of profits is confined to the managerial personnel. But this involves an application of profit sharing so restricted that it disregards the social significance envisaged by early proponents who stressed the importance of enlisting loyalty of a large proportion of manual workers, with resultant enhanced production and industrial peace.

Formalities of definition, however, are less significant than the realities of actual functioning; and even the operation of plans in Europe raises doubts as to how extensively profits in any real sense are shared. In France, where profit sharing has the longest history, frequently deferred participation is established, under which the profits shared are accumulated in a "patrimony" and paid into employees' pension funds. Under such a plan the employees are virtually financing their own pensions, on the assumption that they earn their share of the profits. Such specific segregation and use of employees' shares appear to be no more generous than the arrangements of firms which, while not "sharing profits," provide pensions on some other basis.

Deferred participation has developed most

extensively in France, but it is not uncommon elsewhere to share profits in stock rather than in cash and to stipulate that the capital so represented shall remain for a period in the firm. Other shared profits are paid into a savings fund, the money being used in the business. A frequent requirement, whether benefits accrue through immediate cash payments or are deferred, is to confine application to workers who have been on the pay roll for periods varying from six months to five years. Typically there are additional requirements, including evidence of proper "loyalty" to the firm, such loyalty often being construed as refusal to join a labor organization. In consideration of these limiting factors it has been suggested that it would be appropriate to redefine the practise of profit sharing as the setting aside of a sum payable to those employees who qualify through certain periods of service and through compliance with other conditions stipulated by the management. Participants in profit sharing plans seldom exceed 50 percent of the total labor force, and the proportion is usually smaller.

Although there were earlier developments with features analogous to profit sharing, the modern movement really started in France in the 1840's and was given a powerful impetus by the growth of reformism after the Revolution of 1848. Most noted among the first ventures in profit sharing was that of Edmé Leclaire, initiated in Paris in 1842. Leclaire, who headed a house painting firm, restricted his plan, which included cash distributions, to a nucleus of the higher paid workers and achieved a measure of success partly through his personal influence. He was convinced that by giving the workers the opportunity to participate in profits they would economize on materials and improve the quality of their work to such a degree that additional profits would result both for himself and for the employees. Another noted French experiment in profit sharing was that of Jean Godin, who was engaged in the manufacture of heating apparatus. A follower of Fourier, Godin regarded profit sharing as a means of promoting a broad program of producers' cooperation. Charles Robert, an influential leader in the cooperative movement in France and an admirer of Leclaire, wrote extensively in favor of profit sharing as a method of paving the way for cooperation. In 1878 he founded a society for the study of profit sharing, and his activity was instrumental in popularizing the idea among government officials. Despite the influential sponsorship of the

movement, the great amount of propaganda and the prevalence of small scale industry in which the workers could influence output the growth of profit sharing was extremely limited in France; there were only 120 profit sharing plans in 1889, and by 1924 they had dwindled to 75, one third of them having been started after 1919. Insurance companies provide the largest group of profit sharing enterprises.

In Germany Victor Böhmert, like Robert in France, fostered profit sharing through his writing. He was motivated by the belief that profit sharing would promote his theory of the identity of interest between wage earner and employer. Ernst Abbe, owner of the Zeiss optical works, introduced profit sharing on a liberal basis along with other advanced measures in labor policy. Abbe's plan was the only important one of its kind in Germany; up to 1921 no more than 95 plans had been initiated, of which 29 were still in operation. Most of the schemes provide for payment of shared profits into savings accounts as benefit funds. Major reasons assigned for the failure of profit sharing institutions to gain a foothold in Germany are the opposition of socialist groups, the strong disapproval of the trade union movement and the lack of interest on the part of employers, probably because of the high degree of trade union organization.

The profit sharing movement in France, which in its early stages seemed a spectacular success, attracted the attention of J. S. Mill, John Bright and the Christian Socialists in England. It was linked up early with the cooperative movement; many of the first cooperatives and their leaders insisted that profit sharing and cooperation be combined, but this was rejected by the cooperative movement as a whole. Profit sharing plans in capitalist enterprises made considerable progress until the failure during the 1870's of the plan in the Briggs collieries. This concern in 1865 introduced profit sharing as a preventive of strikes; but when strikes against wages occurred the plan was abandoned, having been in operation only eight years. These happenings influenced British employers against profit sharing, while the trade unions were hostile or indifferent, definitely opposing profit sharing, as early as 1889, on the ground that it would induce workers to abandon their unions and make them averse to strikes.

Profit sharing in England was early identified with the copartnership movement. One interpretation of copartnership, which implies own-

ership of stock by employees, is that a minor stake in ownership will psychologically transform the worker into a capitalist. Others, however, assert that ultimate employee membership on the board of directors is the only way to attain fully the assumed underlying identity of interest. The Christian Socialist movement with its "social workshops," an idea imported from France, and philanthropically inclined employers, such as B. Seebohm Rowntree, evidently influenced in part by religious convictions, appear responsible in some degree for this emphasis on profit sharing as a means to copartnership. The earliest copartnership type of profit sharing appeared in England in 1894. This was a scheme of the South Metropolitan Gas Company to pay the profit sharing bonus (according to a plan adopted in 1889) one half in cash and one half in company stock; by 1926 employees of the company owned £500,000 in stock. This form of profit sharing had considerable development among gas companies. But the movement as a whole did not fulfil the expectations of its advocates. By 1932 there were in Great Britain 469 profit sharing plans of all types; the number abandoned was over 350. The plans in operation included 168 cooperative societies. Those in private undertakings embraced 220,000 workers, a minority of the total number employed; 93 of the plans, embracing 48,700 workers, were linked up with share ownership, or copartnership. In 1923 and again in 1925 the British Trades Union Congress condemned copartnership as "designed to mislead workers and prevent trade union solidarity," but somewhat more favorable sentiments were expressed in subsequent years. Although profit sharing is considered to have made most advance in France, in no country has it progressed more than in England.

Every other European country can supply some examples of profit sharing, but it has no real importance in any of them. In Italy, although the Catholic party favored it, profit sharing was practised by only a handful of firms. In Czechoslovakia it is practically limited to the Bata Shoe Company. In Holland a few firms have adopted it. Profit sharing is almost nonexistent in Belgium, despite various attempts to induce its adoption; employers as a whole have never been much interested and the trade unions have been definitely opposed, their attention being concentrated on political action and labor legislation.

There was a revival of interest in profit shar-

ing because of the labor unrest which followed upon the World War. There were many proposals for compulsory profit sharing and some adoption of legislative measures toward this end—in France in 1919, Czechoslovakia in 1920, Italy in 1921, Norway in 1922, Portugal in 1923 and in Belgium, England and other countries—as a means of socializing industry and allaying the workers' discontent; but the proposals either failed of enactment or produced no results. This is equally true of compulsory legislation in Colombia, enacted in 1923. In 1924 copartnership was legalized in New Zealand, in the form of legislation to facilitate the issue of labor shares, but the outcome was negligible. There was some interest in copartnership among German industrialists after the war; the most important plan, that of Krupp, which lasted from 1922 to 1925, was discontinued because the company was unable to pay the 6 percent preferential dividend on the workers' shares. Since profit sharing seems to be essentially a capitalist device instituted through the initiative of private employers, it is not found in Soviet Russia.

While in Europe profit sharing was in part an expression of the movement for social reform, in the United States it was inspired wholly by employers. It began to develop in the 1870's under pressure of labor unrest, but did not acquire significance until the 1880's. By 1896, however, only 50 enterprises had adopted profit sharing, and by 1916 only 60 enterprises. Many plans were adopted but most of them were discontinued after a few years. Almost from the beginning the movement was opposed by organized labor. The small sums commonly distributed to wage earners under profit sharing have not added enough to the American worker's income to induce him to view the plan without indifference or hostility. This attitude, combined with the traditional optimism of Americans in economic matters, has been partially responsible for the reliance upon "managerial profit sharing" and employee stock ownership as more effective than profit sharing. The most prevalent form of profit sharing is that limited to managerial employees. The earliest forms of employee stock ownership arose out of profit sharing, although it developed mainly as a substitute. Employee stock ownership was emphasized particularly in the decade following the World War, when the speculative aspect of stock ownership seemed to present unusual opportunities for "getting rich quick," although the mass of wage earners were not included in the

various plans of disposing of stock to employees. In 1916 there were 60 enterprises which met the accepted definition of profit sharing, but this figure includes plans which permitted as few as one third the number of the employees to participate; the total workers under the plans did not exceed 30,000, the establishments were nearly all small and none was unionized. There has been very little advance since 1916. A survey in 1927 indicated that of 4409 enterprises, employing 419,000 workers, only 54, or 1 percent, had some form of profit sharing, with an average yearly "bonus" of \$85; 109 enterprises had managerial profit sharing, with an average yearly bonus of \$712. Profit sharing is rare in the United States and seems to be losing ground.

Adversity for profit sharing in Europe has synchronized with the chaotic state of industry characterizing much of the period since the World War. Factors most conducive to the launching of profit sharing ventures are favorable profits combined with rising prices and industrial unrest. Unrest there has been, but the other requisites have not existed in the proper amounts. Even when prices were rising during the period of extreme inflation immediately following the war, especially in Germany, instability was too great to encourage the establishment of new experiments in profit sharing. Little evidence exists that the relatively better economic position of France among the larger nations of western Europe has stimulated profit sharing. No nation stands out conspicuously against the trend of declining practise.

Several generations of experience with profit sharing afford a basis for conclusions as to its decided limitations. In general the small firm, comprising a declining area of industry, is most suitable. An exception under favorable circumstances is a public utility like the British gas industry, where the rates to consumers, output and profits are sufficiently correlated and stable. All public utilities are clearly not so situated; the experience of a leading French railway system, for example, caused the abandonment of profit sharing. Associated with small size are likely to be occupations in which individual skill and responsibility tell strongly on output and economy in materials. Profit sharing may increase output by stimulating the worker's initiative; but this is not so feasible in highly mechanized industry, where the machine largely determines output. Experience also seems to demonstrate that even in the small concern profit sharing will not survive unless it is integrated

with a plan of social welfare work. This is indicated in France, typical nation of small scale industry and handicraft, where profit sharing through deferred participation takes on the aspect of welfare work.

The methods of determining the shares which the workers may receive are somewhat varied; but first provision is usually made for interest on invested capital, depreciation and reserves, and then sharing takes place on a ratio based upon the relation of the annual wage bill to the total capital. As a rule this results in a share for ownership at least three times as great as that available for the employees. If, as has been suggested, the shares for distribution are more logically computed upon the basis of the "earnings" of both labor and capital, the division would depend upon the proportion which interest on capital bears to wages of labor; this would result typically in "profits" to labor at least three times the amount assignable to capital, and it is therefore obviously not popular among employers.

Profit sharing clearly fails to correspond with the wage earner's needs; migratory and casual workers are seldom eligible and lower annual earnings for those qualified result in smaller annual shares. In Great Britain over a long period of years the "labor dividend" declared by profit sharing firms averaged approximately 5 percent on annual earnings. The majority of the plans in the United States resulted in less than a 10 percent increase in the participating wage earner's income. These additions are no larger than the amounts frequently paid as a bonus at Christmas or New Year. It appears further that through profit sharing the same stimulus to output is sought as that attainable under a piece rate system of payment. But the average profit sharing dividend is substantially less than the increase in income which a trade union commonly obtains when it agrees to replace payment by time with a piece rate system.

For profit sharing it has been claimed that the lure of profits acts as a stabilizing influence in reducing labor turnover. This can hardly apply to those numerous workers among whom employment is most irregular, and who therefore represent the most serious social aspect of labor turnover, because the bulk of this labor is excluded under profit sharing. In the case of the better paid workers who are induced through profit sharing to remain "permanently" with a firm there is reduced labor turnover. But this means that labor mobility has been impaired,

and in a competitive system this outcome is no more calculated to enhance the wages of labor than impairing the mobility of capital would increase its return.

Advocates of profit sharing have contended that its relative failure is not attributable to inherent defects but is caused rather by failure to apply "correct principles." One of these principles is payment of the market rate of wages. But even if such payment is maintained at the beginning, with the development of severe competition the management is likely to utilize profit sharing as it would any other available means of lowering wages or preventing wage increases. This tendency under competition would seem to be more "inherent" than the "correct principles" of profit sharing. And since the wage earner's primary economic concern is wages, the view appears justified that in practise profit sharing tends often to create new points of friction. The factors indicated go far toward explaining the high mortality rate in profit sharing plans. Although some trade unions have on occasion accepted a particular profit sharing plan, believing themselves strong enough to protect union standards, the labor movement has opposed profit sharing on the theory that it is a menace to both wages and union organization. Significantly, profit sharing plans are not infrequently brought to an end through strikes. It may fairly be concluded therefore that the value of profit sharing as a stimulus to production is inconsequential.

In addition to the labor aspect there are basic difficulties in profit sharing, which result from the nature of profits. It is asserted frequently that profits are determined by so many influences outside the orbit of the individual establishment that the worker's efforts have little direct effect. This is usually interpreted to mean that the worker has nothing to do with the creation of profits, but it has been pointed out that according to this reasoning owners likewise would not be entitled to profits. Under any theory of profit there are serious obstacles to integrating with theory such a device as profit sharing. Risk theories sooner or later reach the conclusion that "risk taking" owners of property are legitimate heirs to profits. If so, the "profits" bestowed upon labor are not "earned" by labor, and an irresistible tendency will therefore develop to minimize the amounts "shared" and to offset labor's "profit" by compensatory reductions in the wages otherwise paid. The concept of capitalist exploitation of labor, basic to the

Marxian explanation of surplus value as the ultimate source of profits, leads to a similar conclusion regarding the lack of reality of any alleged sharing of profits. It is also pertinent theoretically that the upholders of private property in the means of production envisage competition as causing "pure profits" in the aggregate to disappear or to be a negative quantity, a state of things which does not afford a sound basis for the sharing of profits with employees. If a plan were to include the sharing of losses as well as of profits, it would be initially unacceptable to labor.

PROFITEERING came into general use as a term of opprobrium during the World War. Applied primarily to the manufacturer or merchant who was thought to be amassing huge profits through extortionate prices, it was extended by those inclined to finer moralistic analysis to anyone who used the common situation for personal gain.

War profits were far from being a new phenomenon in 1915 and 1916. There are records of attempts by the Roman Senate to suppress the great war gains of certain Roman generals. At a later date the Rothschilds added to their fortunes through war financing, while the Napoleonic wars brought out numerous charges of extortion and "profiteering." Indeed it may be assumed that commercially minded individuals everywhere have taken all feasible advantage of the opportunities for gain provided by wars.

With the wars of nationalism, however, this indifference of the trader took on a new and less tolerable complexion, at least in theory; but it was only with the World War that the impact of war conditions fell inescapably upon every group within the community and that individual gain came to appear as a direct blow at social—in this case identified with national—welfare. It is indicative of the original significance of the term profiteering that it was almost unheard in the United States throughout 1915 and 1916, when profits for many industries were higher and ascending more rapidly than at any later period. But such gains appeared in a different light when they were no longer made at the expense of a foreign situation but seemed rather a menace to the success of a common program.

Once coined, the terms profiteer and profiteering took their place in the vocabulary of war propaganda. But they were not left for long to achieve their effects merely as slogans; almost immediately they were incorporated in legisla-

tive and administrative programs of price control and production regulation. The series of regulations of industry and trade set up by each of the belligerent nations had a common objective, the maximum production of war materials. In most countries the basic war industries were directly controlled: supplies requisitioned, production allocated and remuneration fixed. But in the case of consumers' goods and trade in general, where such complete regulation was hardly feasible, control was achieved through the establishment of maximum and minimum or fixed prices (see WAR ECONOMICS). Such regulation, however, far from eliminating differential war profits, made them inevitable. It was well recognized at the time that the establishment of a single price for an industry in which the costs of different producers varied greatly, particularly if the price were high enough to call forth maximum production, could result only in huge profits for low cost producers. Legislators and administrators in general fell back upon the faith, hardly substantiated by subsequent experience, that the excess profits tax (*q.v.*) would return to the public treasury the huge amounts thus presented to favored individuals and groups. Another and most important source of war profits was inflation, which also operated in a sense without the intervention of the profiteer. But although war profits were thus inherent in the particular set up of war conditions, it is not to be inferred that they came to their recipients entirely unsolicited.

There have been a number of attempts to estimate the extent of war profits, but lack of data and of agreement as to statistical procedure and interpretation give to all of them an exceedingly tentative character. In the United States the Federal Trade Commission collected evidence in 1917 and 1918 which indicated the existence of profiteering on a large scale. Thus, although early in 1917 the Food Administration had established a maximum profit for flour millers of 25 cents a barrel, with wheat prices fixed, the average profit made for the year 1917 was 45 cents a barrel, with profits for individual mills ranging considerably higher. The abnormal profits of most of the steel companies—the average profits increased from 4.7 percent in 1912 and 2.8 percent in 1914 to 24.9 percent in 1917—were not eliminated even by government price fixing. Extensive profiteering was found to exist in the meat packing industry and examples of excessive gains were culled from a variety of other industries. A careful study published in

1918 (Fuchs, Rudolf, *Die Kriegsgewinne*) indicates similar conditions in German industry and trade. For instance, the gross profits, expressed as a percentage of the share capital, for a selected list of 16 German mining and steel companies ranged in 1912-13 from 13 to 65 percent, in 1916-17 from 35 to 219 percent; but since increases had not occurred proportionately, the percentage increase of gross profits in 1916-17 over 1912-13 ranged from 18 to 467 percent, while the percentage increase in average profits in the 1914-17 period over the average for 1910-13 ranged from 33 percent to 846 percent. A Select Committee on High Prices and Profits set up by the British Parliament in 1919 made a careful distinction—more tenable in theory than in statistics—between large war profits, inevitable under a system of maximum prices, and speculative profiteering. The latter it thought had been largely ended, although not until well on into the war, for the food industries, the munitions industry and other basic war industries by the controls established. In 1918 Josiah Stamp drew the conclusion, from index numbers of profits and prices, that in England business profits in the aggregate, including the part paid away as excess profits duty, had risen to an extent rather less than the rise in prices. It is also to be noted that huge war profits were in many instances followed by huge losses in 1920 and 1921. But there is nevertheless no doubt that in every country, neutral as well as belligerent, favorably situated individuals made extensive permanent financial gains from the war.

The ostentation of many of these newly or increasingly rich kept alive the term profiteer and the resentments it expressed long after the cessation of hostilities. Indeed wartime regulation, particularly of rents and food prices, was continued for several years almost everywhere except in the United States. One of the most ambitious post-war attempts at the regulation of profits was the British Profiteering Act of 1919 which gave to the Board of Trade power to investigate costs, prices and profits for any article of mass consumption upon complaint or upon its own initiative and, where it found proof of unreasonable profits, to declare what price would yield a reasonable profit and require the seller to repay the excess to the complainant. Fines might also be assessed against profiteers. A whole series of local and regional committees were set up to investigate retail prices and see to the enforcement of this law with the Board of Trade as the final court of appeal. The law

as originally passed was to remain in effect for six months; but in May, 1920, it was amended to continue for another year. It operated chiefly as a supplement to existing regulation of trusts and monopolies, giving the Board of Trade some control over retail prices as well during a critical period. A somewhat similar experiment was tried in the Union of South Africa from 1919 through 1922.

By 1924 or 1925 the term profiteering had almost disappeared. If public attention was occasionally directed to the immense profits of public utility companies or chain store organizations, the problem as a whole seemed of minor consequence in the face of increasing prosperity. It came to the fore again after 1929 with the return to price regulation as a method of combating depression. Any attempt at price stabilization must raise questions as to the relative gains of different groups, and the problem of disproportionate prices and profits was prominent in many countries in 1930 and 1931; but it was the series of emergency measures begun in the United States in 1933 that revitalized the term profiteering. Not only did the analogy of wartime organization in "the war against depression" inevitably give new life to the term but, up to 1934 at least, the real force relied upon by the government to curb disproportional price rises—behind the elaborate system of trade associations and compliance boards—was the social disapproval symbolized by the term profiteer.

In 1919 Sir Auckland Geddes in moving the Profiteering Act in the House of Commons said: "The introduction of the word profiteering into the language is really something of a landmark, for it marks an increase in the social consciousness. . . ." The effective utilization of this new social conscience he saw as the only alternative to governmental production of articles of necessity or complete governmental price regulation. Profiteering does indeed take its place among the numerous concepts through which men have attempted to control social activity: usury, just price, fair return, public interest. Just as usury, the most closely analogous concept, meant originally the system of interest taking and only gradually came to mean the taking of excessive interest, so profiteering has sometimes been used to mean the system of profit making and retains always a hint of this meaning, although its general connotation is that of the making of exorbitant profits. Such concepts represent attempts not to establish a new economic system,

but to put limits upon the excesses of that in existence, to moralize and rationalize the course of economic activity.

The very appearance of such a term indicates a fairly widespread recognition of the social implications of certain habits and customs. Its possible effectiveness is less easily determined. As a moral deterrent its effectiveness is largely dependent upon the scope of the social consent which it achieves. If it represents merely the attempt of one group to restrain another, that effect may be extremely limited: to call a man a banker may damn him in Marxist circles but will hardly do so in his own. And it is the moral condemnation of one's own group which counts most heavily. During the war the term profiteering may have expressed a sufficiently widespread sentiment to have acquired real moral force, but it is seldom that such unanimity of aim infuses any people. It is to be noted moreover that even in the case of a war situation it is the little man who is most exposed to the force of disapproval; the powerful manage to disguise the real nature of their conduct, perhaps even in their own eyes.

When the concept reaches the stage of legislative action, however, its effectiveness depends upon a different set of factors; in general terms, upon the detailed intelligence with which it is implemented and upon its adaptability to the given situation. From this point of view just what does or can profiteering mean? One is faced at the outset of any such inquiry by the ambiguity which led official boards to distinguish between unavoidable and speculative profiteering. The idea of excessive profit implies that of normal or average profit. From the strictly economic point of view a normal rate of profit is a meaningless concept since profit is, under any theory, a surplus, an over-and-above, an unpredictable factor. Moreover the attempts of statisticians to discover actual average rates of profit have revealed chiefly a diversity which defies meaningful application of the notion of an average. It might be argued that this is beside the point in so far as profiteering represents a moral attitude, since the common man and the business man, against whom the term is directed, know quite well what it means. It is to be doubted whether even this is true. The difficulties of definition, even from the business man's point of view, were well brought out in the hearings on proposed codes for different industries under the National Industrial Recovery Act in the United States. Ideas as to what con-

stituted a fair profit or the basis on which it was to be computed were almost as diverse as the individuals concerned. Profit varies in constitution and import, according to whether a large or a small industry, one with heavy or light indebtedness, a corporation or a holding company, a manufacturer or a merchant, is under consideration. Profit making always occurs under shadow of the risk of loss; and high profits are often justified as compensation for losses, either of other businesses or of all business in years of depression. But if the concept of profiteering is to make any serious claim to the ordering of economic relationships, such argument is both specious and fallacious. For losses by the less fortunate represent either uneconomic production or production which cannot be measured in profit terms; while the losses of all businesses in depression years are in large part the result of excess profit taking in good times and indeed one reason for its condemnation. These very difficulties of giving any long time meaning to the concept of a normal or fair rate of profit are illustrated in the history of the concept of fair return (*q.v.*) as applied by United States courts in railroad and utility cases. Whether the idea of a fair return might provide a workable basis for regulation under a different economic system is another question.

Profiteering is essentially an individualistic concept. At its center is the profiteer, the individual malefactor, rather than the profit system. And this is the source of its weakness, for the real problem is that of the distribution and hence of the effect of huge profits upon the concentration of wealth, the growth of monopoly, the continued existence of uneconomic businesses and industries, the prevalence of speculation and inflation, the position of the wage earner and the consumer. None of these problems is touched by exhortations, moral or legislative, to curb the desire for too great gain. The introduction of the term profiteering into the language may represent a gratifying increase of social consciousness; it is probable, however, that social welfare will be more quickly advanced by attention to other aspects of the profit system and by the invention of other methods of controlling the wealth of society.

PROGRESS. "Thought," says Pascal, "makes the greatness of man." The universe can destroy an individual by a mere breath; but even if the entire force of the universe were employed to destroy a single man, the man "would still be more noble than that which destroys him, since he is aware of his own death and of the advantage which the universe has over him: of all this the universe knows nothing." This awareness of himself and of the universe is no doubt what chiefly distinguishes man from all other forms of life. Man alone is conscious in the sense that he alone can stand outside of himself, as it were, and watch himself functioning for a brief span in the universe of which he is part. Man alone can coordinate memory of things past, perception of things present, anticipation of things to come, sufficiently so at least to know that he, like generations before him and after him, will live his brief span and will die. It is in virtue of this awareness, and somewhat in proportion to its intensity, that man alone asks the fundamental questions. Why and for what purpose this brief and precarious existence in a universe that endures? What is man's relation to the universe that is sometimes friendly, sometimes hostile, but in the end always fatal to him? How may he elude its hostility, win its favor, find

compensations for the intolerable certainty of the death which it will inflict upon him? The answers which men have given to these questions are to be found in the various myths, religious doctrines, philosophical and ethical interpretations which they have accepted, and in those unconsciously held preconceptions which in every age so largely shape their thought and conduct. The modern idea of progress belongs in this category of answers to necessary but insoluble questions. Like the myths of primitive peoples and the religious and philosophical beliefs of more advanced societies, it springs from the nature of man as a conscious creature, who finds existence intolerable unless he can enlarge and enrich his otherwise futile activities by relating them to something more enduring and significant than himself.

Although grounded in the nature of man as a conscious creature, the idea of progress belongs historically to the European tradition, and its origin may be derived from two sources. One of these is the classical conception of history as an endless series of cycles; the other is the Hebraic-Christian doctrine of messianic intervention and salvation.

In Greek mythology the reign of Cronus was regarded as a golden age when men lived like gods free from toil and grief. The present appeared to be a period of degeneration, and improvement or progress could be conceived only in terms of regeneration—a return to the lost golden age. After the myth ceased to be believed, the Greeks continued to look back to the time of great lawgivers, such as Lycurgus and Solon, whose work they idealized, and forward to the time when other great lawgivers would appear and give them better laws again. "Until philosophers become kings . . .," said Plato, "cities will not cease from ill." Yet however often restoration was accomplished by inspired lawgivers or philosopher-kings, fate and human frailty would again bring degeneration; so that, since "time is the enemy of man," most classical writers regarded human history as an endless series of cycles, a continual repetition of the familiar phenomena of recovery and degeneration. The rational mind, according to Marcus Aurelius, "stretches forth into the infinitude of Time, and comprehends the cyclical Regeneration of all things, and . . . discerns that our children will see nothing fresh, just as our fathers too never saw anything more than we" (*The Communings with Himself of Marcus Aure.*

lius Antoninus, tr. by C. R. Haines, Loeb Classical Library, London 1916, bk. xi, sect. 1). To regenerate the Roman Empire was obviously less easy than to construct a constitution for a small city-state; and Marcus Aurelius, philosopher-king though he was, instead of giving new laws to society recommended that the individual cultivate resignation. The later centuries of the Roman Empire, when resignation became at once more necessary and more difficult, were therefore a suitable time for the hopeless classical doctrine of endless cycles to be replaced by the Hebraic-Christian doctrine of messianic intervention and salvation.

The Jews like the Greeks looked back to a golden age, but it was identified with the creation of the world and with the Garden of Eden, in which the first men lived in innocence. Like the Greeks the Jews regarded the present as a period of degeneration, but they attributed the "fall" to Adam's disobedience to God's commands. God was at once the omniscient creator of the world and the supreme lawgiver, so that regeneration was identified with the coming of a God inspired king of the house of David. Multiplied reverses and the destruction of the Hebraic state gave to this doctrine a less political, a more mystical and transcendent character. The once actual but now vanished kingdom was replaced by an ideal Israel, symbolized as the "son of man"; and the idea of a God inspired king was replaced by the idea of a messiah who would effect a catastrophic intervention in the affairs of men and pronounce a doomlike judgment on the world. The Christian myth was but an elaboration of these ideas. Jesus, son of man, son of God, was the Messiah. But the end was not yet. The death of Jesus was expiation for the sins of men, faith in Him the means of salvation. Jesus the man was dead, but Christ the Lord still lived and would come again; then the earthly city would be destroyed and all the faithful be gathered with God in the heavenly city, there to dwell in perfection forever.

The weakness of the classical version of degeneration and recovery was that it offered no ultimate hope; of the Jewish, that its promise was for the chosen people only. The strength of the Christian version was that, conceiving human history as a cosmic drama in which all men played their predestined part, it offered to all the hope of eternal life as a compensation for the frustrations of temporal existence: by transferring the golden age from the past to the future it substituted an optimistic for a dis-

illusioned view of human destiny. It is easily to be understood that such a view won wide assent in the Roman Empire during the centuries (300-500) of declining prosperity and increasing oppression or that it served so well to make existence tolerable in the relatively anarchic, isolated and static society of western Europe from the dissolution of the Roman Empire to the Renaissance of classical learning. But it lost its hold on the imaginations of men as a result of profound changes in the outward conditions of life which occurred in western Europe from the fourteenth to the nineteenth century. Among these changes were the rise of ordered secular governments, the growth of towns and industry, the geographical discoveries and the extension of commerce which brought western Europe into direct contact with alien customs and ideas, and above all the rise of an educated middle class whose interests were hampered by a form of society in which both the power and the doctrines of the Christian church supported the autocracy of kings and the privileges of a landed aristocracy. It was in this time of revolt against ecclesiastical and secular authority that the Christian doctrine of salvation was gradually transformed into the modern idea of progress.

So long as Christian philosophy was little questioned, men could afford to ignore the factual experience of mankind since they were so well assured of its ultimate significance. But the declining influence of the church was accompanied by an increasing interest in the worldly activities of men in the past. Italian humanists turned to the study of classical writers; Protestant reformers appealed from current theologians to the beliefs and practises of the primitive church. Thus was born the modern historical approach to problems, and human life came increasingly to be regarded rather as a historical process than as a finished drama to be played out according to a divine plan. Seen in historical perspective, classical civilization emerged for the humanists as a resplendent epoch from which the middle period of ecclesiastical ascendancy was manifestly a degeneration. Until the seventeenth century secular thought and learning turned for inspiration to the past—to the golden ages of Pericles and Augustus; and classical writers were idealized as models to be imitated, to be equaled if possible but hardly to be surpassed. In all this there was nothing that could not be found in the Greek notion of history with its cycles of recovery and degeneration, and but for two general

influences modern thought might have been no more than a return to the classical view of human destiny.

One of these influences was Christian philosophy itself. Although it was gradually discredited as an account of events historically verifiable, Christian philosophy had so thoroughly habituated men to the thought of an ultimate happy destiny that they could never be content with a pale imitation of Greek pessimism. The other influence was experimental science which, in proportion as it displaced the Christian notion of a utopian existence after death to be brought about by the miraculous intervention of God, opened up the engaging prospect of indefinite improvement in this life to be effected by the application of human reason to the mastery of the physical and social environment which determines men's lives for good or ill.

In the seventeenth century Galileo and Newton made possible a new attitude toward nature. Nature was now seen to be friendly to man since the universe behaved in a uniform way according to universal natural laws—a behavior capable of being observed and measured and subjected to the uses of men. God was still the supreme lawgiver, the author of the universe; but His will was revealed in the great book of nature which men were to study in order to interpret, and to interpret in order that their ideas and customs might attain an increasing perfection by being brought into greater harmony with the laws of nature and of nature's God. God's revelation to men was thus made not through an inspired book or a divinely established church but through His works, and man had been endowed with reason precisely that he might learn through the course of the centuries what that revelation was. It was therefore no longer so necessary to think of the golden age of Greece and Rome as unsurpassable. "Those whom we call the ancients were really those who lived in the youth of the world," said Pascal, and "as we have added the experience of the ages between us and them to what they knew, it is in ourselves that is to be found that antiquity which we venerate in others." In the ascription of antiquity to the race there is still the implication of degeneration; but if a continuously richer experience made the moderns wiser than the ancients, it was not difficult to hit upon the idea that future generations would, in virtue of the same advantages, surpass the moderns. "We have admired our ancestors less," said Chastellux, "but we have loved our contemporaries

better, and have expected more of our descendants" (*De la félicité publique*, 2 vols., new ed. Paris 1822, vol. ii, p. 71). Thus in the eighteenth century the modern idea of progress was born. Under the pressure of social discontents the dream of perfection, that necessary compensation for the limitations of the present state, having long been identified with the golden age or the Garden of Eden or life eternal in the heavenly city of God, was at last projected into the temporal life of man on earth and identified with the desired and hoped for regeneration of society.

As formulated by the *philosophes* the doctrine of progress was but a modification, however important, of the Christian doctrine of redemption; what was new in it was faith in the goodness of man and the efficacy of conscious reason to create an earthly utopia. The French Revolution was the outward expression of this faith. In the nineteenth century the doctrine of progress still reigned and won even a wider popular support, but it was somewhat differently conceived. After the disillusionment occasioned by the revolution and the Napoleonic conquests the prevailing desire was for social stability and national independence. The rationalization of this desire was provided by the historians and jurists who formulated the notion of historical continuity and deprecated the attempt to transform institutions according to a rational plan. Change was considered necessary but was thought to be beneficial only when it issued spontaneously from national tradition; the concept of natural law was not abandoned, but it was regarded as implicit in historical evolution rather than as a conclusion from abstract reason. Law is not made by the legislator, said Savigny, any more than language is made by the grammarian. Ranke, who influenced three generations of historians, viewed progress as something to be discovered by tracing the history of each nation just as it had occurred and by noting the peculiar contribution which each nation at the appropriate moment had made to European civilization. Hegel formulated the point of view of early nineteenth century jurists and historians in his *Philosophie der Geschichte*. A reason of nature working over the heads of men, a transcendent *Vernunft* reconciling within its cloudy recesses innumerable and conflicting *Verstände*, progressively realized itself in the actual events of history.

After the middle of the century natural science invested the doctrine of progress with a

more materialistic implication. Progress was still regarded as the result of a force external to man; but the force was to be found not above but inherent in the phenomenal world. This view found support in the Darwinian theory of struggle for existence and survival of the fittest and in Schopenhauer's doctrine of the will as an aspect of a universal blind force. Guided by these preconceptions thinkers abandoned the effort to hasten progress by describing utopias and turned to the search for the inevitable law by which progress had been and would be achieved. Of the many efforts of this sort the most important were those of Auguste Comte and Karl Marx. Comte looked upon history as the result of the instinctive effort of men to ameliorate their condition—an effort which could be observed to fall into three stages of culture, the theological, the metaphysical and the positive, or scientific. Marx, interpreting the historic process in terms of Hegel's famous dialectic, found the determining force in the economic class conflict which, having substituted the nineteenth century capitalist competitive society for the aristocratic landed society of the Middle Ages and early modern times, would in turn replace the capitalist competitive society of the nineteenth century by the proletarian communist society of the future.

Of the many theories of progress formulated in the nineteenth century the only one that had much influence on the thought of common men was that of Marx. Yet the idea of progress, vaguely conceived as a rapid improvement in general prosperity and happiness, became a living force. The chief reason for this was no doubt the rapid changes in the outward conditions of life consequent upon the technological revolution. The common man, before whose eyes the marvels of science and invention were constantly displayed, noted the unprecedented increase in wealth, the growth of cities, the new and improved methods of transportation and communication, the greater security from disease and death and all the conveniences of domestic life unknown to previous generations, and accepted the doctrine of progress without question: the world was obviously better than it had been, obviously would be better than it was. The precise objective toward which the world was progressing remained, however, for the common man and for the intellectual, somewhat vague.

Thus the nineteenth century doctrine of progress differed somewhat from that of the eight-

eenth. The difference may be expressed, with some exaggeration in the contrast, by saying that whereas the eighteenth century held that man can by taking thought add a cubit to his stature, the nineteenth century held that a cubit would be added to his stature whether he took thought or not. This latter faith that the stars were carrying men on to better things received a rude shock during the World War and subsequently; and there may be noted two significant changes in the present attitude toward the doctrine of progress. Certain thinkers, notably Spengler, are returning to the Greek notion of cycles, now formulated in terms of the rise, flourishing and decline of "cultures." Others are reverting to the eighteenth century idea that by deliberate purpose and the rational use of knowledge man can reconstruct society according to a more just and intelligible design. To this class belong those who have faith in communism, fascism and the planned capitalist society.

The doctrine of progress is peculiarly suited to western society in modern times; that is, a highly dynamic society capable of seeing its achievements against a long historical background. From the practical and from the rational point of view there is no reason to suppose that it will have a more enduring virtue than other doctrines which it has supplanted. If, as may well happen, the possibilities of scientific discovery and of technological invention should sometime be exhausted, the outward conditions of life might become sufficiently stabilized so that the idea of progress would cease to be relevant. Rationally considered, the idea of progress is always at war with its premises. It rests upon the notion of a universe in perpetual flux; yet the idea of progress has always carried the implication of finality, for it seems to be meaningless unless there is movement toward some ultimate objective. The formal theories of progress are all vitiated by this radical inconsistency. In Hegel's scheme the objective was freedom, already realized in the Prussian state. In Comte's theory the objective was the final positive stage into which Europe had already entered. Marx criticized Hegel for explaining history by a process which would not explain the future, but he is himself open to the criticism of having explained history in terms of a class conflict which would end with the establishment of a classless society. It is easy to picture history as a process working toward an ultimate good if the world is to come to an end when that good

is attained; but if the universe as presented by modern science is to be accepted—a universe in perpetual flux—then a law of history which at some determinate time ceases to apply leaves much to be desired.

Thus the final good, absolute standards of value, are sought in vain; there is merely a universe in which the ideas of things as well as the things themselves arise out of temporary conditions and are transformed with the modification of the conditions out of which they arose. On this assumption we must dispense with the notion of finality, must suppose that the idea of progress and all of its special formulations are but temporary insights useful for the brief moment in which they flourish. "In escaping from the illusion of finality, is it legitimate to exempt that dogma itself? Must not it, too, submit to its own negation of finality? Will not that process of change, for which Progress is the optimistic name, compel 'Progress' too to fall from the commanding position in which it is now, with apparent security, enthroned?" (Bury, J. B., *The Idea of Progress*, p. 352). The price we pay for escaping from the illusion of finality is the recognition that nothing, not even the belief that we have escaped that illusion, is likely to endure. All philosophies based upon the absolute and the unconditioned have their defects; but all philosophies based upon the universal relativity of things have their defects also, a minor one being that they must be prepared, at the appropriate moment, to commit hara-kiri in deference to the ceaseless change which they postulate.

Belief in progress as a fact depends upon the standard of value chosen for measuring it and upon the time perspective in which it is measured. If we look back a hundred years, it is obvious that there has been progress in the mastery of physical forces. If we look back two thousand years, it is uncertain whether there has been much if any progress in intelligence and the art of living. If we look back two hundred and fifty thousand years, it is apparent that there has been progress in all those aspects of life which civilized men regard as valuable. All these judgments are based on standards of value appreciable by the mind of civilized man. But if we take a still longer perspective and estimate the universe as a whole, as an omniscient intelligence indifferent to human values might estimate it, in terms of cosmic energy, then progress and the very existence of man himself become negligible and meaningless. In such a perspec-

tive we should see the whole life of man on the earth as a mere momentary ripple on the surface of one of the minor planets in one of the minor stellar systems.

PROGRESSIVE PARTIES. *See* PARTIES, POLITICAL, sections for separate countries.

PROHIBITION. Ever since the formulation of legal codes, sumptuary laws, including prohibition of the use of certain foods, kinds of clothing and other articles, have been imposed by society upon the behavior of individuals. Indeed social restrictions upon consumption antedate codes of law, for they are embodied in the customs and tabus of primitive peoples. Alcoholic beverages have been among the articles of consumption subjected to legal, customary or religious regulation in nearly all societies from prehistoric to modern times. Comparatively few societies,

however, have by law entirely prohibited their use, production or sale, the predominant association of the word prohibition with this method of dealing with the alcohol problem being a development of the late nineteenth and the early twentieth century. Nominally, legal prohibition, as applied to intoxicants during the past century, is not sumptuary legislation; but because its purpose is to eliminate as nearly as possible the use of alcoholic beverages, it constitutes in reality the most controversial case of sumptuary legislation in modern times.

National prohibition in the United States was preceded by wide experimentation with restrictions on the sale of intoxicants and with prohibition in local areas. During the colonial period and for some years thereafter, in conformity with English law and custom, places of sale were generally licensed and public drunkenness was penalized by fines, imprisonment or other forms of punishment. Although these methods were not adequate to deal with the alcohol problem and excessive drinking was rampant, public opinion would not tolerate any significant interference with production, sale or use. Sales of spirituous liquors to Indians were generally prohibited, but the profitable character of the liquor trade made enforcement difficult.

During the first half of the nineteenth century public opinion gradually came to favor a more stringent regulation of the sale of intoxicants, with the result that a well organized temperance movement made its appearance. Beginning locally, the agitation quickly spread and state organizations were formed in Connecticut and Massachusetts as early as 1813. Thirteen years later, largely through the efforts of Lyman Beecher, there was organized the American Society for the Promotion of Temperance; and in 1833 there appeared the American Temperance Union (at first called the United States Temperance Union), a federation of other temperance organizations. At that time there were about six thousand local temperance societies as well as state organizations in most of the states. It is to be noted, however, that about one third of the membership of these societies was concentrated in New England. Although some of these early temperance societies were associated with local and state politics, the leadership and rank and file of the movement came largely from the churches. Their appeal was of a religious character, and the reform took on the attributes of a huge revival. Stress was laid primarily upon pledges of personal total

abstinence, the suggestion of governmental control over the liquor traffic being avoided.

During the early 1840's another type of temperance organization, led by the Washington Temperance Society (of Baltimore), became extremely popular. This movement was composed largely of former drinkers, was devoted chiefly to the reformation of drunkards through moral suasion and reached a class of the population with which the older temperance societies had had little contact. It was not connected with religious organizations and its membership was unstable. No central body was developed and the society disintegrated within a decade, although a more permanent secret order, the Sons of Temperance, grew out of its New York branch.

The prohibition movement itself, or the attempt to place prohibitory laws upon the statute books and prohibitory clauses in the federal and state constitutions, was an outgrowth of the organized temperance movement and at the same time signalized its failure to accomplish its aims through personal appeal. The temperance movement had aroused the nation or rather the northern part of the nation to the social evils of intemperance, but had accomplished little in checking the excessive use of alcoholic beverages. One of the earliest restrictive laws was that in force in Massachusetts during 1838-40, which prohibited the sale of spirituous liquors, except for medicinal or mechanical purposes, in quantities of less than fifteen gallons. Connecticut and Rhode Island enacted local option prohibitory laws in 1839, the former making it a penal offense to sell wines and spirituous liquors without a license granted by a majority vote of the town meeting and the latter granting to freemen in each town the right to decide whether liquor licenses should be issued. Other states followed, among them Vermont in 1844, New York in 1845, Iowa in 1846 and New Jersey in 1847; many local communities voted no-license.

Local option was destined to be an important method of handling the liquor problem for three fourths of a century, but it was displaced temporarily by a wave of state wide prohibitory laws. The earliest of these was enacted by the territorial legislature of Oregon in 1843, and during the decade from 1846 to 1855 inclusive prohibitory laws or constitutional amendments were passed by the legislature or approved by popular vote in every northern state except New Jersey and Pennsylvania and in the territories of

Minnesota and Nebraska. In Pennsylvania the legislature agreed to abide by a plebiscite but the popular vote gave a slight majority against a prohibitory law. In several states the first laws were declared unconstitutional or were so unsatisfactory that second or third acts were passed. In few states, however, were the laws effective or permanent. In Wisconsin repeated vetoes by the governor prevented the law from going into effect; in Illinois the first law was rejected by the courts and the second by a public referendum; in Iowa a law ratified by a referendum was rejected by the courts; in New York the first law was vetoed by the governor, the second declared unconstitutional and repealed and a third, passed by one session of the legislature, was referred to the next session and defeated; in Indiana two laws were declared unconstitutional; and in Ohio a constitutional amendment was circumvented by taxation (essentially a license fee). In Delaware the law remained in force only two years, in Nebraska three and in Oregon five. The laws were more permanent in the New England states and in Michigan but were repealed by 1875 except in Maine, New Hampshire and Vermont.

The failure and instability of this first wave of prohibitory laws were due to several factors. Leaders in the temperance movement became absorbed in the antislavery campaign; liquor producers and sellers were organized and effectively played the two political parties off against each other; and public sentiment was mollified by federal taxation and by the sharp reduction in the consumption of distilled spirits which resulted therefrom. The fundamental reason, however, for the ineffectiveness of the prohibitory movement was the absence of a united public sentiment. Total abstainers and their supporters were not sufficiently influential to impose their will upon the remainder of the population.

During and after the Civil War the older temperance organizations lost ground, but they were replaced by fraternal orders, such as the Sons of Temperance and the Independent Order of Good Templars, and by the National Prohibition party, the National Temperance Society and Publication House and the Woman's Christian Temperance Union. The National Prohibition party, organized in 1869, was an important influence in eliminating the prejudice against political activity among temperance leaders. It has had presidential candidates in every national election from 1872 to the present

time, but it has never polled more than 2 percent of the popular vote and it has elected only one member of Congress. The National Temperance Society and Publication House, which had been organized in 1856 and had absorbed the American Temperance Union nine years later, and the Woman's Christian Temperance Union, which Frances E. Willard helped organize in 1874, were the most important temperance propaganda societies during the last quarter of the nineteenth century. They distributed enormous quantities of temperance literature, aided the churches in temperance instruction among their members and Sunday school attendants, secured laws or regulations requiring instruction as to the effects of alcohol in the public schools of every state and were influential in state campaigns for statutory prohibition and constitutional amendments.

Under the influence of the sentiment generated by these and other temperance organizations the legislatures of nearly half of the states, during the decade from 1880 to 1890, passed statutory prohibitory laws or submitted prohibitory constitutional amendments to the people. Prohibition was, however, rejected in most of the states by popular vote, and in only five states was it actually adopted: in Iowa by statute and in Kansas, Rhode Island, North Dakota and South Dakota by constitutional amendments. The Iowa law was openly violated and after a decade it was neutralized by the "Mulct Law," which permitted saloons to open in areas approved by popular vote. Rhode Island and South Dakota returned to local option within a few years. Thus the second wave of prohibitory legislation ended as did the first, and again the principal reason was the same—a divided public sentiment.

In the 1890's the organization of the temperance forces was changed radically. Since a half century of total abstinence propaganda had failed to exert a significant effect on the per capita consumption of alcohol, it was concluded that the drunkard was the product of the drunkard maker and that the only method of solving the liquor problem was to eliminate the saloon. Since the saloons were firmly entrenched through political connections, they could be closed only by political action. Yet a third political party had little chance of success, as had been demonstrated by twenty years of the National Prohibition party. Thus when the Anti-Saloon League was organized in 1893 as a non-partisan political body, demanding that the

people of each community have the right to exclude the liquor traffic by a majority vote and offering a means of bringing the various temperance forces into cooperation in local contests for the elimination of saloons, it rapidly spread over the nation. The national organization came into existence in 1895 and within a few years state leagues were functioning in practically every state and territory.

The new strategy of the dry forces was remarkably effective. By 1906 thirty states had adopted local option laws and in more than half of the counties, three fifths of the incorporated towns and villages and over two thirds of the townships in the United States saloons were banned. Saloons were thus illegal in more than half the area of the country, while 40 percent of the population lived in no-license territory. Some states were entirely dry except for a few urban centers. Yet the internal revenue statistics indicated that the consumption of beer had increased greatly during the preceding three decades and that the use of distilled spirits was rising appreciably. Local prohibition had driven the legal saloon out of a large part of the nation but had not succeeded in coping with the alcohol problem. This anomaly was attributed by the temperance organizations to the difficulty of enforcing prohibition in municipalities, villages and counties when there were nearby areas which were still wet. It was necessary to supplement local option with state wide prohibition; thus a third wave of state prohibitory legislation ensued.

Both the alcoholic beverage industry and the temperance forces were now strongly entrenched in politics. For many years the liquor interests had contributed heavily to the campaign expenses of both major political parties, and they had often controlled state and local conventions and elections and dictated or influenced the acts of legislators through powerful lobbies. The chief organizations through which this power was exercised were the United States Brewers' Association (formed in 1862) and its allied bodies, such as the National Association of Commerce and Labor, the National German-American Alliance and numerous leagues of local manufacturers and dealers. The saloons, many of which were controlled by brewers through property leases and loans to saloon keepers, were affiliated with the local political machines in practically every urban center. The dries also conducted lobbies. The legal department of the Anti-Saloon League, under the

leadership of Wayne B. Wheeler, was the chief organization through which they functioned politically, with the support of numerous other societies, especially the Woman's Christian Temperance Union and the Board of Temperance, Prohibition and Public Morals of the Methodist Episcopal church. Thus the temperance movement after a century had become a contest between rival political machines, each with a dominating central authority supported by thousands of local organizations and approved by millions of voters. This time the advantage lay on the side of the dries. With a political machine to match that of the wets they had removed the handicaps of the 1850's and of the 1880's. They had a century of experience in wholesale propaganda behind them. Further the public school instruction regarding the effects of alcohol had begun to bear fruit. By 1910 a large proportion of the voters had been taught during their early years that alcohol in any form was a poison, that not only spirituous liquors but also beer and wine were dangerous drinks and that their use led to poverty, disease and crime. The wets were still supported by public sentiment in urban regions, but political organization supported by a stupendous volume of skilful propaganda was more powerful than political organization alone.

When the Indian Territory and the territory of Oklahoma became the state of Oklahoma in 1907, its constitution contained a prohibitory clause. Alabama and Georgia enacted prohibition statutes the same year, Mississippi and North Carolina followed in 1908 and Tennessee in 1909. West Virginia approved a prohibitory constitutional amendment in 1912. Five states went dry in 1914 (Virginia, Oregon, Washington, Colorado and Arizona), five in 1915 (Alabama, Arkansas, Iowa, Idaho and South Carolina), four in 1916 (Michigan, Nebraska, South Dakota and Montana), four in 1917 (Indiana, New Hampshire, New Mexico and Utah) and five in 1918 (Florida, Ohio, Wyoming, Texas and Nevada). Kentucky followed in 1919. Throughout the period local option contests continued in the states still wet and the areas becoming dry in this way continued to increase. By the end of 1918, when the various states were taking action upon the national constitutional amendment, saloons were illegal in approximately 90 percent of the area of the nation and nearly two thirds of the population were living in this dry territory. The wet territory was confined principally to the large cities; in fact ap-

proximately half of the population still under license lived in fifteen metropolitan regions of more than half a million population each.

Not only had the temperance movement culminated in widespread prohibition but the concepts of temperance, total abstinence and prohibition had changed. At first the agitation had been directed against distilled spirits and strong wines, while the use of malt liquor and light wines had been encouraged. But the difficulty of drawing a line of demarcation between intoxicating and non-intoxicating beverages, the belief that alcohol even in small doses was a harmful and habit forming drink, the rapid growth in the use of beer and the sale of all types of alcoholic beverages in the same saloons had resulted in the inclusion of beer and light wines in the prohibition agitation. Most of the prohibitory laws enacted during the second decade of the twentieth century were bone dry; that is to say, they applied not only to spirituous but also to malt and vinous liquors.

As the prohibition wave progressed, it became evident that state wide prohibition would not be much more effective than local option in reducing the consumption of alcohol. Beer drinking had increased steadily ever since the Civil War, and the consumption of spirits had risen sharply since 1900. With interstate commerce under the jurisdiction of the federal government, dry states had no control over liquor shipped directly to consumers or over that intended for sale until actually sold or offered for sale. An attempt had been made to remedy this situation in 1890, but under the rulings of the Supreme Court it had proved inadequate. In 1913 Congress enacted the Webb-Kenyon law, prohibiting interstate shipments of intoxicating liquor in violation of the law of any state, but even this measure was not effective in protecting the dry states against liquor importations. There were no federal appropriations for enforcement, states found it difficult to patrol their borders, and the growing volume of travel and the advent of the automobile made interstate smuggling relatively easy.

The dry forces, led by the Anti-Saloon League, embarked in 1913 upon a campaign for the submission by Congress of a prohibitory amendment to the Constitution of the United States. A resolution to this effect was introduced but, while it received a majority vote in the House of Representatives, it failed because of the lack of the necessary two-thirds vote. In the years following the Anti-Saloon League utilized

the same type of political pressure upon members of Congress that had proved successful in electing state legislators pledged to prohibitory laws—the pressure of local churches and local dry organizations backed by tons of literature distributed in every village and hamlet in the country. In December, 1917, the resolution received the necessary two thirds of the votes in both houses of Congress and was submitted to the states. Ratification, under the continued pressure of the Anti-Saloon League and allied organizations, began almost immediately and within fourteen months three fourths of the states had approved the amendment. All but three of the remaining states followed within a few weeks; New Jersey's legislature did not join the roll until 1922, while Connecticut and Rhode Island never ratified the amendment. The first and significant section of this Eighteenth Amendment to the federal constitution read as follows: "After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited."

In the meantime Congress had enacted several measures furthering the dry cause. Prohibition for Alaska and Porto Rico, ratified by popular vote, and for the District of Columbia had been enacted in 1917 and for Hawaii in 1918. A measure which prohibited any advertising of intoxicating liquor to go through the mails, in either newspapers or magazines or as circulars, had been passed in 1917, together with an amendment penalizing any person ordering, purchasing or causing intoxicating liquors to be shipped in interstate commerce into any state prohibiting the manufacture or sale of intoxicants, even though the state did not prohibit importations. The Food Control Act of August, 1917, contained a provision forbidding the manufacture of distilled spirits from any form of foodstuffs, and complete national prohibition for the duration of the World War was approved in September, 1918. This last measure went into effect on July 1, 1919, and continued until the Eighteenth Amendment became effective on January 17, 1920.

An enforcement bill prepared with the assistance of Wayne B. Wheeler was introduced into Congress almost immediately upon ratification of the amendment. This bill, officially entitled the National Prohibition Act, but popularly

known as the Volstead Act, was passed without significant amendment. An intoxicating beverage was defined as any beverage containing one half of one percent or more of alcohol. The act also provided severe penalties for the manufacture, sale, transportation or possession of intoxicating liquors and arranged for supervision over the production and sale of alcohol for industrial, scientific, medicinal or sacramental purposes.

Culture conflicts and group struggles were vital factors in the course of the temperance and prohibition movement in the United States. Of especial importance was the conflict between rural and urban ways of life. Rural people have not always been abstemious, but the maintenance of places for the sale and public consumption of alcoholic beverages is an urban phenomenon. The great majority of counties and towns which had obtained local prohibition by popular vote were rural or thinly populated. Virtually all of the remainder were suburban districts, adjacent to license territories, in which the elimination of saloons was more akin to municipal zoning ordinances than to genuine prohibition of the sale of alcoholic beverages. Few large towns or cities ever expelled the saloons by local option or cast a majority vote for state wide prohibition, and state prohibition laws were practically never enforced in large cities. National prohibition therefore was in part an attempt by the rural and village populations of the country to retain their waning influence and to impose their ways of life upon the urban dwellers. The rural influence upon national prohibition legislation is indicated not only by the disproportionate representation of the rural population in Congress and by the fact that virtually the only opposition to the Eighteenth Amendment came from representatives of urban areas, but also by the specific exemption from the penalties of the Volstead Act of home produced "non-intoxicating" cider and fruit juices (unless sold) and the failure to define the percentage of alcohol which would make such fruit juices legally intoxicating.

Another aspect of culture conflict was the alignment of the churches with the prohibition cause and the support given to it by moving picture interests. Drink, religion and such amusements as the moving pictures offer alternative modes of psychological compensation for the unsatisfactory character of actual life; and liquor dealers, religious organizations and the

moving picture exhibitors are natural competitors for patronage. The identification of the churches with temperance reform and prohibition was thus essentially a contest between profoundly different ways of living and a part of the effort of organized religion to retain and increase its influence and power.

Another type of group struggle involved in the long controversy over prohibition was to be found in the attitudes of employers and workmen. Both these classes were generally large consumers of alcoholic beverages and fought prohibition throughout the greater part of the attempt to secure total abstinence by legal enactment. Organized labor continued hostile to prohibition up to the final adoption of the Eighteenth Amendment; but the business interests, persuaded that sobriety among their employees was conducive to their efficiency, went over to the support of the drys. Church members and business groups were the chief contributors to the Anti-Saloon League.

Racial conflict was a factor in the movement toward state wide prohibition in the south. In the first prohibition wave, when the Negroes were under the complete domination of plantation owners, and in the second, when they still resided chiefly in the rural areas and the domination of white landlords was almost as complete as under slavery, the south was virtually untouched by the movement. But with the migration of Negroes to urban centers, drunkenness and crime associated therewith became serious Negro problems. The third wave of state wide prohibition began in the south and by 1917 the entire section was legally dry. Throughout the south state laws and national prohibition have been enforced more stringently among the Negroes than among the white population.

Still another group struggle influential in turning the scales in favor of national prohibition was the participation of the United States in the World War. The great increase in the consumption of alcoholic beverages during the second half of the nineteenth century had been due to the growing popularity of beer, and this increase was closely associated with the German immigration. A large proportion of the breweries were owned and operated by Germans or by American citizens of German birth or ancestry; representative of this group was the National German-American Alliance, which engaged in propaganda against prohibition. In consequence the brewers and their saloons were assumed to be supporters of the enemy, and the

cause of prohibition was thus identified with that of winning the war.

It was apparent within a short time after the National Prohibition Act came into operation that it would be enforced with difficulty in the urban centers. Public sentiment was hostile, and there was a great patronage of hootleggers, speakeasies, road houses, night clubs, beer flats and other illegal dispensers of alcoholic beverages. Home brewing and wine making, smuggling, diversion of medicinal and industrial alcohol and direct distillation began immediately. Within three or four years knowledge of methods of making many kinds of alcoholic beverages was widespread, materials and apparatus could be purchased readily and illicit stills and breweries were common. Large scale liquor dealers, organized liquor rings and so-called syndicates followed. Production and transportation of an illegal product of high value, for which police protection could not be claimed, induced robbery and hijacking. The liquor rings and syndicates developed their own armed guards, fought with each other over the division of territory and became racketeers. The urban police, inadequately staffed in most cities without the additional burden of detecting and reporting violations of the liquor laws, susceptible to bribery and corruption and often inferior as an armed force to the racketeers, were either indifferent to the prohibition law or became the allies and protectors of the industry.

Congress had passed a rigid enforcement act and it was strictly interpreted by the courts. Severe restrictions were placed on the issuing and filling of prescriptions by physicians and druggists. Buildings and other real property, except private dwellings, could be searched with a warrant alleging the manufacture, sale or possession of liquor or even without a warrant if evidence of liquor selling was obtained directly. Private dwellings could be searched if a warrant alleged the selling of liquor. In states with prohibition enforcement laws the evidence collected by state officials could be used in the federal courts, even though it had been improperly and illegally obtained. Liquor seized could be taxed, although it was an illegal product, and when seized was to be destroyed, even though illegal means had been employed in its seizure. Vehicles used in transporting liquor were forfeited. Buildings used for the manufacture or sale of liquor could be padlocked for a year and the owner had no redress, whether or not he was a party to or had any knowledge of

the illegal use. Any person found guilty of making or selling liquor could be fined up to \$1000 or imprisoned for six months for a first offense, or fined up to \$2000 and imprisoned up to five years for a second offense. Under the Jones Act of 1929 the maximum penalties were increased to five years' imprisonment or \$10,000 fine or both for each offense. Most of the states also enacted enforcement laws, and many of these were even more exacting in their requirements and harsher in their penalties than the federal law.

A considerable number of cases relating to the Eighteenth Amendment and its enforcement came before the United States Supreme Court. The validity of the amendment itself was challenged and sustained. The import of concurrent power as provided for in the second section of the amendment was questioned and interpreted to mean that while both the federal government and the state governments had power to pass legislation for the enforcement of the amendment, it did not involve joint power or require that federal legislation be approved by the states nor did it require the states to pass enforcement legislation. The definition of intoxicating liquor was attacked, and it was held that Congress had not exceeded its power. Prohibition of medical prescriptions of malt liquor and limitations upon the amount of other kinds of liquor which might be prescribed were sustained. It was held that the purchaser of illicit liquor could not be prosecuted as such but that he could be prosecuted for the illegal possession of liquor. Evidence obtained by the tapping of telephone wires by officers was held admissible in court. The declaration that premises used for the illegal manufacture, storage or sale of liquor are a nuisance and the provision that in abatement thereof the premises may be closed for a year were upheld. It was decided that the same act might constitute an offense and be punished under both federal and state laws and that a person might be prosecuted and punished separately for the manufacture, possession, transportation and sale of the same liquor.

But although the Supreme Court rigorously sustained the prohibitory legislation, neither Congress nor the states set up adequate machinery for its enforcement and they consistently refused to appropriate sufficient sums to enforce the law. Licensing of manufacturers of alcohol and alcoholic preparations for medicinal and industrial use and the investigation and report-

ing of violations of the prohibition law were made duties of the commissioner of internal revenue, although taxation and revenue were no longer the purpose of the law. The problem of preventing smuggling remained with the Coast Guard. Federal appropriations for the enforcement of prohibition ranged from approximately \$4,000,000 to \$25,000,000 a year, divided about equally between the Prohibition Unit of the Bureau of Internal Revenue and the Coast Guard. At first the agents of the Prohibition Unit were not placed under civil service regulations, and many of the employees were incompetent and corrupt. In later years the machinery of enforcement was improved. In 1927 the Prohibition Unit was made a separate bureau in the Treasury Department and its workers were included in the civil service. In 1930 the bureau was divided into two parts, the Bureau of Prohibition being transferred to the Department of Justice while the Bureau of Industrial Alcohol was retained in the Treasury Department. When, however, late in 1928 the commissioner of prohibition testified that \$300,000,000 would be necessary for the adequate enforcement of the law and an attempt was made to provide nine tenths of this amount, even dry senators and congressmen refused. This combination of strict law and lax enforcement was due to the divided state of public opinion, Congress and the state legislatures attempting to satisfy both the adherents and the opponents of prohibition. It was truthfully remarked that the dries had the law and the wets had the liquor.

The sources of illicit liquor may be divided into four categories: smuggling; diversion of alcohol or alcoholic preparations produced legally for medicinal, sacramental or industrial purposes; home brewing and home distilling; and commercial distillation, brewing and wine making. The customs office and the Coast Guard, with the limited resources at their disposal, made a genuine effort to prevent smuggling, and treaties were negotiated with foreign nations increasing the limit to which suspected rum runners might be chased and seized from three to twelve miles from the shore. The Bureau of Industrial Alcohol developed an elaborate permit and inspection service in regard to the legitimate production of alcohol and alcoholic preparations and, despite protests regarding the poisoning of innocent citizens with denaturants, continued until 1931 to use wood alcohol in its most important formulæ for de-

natured alcohol. But although smuggling and industrial alcohol figured prominently in the public estimation of the sources of beverage alcohol and in the attention of the government, they were of only minor importance in the supply of illicit liquor. Home brewing and home distilling developed to an enormous extent, as evidenced by the widespread sales of bottles, caps and distilling apparatus and such products as hop flavored malt syrup. Low prices of farm products and high prices of corn liquor and gin stimulated rural distilling. The greater part of the illegal beer and spirits sold in the larger cities, however, was produced apparently in small and moderate sized plants located in alleys or garages or masquerading as legitimate business enterprises. The frequency of raids and seizures tended to develop new techniques of production, with rapid chemical processes substituted for the former methods of aging and flavoring and with ordinary sugar and corn sugar used instead of corn meal and unground corn and rye in the making of spirits.

During the twelve and a half years from the date when the National Prohibition Act went into effect up to June 30, 1932, federal prohibition officers arrested more than 750,000 persons, of whom more than 500,000 were convicted of violating the law. Fines and penalties amounting to more than \$75,000,000 were assessed upon the offenders, and after the passage of the Jones Act more than half of the persons convicted were given jail sentences. In addition federal prohibition officers, not including customs and Coast Guard officers, made the following seizures of property:

Boats and launches	1,563
Automobiles	74,351
Still and distilleries	314,346
Fermenters	1,569,248
Distilled spirits, gallons	14,117,549
Malt liquor, gallons	68,415,307
Wine, cider, mash and pomace, gallons	222,274,021
Total appraised value of property seized	\$205,251,017

The courts, faced with congestion and intolerable delays, resorted to "bargain days," on which persons charged with violating the prohibition law could plead guilty, dispense with a jury trial and be assessed a fine by the judge. In practise this tended to become little more than a moderate license fee levied on those without sufficient influence to escape prosecution altogether. Many of the more notorious producers and dispensers of illegal beverages operated in such a way as to avoid prosecution, although

some of them were convicted and imprisoned for failure to report their incomes and to pay income taxes in full.

It is impossible to determine accurately the consumption of alcoholic beverages under prohibition. Nevertheless, the estimates given below for average annual per capita consumption in gallons, which are derived from a careful analysis of the figures for materials used in producing alcoholic beverages and of death rates from alcoholism and cirrhosis of the liver, undoubtedly reflect the approximate changes in consumption for the United States.

PERIOD	SPIRITS	BEER	WINE	EQUIVALENT IN PURE ALCOHOL
Local prohibition:				
1911-14	1.47	20.53	0.59	1.69
Wartime restrictions: 1918-19	0.80	11.44	0.50	0.97
Early years of national prohibition: 1921-22	0.92	1.49	0.51	0.73
Later years of national prohibition: 1927-30	1.62	6.27	0.98	1.14

Source: Warburton, Clark, *The Economic Results of Prohibition* (New York 1932) p. 24, 107.

The chief effect of prohibition upon consumption habits was in the reduced use of beer and the increased use of milk and carbonated beverages, particularly by the working class. In most communities prices at speakeasies and beer flats were too high for the patronage of wage earners, while home brewing offset only partially former purchases at saloons and restaurants. The business and professional classes of the population appear to have consumed as much liquor under prohibition as in previous years. Farmers formerly supplying brewers and distillers with materials lost a part of their market, but other farmers gained by furnishing corn for corn sugar, grapes for homemade wine and milk for restaurant consumption.

Organized opposition to the Eighteenth Amendment and to the National Prohibition Act began almost immediately. Within a few years many wet organizations were formed, supported largely by business interests anxious to shift taxation back to the liquor industry and by other groups which held that liquor was a matter for state and local regulation rather than for national constitutional prohibition and which were disturbed also over the retention of a law impossible of enforcement. But although the propaganda of these societies was more skilfully handled than that of the liquor industry prior to

the adoption of prohibition, and while a few states repealed their enforcement laws within a few years (New York in 1923, Montana in 1926 and Wisconsin in 1929), no decisive change in public sentiment occurred for a decade. The period from 1922 to 1929 was one of unusual prosperity, especially for the business, professional and upper salaried classes, and there was relatively little unemployment. Under these circumstances the drys were able to make great claims as to the beneficial effects of prohibition: that immense sums had been diverted from the purchase of liquor to the purchase of other commodities; that prohibition had resulted in great additions to savings accounts, holdings of life insurance and employee purchases of corporate securities; that industrial accidents had been reduced and the public health improved; and that resources devoted to the production of alcoholic beverages were being used more advantageously for other purposes.

As time went on, however, a gradual weakening of popular support of prohibition was being reflected in a number of ways, notably in the results of unofficial polls and state referenda and in the report of the National Commission on Law Observance and Enforcement. A *Literary Digest* poll in 1922, in which nearly 1,000,000 ballots were returned, indicated that 38.6 percent of those voting favored the law as it stood, 40.8 percent favored modification to permit the sale of light wines and beer and 20.6 percent favored repeal. In 1926 a poll taken by the Newspaper Enterprise Association, in which nearly 2,000,000 persons voted, showed 19 percent favoring the existing law, 50 percent for modification and 31 percent for repeal. Out of eight state referenda held during the years 1920-24 on various prohibition questions (adoption or repeal of state prohibition laws, legalization of light wines and beer and appeals to Congress to modify the Volstead Act or to modify or repeal the Eighteenth Amendment) four showed a majority for the drys and four for the wets; while out of twelve such referenda held during 1926-29 the drys obtained a majority in but four states and the wets in eight. The National Commission on Law Observance and Enforcement, appointed in 1929, made its report early in 1931. After surveying the history of liquor regulation, the inadequate enforcement of the law and the wide extent of illegal production of liquor, the commission as a whole reported its opposition to repeal or modification of the Eighteenth Amendment; nevertheless, seven

out of its eleven members individually recommended revision or repeal and two other members recommended a referendum to determine the opinion of the majority of the population.

With the collapse in 1930 and 1931 of the period of prosperity public opinion rapidly developed in opposition to the continuance of the amendment and the Volstead Act. The propaganda of the Association Against the Prohibition Amendment had become an important element in influencing public sentiment. The prosperity arguments of the dries became a boomerang, improvements in the machinery of enforcement recommended by the National Commission on Law Observance and Enforcement had not been effective, and the public had begun to fear the power of racketeers. The argument that the return of beer and distilled liquors would tap new sources of federal and state revenues also had great weight. The Democratic party, its urban wing long hostile to prohibition, adopted for the presidential campaign of 1932 a platform openly advocating repeal of the Eighteenth Amendment and a redefinition of intoxicating liquor to permit the sale of light wines and beer; and the victory of the party in November incidentally sanctioned repeal. In February, 1933, before the new administration came into office, a new constitutional amendment was submitted by Congress to the states with the following provisions: it repealed the Eighteenth Amendment; it prohibited the transportation or importation of intoxicating liquors into those states whose laws forbade delivery and use of such; and it called for ratification of the amendment by conventions in the several states.

In March, 1933, the National Prohibition Act and the various prohibitory laws applying to the territories were amended to exempt from their provisions beverages containing not more than 3.2 percent of alcohol by weight. Within a few months the majority of the states had passed legislation authorizing the sale of beer. Before 1933 was over the necessary three fourths of the states had ratified the repeal amendment and with its proclamation by the secretary of state's office on December 5, 1933, the national prohibition experiment terminated.

This reversal of public sentiment does not represent a unanimity of public opinion. The return to the states of the alcohol problem by repeal of the Eighteenth Amendment is not the final solution of the matter. Public opinion is still divided in respect to the use of alcoholic beverages and the extent to which their use should be

discouraged or forbidden by law. It appears, however, that the American people are likely to be less sharply divided in the future than during the past century. Drinking has spread during the prohibition period among classes of the population that were formerly total abstainers. Modern methods of transportation and communication, particularly the automobile and the radio, have greatly facilitated contacts between rural and urban regions and have tended to reduce the divergences between their ways of life. The urban population continues to become a larger and relatively more influential part of the total population. Under these conditions it appears doubtful that prohibition will be retained by many of the states; but that most of them will return to local option, with an increased supervision over the conditions of sale, seems fairly certain. This is indicated by the creation in New York state, and the proposed creation in other states, of commissions to control the sale of beer and of other alcoholic beverages.

Several nations besides the United States, notably Finland, the Scandinavian countries and the British dominions, have for a time prohibited by law the manufacture and sale of intoxicating beverages. In Finland as in the United States state or national prohibition had been preceded by a long period of temperance agitation and by extensive experience with local prohibition. By 1900 nearly all of the parishes were dry. The Finnish parliament passed a prohibition bill in 1907 and again in 1909, but neither of these was approved by the Russian czar, on the ground that treaties with other countries would be violated. With the advent of independence in 1917 a prohibition law was adopted which was to go into effect in 1919. As a result of strict regulation for many years consumption of alcoholic spirits had been reduced to a lower figure per capita than in any other country for which statistics are available. Prohibition was thus introduced under exceptionally favorable circumstances; the result, however, was similar to that in the United States. Smuggling, private distillation and abuse of medical prescriptions were extensive. A government investigating committee in 1931 found that drunkenness had increased rapidly and that the number of intoxicated persons committing crimes had risen enormously. Following a plebiscite the prohibitory law was repealed in 1932 and prohibition was replaced by a government monopoly.

Two of the Scandinavian countries, Iceland

and Norway, have had considerable experience with state prohibition; and the other two, Denmark and Sweden, with local prohibition. In Iceland the manufacture of intoxicants was prohibited in 1900, while importation and sales were prohibited in 1912 and 1915 respectively. These laws continue in force, except for a modification to permit the importation of wine; but smuggling is so easy that enforcement is difficult. Medical prescriptions have been abused and in recent years druggists' imports of spirits have been very large. In Norway the home distillation of spirits was prohibited in 1845 and licenses for sale were restricted. Later the sale of spirits was placed in some districts in the hands of municipally chartered limited dividend companies, while in others it was prohibited by local option. In 1916 the sale of all alcoholic spirits, and of wine with more than 12 percent of alcohol, was prohibited; and in 1919 general prohibition of all beverages containing more than 14 percent of alcohol was adopted by popular vote, with the sale of beer and wine of from 2.5 to 14 percent subject to license. Smuggling, private distillation and abuse of medical prescriptions resulted, and the country encountered difficulty in renewing commercial treaties with France, Spain and Portugal. Prohibition was repealed in 1927, following a popular vote, and the manufacture, importation and wholesale distribution of spirits was placed in the hands of a limited dividend company.

The state licensing official of Denmark agreed in 1910 to abide by parish elections in granting licenses, and many parishes voted no-license. Under a new law of 1913 licenses were granted by parish councils, and most rural parishes elected councils pledged to refuse licenses. A few years later local option privileges were granted to both country and urban regions, and municipalities were authorized to set up limited dividend companies for the exclusive sale of liquor. Despite rigid licensing and, since 1917, extremely heavy taxation upon spirits, smuggling has been kept at a minimum, and both drunkenness and alcoholism have been drastically reduced. In Sweden home distilling was forbidden and rural districts were given complete control over the sale of spirits in 1855. Most of the parishes went no-license and have remained so ever since. Ten years later limited dividend companies were introduced for the sale of spirits in the cities and gradually spread throughout the country. The entire manufacture, importation and wholesale distribution of

intoxicants was in 1919 concentrated in a single limited dividend company.

In Canada municipal councils had in early years full control over retail sales of liquor, subject to the approval of the electors. The United Provinces (now Ontario and Quebec) provided for local option by counties and municipalities in 1864. Fourteen years later a comprehensive local option law was enacted by the dominion government. Most of the provinces passed laws making provision for voting in respect to licenses and many localities, mostly rural, voted no-license. Liquor importations, however, were not prohibited. The earliest provincial law prohibiting the sale of alcoholic beverages was passed in Manitoba in 1900, but it was suspended. Prince Edward Island adopted prohibition in 1900, and Nova Scotia (except Halifax) in 1910. The other provinces followed during the World War: Alberta in 1915, Saskatchewan in 1915 and 1916, British Columbia, Ontario, Manitoba and the remainder of Nova Scotia in 1916, New Brunswick in 1917 and Quebec in 1918. Except in the province of Quebec, where only spirits were prohibited, these acts applied to the sale of all alcoholic beverages. The dominion government cooperated by prohibiting importations into the dry provinces, and from April 1, 1918, to December 31, 1919, banned the manufacture of spirits throughout the dominion as a wartime food conservation measure. After the close of the war prohibition rapidly lost the support of the public and by 1930 all of the provinces except Prince Edward Island had abandoned prohibition in favor of direct provincial control over the sale of alcoholic beverages. The local option privilege has been retained, and a considerable part of the rural area remains no-license. Control is exercised through commissions, which in some provinces are chiefly licensing boards and in others monopolistic sales agencies.

Newfoundland, which had had local option in several districts as far back as 1883, adopted prohibition by popular vote in 1915 and abandoned it nine years later in favor of control through a commission. In the Australian states and in New Zealand local option prevailed for many years; but although large areas became no-license, state prohibition was not attempted. In the Union of South Africa sale to natives has been forbidden and local option has been introduced in part of the union. Local areas in Scotland may forbid the granting of licenses, but few have done so.

In Russia the government prohibited the sale of vodka during the war and for some time after the October Revolution; but the government monopoly, first instituted in 1894, was restored in 1925. Estonia, Latvia and Lithuania, which came under the wartime prohibition in Russia, abandoned the policy upon achieving independence. The Nationalist government in Turkey enacted prohibition in central Asia Minor in 1920 and gradually extended the program over the country as its power increased. Prohibition was repealed, however, by the spirits law of 1924, and a government monopoly was instituted in 1926.

In other countries legal prohibition of the sale of intoxicating beverages has been undertaken only in emergencies, in respect to certain classes of the population or in case of extremely injurious types of liquor. The countries bordering the North Sea agreed in 1887 to prohibit the sale of spirits to fishermen. At the International Conference for the Suppression of the Slave Trade at Brussels in 1889-90 European powers with African possessions agreed to prohibit the sale of intoxicants throughout central Africa, allowing importations for the use of European residents. Governing authorities in most of Africa have also prohibited the sale of spirits to natives. It has been difficult, however, to enforce these prohibitions, especially in the coast regions and in the areas penetrated by the railways. Sales of extremely deleterious alcoholic beverages, such as absinthe, have been forbidden in France, Belgium, Holland, Switzerland and Italy. In many of the countries of Asia the use of alcoholic beverages is prohibited by religious dictates and by custom; these strictures are effective in some regions and observed laxly in others.

PROHIBITION, WRIT OF. *See* WRITS, LEGAL.

PROLETARIANISM. *See* PROLETARIAT.

PROLETARIAT. The term proletariat is used to designate the class of workers who are legally and economically free to dispose of their labor power and who sell it for wages to a capitalist entrepreneur for a definite period of time. Their "legal freedom" distinguishes proletarians from slaves or serfs; their "economic freedom" sets them apart from simple producers of goods, such as artisans and peasants, who possess their own instruments of production; and their sale of labor power to a capitalist entrepreneur differentiates them from public officials and employees engaged in other than profit making government enterprises. This concept of proletariat is comprehensive enough to include not only the skilled, semiskilled and unskilled workers but also all other employees in capitalist enterprises except the small but important group of technical, supervisory and executive employees whose income is large enough to permit an accumulation of wealth. In this sense

the term proletariat does not include those petty bourgeois and semiproletarian border groups in transition from one class to another. Some of these groups are embraced in the broader concept of working class, which includes not only the proletariat but also servants and other semiproletarian elements who receive low wages and maintain a modest standard of living. Both proletariat and working class are differentiated from the concept of masses, which transcends class lines and may include proletarian, semiproletarian, petty bourgeois and agrarian elements. The proletariat is essentially a class of industrial workers.

The rise of the proletariat is linked indissolubly with the development of the capitalist economic system. Industrial capitalism could develop on a large scale only when and where there was an available and free labor market. The separation of the direct producers from their instruments of production and the independent position assumed by these instruments as capital were thus the necessary prerequisites for capitalist production. Marx maintained that the first generation of the proletariat arose as a result of the expropriation of masses of peasants from the land, the process assuming its "classic" form in England. In criticizing this thesis Sombart asserts that Marx generalized from what was specifically an English phenomenon. But Marx did not deny the existence of other factors in the creation of the early proletariat. And it cannot be seriously contested that not only in England but in many other countries the expropriation of peasants from the land and its enclosure against settlers constituted one of the most important methods of "original accumulation." Nor is the social significance of this appropriation restricted to the older capitalist countries; land spoliation and land restrictions have contributed to the development of a proletarian class in the economically undeveloped regions of Asia, Africa and Latin America where imperialist capital has penetrated. On the other hand, the fact that there were no land restrictions in the United States for a long time was conducive to the maintenance of a high standard of living among the skilled white workers. As long as the worker, particularly the aggressive worker, could avoid an eventual lowering of wages by migrating to the free lands of the frontier, wages could never sink far below the farmer's income, which served as an index by which the workers judged the price of their labor power.

In addition to recognition of the influence of the agrarian factor in the emergence of the proletariat, attention must be given also to the other factors which Sombart emphasizes so strongly and which Marx also recognized. The break up of the guilds and their primitive democracy, expressed in the beginnings of the domestic system with its contrast between capitalist traders and domestic hand workers as well as in the development of a permanent class of journeymen, the disintegration of the feudal comitatus, the dissolution of the monasteries, the ruin caused by wars and oppressive taxation—all these factors, no matter how different their point of departure, tended in final analysis in the same direction. The destruction of the pre-capitalist mediaeval order of society was accompanied by the rise of an increasingly large army of outlawed individuals, belonging nowhere and having no secure place in society; these, as beggars, vagabonds, tramps, mercenaries and adventurers, infested the highways, pillaging and killing. This gray army of decayed and degenerate individuals, of socially shipwrecked and homeless elements, composed the beginnings of the proletariat; but they represented a potential not an actual proletariat. At the same time that complaints of "universal vagabondage" were being voiced, the early capitalist entrepreneurs were lamenting the fact that they could not procure enough labor. Sombart traces this curious coincidence of abundance and shortage of labor supply to three causes: the bad organization of the labor market, which prevented interlocal and interregional adjustment between supply and demand; the empirically traditional and non-rational character of production, which was inimical to the migration of laborers from overcrowded to less crowded occupations; and the hostility of the early proletarians to the needs of capitalist production. In this respect as in all others capitalism could cast off only gradually the remnants of its feudal and guild past. The static, corporate character of mediaeval economic life, with production for traditional demand instead of for unlimited gain, was revealed in the numerous holidays, the many rest periods during the working day, the early holiday eve and the frequent changes in tools and manner of working. Quite different was the lot of the workers in the early factories: uninterrupted labor for an intolerably long number of hours, severe discipline, restriction to one detail of the production process. It was this set up which aroused the

fears and antagonism of the proletariat. Such resistance could most easily be overcome by owners of the instruments of production who were great landowners and who by virtue of their feudal rights could dispose of semifree or bound labor. The fact that a landowner, unrestrained by his feudal ties, possessed an advantage in the establishment of capitalist enterprises was one of the reasons why wealthy burghers were so anxious to acquire landed property.

The power of the great landowners over their dependent *glebae adscriptae* was not sufficient, however, to overcome the resistance of the early proletariat to the full development of capitalist production. The capitalist bourgeoisie, in its exploitation of the "lazy and recalcitrant poor," acquired a powerful ally in the absolutist state, which developed a clever and skilful system of forcible measures to corral the necessary labor forces. The severe penalties for beggars and vagabonds, the many forms of forced labor, the establishment of orphan and foundling homes, the leasing of prisons and jails—all of these measures served the same final end, to encourage capitalist enterprises by providing a supply of labor. The policy became one of the most effective means of increasing the wealth of the state.

The American proletariat had a development in some respects parallel to and in others different from that in Europe. Colonists imported indentured labor from England; artisans were deprived of their crafts by the rise of the factory system; and women, children and orphans were thrust into factories. The procedure, however, was not as relentless as in Europe. In general immigration supplied the workers required by the development of capitalist industry. Farmers in New England who were unable to make a living from the soil entered the factories (many also went west to occupy free land); but there was no direct expropriation of peasants, although many of the immigrant workers were originally peasants driven from the land in their native European countries.

This severe process of "rearing" a proletariat came to an end with the bourgeois revolutions. The newest social class, the proletariat, had reached a stage where the old repressive measures were not only superfluous but even inconvenient. The bourgeoisie, acting on its ideals of liberalism, humanitarianism and individualism, accorded the proletarian free disposition of his labor and abandoned him, as it could well afford

to do, to the inexorable laws of the capitalist economy. The accelerated disruption of handicrafts and the proletarianization of the artisans which set in with the industrial revolution, the utilization of the labor of women and children and the new possibilities of bringing together great masses of workers wherever the needs of capital demanded as a result of the newly established free mobility of labor—all worked toward an increase in the available number of workers and toward a decrease in wages. Adam Smith in that bible of economic liberalism, *The Wealth of Nations*, raised the demand that in bourgeois society every individual should become a merchant. It soon became evident, however, that the transformation of the workers into "merchants," into sellers of their labor power, was not sufficient to convert them into a conservative and stagnant social class. The socio-economic status of the workers, conditioned by the contradiction between their formal liberty and equality and their material dependence and inequality, led to a further development of the proletariat, its challenge of the existing capitalist order and the initiation of a new social order; while the bourgeoisie, petty bourgeoisie and peasants eventually reached a standstill in their development.

The commodity labor power of the proletarian is disposable; indeed it must be disposed of, must be sold, in order that he may live. But it is not disposable in the same sense as are the capitalist's commodities produced in the factories. Since the proletarian's commodity, his labor power, is indissolubly bound up with his person, he cannot be indifferent to what happens to the commodity after it is sold. When, for example, he is forced to work in unsanitary and unhygienic industries, his vital existence is immediately threatened. But even when such conditions do not exist, the fact still remains that the proletarian who enters a factory is confronted with an order of existence which is opposed to him as a sort of fate, an oppressive force completely independent of his own will. Through the separation of the proletarian from the means of production he is torn away from the spiritual and organizational powers of the labor process. Modern capitalist industry has thus created a psychic labor problem centered around the relation between man and the machine, a problem which increased technological development has served only to intensify. The machine began as a mechanization of manual processes of labor as well as of

tools; its upward and downward and sideward movements had some resemblances to those of man. More recent developments have emphasized the inorganic and mechanical character of the machine, which has assumed the real work and left to man only the function of regulating, servicing and watching. For the great mass of workers in workshops, factories and offices their work has lost its occupational character and become mere employment, increasing the tension between external work and inner emptiness.

The "permanent breakdown of the spiritual qualities" in work becomes evident in the increase of those groups of semiskilled workers who occupy an intermediate position between the skilled and the unskilled. The spasmodic attraction and repulsion of great masses of workers, characteristic of the dynamics of capitalist production, require that the worker be unattached, ready to move wherever needed by the industrial process. In the case of semiskilled workers these changes in the place of employment and in the nature of their tasks serve as a sort of compensation for their monotonous existence. This is, however, not true of the skilled worker, who is better off under normal conditions but whose specialized labor function places him in a worse situation than that of the semiskilled worker when he is unemployed or displaced by technical progress.

The increasing rationalization of production has resulted also in a greater intensification of labor. From the standpoint of the proletariat a rise in the intensity of labor means accelerated consumption of labor power: greater danger of accidents, spread of occupational diseases and further reduction in the age limit beyond which a worker no longer has a chance of securing employment. The development of modern technology, whose laws subjugate the proletariat selling his labor power, leads to a neutralization of human relations within the giant industrial plants of today. Although a great number of industrial workers are employed, the individual workers must serve an increasingly large mass of machinery and apparatus, so that in the modern factory machines are overwhelmingly preponderant over men. The workers neither love nor hate one another; they are indifferent and strange, and no amount of welfare activities can change the situation.

In addition to the indissolubility of the tie between the worker and his labor power there is another factor which places the proletariat as a seller of his commodity at a disadvantage as

compared to other sellers of commodities. The only commodity the worker has to offer for sale is not reproduced and sold under typical market conditions. Since the worker is dependent for subsistence on his wage, while the wage is the price of his labor power, the mechanism of the capitalist economic system forces him to offer himself for sale even when the labor market is unfavorable. This factor is followed by a third: labor power, especially that of the unskilled and semiskilled workers, is the most perishable of all commodities and is therefore subject to a sharp decrease in price as a result of competition among workers. This situation is improved somewhat only when a period of prosperity creates an active demand for labor. For the industrial enterprise wages represent merely an item of costs; for the proletariat they constitute the basis of his standard of living. Among the essential and more important effects of low wages is the transformation of the family, which in mediaeval times was both a producing and a consuming community, into a purely consuming community. Great masses of people go out to work and, at least in the large cities, do not return until evening; working quarters and living quarters are separated. These conditions have a particularly disastrous effect upon proletarian families. The proletarian dwelling place in an overcrowded tenement in a working class district lacks that individual character which a bourgeois citizen still finds a desirable ideal in his "home." Moreover in the bourgeois family there is always a certain bond between the members in that only the husband is engaged in the task of providing for the family, the wife is occupied at home (although in certain middle class circles, especially in the United States, it is becoming customary for the wife to pursue a profession) and the children remain economically dependent until relatively late in life. In the proletarian family the exact opposite is the case. The meager wage of the husband frequently makes it necessary for the wife to help support the family, and the children not only become economically independent at an early age but in their younger years may earn even more than their parents, who are soon forced out of the active army of employed workers. One expression of this contrast in parental authority is the lack of response among the proletarian youth to the revolt against the older generation which was the strongest force in the bourgeois youth movement.

The bourgeois revolution, whose dramatic

sweep is expressed in the American War of Independence and the French Revolution, pressed back the forces of the past, nobility, church and monarchy, but did not entirely overthrow them. The overthrow was in large degree decisive in the United States: the suzerainty of the British crown was destroyed by the revolution, and shortly thereafter the new nation cast off the transplanted feudal institution of the great colonial manorial estates, supplementing the earlier abolition of entail and primogeniture. There was no real feudal class to overthrow. Only Negro slavery remained as a precapitalist survival, and its abolition by the Civil War completed the bourgeois revolution. The "pure" character of American capitalism with its unrestrained economic enterprise and political democracy influenced profoundly the character and development of the proletariat; one manifestation of this is the fact that American labor was influenced neither by the struggle against surviving feudal elements, except for a brief entanglement in the movement against tenancy on the manorial estates, nor by the feudal struggle against capitalism. In Europe, however, much of the feudal structure survived the bourgeois revolution and the feudal classes retained a considerable measure of political power, which they strove to augment. But in order to recover even a portion of their lost ground the feudal classes found it necessary to "democratize" themselves, for during the era of bourgeois parliamentarism the path to political success was through the adherence of great electoral masses. Nobles and clergy thus attempted to attract "democratic" petty bourgeois, semiproletarian and proletarian groups. It was relatively easy to bridge the gap from the old ruling classes to the "simple producers of goods" of the Middle Ages. The successful bourgeois revolution liberated the peasants from the burden of their feudal dues and set aside the guild regulations, which had eventually come to serve the interests of only a privileged minority of artisans; but while the old contrasts lost much of their intensity, there emerged new contrasts between the "simple producer of goods" and the new power of money and capital in the form of money lenders, merchants and manufacturers, who offered the competition of factory enterprise. Under these conditions the petty bourgeoisie and the peasants came to feel that perhaps their interests could be served better in a romantically transfigured mediaeval society than in the age of machines, free compe-

tition and the scramble for wealth. "Social conservatism" or "feudal socialism" sought to intensify and exploit this feeling. Praise of peasants and artisans is one of the leitmotifs of the literature of social conservatism. With Sismondi, however, this praise already reveals a definite relation to the proletariat; when he demanded the support and maintenance of the small independent classes, he did so not only in their interests but also because he wished to prevent the proletarianization of as many people as possible. This was the first attempt by social conservatism to "solve" the problem of the proletariat by preventing the emergence of a proletariat.

This movement was powerless against the upsurge of capitalism in the first half of the nineteenth century and offered too little to those who had already become proletarians to serve as a program. Characteristic of the proposals which social conservatism put forward on behalf of the proletariat was the program of Disraeli and the Young England circle. They sought to "feudalize" capitalist industry, to constitute it a social relationship based on responsibility of leadership and allegiance, like the relation between the noble and his dependent serfs in fully developed feudal society. By an alliance of the crown, nobility and church with the "people," they hoped to isolate the liberal bourgeoisie. But the time was not favorable for the realization of such plans. Feudalism within its real domain, agriculture, was in process of complete disintegration; feudal relations could hardly be carried over into industry with its great, fluctuating human masses, its drive toward profit and its categorical imperative, "save costs." Of much greater practical significance was the fact that in the newly created German Empire of 1871 a social conservative government established a system of social insurance which assured the proletarian a measure of economic support during sickness, disability and old age.

This social conservatism has lost practically all its significance in the older capitalist countries. The great feudal landowner who has become an agrarian capitalist is neither able nor willing to pursue a labor policy directed against the entire bourgeoisie. Nevertheless, the historical and social significance of social conservatism should not be overlooked. It was much more difficult for the liberal capitalist bourgeoisie than for the "forces of the Middle Ages" to work out an approach to the solution of the problems bound up with the existence of the

proletariat. The reasons are evident: the interests of the industrial bourgeoisie are best served by "free trade in labor power." It is therefore not to be wondered at that both in Europe and in the United States the bourgeoisie resisted attempts to place limitations upon its advantageous position in the form of laws to protect labor or similar measures. There was also the conceptual motive. Liberalism, having made the proletariat a "merchant" like other merchants, a seller of the commodity labor power, could go no farther. The proposals of the first advocates of reforms on behalf of the workers smacked of modernized guild restrictions or of the absolutist state, the same type of social regulation against which liberalism had raised the banner of free competition and individual initiative. This callous attitude of liberalism toward the lot of the proletariat was expressed in denial, as long as denial was possible, of the existence of a specific labor problem. But unpleasant facts do not disappear because they are declared to be non-existent. Liberalism was forced to produce more potent arguments in its contest with the social realities which pressed upon it. The new arguments admitted the misery of the proletariat but declared it to be inevitable. The inevitability of proletarian misery was argued on the basis of survivals of a Calvinist-Puritan eschatology as the result of divine retribution or on the basis of Malthusian-Darwinian ideas as representing the defeat of the unfit in the struggle for existence. Liberal writers more sensitive to the suffering of others explained that not too much but too little liberalism was the cause of proletarian misery, which was but a transition and would disappear when the principles of freedom of economic activity were everywhere triumphant.

All these nostrums for soothing the bourgeois liberal conscience could not be of permanent help. Liberalism, which had disappointed the petty bourgeoisie, was threatened with the loss of its influence among the workers. This danger became more menacing when the proletariat made its first steps in the direction of socialism. Out of this situation arose the ideology and practice of European social liberalism, of which progressivism was a kind of American counterpart. The social liberal program included high wages, low prices for goods in mass demand by workers, recognition and support of labor unions and cooperatives and democratization of state institutions to allow a political outlet for the increasing social significance of the prole-

tariat. Social liberalism was further distinguished from the pure liberalism of the Manchester school in that it did not necessarily exclude state intervention in the free play of economic forces on behalf of the proletariat, which it considered a matter of practical necessity and not of principle. While social liberalism (and liberalism itself as a concrete social manifestation in general) never gained much of a foothold in central and eastern Europe, it developed into a deeply rooted and far reaching movement in the Anglo-Saxon countries, particularly in England. The fact that in the heyday of England's practical monopoly of industrialism the most important sections of the English working classes accepted social liberalism as a program prevented the emergence of a socialist movement and supplied liberals in England with a power which their brethren on the continent either never possessed or lost after a short period. For the continental liberals, especially the German bourgeois democrats who studied English social conditions, England was not only the classic land of political freedom but also that wherein social contradictions had been solved.

In the midst of these great social changes the proletariat was being shaped as a class, economically and politically, slowly developing a consciousness and a movement of its own. The early proletariat in the period of its emergence was not a conscious, independent historical force. It had no rights, neither suffrage nor the freedom of combination, the absence of which in turn expressed the lack of an independent proletarian will. It was symptomatic that the term proletariat was deemed an insult by those who really were members of the proletariat. By reason of the tension between the passivity of the proletariat and its wretched condition, urgently demanding relief, the workers directed their hopes beyond their own class. They looked for a god or a king made omnipotent by divine grace, for a savior who would relieve them of the burden of independent activity and responsibility. Along with these exalted images appeared that of the noble bandit, who also played a considerable role in the expectations of the early proletariat (and of the oppressed peasantry). The sympathy of the poor was aroused by the bold and stubborn guerrilla warfare which the bandit carried on against the rich, against their state and its justice, police and military, and the sympathy was all the greater when the bandit shared his spoils with the poor. This ideology with its underlying passivity was never charac-

teristic of the American proletariat because of the many differences in its origins and development; the conditions which made for passivity were offset by the possibility of migration to the free lands of the frontier. After the Civil War there was a popular literature idealizing the western bandits, for example, Jesse James, but it was an expression of other social factors than proletarian passivity; it coincided with the great labor upheavals of the 1870's and 1880's, while the industrialization of mining in the west led to great labor struggles against corporate control. On the other hand, even in recent years the bandit has been idealized in Latin America and in China, where peasants have been torn from the soil, artisans are deprived of their crafts and a proletariat is emerging, although conscious revolutionary ideas and action are increasingly ascendant.

The first stage of an independent proletarian movement was characterized by far reaching but aimless activism. There were either no organizations at all, proletarian movements rising and falling like quicksand, or where organizations did exist they were in the form of sects, alliances or conspiracies. The choice of means and methods to accomplish desired ends gave evidence of the same groping as did the problem of organization. Chartism, the first great proletarian movement in England, was affected deeply by the struggle between the adherents of physical force and those of moral force. The goal of the movement also fluctuated between political and democratic ambitions centered around the Charter and reactionary economic aims which looked toward the transformation of the proletariat into small peasants or artisans. While it likewise formulated general political and democratic demands, the early American labor movement was strongly influenced by the agrarian radicalism of the frontier and the struggle for free land.

The second stage of the proletarian movement was reformism, the economic and social background of which was bound up with the full triumph of capitalism over the forces of the past. The proletariat built up its own organizations to defend and advance its immediate interests under capitalism. Trade unions and cooperatives were to raise wages; political action was to complete the democratization of state institutions begun by the French Revolution. The motive behind the political activity was the more or less clear idea that the increasing numerical growth of the proletariat offered it a chance to secure a

dominant influence in the state by means of democratic majority decisions. There were sharp differences of opinion, however, as to how the workers should advance their interests in a democratic state. In England during the period of its industrial ascendancy in the world markets the workers refrained from forming their own party and usually supported the Liberals. This attitude still persists in the United States, where workers traditionally support the Democratic party, although not as a class. Proletarian support of bourgeois parties was generally determined by the expectation of immediate practical results rather than by any ideological considerations. In other instances independent labor parties were formed. These parties in general did not exclude members of other classes but had their mass basis among the workers. When they did not raise the question of the form of the economic structure of society, or when they answered it by accepting the capitalistic system, seeking merely to better the conditions of the proletariat within its framework, these political organizations were bourgeois labor parties whose membership and following were chiefly proletarian but whose aims were bourgeois capitalist. The classic example of this type of party is the British Labour party.

The third stage is reached when a workers' party accepts the idea that although the struggle for the immediate demands of the working classes is important, it represents only the first step in the decisive contest for the complete transformation of the economic system; and when it affirms that the historical task of the proletariat is to substitute common ownership of the means of production for private ownership, just as the historical task of the bourgeoisie was to replace the feudal and guild system by the capitalist system. A proletarian party accepting this revolutionary task is distinguished by three characteristics, which only the Bolshevik party led by Lenin possessed in full measure but which were stressed also by several other pre-war socialist leaders: it must break completely with both left and right opportunism; it must retain the closest contact with the masses under its leadership, neither running away from them nor lagging behind; and it must combine a maximum of fixity of purpose, determination and centralization with the utmost flexibility and activity of the individual party groups. Where such parties arise and are able victoriously to break through the hostility of the world around them, the labor movement enters a new stage.

The transition from one stage to another is naturally not without critical disturbances, which sometimes are almost catastrophic. And just as there are individuals who do not go beyond a definite stage of development even as they grow older, so there are groups and whole organizations in the labor movement which are so firmly bound up with a definite stage of the movement that it is impossible for them to move on to the next stage; instead they are converted by the dialectical process of historical development into brakes upon the labor movement and even into its opponents.

That the proletariat came into being with the rise of capitalism, increased both in numbers and in social significance as capitalism became dominant, gathered millions around the banner of the socialist movement and seized political power in Russia and maintained it against all opposition—these facts have left a decided impress on the social physiognomy of the world. World economy and world politics are striving to solve the problems bound up with the existence of the proletariat.

In the countries of western and central Europe, where an older capitalism has sunk deep roots, the labor movement has thus far been unable or unwilling to supplant the capitalist system of private ownership by socialist community of ownership. The tendency has been to let capitalism remain, reconciling the proletariat with existence and incorporation within the capitalist system. The methods of doing this comprise a whole system of politics. One of the measures employed consists of raising the general level of the proletariat as a class and allowing individuals to rise out of the proletariat; thus many talented children of workers enter the schools of higher learning and later become members of the professions and government officials. But the opportunities for such elevation are limited, for both the individual and the class. Of much more practical weight is the fact that in the European countries engaged in the World War the bourgeoisie found it temporarily necessary to entrust the bourgeois labor parties with a share in the government or with its entire direction. The leaders and functionaries of these parties secured important positions in the government bureaucracy. But this process whereby a worker rises to the ministry in a bourgeois democratic republic or in a parliamentary monarchy was preceded by another, the elevation of a worker to the position of a party, trade union or cooperative official.

The officials, taken out of the production process and dependent on the undisturbed functioning of the apparatus of their organizations, instinctively opposed all decisions which might threaten the tranquillity of bureaucratic activity. Enjoying an income more petty bourgeois than proletarian and a corresponding standard of living, relatively secure in office and averse to revolutionary decisions, intimately acquainted with workers' psychology and their organizational life, the labor bureaucracy became a significant force of social stabilization. Its importance was increased and complemented by sections of the proletariat which, having somewhat bettered their social and economic position, came to be known as the aristocracy of labor, or labor élite. This was not a case of individual success or of a rise in the general level of the proletariat, but rather the attainment by certain of its elements of a standard of living decidedly higher than that of the majority of the workers. The members of this aristocracy of labor are essentially proletarians but of a higher order; their income, at least in great part, is still derived from the sale of their labor power. They are largely untouched by unemployment, the scourge of proletarian life, although rationalization and increased severity of cyclical breakdowns are making this less true; their high wages enable them to participate in the gains of civilization and to accumulate some savings; their children attend the higher schools and through either marriage or vocational activity rise into the labor bureaucracy, perhaps, particularly in the United States, into the ranks of the petty bourgeoisie. The net result is the establishment of a strong contact between the urban lower middle classes and the upper proletarian layers. The influence of the labor élite upon the workers' organizations is normally very strong, because of its relatively higher cultural level, its activity and its urge to advancement. The upper stratum of the trade union and cooperative workers in nineteenth century England supplied to social liberalism the greatest share of its power. In Germany, where a socialist labor movement independent of bourgeois democracy arose much earlier, the labor élite provided the social basis for revisionist aspirations, which in practise meant the adaptation of socialism to liberalism. In the United States the trade unions, dominated by the aristocracy of labor, have steadfastly opposed socialism and independent political action by the proletariat. These developments cannot properly be understood,

however, without consideration of the fact that the general level of the proletariat also has risen. Although the disparity has increased between the labor élite and the lower levels of the proletariat, consisting of unskilled, semiskilled and agricultural workers, these groups also have secured some gains in wages and working conditions. At the same time the conditions of the workers have been improved by social legislation, a result of the state's intervention in the free play of economic forces on behalf of the proletariat. The whole process of incorporation has resulted in the spread among the workers of bourgeois, nationalist and imperialist ideas, which struggle with socialism for hegemony over the proletariat.

The incorporation of the proletariat into the social system of capitalism is not only a result of its necessity in the system but an outcome of capitalist recognition and acceptance of the fact. After four years of world economic crisis and twenty years of catastrophe the question as to the success or failure of the policy of incorporation cannot be simply affirmed or denied. In so far as neither increase in wages nor social legislation has permanently stemmed the dynamic force of the movement for the overthrow of capitalism it has been unsuccessful. But it has gained a sort of victory since the one country in which capitalism has been overthrown was not one of the fully developed capitalist nations but one of the least developed, as compared with England, Germany, France and the United States. The economic and political significance of the Soviet Union lies in the fact that there the proletariat is organized as the state and that as the ruling class it has undertaken to create a new social order based on common ownership of the means of production. If it succeeds, the opposition between ownership and non-ownership and between capital and labor will be abolished. Society will consist not of "proletarians" but of workers obligated to perform socially useful labor. Attempts to establish communistic forms of social organization have been made in other times and in other lands. But Bolshevism far surpasses its utopian and sectarian predecessors in the enormous breadth of territory and size of population ruled over by the proletarian dictatorship, in the energy and will to realize socialism and in the conscious utilization of all the modern technical and social forces for socialist construction.

PROMOTION. The fundamental economic problem which no system of industrial organization can evade is that of adjusting production to consumption. It has always two fairly distinct phases, or aspects: the long run, the selection of the directions of productive activity; and the short run, the determination of the method and intensity of utilization of resources after they have been committed to a particular field of employment. A capitalistic economy depends upon private enterprise to solve this problem in both its forms; the activities of individuals attacking the former phase constitute what is called promotion, of those who attempt to solve the latter phase, management.

This distinction between promotion and management is more analytical than practical. Both types of activity are conjoined in the performance of a single function: the maintenance of a flow of products which in variety and relative amounts conforms to the demands of the market (in a capitalistic economy) or to the con-

suming disposition of the community (in any economy). In modern industrial society moreover both types of activity are pursued by a single economic class, the so-called entrepreneurs. Nevertheless, within this class there has gradually emerged an appreciable division of labor between the promoters and the managers, or executives, of capitalistic industry. In any case the solution of the problem of adjusting production to consumption always involves two types of decisions—where to apply productive resources and how to use them in any given field of application—which are sufficiently distinct to warrant their separation for purposes of study even if it had never occurred in practise.

Under the conditions prevailing in the seventeenth and eighteenth centuries, when the social policy of dependence upon private enterprise to effect an adjustment of production to consumption emerged in its modern form, the productive resources thus to be allocated were in the main the private accumulation of the individuals to whose free choice their distribution was entrusted. The theory underlying the new policy of *laissez faire* assumed that the owners of these resources would retain direct supervision and immediate responsibility for them in whatever field they might be applied. In other words, any venture which a person "promoted" he "backed" wholly or at least predominantly with his own resources; and any business which he "backed" or for which he provided the funds he "managed." Under these circumstances there was at least some reasonable ground for believing that, given the opportunity, the voluntary action of individuals seeking their self-interest would discover the directions of production conforming to the community's demands and would provide the appropriate allocation of productive resources.

It is the departure from these conditions which has brought the *laissez faire* policy into general discredit and more especially has given a dubious connotation to the name and office of the promoter. In an environment transformed by the machine technique, large scale production, corporate enterprise, bank credit, world markets and capital concentration, the expectation that a multitude of private interests operating at random will somehow achieve an economical distribution and an efficient utilization of productive resources has less and less substantiation in experience. For where promotion has been divorced from management and both have been separated from ownership, until there is no-

where any clear and challenging responsibility for the successful discharge of the fundamental function of adjusting production to consumption, the economical direction of industry becomes not only an indirect but a subordinate objective of private enterprise.

It is not without significance that the earliest instances of promotion as a specialized vocation, in other words, the launching of projects in which the funds of others than the promoters were solicited, exhibit in their most conspicuous forms the very evils which still plague societies that continue to entrust this vital function to private interests. The prototypes of all the modern devices for getting rich quickly by giving nothing for something may be found in such enterprises as the South Sea bubble, the "Mississippi Bubble," the Darien venture and the innumerable companies organized for land speculation, either exclusively and for its own sake, as was most commonly the case in North America, or in connection with colonization and with commerce, as was more generally the case in Europe. The Hatrys, the Insulls, the Kreugers—the field marshals of high capitalism—have but followed in the footsteps of John Law and Robert Morris and the host of nineteenth century adventurers who in the process of constructing great railroad systems and large scale mechanized industrial plants managed often to divert so large a share of the funds assembled for the enterprise, or to loot so recklessly the properties of the going concern they sponsored, as to impair whatever prospects it may have had and eventually to wreck the entire project. Not infrequently these promoters, like every one of those specifically mentioned above, have witnessed the crumbling of their own fortunes in the ensuing debacle.

Among the basic features of the economic situation which has called forth and made possible the methods of the promoter is the increasing and substantial accumulation of capital in the hands of persons ill equipped by training or temperament for its fruitful employment. Another is the existence of vast unexplored fields for the development of industry, whether, as in the eighteenth century generally, and in America through a considerable part of the nineteenth century too, through geographic extension of the boundaries of the market, with the typical form of promotion that of land speculation; or, as in the nineteenth century, principally through the addition of new lines of production—the railroad, the telegraph and the

telephone, the machine tool industries, the electrical industry, rubber manufacture, the chemical industries. The addition of new industries to old continued in the twentieth century but at a slackening pace and with a diminishing significance. Such outstanding examples as the automobile, the cinema and the rayon industries represent substantially only a novel application of principles and devices previously developed. Radio is an exception that proves the rule. Rather the new fields for industrial pioneering have latterly been provided in the main by what may be called rationalization, the horizontal and vertical integration of productive processes, the internal and external organization and administration of industry. Mergers, cartels, syndicates, institutes and trade associations indicate the predominant forms taken by the contemporary imperialistic tendencies of business enterprise.

The presence of psychological, social and legal norms or patterns conducive to or facilitating experimentation and risk taking also plays a part in the development of promotion as a characteristic feature of an economy. These psychic and institutional factors, which so largely shape the economic destiny of a people, vary in the encouragement offered to new enterprise or promotion, not only from country to country and from time to time but also among themselves. Social and legal institutions reflect only tardily changes in the psychological norms of the people whom they help to govern, as is evidenced by the growth in Germany of an intense psychological restlessness or impulse to escape in recent years, which only with considerable difficulty and to a comparatively meager extent has found expression in speculation, because of the retarding influence of social habits and legal forms. Eventually, however, what seem to be more or less abiding distinctions among different peoples in respect to their readiness to undertake experimentation in industry do become embodied in institutional form. Perhaps the French are of all modern nations the least inclined toward speculation; and the predominant form of business organization in France, the *société anonyme*, is not designed to foster promotion. On the other hand, Americans are perhaps typically the most disposed to speculate; correspondingly in the United States the relatively slight legal safeguards placed around credit extension and the elasticity of corporation laws have afforded wide scope for the exercise of the talents and the un-

doubted ingenuity of the professional promoter. Finally, it is everywhere coming to be recognized that these psychic and institutional factors conducive to chance taking, and therewith to promotion, vary in intensity from time to time. The alternate optimism and pessimism which accompany the swing of the business cycle appear to affect not only the managerial but also the promotional groups in modern industry. New enterprises, plant extension and mergers are no less characteristic of boom periods than are inventory accumulations and increase of the volume and speed of operations.

These basic features of the economic situation which invite promotional activity have become more and more pronounced, more and more prevalent, with the growth in the complexity, scope and instability of capitalistic industry. If, as Schumpeter has suggested, its dynamic quality is at once the most distinctive trait and the most imperative need of a capitalistic organization of industry, promotion has both exhibited this quality and ministered to this need. The types of promoters and the methods of promotion have by no means remained fixed. When promotion first emerged as a specialized function, it was generally carried on as an incidental, occasional, part time vocation. Lawyers, brokers, occasionally bankers and rarely business men, discovering, frequently by chance, promising profit opportunities, would undertake to assemble the technical requirements, solicit the necessary funds and launch a new enterprise. The promoter of this type needed not so much foresight, technical capacity or experience as a certain shrewdness and quickness of wit and above all enthusiasm, self-confidence and negotiating ability. These qualities continued to be of service to the professional, full time promoter when he appeared upon the scene in the latter part of the nineteenth century; but in addition it became necessary to apply also a certain perspicacity, if not much probity; a certain power to visualize the future, if not much prudence; and a certain hold and dramatic leadership, if not much personal magnetism. For the scale of business ventures was expanding, commitments (in the form of fixed capital) had to be made irretrievably, and the elements to be assembled were too numerous and too diverse to admit of guesswork or trial and error procedure. Gradually promotion came to be undertaken primarily by a group not only professionally specialized but institutionally organized. Promotion was incorporated as a recognized

function of the investment banking or security brokerage business. While the independent promoter did not disappear, his importance was diminished by a variety of advantages enjoyed by his institutional competitor: the advantage of continuous contact with the inventors, technicians, roving speculators and business men (called in the profession the clientele) who supply the ideas upon which new business enterprises are projected; the advantage both for profit and for reputation of continued connection with new and reorganized enterprises previously promoted; and above all the advantage of maintaining steady relations with a large and scattered body of investors or security customers.

With the advent of the institutional type of promoter the influence of the "demand" upon the "market" for promotion has become more direct and more obvious. The established investment banking houses have their lists of regular customers, who must be supplied with a more or less continuous flow of securities if their patronage is to be retained. This leads, especially during periods of prosperity when capital accumulation is rapid, to zealous and persistent efforts by these houses to find new outlets for savings. At such times their representatives comb industry for opportunities to organize, reorganize, expand or merge enterprises; and only the most sober and cautious entrepreneurs are able to resist the temptation to utilize some share of the funds thus literally thrust upon them. If, as experience tends to indicate, such promotion eventually involves an appreciable impairment of managerial prerogatives and the necessity of considering interests other than, if not strictly opposite to, the long run welfare of the enterprise, this is an outcome which in any judgment must be weighed against the dynamic character which promotion activities help to give modern industry.

It cannot be gainsaid that the ingenuity shown by the latter day promoters in splitting up the elements and incidents of ownership participation in corporate enterprise has contributed substantially to the progressive increase in the volume of savings, through providing effective appeals for funds to income receivers of the most varied classes and circumstances. If it has resulted at the same time in such an intricate and confusing subdivision of interests and multiplication of privileges that it can scarcely be determined where responsible control lies, if indeed it lies anywhere, this is

only a part of the price paid for blindness to the fundamental fact that in a capitalistic system social interests are secondary and (some) private interests paramount. That the conflict and competition of special interests do result in a tremendous pressure for innovation, change, adjustment and readjustment may be admitted. Essentially promotion is a response to this pressure. In the end, however, it is a question whether the "progress" thus made possible is cumulative or only circuitous, whether progress so promoted and so directed is worth its cost. The answer commonly given depends ultimately upon the temper of the times. The nineteenth century thought it was; there are many signs that the twentieth century may take a different view.

PROPAGANDA in the broadest sense is the technique of influencing human action by the manipulation of representations. These repre-

sentations may take spoken, written, pictorial or musical form. The expected disproportion between the specific consequence and the general reaction which is behind some political assassinations justifies the category "propaganda of the deed." Many official acts of legislation and administration derive their significance from the general as distinguished from the circumscribed results anticipated; these are the propaganda aspects of public policy. Both advertising and publicity fall within the field of propaganda. The word was first given general currency by the Roman Catholic church to refer to the dissemination of its doctrine and was later adopted and adapted by Marxists. Modern revolutionaries use propaganda to mean the spreading of doctrine; incitement is agitation (*q.v.*).

It is true that techniques have value implications, even though values do not necessarily depend upon technique. Nevertheless, the processes by which such techniques as those of spelling, letter forming, piano playing, lathe handling and dialectic are transmitted may be called education, while those by which value dispositions (hatred or respect toward a person, group or policy) are organized may be called propaganda. The inculcation of traditional value attitudes is generally called education, while the term propaganda is reserved for the spreading of the subversive, debatable or merely novel attitudes. If deliberation implies the consideration of a problem without predisposition to promote any particular solution, propaganda is concerned with eliciting such predispositions.

The antiquity of the practise of propaganda, as distinguished from its name, is apparent from the fact that much classical Greek and Roman literature is the more or less accidental residue of propaganda. The walls of Pompeii were found to be covered with election appeals. Frederick the Great was ever anxious to influence European public opinion. Napoleon subsidized a London newspaper, *Metternich* and the Rothschilds employed Friedrich von Gentz and Bismarck used Moritz Busch to spread favorable press comment. In the American Revolution committees of correspondence fostered anti-English sentiment. During the American Civil War the federal government sent perhaps a hundred agents, including Henry Ward Beecher, to England to plead its cause and added the dramatic touch of a shipload of foodstuffs to mitigate the sufferings of unemployed textile workers. It is estimated that in 1905 the czar's government spent in France alone nearly 1,700-

000 francs on counter-revolutionary propaganda. In the World War the battle on the propaganda front was as intense as on the military front. In the United States a federal Committee on Public Information spent nearly five million dollars. The chief of the American Red Cross in Russia spent a million dollars in an effort to keep the revolutionary government in sympathy with the Allies.

In every city hall and in every state and national capital congeries of propaganda organizations and agents speaking for every conceivable vested interest or general sentiment swarm about the legislative and administrative organs of government. Specialized promotional agents include "public relations counsels," who advise clients on broad implications of their activity in relation to the community, advertising agencies, individual press agents, vice presidents in charge of public relations and publicists who produce interested "news" and opinion. Perhaps five hundred rather important propaganda institutions are organized nationally and usually have offices in Washington, D. C., or New York City. They include social and professional organizations, such as the United States Chamber of Commerce, the American Federation of Labor, the American Farm Bureau Federation, the National Educational Association and the American Medical Association, and trade associations, such as the Cotton Textile Institute, the National Retail Drygoods Association, the Institute of American Meat Packers, the American Railway Association, the National Electric Light Association, the New England Council. In every community city clubs, community chests and other associations appeal on civic and patriotic grounds to classes or to sectional, age, sex and prestige groups. In Germany, France, Czechoslovakia, Great Britain and elsewhere there are in addition authorized economic councils which have an advisory relation to the government. Even where fascists and communists hold a legal monopoly, there is no end to propaganda; indeed new regimes are particularly dependent upon this instrument for the consolidation of power.

Propagandas are particularly prominent in intergroup and therefore in international politics. Some promotional enterprises exacerbate intergroup relations by imperialistic pretensions, militaristic provocations and separatist demands. Others stress the advantages of conciliation, of pacific methods and of cooperation without the sacrifice of independence. A chief executive, a

popular aviator or artist travels abroad to demonstrate national friendship. Professors, fellowships, statues, are exchanged. Friendship propaganda is institutionalized in such associations as the English Speaking Union, the Alliance Française, the Friends of the Soviet Union. Hatred propaganda is always necessary in war time to arouse and intensify animosity against military and diplomatic rivals and to attract neutral support. In 1914 the United States became the seat of one of the most famous propaganda battles in history, with the British working through native sympathizers, Rhodes scholars and other cultural and business affiliates and the Germans rather through German nationals with such unhappy results as the so-called Dernberg episode. Some of the most prominent post-war campaigns have been prestige propagandas. "The myth of a guilty nation" has been persistently attacked by German propaganda to wipe away connotations of responsibility in both the legal and the invidious moral sense.

Intragroup propagandas may be classified as unity or disunity, revolutionary or counter-revolutionary, reformist or counter-reformist. Considered from the standpoint of its purpose, the huge network of organizations to keep German sentiment alive in Silesia, Alsace and other abodes of former German nationals or the promotion by the Italian Fascist government of pro-Italianism among overseas emigrants is propaganda of cultural unity. While the propagators, too astute to avow practical political aims, usually dwell among the somewhat diaphanous clouds of the spirit, it is often impossible to avoid a strong irredentist tinge, which, even when due to local exuberance rather than to central policy, reveals that a propaganda of cultural unity is in its effects also one of political disunity.

Propagandas which threaten the fundamental patterns of a given group are revolutionary and invariably call counter-revolutionary propagandas into existence. Antigovernmental monarchists in France and Germany are confronted by progovernmental activities. The revolutionary propaganda of the Third International is opposed by the propaganda of all identified with the capitalist political and property system. Reformist propagandas work for limited changes in the social order. As the term is used in America, reformist propagandas are those which set out to modify conditions in the name of moral standards, as, for example, efforts to prohibit the drinking of alcohol or recreation on

"the Lord's Day." As the term is used in Europe, reformist propagandas are those directed at broad or deep political, economic or social changes by gradual modifications of an existing structure rather than by its replacement by a new one.

Propagandas may be classified from other points of view. Some are carried on by organizations, like the Anti-Cigarette League, to promote a limited objective; others, like those conducted by many civic associations, are for "general" purposes. Some promotional efforts are essentially temporary, like a booster group for a favorite son. Propagandas may be manned by amateurs or by professionals. Those directed by persons who hope to reap direct, tangible and substantial gains for themselves may be called profit propagandas; others, such as some civic propagandas, are headed by persons content with deriving general or diffuse advantages for their group or class. Some propagandas depend upon a central staff, others upon numerous local branches. Some operate in secret, others invite publicity. Some exist to organize an attitude toward a person or group, others toward a policy or institution, such as free trade or democratic government, still others toward a specific mode of participation, as buying war bonds, joining the marines, contributing to the community chest or crossing streets cautiously.

Military writers were among the first to see how greatly the displacement of cults of simple obedience by democratic assertiveness complicated the problem of eliciting concerted action. Warfare reached a phase calling for the cooperation of the whole population in military action, munition production and the supply services. As older sentiments gave way to nationalism, the spread of schooling augmented the prestige of national heroes, legends, virtues and emblems at the expense of local symbols. It did not release the masses from ignorance and superstition but altered the nature of both and compelled the development of a whole new technique of control, largely through propaganda.

Since the World War accelerated social change has fostered new perplexities, disintegrated old loyalties and spread a new self-will. Merely automatic and historically hallowed ways of handling social adjustments have been rendered obsolete by shifts in technology and by strange new conditions of human contact. The programs of contending leaders, duly sanctified by theocratic or aristocratic connections, are con-

futed by one another. When lords fall out, commoners come into their own. Simultaneously with the fading away of old loyalties, the scale of collective activities has broadened. As proposals for action along new lines arise to compete for the moral and physical support of masses, propaganda attains eminence as the one means of mass mobilization which is cheaper than violence, bribery or other possible control techniques.

The significant symbols of propaganda may often be circulated free of expense to the propagandist. The skilled manipulator makes events so interesting in themselves that attention is spontaneously turned in their direction. For example, an insurance company recently received plentiful free space in the press when it announced that a former president of the United States had become one of its directors. Not only would the cost of an equivalent amount of regular advertising space have been enormous, but it would have been difficult to obtain headline space through a simple commercial transaction.

The propagandist's task is to intensify attitudes favorable to his purposes, to reverse obstructive attitudes, to win the indifferent or at least to prevent them from becoming antagonistic. In general, his problem is so to control the presentation of an object that a desired act will be elicited toward it on the part of selected persons. He must have a clear working conception of his goal, which is sometimes definite (to secure a majority of votes, to secure the enlistment of fifty thousand soldiers within a given period, to double the sale of a product within six months) and sometimes diffuse (to increase "good will" toward private owners of a public utility enterprise in such measure as to render impotent demands for government ownership or operation, to create a favorable atmosphere for the conduct of an international conference, to modernize community taste in public monuments).

The propagandist requires an inventory of existing facilitating and retarding factors in order to discover which hold the "balance of power." To some, which he cannot change, he must adapt. In a war problem there are some relatively immovable conditions: communication networks, similarities and differences in customs and institutions, interpenetration of population, economic ties, relative military power, organized prejudices. Allowance must also be made for factors tending to modify the general reac-

tivity level, such as that condition of adaptation or maladaptation variously described as public anxiety, nervousness, irritability, unrest, discontent or strain. In a community with a high reactivity level a very small match can touch off an explosion.

The propagandist's creative ingenuity is tested by his selection of modes of representing a social object which will accomplish his ends. Any particular group has vested values, ranging from claims upon property to claims for ceremonial deference; hopes of increasing its non-sharable assets; and universalized patterns of right and wrong, of propriety and impropriety (mores), which it tends to defend. The propagandist must redefine the significance of social objects in terms of these various value constellations.

Thus for the mobilization of national hatred the enemy must be represented as a menacing, murderous aggressor, a satanic violator of the moral and conventional standards, an obstacle to the cherished aims and ideals of the nation as a whole and of each constituent part. Through the elaboration of war aims the obstructive role of the enemy becomes particularly evident. The maintenance of hostility depends upon supplementing the direct representation of the menacing, obstructive, satanic enemy by assurances of ultimate victory, thus preventing diversion of attention. The preservation of friendly relations depends upon representing an allied nation as strenuously prosecuting the war and thus protecting common values. The ally must appear to assent heartily to the cherished war aims of the nation and to conform to all the mores.

The propagandist may pursue his task not only on the ordinary "common sense" level but also on a level leading to the underlying emotional life of those whom he desires to influence. To elicit acts severely condemned in the culture, such as lynching, the problem is to divide each conscience against itself, thus weakening its inhibiting capacity. Emphasis upon the aggressiveness, immorality and impropriety of the "enemy" is a sop which loosens the restraining grip of the conscience upon destructive impulses. The effective choice of appropriate representations, or symbols, demands careful attention to the relativity of culture. A cartoon of a burly officer beating his wife will not stir anger in a population of peasants to whom wife beating is a sign of virility. Due account must also be taken of the continual process of redefinition of patterns of morality (mores), immorality (countermores) and expediencies and of the continual

modification of the vocabulary of opprobrium and encomium, taking place in all cultures.

Numerous problems of organization arise in propaganda work. It is advisable for the propaganda specialist to be in constant touch with those responsible for policy. The experiences which create sensitiveness to the psychological implications of particular acts are quite different from those of the usual military man, engineer or scientist. Judgment on these matters is so difficult to "objectify" that it is important for comments about psychological implications to be made by forceful personalities in the immediate presence of policy determiners. Propaganda must be coordinated with information and espionage services which can supply material to the propagandist and report progress of propaganda work. That propaganda can be effectively correlated with diplomatic, military and economic pressures was abundantly demonstrated during the World War.

The importance of proper personnel is shown in the relative success of the British and German propagandas in America during the war. British civilian propagandists made no such mistakes as did German military propagandists, who complained of sniping by the Belgians, forgetting that the American civilian mind approved sniping as the sly and plucky act of an under dog. Propagandists should ideally be individuals with a capacity to view themselves as objects in a world of objects. They must maintain contact with the reactivity of the community and expose their minds to experiences which impinge upon it. Adroit public relations counsels read popular novels and attend popular plays and have great capacity for identification with others. It is doubtful that non-introspective personalities will be successful propagandists.

Increasing attention is now being given to the problem of devising precise means of assessing the influence of propaganda. Working propagandists are accustomed to proceed by the "trial balloon" method, which consists in trying out public responsiveness to material which can be disavowed. The "official spokesmen," the "unofficial spokesman," the "semi-official organ," are instruments of this technique. Advertisers have tried pre-testing, choosing matched communities and varying details of their product to discover relative popularity. Speeches may be tried out on selected groups much as plays are tested in the "provinces." Non-verbal indicators of response (pulse rate, psychogalvanic reflex and involuntary muscle innervation) are being

adapted to measurement purposes. Changes in registering or voting behavior in response to different stimuli have been studied by matching precincts and varying the stimuli. Efforts have been made to hold the audience constant while changing from periodicals as a medium to radio and back again. Straw ballots, questionnaires, interviews and "listening" are regularly employed to gauge reaction.

Very little in the way of successful generalization has so far come from these preliminary studies. But certain limitations upon the role of propaganda are clear. Many fundamental social changes never pass through an active phase of propagation. New standards of courtesy and new codes of personal integrity may rise and spread unnoticed by those in the midst of the drift. Many changes come to pass because someone invents a new practise and communicates it to a very small circle necessary to its propagation. Even if it were known what proportion of significant social changes passes through active propaganda phases, some questions would remain unsolved. Since propaganda is used for and against, as was the case with repeal of prohibition in the United States, the question arises whether propagandas cancel out, leaving other factors in control.

The complaint is made against the specialized function of advocacy which is the propagandist's that it distorts judgments by exalting scoring values at the expense of welfare values. Just as the criminal prosecutor keeps a "batting average" in terms of cases won and lost rather than in terms of sound social acts furthered or retarded, the propagandist substitutes scoring values for human values. His propensity to do this is fostered by the peculiar circumstances attending his field of operation. Unlike the lawyer who works within the purview of a judge, the propagandist appeals to the public at large. And if a judge cannot always be relied upon to possess the acumen, the facilities or the motivation to subordinate tricks of professional advocacy to the necessities of just litigation, the public is much less likely to impose rules of evidence upon often anonymous advocates. The propagandist in fact operates on a jury without a judge and frequently without the cognizance of the jury.

Propaganda as a mere tool is no more moral or immoral than a pump handle. That it may be employed for subversive, fraudulent, libelous and lascivious purposes is evident. Popular confidence in such words as "bonds," "preferred

stocks" and "securities" may be abused to the tune of many billions of dollars worth of "lamb's wool." The name of science may be prostituted on behalf of germicides which do no damage to the germs and tooth pastes with very little or very dubious value. A rich manufacturer may ride his anti-Jewish hobby in a prolonged press campaign and ultimately withdraw from the field with a simple apology.

There are, however, correctives for the irresponsibility of the propagandist. Some campaigns face handicaps which can be overcome by no amount of financial subsidy, a fact which is revealed by a study of public utility propagandas. Anonymous propaganda is vulnerable through exposure, and the best public relations counsels are careful to reveal to interested parties their relation to their clients. Current suggestions for the control of propaganda range from requiring the registration of propagandists to fatuous generalities about wiping propaganda off the social map. The only effective weapon against propaganda on behalf of one policy seems to be propaganda on behalf of an alternative. Legal regulations to enforce publicity, to censor or to punish for fraud, libel and slander can be effective when there is a consensus upon the meaning of integrity. The rectification of objectionable conditions may remove the provocation to subversive propaganda. But repression unsupported by concession and propaganda merely drives hostile propaganda underground.

Propaganda is surely here to stay; the modern world is peculiarly dependent upon it for the coordination of atomized components in times of crisis and for the conduct of large scale "normal" operations. It is equally certain that propaganda will in time be viewed with fewer misgivings. At first sight its practise by specialists would appear to clash irreparably with some fundamental canons of a society which calls itself democratic. Such are the theory that the individual is obliged to participate openly and continually in ascertaining the general will and the theory that one who regardless of his private opinion propagates a view for a client commits a breach of obligation. The propagandist can show, however, that even a democratic society permits exceptions. Such are the diplomat and the lawyer, whose functions, being regarded as a necessary adjunct of litigation (a substitute for violence) and a guaranty that thorough deliberation will be fostered by interested representation, have social advantages which outweigh the disadvantages of deviation

from the democratic rule. The importance of keeping channels of communication (press, post, radio, platform, cinema, theater) open to all on equal terms is at once apparent.

Any comprehensive appraisal would ascertain the magnitude of the effect of propaganda considerations upon the policies of typical individuals and groups. The public relations counsel is no mere errand boy who discharges quantities of mimeographed releases in all directions the moment his client pays him a retainer. He may interact powerfully with the policy determiners of a given enterprise and extensive changes may result. No detail of operation (commodity appeal, marketing policy, labor policy, credit practise) is immune from review and criticism by an expert objectively engaged in discovering a profitable sphere of activity for a client. That propagandists have induced important policy changes is well known, but what is unknown is whether the usual effect of those who specialize in assessing currents of public favor and disfavor is to make clear to determiners of business policy the advisability of adopting broad interpretations of self-interest.

One of the consequences of propaganda in the international field is that international legal conventionalities are becoming demonstrably more archaic. The modern state system rests upon the presumption that people who happen to be living within a certain territory are the sole determiners of their own interests, and that they will abstain from interfering with the affairs of people who live elsewhere. This presumption has less validity as the economic system becomes more integrated on a world scale. Propaganda is the tool upon which most interests with ramifications in several states rely to make themselves effective within what is technically a foreign jurisdiction. Propaganda thus assists in making a fiction of the national state and in fabricating new control areas which follow activity areas, intersecting old control areas in every direction. Thus propaganda on an international scale is one important medium for transmitting those pressures which are tending to burst the bonds of the traditional social order.

The modern conception of social management is profoundly affected by the propagandist outlook. Concerted action for public ends depends upon a certain concentration of motives. The propagandist is accustomed to go directly to the springs of motivation and to utilize governmental patterns only incidentally as expedience dictates. Accidents and fire hazards, for example,

have been reduced by concerted movements which involved a minimum of government collaboration. The propagandist outlook in fact combines respect for individuality with indifference to formal democracy. The respect for individuality arises from the dependence of large scale operations upon the support of the mass and upon experience with the variability of human preferences. The newspaper, the cigarette, the tooth paste, all depend upon a daily mass referendum. The possibility always looms that a new combination of appeals will supersede the old and push old tracts of fixed and specialized capital out of use.

This regard for men in the mass rests upon no democratic dogmatism about men being the best judges of their own interests. The modern propagandist, like the modern psychologist, recognizes that men are often poor judges of their own interests, flitting from one alternative to the next without solid reason or clinging timorously to the fragments of some mossy rock of ages. Calculating the prospect of securing a permanent change in habits and values involves much more than the estimation of the preferences of men in general. It means taking into account the tissue of relations in which men are webbed, searching for signs of preference which may reflect no deliberation and directing a program toward a solution which fits in fact.

Such an approach places a premium upon candor and hard thinking rather than upon hypocrisy and formality. The older democratic doctrines allowed the nominal leader to escape his task of leadership by some procedural rigmorale: a "general will" was supposed to be "out there," and the leader's duty was to watch carefully for it to manifest itself through the machinery of balloting and legislative discussion. The focus of attention was shifted away from administration and reflection to hocus pocus, and behind the scenes or under the surface played the really determining forces. The removal of the recurrent sources of strain in interpersonal relations depends upon finding the relations which do in fact remove the strains, and this may involve mass consultations on a scale not implied in pure democratic theory.

With respect to those adjustments which do require mass action the task of the propagandist is that of inventing goal symbols which serve the double function of facilitating adoption and adaptation. The symbols must induce acceptance spontaneously and elicit those changes in conduct necessary to bring about permanent

adaptation. The propagandist as one who creates symbols which are not only popular but which bring about positive realignments of behavior is no phrasemonger but a promoter of overt acts.

It follows that the management ideal is control of a situation not by imposition but by divination. The job is not to "put something over," but to find out what will stay put in social practise. This involves the cultivation of sensitiveness to those concentrations of motive which are implicit and available for rapid mobilization when the appropriate symbol is offered. The history of many social innovations, like the Boy Scout or the Girl Scout movement or the spread of parent-teachers associations and child guidance classes and clinics, is not a record of social imposition. Diffusion was due to the fact that their relevance seemed somehow to be self-evident on statement. Indeed Jordan has cogently argued in his *Theory of Legislation* that the invention of goal symbols which are popular, and which actually make an overt difference, is the act of legislation itself.

The propagandist takes it for granted that the world is completely caused but that it is only partly predictable, and he believes that one of the most potent causes of social change is the problem attitude itself, which so often produces the goal symbols capable of guiding adjustment. This means that the propagandist is able and anxious to apply the methods of scientific observation and analysis to the processes of society but that he is content to direct his creative flashes to final guidance in action.

PROPERTY is a euphonious collocation of letters which serves as a general term for the miscellany of equities that persons hold in the commonwealth. A coin, a lance, a tapestry, a monastic vow, a yoke of oxen, a female slave, an award of alimony, a homestead, a first mortgage, a railroad system, a preferred list and a right of contract are all to be discovered within the catholic category. Each of these terms, meaningless in itself, is a token or focus of a scheme of relationships; each has its support in sanction and repute; each is an aspect of an enveloping culture. A Maori claiming his share of the potato crop, a Semitic patriarch tending his flock, a devout abbot lording it vicariously over fertile acres, a Yankee captain homeward bound with black cargo, an amateur general swaggering a commission he has bought, an adventurous speculator selling futures in a grain he has never seen and a commissar clothed with high office in a communistic state are all men of property.

In fact, property is as heterogeneous as the societies within which it is found; in idea, it is as cosmopolitan as the systems of thought by which it is explained.

An abstract term, indigenous to a way of thought, has meanings and compulsions of its own; the institution of property is inseparable from the verbal symbol through which the mind attempts to capture its actuality. The word appeared first as a Latin adverb. *Propter*, which smells of remote folkways, meant in accordance with custom. It blossomed out as the substantive *proprietas*, was intellectualized by Roman lawyers, battered around during the Dark Ages and given a home in colloquial French. At the Norman Conquest it became an unobtrusive immigrant into English; under the influence of Christian doctrine it was Anglicized; and in the quaint forms of "proprete," "proprie," "propirte" and "proportie" it was used to characterize a feudal privilege or relationship. In the turmoil of the seventeenth century, when ancient liberties were transmuted into a generic liberty, it was enlisted as an idiom of apologetics in the cause of Parliament against the crown. It became "the right of property," the "highest which a man can have in anything," and independent of "the courtesy of another." In the eighteenth century, as the successor to estates, it came into popular usage. As it became presumptuous for the state to direct the affairs of trade, it was caught up into the language of individualism. In time, by dint of repeated use, a "property in" became simply a property; and, with metaphorical significance worn away, it came to denote an objective reality. A creature of its own intellectual history, the word belongs to a culture, to a society and to a vocabulary. The hazard of reading the associations of the word into the subject of inquiry constantly attends its use; at best it is a darkened glass wherein to exhibit passing systems of ownership.

If the word is to be employed away from home, property must be exalted into an abstraction; yet it is not easy to find the least common denominator for a series of facts which sprawl across diverse societies. In a world of the check-board each person might have his absolute dominion over tangible things, and the sum of all the rights would be property. In a human nature untarnished by culture the phenomena might be rested upon an instinct for possession and explained in the tropismatic terms of stimulus and response. But existence is more than basal metabolism; the chromosome is converted

into personality under the directive impact of environment, circumstance and convention; every urge which reaches out toward possession and enjoyment is shaped by the life of the community. The desire for food is to be satisfied, not by a pure chemical diet of calories and vitamins, but by particular foods prepared in specific ways. The clothing, housing, amusements, arts and consolations by which men seek to make humdrum lives tolerable, all bear the touch of vogue. The apparatus of production, in its concrete reality of field and mine, factory and bank, movie palace and beauty shop, is an expression of the accumulated knowledge and technology of a people. Even natural resources, far from being fixed and finite, are creatures of the state of the industrial arts. About every great need—food, sex, work, parade, worship, defense—a group develops its own unique ways of accomplishment. Such usages endow object and office with worth and fix the conditions under which wealth may be appropriated. In essence property is a conditional equity in the valuables of the community.

The mark of a particular society always attaches to a property. An owner is concerned with trinket, vineyard or power, not for what it is in itself, but for what the community allows him to extract from it. In one society a string of scalps are a badge of honor, in another a mere reminder of the ways of savages. The touch of superstition gives value to a rabbit's foot, the bone of a reputed saint and Dr. Wiseman's Panacea-for-Everyill; at the coming of science their places are taken by the test tube and the guinea pig. The march of invention subdues waste land with dry farming, converts a flash of lightning into a great industry, and keeps the catalogue of natural resources in perpetual flux. In one age a moral revolution outlaws the theater, in another it consigns the traffic in alcoholic beverages to oblivion. Under industrialism the fact of property is as fresh as the morning newspaper, the ticker tape and the latest judicial utterance. A curious twist in social habits leaves strange anomalies in its wake; a beggar, under his code, disposes of his street corner to a fellow craftsman; a Scotch chief for a consideration sells to the lowland lord "a better protection than ever the king can offer"; a university transmutes the income from an endowment into a salary for professorial service. Among every people convention limits the opportunities which property affords; the law, resting upon custom, disburses ownership between individuals and

the community; and morality restrains even the pleasure of a man "to do as he will with his own." As a thing apart property is only an academic norm.

Authorities as diverse as the psalmist, the biologist and the Fabian have reported property among the animals. The wasp, the solitary bee, and the honey drone save food. Ants, living in communities, make a virtue of thrift and defend their frontiers against aggression; a number of species keep "slaves" for their skill in digging or their secretions. Such birds as magpie, jackdaw and crow take an amateur fling at the acquisitive art and lay up treasures of decrepit trinkets. And in general, especially during the breeding season, animals will defend domicile or territory to the last howl or bite. It is plausible to dub these practises "property." But all such acts are mere aspects of a larger round of behavior. The storing of food by the wasp is an incident in the reproductive cycle. If nests are changed, the bee continues its labors; but if the substituted article is in a different state of completion, the poor dumbbell can neither repeat nor skip a stage. The nimble winged birds meet the rigors of winter by migration and exhibit no taste for collection. The squirrel is never sure where his treasure lies buried and leaves its rediscovery to chance. Whether it is the way of animal behavior or a behavioristic way of studying animals, it seems reasonable to explain such phenomena by instinct, stimulus and response and the fulfilment of the generative urge. Even among the ants slavery seems to rest upon a division of labor based upon physiological difference; and the intricate antics of termites are no more than a reiterated round of mechanistic behavior. In all of this there is no element of tradition, no adaptation of custom to events, no variation in conduct with the passing generations and no characteristic of the folkways. A suspicious analogue alone enables man to find property in the animal kingdom.

Among primitive folk property is embedded within the mores. The tribe is an overgrown family rather than a state in microcosm; its elementary life affords no such luxuries as abstract rule and legal system; it is held together by the intimate ties of kinship and ceremonial. The headman is father or brother to his people; the line of descent—father to son, mother to daughter, uncle to nephew—determines social position and inheritance; the stranger is received into the clan by adoption. The compulsion of blood makes the terms "public" and "private"

singularly inappropriate. The mark of property is most manifest in intertribal relations; the group lays exclusive claim to hunting grounds, images, dances, songs, incantations and gods and with weapon and tabu defends communal possessions against invasion. In common enterprises the fact of kinship or the fiction of brotherhood—perpetuated by church and court even to this day—is basic to the division of work and of booty. In an island community a master determines how the canoe is to be built, is responsible for its repair, exercises authority on the fishing trip and takes the lion's share of the catch. Each of the co-owners has an obligation to work on the boat, the privilege of his customary seat and the right to a fixed portion of the takings. Whether the object of joint ownership is a fertile river valley, a grove of date palms, a hunt of the buffalo, a clubhouse, a celebration of the harvest, a spell of magic or a descent upon a neighboring tribe, the actions and perquisites of the participants are neatly defined.

In every society a minimum of valuables—dress, tools, beads, blankets—are severally owned. As the patriarch, the young buck and the medicine man turn position, prowess and magic to account, the catalogue is lengthened; but personal privilege never escapes bondage to tribal custom. An uncle must support a nephew whose future labor is his due; a headman receives gifts and dispenses largess; the acquisition by a chief of wives with dowries may be a disguised tax levied in support of tribal service and ceremonial. After land has passed into individual possession, the rights of the commune still survive in an assortment of claims upon the crops. As private equities grow in importance and number, the owner is limited to a single harvest of grain and the gleanings must be left to the poor. The right of man to help himself to necessities takes precedence over the injunction, "Thou shalt not steal." Trade emerges unobtrusively as an exchange of presents; and long after generosity has come to be measured out on the expectation of return, profitable deal is affected to be polite gift. Among different peoples personal and communal rights are put together after many patterns; but, always and everywhere, property is an accepted medley of duties, privileges and mutualities.

From the musty records of antiquity the institution stands out in sharper relief. In the Near East individual equities were established in lands, in chattels, in persons and in moneys. It was chiseled into stone and brick that the

land belonged to Pharaoh, Hammurabi or Darius. But grants which were little more than leases took on the qualities of ownership; and, within the limits of the king's capricious pleasure, his favorites ruled as monarchs over their estates. In theory, at least in Egypt, all men were equal before the king; in fact, there were castes of serfs and slaves. Equities in their persons were divided between nobles, who employed them as agrarian laborers or as artisans, and the monarch, who conscripted their services in the building of roads, monuments and temples. The presence of social inequality made it possible to disguise as polygamy a servile relationship; women acquired by raid or purchase adorned the couch of a potentate or did menial work in his establishment. A property in moneys had everywhere to be stubbornly won against the prejudices of a strong rural tradition. Among Semitic peoples a loan with interest was at first prohibited, then limited to sharp deals with strangers and at last accorded a qualified tolerance. The Hebrews had a sabbatical year in which all debts were legally forgiven; and where debtors held political power, vested rights in moneys were strictly limited. As commerce grew, a greater indulgence was allowed to the interest on capital by making it an undisclosed item in the price of goods. Property in general, and slavery in particular, could not escape the contagion of the prevailing notions of absolutism. But principles are weakened in practise; and the fact was always far to the left of the law.

In Greece our current interest attaches not so much to what property was as to what was said about it. An agrarian had given way to a commercial society; a relative equality of possessions, at least among those accounted citizens, had been replaced by large estates; the noble pirates of Homeric days had been succeeded by traders whose avarice knew no bounds; and large manufacturing establishments had arisen, manned by metics, freedmen and such like. For a debt a man might still be delivered into bondage, but law and custom were stripping the master of his despotic power over his slaves. A suffrage based on income had been broadened with the emergence of new forms of wealth; a social restlessness prevailed among classes in the community but not of it; and the privileges of the exclusive club of the *polis* were threatened. The philosophers, in the manner of a discussion on the agora, commented upon the passing show—and by later generations they were lifted from the side lines to Olympus.

The thinkers, in their concerned detachment, were on the side of the ancient standards and gilded into verbal gold an opinion which had been long in the making. A tribal origin had created an organic conception of the community; the course of events had resolved the society into classes, and custom had assigned to each rank its privileges and duties. The man of wealth was expected "to sacrifice often and on a lavish scale," "to entertain numerous strangers and that in a sumptuous way" and to pay to the state heavy contributions for "the rearing of studs, the training of choruses, and the direction of gymnastic schools." The requirements were not such as philosophers turned rulers would impose, and the customless ways of commerce helped the newly rich to evade performance; but public opinion had long associated social obligation with the possession of wealth. The thinkers looked back to an agrarianly golden age, gathered up such traditional wisdom, selected the best of contemporary opinion, added a dash of wishful thinking and produced the ideal commonwealth. The most exalted rank was reserved for guardians and warriors. In deliberation and defense they were to give themselves exclusively to the service of the state and were to enjoy such prestige, comforts and excitements as wise men would choose for themselves. Below them artisan, merchant and farmer had each his place and his office. Although such proprieties were at the expense of the liberty of freedman and slave, little is said about the perquisites which go with stations of low degree. The authors of the utopia doubtless preferred to temper the exactions of masters through the inculcation of duty rather than to abridge their privileges by law. A property which can be exploited only within a moderate mode of life precludes a severe treatment of slaves. The thinkers agree that "without the necessities of life" it is impossible "to live virtuously." Plato, oblivious to his class consciousness, would have wealth held in common—among his elect. Aristotle, with an Hellenic realism, would anticipate the outcome of communistic quarrels over *meum* and *teum* by establishing individual equities in advance. At the base of argument lie the kindred principles that man attains his highest development in society and that custom accords protection to his rights. Property is a mere instrument which in its every manifestation is to be justified, limited and enjoyed by reference to the good life which it is meant to serve.

The contribution of Rome came, not from

the spectators, but from the actors themselves. If its genius fell short of garnering high ideals into literary classics, it was equal to the task of hammering the stodgy fact of property into a hardheaded law. A corporate body, styled the *Senate and people of Rome*, reduced conquest to a system, made of taxgathering a business enterprise, bought off the urban citizens with rights to bread and circuses and established a commonwealth upon imperial administration. To the tramp of the legions across Britain and Gaul and along the Pontic shore, a diversity of customs, beliefs and nations were welded into a world state, and the resulting security conferred respectability upon possessions. As there was one Rome, one Caesar and logically and eventually one god, so was there to be one law, *semper ubique et ab omnibus*, and all men were to be equal before it. A work of communal authorship, a millennium went into its making.

The weaving of the fabric began in orthodox fashion. In ancient customs, of which the Twelve Tables are a symbolic fragment, the law was written down in great elementary formulae. As in all primitive attempts at abstraction, "thou shalt" and "thou shalt not" were uncompromising absolutes. *Res publica*, an exacting overlord, imposed upon subjects a rigid military discipline and qualified freedom and wealth with liability to conscription. Woman belonged to man for use and enjoyment, but the duty of bearing children made her an instrument of an aggressive state. In his miniature domain the patriarch was king and priest. The patria potestas, plenary as adjective and substantive could make it, extended to wife, children, *familias* and chattels. The services and the earnings of all went into the common pool; whatever any dependent had of necessities, leisure or liberty was a paternal gratuity. A Brutus could condemn his own son to death—and receive the plaudits of his peers.

It is a far cry from the Twelve Tables to the Justinian Code. Under the unceasing impact of events the abiding letter of the law was released from its austere spirit. As a father became incapacitated, a son with power was to act in his stead—and a stern definition of capacity was softened as manners became gentler. As an incentive to enlistment soldiers were exempted from ancestral control—and it is an impotent exception which does not beget its kind. The jurisdiction of the father must not invade the *res publica*—and one after another affairs of the household were affected with an interest to the

state. In the end the authority to marry and to divorce was replaced by a veto; the right of alienation and adoption was hedged about with peradventures; and the power over life and death had dwindled into the privilege of reporting offenses to the magistrates.

In like manner authority over slaves was depleted by a recurring gloss upon an eternal text. The mass of slaves were persons of low degree suited to menial employment. But within the ranks were captives from Asia Minor, skilled in the law, medicine and the arts; Greek scholars, useful to men of affairs who required ghost writers or aspired to culture; unfortunate citizens who had pledged their bodies for debt; and, after the first generation, servants whose bodies bore the blood of their masters. Involuntary servitude was mitigated, not so much by what the law forced as by what the master found it to his advantage to concede. The slave became the agent of his master. It was convenient for him to appear to act for himself in dirty little deals in which the noble Roman did not wish to show his hand; so he was encouraged to engage in pecuniary ventures of his own. He might, chattel as he was, hold chattels of his own, make his master his debtor and purchase his own freedom. Thus a norm of slavery was disbursed into a miscellany of only half servile relationships. Nor was a sacrosanct control over lands and chattels immune to the conspiracy of circumstance and logomachy. As early as the Twelve Tables a public interest in private possessions was recognized; the city owner could not build to the line; the pathway across the field was to be kept open; access to water from private wells was not to be denied. The growth of commerce brought in contract, introduced usages of trade and transformed a customary into a pecuniary institution. As time passed, a most pretentious absolute was resolved into separate rights.

Nothing was ever formally abolished; novelty appeared in the inconspicuous garb of the mores. Logical concepts became living words to serve the passing occasion; principles, relaxed so far as concrete instances made imperative, became heavy with exceptions; and neat distinction, categorical push and subtle fiction kept departures under cover. The growth of the code was shaped by the interests it served. In a society in which military force was subdued into the pursuit of gain, privilege could be qualified only for the sake of privilege, and the law could rise no higher than the maxim, "so use your own

as not to injure another's." Only a Seneca, in terror of the playboy Nero, could find compensation for a fortune won by the chisel in a retreat to moral philosophy. In "an oblique satire upon the vices of his own age" he creates an age of innocence in which "money, person, and position" are all chattels "prone to perish and of uncertain tenure." The Romans could not practise what the Greeks had preached; but in the anomaly of a person who was at once paterfamilias, slave of the emperor and minister of state lies a silent revolution.

In the Middle Ages property was the adventitious product of event, conflict and apologetics. The decline of Rome was attended by an almost complete break between ideal and fact. The political authority was stripped of its power, symbols of order lost their compulsions, and the great society fell apart into disordered communities. In their minds men came to despair of civil society, fixed their hopes upon the City of God, condemned material things as worldly and damned human nature with original sin. In their acts they were tempted by the devil, yielded to the lusts of the flesh and reached out after material possessions. A people who had known better days were driven back upon the land for an elemental existence and were expected to conduct themselves as a community of saints. Amid the confusion barbarian chieftains established upon physical might a competitive regime; and the church, appropriating the prestige and trappings of Rome, used its control over the keys of heaven to found a spiritual order. At the beginning the way of the flesh, the warrior and the rich man was a right-less might; that of the spirit, the monk and salvation a might-less right. In a continuous process of give and take the ruthlessness of nobles was curbed, the asceticism of the church lost its austerity, the customs of the folk became conditions of possession, and a truce was patched up between inescapable fact and impossible ideal. In a superb formula, which made up in comfort what it lacked in logic, things temporal were endowed with symbolic value and in their instrumental character received into Christian society. In the mediaeval commonwealth property bore the mark of the resolution of a great antithesis.

In the unconscious symbolism of the times, "the house of God is tripartite; some pray, some fight, and some work." As the heavens declare the glory of God, so do estates proclaim the stations to which it has pleased Him to appoint men. The clergy came to be a first estate. In the

means of salvation it controlled a popular necessity. It established a confessional, set up moral standards for conduct, imposed penances for sin, excommunicated, withheld Christian burial, closed churches and even denied to a whole people the consolations of religion. It dispensed charity, received fees for masses, accepted foundations in honor of the dead and lured material possessions into the spiritual fold. Its dominion, whether over souls or goods, was vested in Holy Church; the perquisites of bishop or abbot were his by virtue of the office he held in trust. The monk continued to take the vow of "poverty, obedience, and chastity"; but obedience was made tolerable by the rules of the order and poverty was mitigated through membership in a wealthy corporation. A hereditary caste, affecting a vanishing military office, constituted a second estate. Under a feudal regime, whose untidy ranks fell away from king to knight, the overlord accorded to his vassals a none-too-dependable protection and exacted in return dues of produce, entertainment, attendance on his person and a corvée fixed by custom at forty days. As again trade began to run its course, guilds were formed for the worship of God, the adoration of the saints—and the fabrication of wares. The close fraternity enabled tanners, drapers and barber-surgeons to exploit their mysteries; and in time rich burghers won for themselves, by the side of lords spiritual and temporal, a third estate.

To men of rank such properties were of serious concern, and no activity was without its incidence upon the institution. Clerical celibacy was prompted in no small measure by the desire for guarding the possessions of the church against the dissipating influence of family ties. The right to give in holy matrimony was exercised rather toward the enjoyment of wealth than the union of bodies; primogeniture was a device to keep estates intact; the elementary formula of Christian marriage was a prop to the established order. The length of apprenticeship and the limit upon numbers enhanced the vested interest of the artisan in his craft. In time coercive origins were forgotten; the structure of estates was furnished out with vow and oath, homage and fealty, vestment and ceremonial, and its sprawling actuality was written down in the trim lines of an establishment.

In a feudal society land naked of service was unthinkable. The lord, clothed with the propriety of an estate, enjoyed a miscellany of rights in a miniature agrarian commune. He accorded

to his villen security in possession, left him free of interference in his agricultural work and exacted as tribute a share of the crop, a measure of personal service and a toll of the increment of cattle, chickens and pigs. By means of banalities, or bans upon outsiders, the seignior enjoyed his innocent little rackets; grain must be ground at the banal mill, bread baked at the banal oven and grapes crushed at the banal press. The right "to exploit justice" was a commodity of value; it was the "liberty" of my lord to fine the alewives twice a year for giving short measure; he might possess one half or one quarter of all the justice in the village. The price for redress came to be fixed; the spoken insult at four sous, the lie direct at five, a bloody wound at twenty.

In England, where the manor exhibits such arrangements in sharpest outline, a conquest had been superimposed upon a village community. The exactions of the upper class met the stubborn fact of ancient rights; and the unequal privileges and obligations became the slowly made terms of a continuing relationship. Even if the some who work were of no estate, they were "bound to" and had equities in field and village. An impecunious society had to accept serfdom as a substitute for slavery. The villen might, even before *Domesday Book*, be beholden to different masters in different ways. His tenure was a variable compound of particulars, and whether he was servile or free was wholly beside the point. The survival even beyond Tudor times of "common" as prefix to such words as pasture, altar, prayer, scold and callings, attests a residuum of properties in the commonwealth which private investment could not take away.

In the writings of the monks, who enjoyed a monopoly of apologia, this conglomeration of properties was converted into a divine ordination. In an organic community all good Christians were severally members one of another. External possessions, of no inherent worth, were to be justified only from their "character of things useful to our end." They were "subject to man," who might "use them for his necessity" but was not "to set up his rest in them or to become idly solicitous about them." Every man was to enjoy as much of "goods of fortune" as served for "instruments to acts of virtue"; and had duties and perquisites in accordance to the station ordained for him. Thus a comfortable dialectic diluted the communism of the early church into a doctrine of stewardship, and the very imminence of the mediaeval deity enabled responsibility for inequalities in wealth

to be placed upon divine shoulders. In such an explanation a circular logic served the double purpose of defending the status quo and of providing a standard by which grosser abuses were to be condemned. At least upon parchment, in a Christian commonwealth the Greek idea of office had been united with the Roman norm of order.

In a process of organic change the feudal order was commuted into "private property." The ideas of the atom and of quantity appeared to turn the heavens into laws and measurements. A unit of value supplied a pecuniary measure for all wealth. The acquisition of precious metals supplied the means for a national currency. The traffic in wares acquired importance and made its way up in the world toward respectability. To a market, enlarging its control over industrial activity, men brought first their goods, then their services and finally their estates. The serf, freed from bonds and stripped of landed rights, was elevated into the state of wage slavery. The proprietor, liberated from obligation and deprived of equities in his tenants, became a landlord. All rights in possession were freed of collateral claims; all interests in his person were consolidated in the individual. In a great untanglement liberties were dissociated from properties. At last as seller or buyer, investor or enterpriser, master or servant, a man was conditionally free to do as he willed with his own. But if there was to be employment, sales or consumption, the severally owned elements had to be drawn together into an organization. This task was to be effected through mutual understandings between interested parties; and contract became the institutional complement to liberty-and-property. The drift was toward a system agglomerated out of atomic services and possessions. In short, with custom lingering to help over the hard places, individualism was in the making.

The emerging proprietary order demanded peace and security. The market was the organizer of wealth and the arbiter of values; if it was to perform its continuous office with neatness and dispatch, there had to be certainty in respect to possession and obligation. A man owns as far as he can do; his equity holds so far as it is accorded protection; a promise is potential performance so far as it is enforceable. Under the negligent supervision of the legislature this task of precise definition and adequate protection fell to the courts. By the art of the jurist, with its arsenal of neat and subtle

tricks, realty was fitted out with such perplexing niceties as the rule in *Shelley's Case*. Personalty was persuasively accommodated to the newer forms of wealth which commerce had produced. An ancient writ of *assumpsit*, with help from mercantile custom, the Roman code and sheer improvisation, was elaborated into a law of contract. The domain of the suit for damages was extended. Judges set forth in opinions the merits of ingenious legal remedies which chancery could offer. A series of decisions gave to the landowner protection against the trespasser, but not to the merchant against the rival who invaded his trade. It subdued commercial warfare with a rule of fair competition and allowed goodwill in custom to be capitalized. It made a conspiracy of an association of business men to enhance their prices or of workers to raise their wages. It exacted specific performance from the person who had covenanted to sell his house, but not from the laborer who had contracted to dispose of his services. In the end, in its empirical way, the judiciary reduced the uncertain fact of ownership into specific rights, privileges, powers and immunities, vested in particular persons and validated in distinctive ways. A system of property is an abridgment of the liberties of the persons excluded. Yet the sanctions of justice were so generally accepted that a personal resort to violence was rare, and even among gentlemen the art of using weapons fell into neglect. As a result the market, which gave and took away, was blessed with the borrowed halo of law and order.

The state of peace, in which the occasional presence of sheriff or deputy was a mere reminder of the law, rested upon the popular respect for property. A saint might regard money as the root of all evil; a professional Christian might look upon Mr. Worldly Wiseman as an inexplicable phenomenon; a historian might regard the patience of the dispossessed as the marvel of human society; and a reformer might denounce ownership as a theft against nature. But to a people who had just been given business, new continents and the machine to play with, property was an object of reverence. A society-on-the-make found it easy to construct, not one, but a number of arguments in its defense. John Locke, venturing timidly to defend the institution by proclaiming its rightful origin, insisted that whatsoever a person had "mixed his labor with and joined it to something that is his own" he thereby "makes his property." As an unexpected empire of commerce

came with a bewildering rush, his limitation of ownership to "as much as one can make use of to any advantage of life" was forgotten; and rising mercantile interests were endowed with an apology for primitive forms of ownership.

As God by virtue of being the Great Artificer was the Supreme Proprietor, so man in his lesser capacity had title to his own creation. To Adam Smith "the property which every man has in his own labour" was "the original foundation of all other property"; to David Hume the convention existed "to bestow stability of possessions and to insure the peaceable enjoyment" of what one "may acquire by his fortune and industry"; to William Blackstone, the Great Commentator, it seemed that nothing "so generally strikes the imagination, and engages the affections of mankind, as the right of property." As business consolidated its control over industry, a version of this argument, revised and refined to meet the exigency, justified capital by showing that wages were fixed by the specific productivity of labor. It was, however, equally plausible to appeal to Nature and to Nature's god; to endow ownership with such majestic adjectives as "inalienable, immutable, and indefeasible," and to establish the institution within the Order of Nature itself. And, to make the case inconsistently complete, an appeal was made to function; property was identified with liberty; private possession was made the cause of prosperity, the advance of culture and the progress of mankind. In a grand apologia, society became "a joint stock company established in the interests of property-owners."

In America lawyers employed the phrases of English philosophers to guard the frontiers of a rising industrialism against invasion. The Declaration of Independence was justified as "the act of reasonable men defending their natural rights against the usurping king who had broken his covenant." In the constitution, which was "the supreme law of the land," a "fundamental division of powers" was effected between "the forces of democracy" and "property-owners." In its provisions the federal government was put in control of the currency, property was not to be taken for public use without just compensation, and the states were forbidden to pass acts impairing the obligations of contract. After the Civil War, for the protection of the emancipated Negroes, an injunction against the taking of life, liberty or property without due process of law was imposed upon the states. Nearly twenty years later "the right to an occupation" was read into the words of this inviting formula. In the

New World there had not been overmuch of feudal nonsense; and in a vanishing culture of free land, emerging industry and personal opportunity, liberty and property had been inseparable; liberty was the means to the acquisition of property.

In a society in which petty trade faded gradually before big business, an easy gradation led from person to corporation and from right to privilege. The rhetoric of democracy provided a plausible verbal disguise for the cause of property; and in the name of freedom of contract the United States Supreme Court declared invalid many acts of social legislation and established a judicial review of the findings of administrative commissions. The constitutional protection accorded to vested right was at the expense of the regulatory powers of government. It is incorrect to say that the judiciary protected property; rather they called that property to which they accorded protection. In a transition as gradual as the course of events which gave it protective coloring, the rights of man were being converted into the immunities of corporations. The constitutional position of property in America—an aspiration only partially realized—represented the independence of the business system from political discretion.

In all its activities and for all of its necessary strength the state was to know the voice of its master. The oft repeated injunction "let it alone" was addressed, not to the judiciary, but to the legislature. Its reiteration was an acknowledgment of the potential power possessed by the more popular arm of the government. It was to be interpreted as a command, not to abstain from all exercise of authority, but only from acts subversive to intrenched interests. The state might encourage the useful arts by the issue of patents of monopoly, grant a limited immunity from competition through the protective tariff, make a decorous use of the public domain to stimulate private enterprise and in genteel fashion help worthy causes along with subsidies. It would have been ideal if its powers could have been arrested at the frontiers of the province where a man might—so far as an unruly market would let him—do as he pleased with his own. But the equities of the state in the social establishment survived; it could exercise eminent domain to appropriate property for public use; it might employ the raising of revenue as a means of control; it was at liberty, at least if the judiciary concurred, consciously to promote the safety, happiness and prosperity of the people.

If its powers were not used in their amplitude, it was because its rulers believed that the greater good lay in their more reasonable exercise. As irony would have it, the persons whose properties were made secure affected to look upon the policy of the state as *laissez faire*.

As events went their hurried way, the market threw off the shackles of custom, and capitalism began to dispute the claims of individualism. The liberation of thought from ancient dogma, the march of science, the exigencies of trade and the ingenuity of courts conspired to enlarge the province and change the character of ownership. Equities of value were recognized in the good will of laborers toward their employer and in the response of customers to the display of a trademark. The broadcaster was accorded a right of way "on the air"; the ephemeral interest of the publisher in news was made property for a quarter of a day. A proprietorship which had rested in solid comfort upon such tangibles as realty and personalty declined. Where petty trade still persisted, a farm or shop might be saddled with lien or mortgage; and the legal rights accorded the creditor disturbed the integrity of individual ownership. As enterprises grew larger in scale, a possession which had once been nine points in the law was detached from ownership, and the swashbuckling captain of industry was succeeded by an officialdom whose members held each his office-in-trust, his realm of discretion and his responsibility. As the corporation came into general use, its devices were elaborated and refined, ownership was resolved into an assortment of equities, and perquisite and obligation were variously combined. A catalogue of securities, lengthening with legal acumen and the years, distinguished bond from stock, divided each genus into species and in purposive ways distributed to the various classes rights to vote for directors, preferment in claims upon income and liability to assessment. The legal distinction between proprietor and creditor was confused; the actualities upon which equities rested were smothered beneath a heap of paper; and only a wise man or a court of last resort could tell with what valuables a man had been endowed by a certificate. The existence of such devices as the holding company and the voting trust invited a pyramiding of ownership and made possible the control of gigantic enterprises by administrators who had only small investments in them. The effect of all of this was to blur the privity which an individualistic state had read into property.

Equities were still vested in persons; but they were attributes of arrangements which ramified to the ends of the social order. The market alone, with its stamp of pecuniary approval, could give or withhold wealth. A valid title, however material might be the objects to which it pertained, was a poor compensation for a utility which had gone. The transitory touch of fashion could strip of its value as a possession a hat, a chair, a mineral spring or a residence section. The relentless march of technology could take from laborers their trades; create industries about the automobile, the moving picture and the radio; and convert waste land into a great metropolis. The democracy discovered in universal suffrage a political asset; in countries which could not find jobs for willing workers the dole became a charge upon national wealth; taxation was generally employed to divert private income into such social services as schools and playgrounds; and shorter hours, compensation for accident and working standards were through legislation made items in the costs of production. All properties, whether in lands, securities, goodwill, patents or intangibles, were at the mercy of a state which could desert the gold standard, engage in open market operations and manage its currency. A farflung division of labor had delivered all wealth into captivity to an empirical collectivism.

Long before capitalism was established, signs of strain and stress were remarked. Fault lines came increasingly into evidence in the structure of ownership. The managerial group escaped responsibility to investors; dabbled in securities of their own corporations; and, with a nice appreciation of their own merits, voted to themselves bonuses. In what had gradually come to be positions of trust they disported themselves in the grand tradition of personal ownership. The separation of finance from industry created the absentee proprietor, the speculator and the investment banker. As a result authority was divorced from responsibility, and power was removed far from the sources of knowledge. The mechanisms of the system proved inadequate to the demands of order. The progress of the useful arts went its turbulent and undirected way. An overdone competition broke down standards of fair play, glutted markets with unwanted goods and put in jeopardy the livelihood of the workers. In the bankruptcies which followed equities were liquidated and new properties created. The failure of the gears properly to engage was at first regarded as a lapse from normalcy, then set

down as a phase of the economic cycle and eventually recognized as a manifestation of the failure of capitalism to domesticate industry. The immediate interest of the individual was interlocked with the system; the workers were dependent upon its continuous operation for their weekly wages; the people, through savings banks, insurance companies and a partial diffusion of ownership, had given hostages to the status quo; even the state was dependent for its necessary revenue upon taxes whose source was personal possession. The prevailing disorder prevented the realization and appropriation of a large part of the potential wealth of the community. But instability was most manifest in an antithesis between prevailing opinion and current fact. In the period following the World War the regime of industrialism was often spoken of as rugged individualism; and in high quarters it was assumed that, with a little tinkering, a scheme of control developed out of petty trade could be made to govern big business.

The supremacy of a capitalism was brief even as human systems go. Its properties began to be transformed long before it had brought all industrial activity within its dominion. An incipient commercialism had worked well enough so long as trade was local, shops were small and custom fixed the limits and cushioned the shock of change. But as the division of labor became continental and the compulsions of the market were freed of restraints, evidence of failure in performance could no longer be ignored. As early as the fourth decade of the twentieth century heroic measures were being taken to conserve arrangements commonly regarded as ancient institutions. In Italy, with concessions enough to keep the proletariat quiet, a Fascist regime was set up. In England, as the price of exemption from revolution, the ruling group taxed itself out of one quarter of all its income, and through the dole the lower classes acquired a substantial equity in the commonwealth. In the United States innovations made their appearance under cover. An era of prosperity, which was one of the most finished products of the art of the speculator, was followed by a severe and protracted depression. An unwillingness to accept a general liquidation of ownership as the price of a fresh start set the stage for a voyage into the unknown. In a reconstruction finance corporation a socialization of losses pointed toward state capitalism. In a national recovery administration, which aimed at "self-government in industry"—a technical term for

control by the managerial group—the move was in the direction of business socialism. In general capitalism was too entrenched in interest and idea to be formally overthrown. The state was called in to protect investments and employment, and novelties won acceptance as prop and support to individualism. The proprietary order was made over through the efforts of its supporters to save it.

The leftward drift, however, was too strong to be completely withstood. In Russia, where a dynastic state had been overlord to an agrarian commune, neither individualism nor capitalism had obtained a real foothold, and the machine system was introduced under other than business auspices. There, with the tyranny of the state to supply the impulse and the dialectic of Karl Marx to point the way, a group of revolutionists proclaimed a united soviet of socialist republics. In early evangelical days the zealous leaders, themselves creatures of czarist oppression, adhered rather strictly to a hardheaded but uncompromising equality, and the habits of popular discipline imposed by the departed regime made possible its success. But in time generations came into power who learned the creed of a humane materialism, not through rebellion and exile, but out of schoolbooks. Then, as increasing wealth raised living standards, the primitive communism was tempered to more prosperous times. It was discovered that general terms, such as capitalism and socialism, solve no concrete problems and that the equities of persons in the commonwealth had to be reduced to specific arrangements. Inheritance, however, ceased to be a key to possessions; and in general perquisite and prerogative attached to the offices which men held. But a more indigenous symbol must be enlisted for an analysis of the engaging associations of privilege and obligation which followed. The word property has no passport to cross the frontiers of the collectivist state.

PROPERTY TAX is a tax levied upon that body of economic goods and rights of the taxpayer which is generally used for the purpose of producing a recurrent flow of goods and services, known as income, and which under ordinary circumstances is expected to remain intact in the course of the income yielding process. The property tax is not, as the term might erroneously suggest, a tax paid out of property. It really aims to reach the income derived by the owner from his possessions and uses property merely as the basis of assessment on the assumption that it constitutes an adequate index of taxable capacity.

The classification of property for fiscal purposes has usually followed legal traditions. Three methods of classification stand out as of historical importance. The Roman law emphasized as the true, or so-called quiritarian, property the *res mancipi*, consisting of land and the capital associated with land, such as houses, slaves, cattle and agricultural implements. The feudal law distinguished between real and personal property, including in the former certain incorporeal rights but excluding cattle and agricultural capital. The feudal distinction is still followed in the United States, although it is so modified by statute that it varies widely in the separate states, especially as applied to roads, bridges, railway tracks, telegraph lines, gas and water mains, ferries, mineral rights and

franchises. On the continent modern law generally distinguishes between movables and immovables.

The property tax is levied either upon the property as a whole or upon particular pieces or classes of property. In the former case it is a general property tax; and since it is assessed on the individual according to the mass of the property owned by him, it is called, in the United States at least, a tax in personam, i.e. a personal tax. Where the tax is imposed on particular items or classes of property, it is a specific property tax and, as in the case of the land tax, is called in the United States a tax in rem. A more appropriate term to describe this levy would be "semipersonal tax," because the tax although levied on some particular thing relates to and is intended to be paid by some person—the owner. It is semipersonal in contrast to an impersonal tax, like a stamp tax, which is levied on a thing or transaction irrespective of the person involved and which is paid now by the seller, now by the buyer, according to the changing prescriptions of the law. A general property tax may be either recurrent or paid once and for all. In the latter case it is called a capital levy (*q.v.*), because it is presumably levied on the capital value of all property.

Where a property tax is assessed on specific categories of property, it acquires a distinct terminology. The class may be broad, like real estate as opposed to personalty or movables as contrasted with immovables; or it may be somewhat more restricted, as where real estate is divided into lands and improvements or personalty into tangibles and intangibles. The distinction may be still more minute, as where land is classified into agricultural property, city plots, forests and mines; or where tangibles are classified into money, furniture, cattle, tools, ships, cars, machinery and stock in trade; or intangibles into mortgages, stocks and bonds, franchises and the like. In all these cases the distinctive mark of the property tax is that it is assessed according to market, or selling, value.

The property tax has everywhere followed a definite course of development. The origin of the tax is closely associated with the emergence of the idea of individual ability to pay, measured in terms of property. The oldest type of property tax is the land tax, since land was the chief form of property in primitive communities. Gradually other forms of wealth became significant: first farm houses, cattle and horses, mills, improvements and agricultural implements; then uten-

sils, furniture, apparel, weapons and ornaments; finally, with the growth of urban life, stock in trade, money and commodities. One by one these items were included in the assessment lists, and the property tax reached the second stage of its development, consisting now of the land tax plus a series of specific taxes on other forms of wealth. In time these supplementary forms of property began collectively to rival land in importance, and it proved to be more convenient to make a summation of a man's entire property and to assess the mass of his wealth as a lump sum. When this third stage was reached, ability to pay was measured by total property, stated in terms of its selling value. The general property tax became the chief source of public revenue. It remained so for generations or even for centuries in every civilization of which there is adequate knowledge—Greece, Rome, the various countries of mediæval Europe and the early American commonwealths.

In the course of time, however, personal property underwent more complications and refinements. Intangible wealth developed. It became more difficult to prevent evasion, and one form of personalty after another disappeared from the assessment lists. This constituted the fourth stage in the development of property taxation. As it became increasingly difficult to reach all these classes at a uniform rate, attempts were made, first with intangibles and then with tangibles, to assess particular categories at lower rates in the hope of bringing them back into the tax lists. Thus the tax became a classified property tax, which amounted virtually to a reversion to the second stage, for the classified property tax is nothing but a series of specific property taxes.

This attempt, although it was in some instances protracted, finally failed of its purpose. As a consequence evasion was followed by exemption, as the acknowledged fact became crystallized in law. First certain classes of intangible personalty, like mortgages, were exempted, then all kinds of intangible personalty and finally all classes of tangible personalty. Thus the fifth stage was reached, wherein nothing was left except real estate. The general property tax disappeared and reverted to its original form of a tax on real estate. What had started out as a semipersonal tax, or tax in rem, and in the meantime had developed into a personal tax, again became a semipersonal tax. In England the process was completed at the end of the seventeenth century when the old subsidy

and commonwealth assessment once more became the land tax. Later on indeed, when the changing economic basis of society and the need of greater revenues disclosed the insufficiency of the mere land tax, the property tax was supplemented in some countries, as in revolutionary France, by additional taxes in rem; in other countries, as in Great Britain, by a new personal tax on income. But there was no return to the general property tax.

In new countries like the United States there was the same development, although obviously somewhat belated. The earliest property tax was the land tax, first according to area, as in Vermont and the Carolinas, then according to fertility or mode of cultivation, as in Connecticut and Ohio, and finally according to value, in virtually all the provinces and states. The second stage, that of specific property taxes, was reached in New England in the early eighteenth century and in the newer states at the beginning of the nineteenth. The general property tax came toward the end of the eighteenth century in New York and somewhat later in the south and west. By the middle of the nineteenth century it was applied universally. But the process of disintegration soon set in, and by the end of the nineteenth century there was a well defined movement toward the so-called classified property tax. In the second decade of the twentieth century intangible personality was exempted in a number of states and replaced by an income tax. In 1933 the final stage was reached when tangible personality as well was exempted in New York City (including about 80 percent of the total State assessment), the property tax thus again becoming a tax on real estate. The movement is now rapidly proceeding. In the less industrially developed states the third stage is merging into the fourth and intangible personality is being taxed at a lower rate or replaced by the income tax. In the more advanced states the fourth stage is merging into the fifth, with tangible personality suffering a similar fate. Movables, like ships, rolling stock, money and itinerant flocks, become almost impossible to locate; immovables, like machinery, fixtures and stock in trade, are reached by the business tax; non-productive property, like clothing, jewelry, furniture, libraries and pictures, are considered more and more in the light of expenditures rather than of wealth yielding a taxable surplus. The result is that virtually the only tangible personality still subject to the property tax consists of farmers' livestock and agricultural implements; this has

obvious elements of discriminatory taxation. As a consequence there tend to remain as the personal tax the income tax and as semipersonal taxes in rem the real estate tax and the corporate or business tax. The property tax, except on real estate, will in all likelihood soon disappear in everything but in name.

The reasons for the decay and disappearance of the general property tax as the principal source of revenue are administrative, economic and social. Administratively, intangible property is easy to conceal and difficult to assess. Economically, the assessment of property leads to denudation of forests, to the waste of natural resources or to inequality in the case of securities with the same capital value but divergent yields. Socially, property becomes increasingly defective as a criterion of ability to pay. As business life undergoes transformation stock in trade gives way to profits as an evidence of prosperity. Professional earnings and corporate salaries escape if spent immediately. The net result is that in theory as well as in practice property no longer responds to the ideas of equality and uniformity and thus loses its claim to justice.

The chief surviving example of a specific property tax in the United States is the real estate tax. Although the basis of the land tax was everywhere at first area, followed in turn by gross produce, net yield and finally by selling value, the feudal system under which land could not be bought or sold led throughout Europe to the adoption of the rental, or yield, basis. In England under the system of tenths and fifteenths the fifteenth of the land rental was deemed equivalent to the tenth of the selling value of personality. In France the *taille réelle* was likewise assessed on yield. In the United States, however, under more dynamic economic conditions land rentals, although sometimes serving as the criterion of assessment, soon gave way to capitalized rent, or selling value, so that the real estate tax is today a property tax, in contrast to the situation in Europe, where it is a yield, or rentals, tax.

The advantages of the American system are that selling value does not necessitate so elaborate a survey and valuation, that it automatically takes account of the so-called unearned increment and that it hits unimproved land held for speculation. The advantages of the European system are that yield responds more rapidly to changing economic conditions and that it is in closer harmony with the idea of ability to pay. Accordingly in the rapidly growing cities of Ger-

many and Australia and New Zealand there is a movement to substitute property for produce in the land tax, whereas in certain parts of the United States and Canada, especially as a result of the recent depression, there is a reverse movement to substitute yield for property as the criterion. The property tax through its regularity favors the state; the yield tax through its more sensitive adjustment favors the individual. As economic conditions become more similar throughout the world, the ultimate result may well be a compromise between the two systems.

Outside of America the property tax is found as an important source of revenue only in some of the Swiss cantons. Even here, however, it is in process of being replaced in part or in whole by the income tax. In a few countries, like Germany and Holland, the property tax is utilized as a minor source of revenue in order to supplement the income tax. Instead of providing for the differentiation between earned and unearned incomes by a variation of rate, as is now almost universal in other countries, the same result is achieved, but with considerably more complexity, by taxing all incomes at the same rate and then imposing an additional tax on property, the income from which is thus tapped twice. There seems to be little disposition to follow this example in the rest of the world.

PROPORTIONAL REPRESENTATION.

The term proportional representation is used to designate the various electoral devices which aim to secure a legislative body reflecting with more or less mathematical exactness the strength of the groups in the electorate. As a concept it came into general use in the mid-nineteenth century

when under the sway of utilitarian philosophy reformers placed their faith in mechanical devices as aids to the functioning of democratic institutions. The underlying rationale of proportional representation is the desire to prevent the exclusion of minorities from the benefits of the state—a rationale based on the democratic premise that in the absence of some means of protection minorities may be exploited by the majority.

Nineteenth century parliamentary experience revealed certain basic defects in the traditional systems of representation. Where each district returned a single member or several members according to a majority or plurality vote, important minorities often failed to secure representation. The size of legislative majorities was frequently greatly exaggerated by the single member district plan and occasionally a minority of the voters returned a majority of representatives, as in the British elections of 1886. In districts where one party predominated voting had been discouraged, and in the doubtful districts important leaders were sometimes defeated. A failure to reapportion the districts at regular intervals had resulted in gross inequalities, while reapportionment was sometimes accompanied by deliberate efforts to secure party advantages by the practise of gerrymandering. To remedy these defects various schemes of proportional representation have been devised.

Under practically all of the leading systems of proportional representation multimembered districts are used. Limited voting is a scheme whereby the voter is restricted to voting for some given number less than the number to be elected from the district. The main drawback of the system is that it may be manipulated by well disciplined parties as it was in Birmingham, England. Under the cumulative voting plan the voter has as many votes as there are candidates to be elected from the district, but he may distribute them in any manner that he sees fit. He may concentrate them on a single candidate or he may distribute them among several candidates. As this system has worked in Illinois, it requires the parties to limit the total number of candidates and even then the results are not always fair. To many proportional representation means the single transferable vote, or the Hare plan. According to the Hare rules the voter indicates his preferences among the various candidates by marking his first choice and his succeeding choices with the appropriate nu-

merals. The first step in the count, the determination of the quota, involves dividing the number of valid ballots by the number of candidates to be elected plus one and completing the quotient to the next round number. All candidates having more than the quota are declared elected and their surplus ballots are transferred to the next available choices. After this is done the low men are eliminated in turn and their ballots transferred in the same manner until the offices are filled. Experience has shown that the Hare plan gives complete freedom to the voters, cannot be manipulated by the parties and secures the representation of groups in proportion to numbers; on the other hand, it is regarded by many as complicated.

A great variety of list systems of proportional representation are to be found on the continent of Europe. All of the plans used have some method, more or less refined, for assignment of seats to the various lists in proportion to the votes received. In parliaments where there is a fixed number of seats the method devised by the Belgian mathematician d'Hondt has been adopted widely. The basic principle underlying this method is the allotment of seats in succession to the lists which show the largest number of votes per seat were they allotted the seats in question. In Belgium, Sweden, Denmark, Norway and Switzerland, where this method has been employed, it has been found that it confers a slight advantage on the large parties. Under the German electoral law of 1920 the quota for the election of a deputy to the Reichstag was arbitrarily fixed as 60,000. As many deputies were allotted to each constituency list as quotas attained in its vote. The remainders left over were grouped by regions and seats were allotted to the regional lists according to the same quota. The unused regional votes were added together and counted in the same fashion toward the election of national lists. Except for a minor rule the law carried out the principles of proportionality to a logical conclusion. In contrast to the Hare plan, all of the list systems, particularly the German plan, give the voter little or no discretion in choosing particular candidates. This feature of the list plans tends to strengthen the party organizations and has given rise to some dissatisfaction.

Historically the movement for the establishment of some form of proportional representation may be traced to the French National Convention of 1793, although at that time no definite action was taken. In 1820 the French

mathematician Gergonne published an article on political arithmetic ("Sur les élections et le système représentatif" in *Annales de mathématiques*, vol. x, 1819-20, p. 281-88), and an English schoolmaster, Thomas Wright Hill, proposed and applied to the elections of a private society a plan which closely resembled the single transferable vote system. At the suggestion of the latter's son, Rowland Hill, the first public application of this system was made in 1839 in Adelaide, South Australia, without the use of ballots. The movement for proportional representation in Switzerland was initiated by Victor Considérant, who in 1842 proposed a list system of voting to the Geneva council. In the United States Thomas Gilpin published a pamphlet (*On the Representation of Minorities of Electors to Act with the Majority in Elected Assemblies*, Philadelphia 1844) outlining a list plan of proportional representation. Twelve years later in Denmark the first public proportional representation election was carried out by ballot. The Danish minister of finance, Carl Andrae, worked out the provisions for a system which was very similar to Hill's except that it provided for the use of ballots. In the following year an English barrister, Thomas Hare, published a pamphlet outlining a plan closely resembling the Danish system, although apparently he reached his conclusions independently. In English speaking countries the single transferable vote plan has come to be associated with Hare's name.

When Hare's plan was praised by John Stuart Mill as "among the very greatest improvements yet made in the theory and practice of government," world wide attention was called to the idea of proportional representation. The actual spread of the system, however, was slow. In 1861 an imperfect system of proportional representation, called the limited vote, was adopted for the elected members of the Council of Malta. In 1867 this same system was applied to the three-membered parliamentary constituencies in Great Britain. Subsequently the limited vote was tried for a number of uses in such widely different communities as the Swiss canton of Vaud, the state of New York, Brazil, Spain and Italy. Other results of the agitation were the adoption of cumulative voting in 1870 by the state of Illinois for its lower house and by the British for school board elections, the introduction of the single non-transferable vote by the Free City of Hamburg in 1879 and the first trial of a list system of proportional representa-

tion for local elections in Serbia in 1888. Beginning in 1891 the list plan spread to many of the Swiss cantons, and in 1899 as a result of the socialist threat of a general strike it was incorporated in the Belgian constitution for national elections. By 1914 it was also used for national elections in Finland, Cuba, Sweden, Portugal and Bulgaria. The World War gave a great impetus to the movement and all of the newly created states adopted proportional representation almost without discussion. The movement likewise swept through Switzerland, Germany, Austria and Norway, apparently marking a temporary revival of faith in democratic mechanisms.

Agitation in England for the adoption of a thoroughgoing system of proportional representation has met with little success. A society for the promotion of such reform was founded in the 1880's by Lord Courtney and Earl Grey. Subsequently important political leaders like Viscount Cecil, Sir John Simon and Philip Snowden came out in favor of the system. Tasmania in 1896 was the first English speaking community to try the single transferable vote. Following the British act of 1918 the eleven (later nine) university members of the House of Commons have been chosen according to the same plan. The year 1918 also marked the beginning of proportional representation in Ireland, where the first trial was made in the city council elections of Sligo. The Irish Free State Constitution of 1922 extended the system to the Dail and *Seanad*. In Great Britain full application has met with firm resistance. The Liberal party as a party was not interested in the reform until it was reduced to a minority position. On the other hand, many of the Labour party leaders now think that the single member district plan may tend to benefit them again as it did in 1929. The two larger parties are more interested in strong government than in a system of representation which is mathematically just.

In France the movement for the adoption of proportional representation has been led by such diverse political leaders and groups as Jaurès, Briand, Poincaré, the Republican Federation and the Socialist party. A proportional representation scheme was passed by the Chamber of Deputies in 1919 but was rejected by the Senate. A compromise system adopted in the same year has sometimes erroneously been referred to as a proportional representation scheme, but it was in fact a majority bloc or general ticket plan.

After two trials the plan was abandoned and the country returned in 1927 to the single member district plan with the double balloting arrangement to insure majority elections. The defenders of proportional representation, including Poincaré and the Socialists, failed to take a determined stand for it in 1927. It appears that many of the French deputies, anxious to gerrymander the districts against the Communists, felt that their own fortunes were more secure under the old *scrutin d'arrondissement*. While there are a dozen or more groups in the Chamber of Deputies, usually not more than four or five candidates contend for a given seat. The Radical Socialists in particular argue that the old plan suits French electoral customs.

In the United States a serious movement for proportional representation got under way shortly after the publication of Mill's ideas on the subject. The adoptions of limited and cumulative voting schemes were the result of agitation by Simon Sterne, Senator C. R. Buckalew, Joseph Medill and others. Later, academic men like John R. Commons and civil service reformers like William Dudley Foulke championed the proposal. The Progressive movement stimulated interest in the idea, and following 1910 a number of initiated proposals for proportional representation were presented to the voters in Oregon. The adoptions since 1915 of the Hare plan in cities having the council manager form of government were in part the result of the promotional activities of C. G. Hoag and G. H. Hallett, connected with the Proportional Representation League. The Hare plan has been tried in eight American cities at different times, but at present it is in operation in only three, Boulder, Colorado, Cincinnati and Hamilton, Ohio. The use of the Hare plan in Kalamazoo, Michigan, met with legal difficulties after two elections. The Supreme Court of the state in the case of *Wattles ex rel Johnson v. Upjohn* [211 Mich. 514 (1920)] declared the plan unconstitutional on the ground that the vote must be of equal potential value as to each of seven candidates. In Sacramento, California, application of the plan was likewise forbidden by the courts [*People v. Elkus*, 59 Cal. App. 396 (1922)], which held that it violated the constitutional right to vote at all elections. These decisions, difficult to explain on logical grounds, have retarded the spread of the system. In Ashtabula and Cleveland, Ohio, where the courts upheld the plan under the home rule section of the constitution, the voters rejected

the system after trying it a number of years. In spite of many obstacles the agitation for proportional representation continues, particularly in large centers like Philadelphia and New York.

One of the common criticisms of proportional representation is that it tends greatly to increase the number of parties and thus makes the formation of legislative majorities very difficult. A careful examination of political conditions in a number of countries before and after the adoption of the reform shows that no such generalization is warranted. In Belgium the Catholic party maintained its parliamentary majority for many years before and after 1899. The multi-party system in Germany antedated the electoral laws of 1918 and 1920. In Switzerland one new important party was encouraged by the law of 1919, but the foundations of this party had been laid before the electoral change was made. Cumulative voting has not produced minor parties in Illinois, and the American city manager communities which have used the Hare plan have not witnessed the rise of many small parties. The nature of the party system depends not so much upon the system of representation as upon social, economic, religious, racial, linguistic and political conditions existing in a given country at a given time.

A number of claims have been made by the proportionalists which have not always been realized in practise. It was hoped that because it would lessen the number of wasted votes the reform would stimulate interest in voting. Since its adoption in Switzerland average participation in elections has been 20 percent higher than under the old system. The influence of proportional representation upon voting interest in republican Germany is difficult to estimate because many other factors, such as the form of the government and the party system, underwent transformations at the time of its introduction. In communities which have adopted the Hare plan the changes in voting records are likewise difficult to analyze. The Irish Free State Senate election of 1926 was not marked by increased voting. In American cities the Hare system has not succeeded in raising the total number of votes cast.

An ideal system of representation would impress the voters with its fairness, encourage the selection of able representatives, give expression to all important opinions and at the same time facilitate the formation of a workable government. Proportional representation has not secured all of these objectives. Indeed no system

of representation will of itself secure these ends. Where the political parties have put up able candidates, as in Belgium, Switzerland and Denmark, proportional representation has made the election of these candidates comparatively certain. In American cities where active citizens' groups have nominated civic minded candidates, as in Cincinnati, the Hare system is generally held to have worked well. The plan does away with the need for a primary election, eliminates ward politics and insures fairness to all groups. On the other hand, the list systems used in such countries as Italy, Poland and Germany have not prevented the establishment of dictatorships. Some modified form of functional representation, such as prevails in Italy, appears to be popular with countries ruled by dictators.

Faith in proportional representation, which was so strong in the nineteenth century and which was vigorously revived in the years immediately following the World War, seems to have waned in many places in recent years. But where democratic institutions have held intact, there are still movements for the adoption or preservation of the principles of proportional representation.

PROSECUTION. Public prosecution is a proceeding conducted by the state against persons charged with criminal acts. It thus implies the existence of a public criminal law which has suppressed private vengeance. In its operation it is an interacting system of rules of criminal procedure, the substantive criminal law and various administrative factors.

Legal historians have differentiated sharply between two great classic systems of prosecution: the "inquisitorial," which has generally prevailed on the continent of Europe, and the "accusatorial," which has predominated in English speaking countries. The principle underlying the former is not only that infractions of the criminal law are offenses against the state, but that responsibility rests directly upon the state to proceed against offenders, secure evidence of guilt and inflict punishment. Among its principal features have been the secret inquiry to discover the culprit and the employment of torture to obtain confessions. Primarily the product of the later Roman and the canon law, the inquisitorial system has been described by Esmein as more scientific, complex and rigorous than the accusatorial system and thus better designed to meet the needs of social repression. The dominant characteristic of the latter system is the principle of popular accusation, freely exercised by all persons, with the state umpiring the ensuing controversy as to guilt. The litigious criminal proceeding thus became in its classic form a judicial duel between complainant and defendant before an impartial court with a jury of the accused's peers to determine the outcome. It is probable, however, that institutional commentators have emphasized unduly the inherent differences between the two systems. The state plays an important and active role in both. Unquestionably, Anglo-American criminal procedure has frequently utilized inquisitorial practises and the continental technique has likewise been materially influenced by accusatorial methods. At all events the so-called "mixed" system, now prevalent in varying forms in western countries,

is an amalgam of certain important features of both classic procedures. It involves the use of the public prosecutor, the preliminary examination, trial before a court and jury characterized by the principles of confrontation and publicity, and rendition of judgment on the issue of guilt, which is subject to judicial review by a superior court.

The development of criminal prosecution has always been affected by prevailing political ideals and theories of punishment. When concern for the general security has been the social desideratum, harsher procedural devices have usually found favor. In general constitutional democracies have tended to view with suspicion inquisitorial methods and have sought to safeguard individual freedom against arbitrary or repressive conduct by agents of the state. When punishment has been popularly viewed as in the nature of satisfaction to the injured party, accusatorial practises have generally predominated. The ascendancy of the theory that crimes are offenses against the state itself rather than mere private injuries to its members is one of the outstanding developments in modern systems of criminal prosecution.

Roman prosecution was based upon the accusation. The issue was between accuser and accused and was limited to the formal allegations of the accuser, upon whom lay the burden of presenting the evidence of guilt. In early times criminal cases were tried before the kings or before such boards as the *quaestores parricidii* or the *duumviri perduellionis*. Popular courts had jurisdiction in cases referred to the people through *provocatio*, or appeal. In the *judicium publicum*, or popular assembly, the *populus* itself was judge and jury, the magistrate serving merely as the president. In the later republic *quaestiones* were often appointed as courts for the trial of particular crimes. Because of the increase of crime and the inconvenience of appeal to the popular court the *quaestiones* came to be permanent tribunals for the disposition of the more common crimes. There was a separate *quaestio* for each crime; each *quaestio* was created by a special statute designating the offense over which it had jurisdiction and the appropriate procedure; the presiding magistrate was called *quaesitor*. Judgment was rendered by *judices*, whose chief similarity to the modern jury lies in the fact that they did not constitute a permanent tribunal but were chosen specially for each case, the accused exercising the right of challenge. In the older popular courts the right

of accusation belonged only to certain magistrates, whereas any citizen had the privilege of instituting a criminal proceeding before the *quaestiones*.

Under the empire the distinction between judicial and executive power gradually lost its significance. The old popular courts were abandoned, a system of permanent courts with a regular process of appeal was established, the *quaestiones* underwent substantial modification and eventually disappeared and the voting *judices* finally ceased to function. Both emperor and Senate frequently exercised criminal jurisdiction or conferred judicial powers upon designated officials. Inquisitorial elements were introduced, including new methods of instituting proceedings, the use of special investigators for the discovery of crime, the employment of torture to extort confessions and increased activity of the judge at trials. Although traces of the accusatorial procedure were still to be found, notably the right of free accusation and the absence of the public prosecutor, the spirit which had permeated the administration of justice under the older institutions was modified greatly. Political absolutism had undermined the democratic procedure.

The forms and functions of primitive Germanic criminal procedure were accusatorial, shaped largely by the concept that the most effective method of punishing offenders was to leave them to the private vengeance of the person injured or of his kinsmen or friends. The first step toward a more orderly system of law enforcement was the substitution of the public contest for the unofficial skirmish. Nevertheless, primitive juristic institutions, such as trial by battle, compurgation and the ordeal, while conducted in accordance with prescribed forms, were merely very crude substitutes for private war predicated upon the belief that divine aid could be relied upon for the ascertainment of truth and the protection of the innocent.

During the twelfth and thirteenth centuries, under the influence of the later Roman precedents, an inquisitorial procedure developed in the ecclesiastical courts. The church borrowed most of its procedural elements from secular institutions, speedily adapting them to meet its own distinctive needs. Relying originally upon the principle of free accusation, ecclesiastical criminal procedure as early as the ninth century had permitted notorious crimes to be prosecuted by the judge without requiring an accuser. The difficulty of proving notoriety and the absence of

a public prosecutor eventually led to papal legislation allowing the judge, on proof of ill fame, to proceed officially against the suspect. Thus was evolved a form of official prosecution, *processus per inquisitionem*, with the substitution of the inquest for older methods of proof. Inquisitorial methods received special application in the Holy Inquisition, which was not, as has sometimes been popularly supposed, the source of the inquisitorial procedure. The judges of the Inquisition who were papal delegates resorted to the most drastic procedure of the canon law, often withholding from the accused the names of witnesses, restricting or prohibiting the right of counsel and receiving testimony from questionable sources.

The inquisitorial technique of the canon law influenced profoundly the administration of criminal justice in the continental secular jurisdictions. The French development, which is the most important, is typical. At first the *processus per inquisitionem* could be used only with the consent of the accused. But during the thirteenth century under the term *aprise* there developed a form of official prosecution applicable to crimes of common knowledge and to cases where the offender was captured in the act. The judge, thus "apprised" of the facts, could proceed by inquest without formal accusation or the consent of the accused. It was not long before the *aprise* and the inquest were merged. The accusation itself gradually fell into disuse and was replaced by the "denunciation," whereby the complainant denounced the suspect, produced or named the witnesses and left further prosecution to the judge. Canonical methods of taking evidence found favor also. The information was made to the judge or his delegate; the witnesses were then summoned and questioned secretly and apart; their depositions were reduced to writing and formed the principal material for use at the inquest, if it were decided that further confrontative action should be had. The inquest necessitated the reappearance of witnesses for the purpose of oath taking.

By the thirteenth century the punishment of crime had come to be viewed as primarily the concern of the sovereign. The rise of this concept led to another important development: the advent of officials specially charged with the duty of denouncing culprits and thus initiating the judicial process. The conversion of the royal procurator fiscal, originally a steward or business agent of the king, into an official prosecutor marked the triumph of the inquisitorial system.

Thenceforth the procurator assumed fundamental significance as the denunciator of crimes, the producer of witnesses and the supervisor of the prosecution, subject to rules embodied in royal ordinances. The accused could be questioned on oath; and since conviction was justified only by conclusive proof, harsh practises were often used in order to force confession. During the fourteenth and fifteenth centuries a distinction grew up between "ordinary" and "extraordinary" procedure. Torture, secrecy, documentation and restricted opportunities of defense were salient characteristics of the latter. In course of time the ordinary procedure became obsolete and the more oppressive practises were resorted to in the prosecution of all serious crimes. Popular acquiescence in the severity of the inquisitorial procedure is probably to be explained by the desire for security after the devastating wars and social anarchy of the Middle Ages.

The codification of French criminal procedure effected by the famous Ordinance of 1670 embodied the essential features of the inquisitorial system. For more than a century it exerted marked influence on the course of criminal law administration. The precedence of the royal over the seigniorial and ecclesiastical jurisdictions was definitely established and a uniform procedure set up which was sufficiently detailed to prevent local usages from becoming greatly diversified through subsequent judicial interpretation. The liberal political and social philosophy of the eighteenth century, however, with its emphasis on tolerance and humanity in dealing with crime, set in motion forces destined to alleviate the prevailing rigors of law enforcement. The writings of Montesquieu, Delolme, Beccaria and Voltaire pilloried the inhumanity of a system which consistently favored the prosecution to the disadvantage of the defense and glorified the English procedure with its ideals of private prosecution, publicity, liberty of defense and trial by jury. Accusatorial methods were in harmony with the spirit of the revolution and in 1791 the Assembly passed a law importing into French procedure many cardinal features of the English system. Particularly noteworthy were the virtual abolition of the institution of public prosecutor, the introduction of partial private prosecution, the creation of a justice of the peace or examining magistrate, the setting up of a modified system of grand and petit juries, the adoption of the doctrines of orality and publicity and the re-

pudiation of the evidentiary system of "legal proofs." During the Napoleonic era, however, with foreign wars imperiling national security, the desire for social stability again became predominant. The old principle of authority was reasserted in the enactment of the Code of Criminal Examination of 1808, which forms the basis of contemporary French criminal procedure. The code was essentially a compromise between the two classic systems of procedure; the petit jury was retained but official prosecution was restored as the crux of the criminal judicial process.

The present machinery of public prosecution in France is centered in the *ministère public*, an administrative hierarchy chosen by the executive on the nomination of the hierarchic head, the minister of justice, and organized to conform to the needs of the particular tribunal in which it must function. In the trial of *contraventions*, or minor offenses, before a *tribunal de simple police* the prosecutor is the local *commissaire de police*. In the higher courts of first instance, such as the Tribunal Correctionnel, which tries *délits*, or infractions of an intermediate grade, and the Cour d'Assises, which disposes of the gravest offenses known as *crimes*, and in the superior courts (Cour d'Appel and Cour de Cassation), the prosecuting department is known as the *parquet*. At every Cour d'Appel and Cour d'Assises all the functions of the *ministère public* are vested in a *procureur général* and his substitutes, the *avocats généraux*, who personally supervise the proceedings; in the lower courts the prosecutors are the *procureur de la République* and his subordinates. The *procureur général* also exercises general supervision over the *police judiciaire*, who deal with crime detection and investigation. Subordinate to him in this respect and directly controlling criminal investigation activities within an *arrondissement* are the *procureur de la République* and an official of the *police judiciaire* called a *juge d'instruction*. The latter has extensive powers in respect to the arrest, detention and interrogation of witnesses, domiciliary searches and seizures and preliminary examination of suspects. As the objective guardian of the law, the *ministère public* has virtually absolute control over the initiation, management and continuance of prosecutions. The theory of private prosecution still survives, however, in a procedure by which a person injured may constitute himself a *partie civile* before a *juge d'instruction*, who must thereupon investigate the complaint even though the

prosecutor has refused to act and whose decision is subject to judicial review.

Probably the most important survival of the inquisitorial system and the feature of French criminal procedure which distinguishes it markedly from Anglo-American methods is the preliminary inquiry. The *juge d'instruction* visits the scene of the crime, investigates personally all the circumstances and conducts a secret examination of the suspect, who may be represented by counsel but whose interrogation is thorough and searching. If the evidence is deemed sufficient to justify further action, the case is sent to the indicting tribunal, the *Chambre des Mises en Accusation*. At the trial the prisoner is subjected to another stringent examination by the presiding judge and must satisfy the jury that he is not guilty; the procedure of cross examination of witnesses is practically non-existent.

The French legislation of 1808, with its emphasis on official prosecution, has had a far reaching influence upon the criminal codes of other continental countries, notably Belgium, Germany, Italy, Spain, czarist Russia and the Swiss cantons. Virtually everywhere there are the public prosecutor and the familiar division of procedure into two stages: the preliminary examination with its rules borrowed from the inquisitorial system and the ideal of jury trial with its accompanying accusatorial safeguards. There is a growing tendency, however, to encroach upon the province of the jury or to transform it into a board of professional and lay judges, as evidenced by recent legislation in Germany, Fascist Italy and Soviet Russia (see JURY).

The accusatorial system has its outstanding embodiment in the English administration of justice. Save in certain classes of offenses, criminal prosecutions are in theory left to the agency of private individuals. Proceedings are instituted in the name of the crown but there are no legally constituted local prosecuting officials either in courts of summary jurisdiction or in courts of trial; nor is there any uniform method of conducting prosecutions. During the nineteenth century, however, there evolved a partial system of public prosecution which led to the enactment in 1879 of the Prosecution of Offences Act creating the Office of Director of Public Prosecutions. Prior to that time it had become customary for certain offenses to be prosecuted by the law officers of the crown (the attorney general and the solicitor general) and for the

home secretary to direct the solicitor to the treasury to furnish the police legal advice and assistance in the prosecution of other important crimes. The legislation of 1879 therefore merely sanctioned and amplified machinery which had developed informally over a period of years as a result of a continuous series of adaptations to prevailing needs. It preserved the right of private prosecution, subject to broad powers of intervention and control by the director of public prosecutions.

In actual practice, while many offenses are still prosecuted through private initiative, the great majority of important prosecutions are now conducted either by the police or by the director. Certain less important prosecutions are undertaken also by government departments and municipal and county authorities. The director prosecutes all crimes punishable by death and all cases in which it appears to him that the public interest requires his participation or in which he is specially ordered to proceed by the attorney general. Although statistically the number of "public prosecutions" is comparatively small, the significance of the director's office lies in its defense of criminal appeals, its restraining influence over private prosecutors and the outstanding importance of the cases in which it does participate. Ordinary crimes involving the professional criminal class are prosecuted by the police. Provisions for legal assistance in the conduct of a "police prosecution" depend on local custom, the character of offense involved and the prevailing usages of the court in which the case is pending. In courts of summary jurisdiction, which now dispose of a large number of indictable offenses formerly triable only before juries, clerks to the justices of the peace or to the police magistrates often assist in the presentation of evidence. In important or difficult cases the police in many larger boroughs are represented by their own solicitors; in Greater London these solicitors are paid out of police funds and act under instructions from the commissioner of police; in some larger provincial cities they are specially employed by the corporation and devote all or a large part of their time to the management of prosecutions. Again, such work is performed by the town clerk, by one of his deputies or by a special solicitor nominated for each case by the local police establishment. In some prosecutions, especially those disposed of on circuit and in courts of quarter sessions for counties, trials are conducted by counsel freely chosen by the

prosecuting solicitors. In other cases, notably those tried in the metropolitan area and in courts of quarter sessions for boroughs, an attempt is made to select counsel in rotation from among local barristers in attendance at the sessions. "Private prosecutions" are conducted by solicitors employed by private complainants, assisted by the police.

The essentially litigious nature of English criminal procedure is doubtless the consequence of the survival of primitive ideals of private war, the historical development of the jury and the English distrust of innovations and habit of adapting time honored governmental mechanisms to existing needs. Even in England, however, certain severities and inquisitorial tendencies have existed. The grand jury has always functioned as an agency of public inquiry into crime. For several centuries justices of the peace exercised investigatory powers of a sort entrusted in continental countries to the police and public prosecutors. The methods of the old Star Chamber were often a contradiction of accusatorial ideals. Prior to the Restoration the technique of stringent judicial cross examination was closely akin to the continental interrogatory. Before 1837 persons accused of felony were denied full right of counsel. Prior to the establishment in 1907 of the Court of Criminal Appeal there was no right of direct appeal from a judgment of conviction. In recent years the tremendous growth of summary jurisdiction over indictable offenses has undermined the jury.

Criminal procedure in the United States is fundamentally accusatorial. The guaranties and safeguards set up for the protection of defendants are the products of English jurisprudence. The outstanding administrative difference between English and American methods lies in the American adoption of the public prosecutor. Following English precedent, the office of attorney general was established in nearly all the colonies by the seventeenth century; when the county prosecuting attorney first appeared in Connecticut in 1704, his principal function was to assist the colonial attorney general. The practise was soon taken up in other colonies and subsequently in the states. At present the constitutions of thirty-eight states provide for the office and in others it is statutory. In all but five states the method of choice is by election; the term is from two to eight years.

The unique character of the American prosecuting attorney lies in his virtual independence of administrative or judicial regula-

tion. The attorney general's control over the office is usually limited to a general grant of supervisory power; in a few states, however, the governor may in certain cases supplant local prosecutors by the attorney general. In most states the prosecutor is now paid a fixed salary; but in jurisdictions where the fee system is still in effect his income may depend wholly or in part upon the number of convictions or indictments. In the preparation of cases the prosecutor is often handicapped by inadequate police assistance. As the mainspring of law enforcement he frequently takes the initiative in crime detection and investigation.

Recent surveys have demonstrated the prosecutor's almost dictatorial control over criminal proceedings. His broad investigatory and discretionary powers have minimized the importance of the preliminary examination, in which small effort is now made to conduct an adequate judicial inquiry into the circumstances of the crime. In twenty-four states proceedings may, with certain exceptions, be initiated by information, or by accusation of the prosecutor, without the intervention of the grand jury; in most of these states the information has superseded the indictment in the great majority of prosecutions. Even where the grand jury is used it has usually fallen under the prosecutor's domination. The recent decline of the petit jury has been due largely to the prosecutor's practise of "bargaining" for pleas of guilty to lesser offenses and to his widespread use of the *nolle prosequi* or other methods of discontinuance. The prosecutor's role in politics has also profoundly affected the judicial process. Frequently young and inexperienced, generally poorly paid and selected for political reasons, bent upon attaining personal preferment, the American prosecutor has been caught up in the seething caldron of politics and controlled by the entangling forces which encompass him.

Much recent criticism of prosecution in the United States has centered around procedural rules which are said to be outworn and unduly technical and thus productive of delay, miscarriages of justice and general ineffectiveness in administration. Proposed reforms, some of which have been adopted widely, include simplification of indictment forms and alternative use of the indictment or information, uniform interstate rendition laws, regulation of bail bonds, rendition of jury verdicts by five-sixths vote, new rules to speed up appellate procedure, enlarged judicial control of the trial,

waiver of jury trial by the defendant, judicial control of the selection of the jury, new rules relating to the insanity defense and more stringent regulations pertaining to probation, parole and pardon.

Any comparison of the effectiveness and integrity of criminal prosecution under various "systems" involves consideration of many elusive factors and raises difficult questions. Partisans of continental justice contend that it is thorough, expert and unencumbered by hypocritical legal fictions which delay or defeat the detection and punishment of crime. Its critics assert that it is at hopeless variance with the juristic ideals of Anglo-American countries. Opponents of the English ideal of private prosecution stress its lack of uniformity and the probability that many offenses go unprosecuted because of the inability or unwillingness of persons injured to carry on prosecutions. Its advocates emphasize its comparative freedom from the strife of the party system and excoriate the baneful influences of politics on American law enforcement.

The chief obstacle in the path of objective comparative analysis is the paucity of reliable data as to the actual working of continental systems. It is necessary to view the operation of the administrative and judicial process from "behind the scenes." Available sources of information are at best inconclusive and unrealistic. Idealized concepts have fostered uncritical assumptions and hindered unbiased observation and interpretation. Are life and property any more secure in France than in England? Is the influence of the administration in continental countries comparable to subterranean political forces in the United States? Have causes similar in nature contributed to the recent decline of the jury? To what extent do the more obscure psychological and administrative factors operate to adjust the complexities and idiosyncrasies of the several systems to prevailing ideals of justice in the western world? Answers to these and like questions cannot be given with any degree of assurance. Certain it is, however, that no test of the efficiency of any system of prosecution based wholly upon the proportion of convictions to offenses will commend itself to an individualistic society, in which the principle of the protection of private rights overshadows the ideal of public security.

PROSELYTISM. The term proselyte was coined to designate those Gentiles who in order to become naturalized Jews passed through the threefold rite of circumcision, baptism and offering, accepted the full obligations of the Mosaic law and thereby acquired the hope of a share in the life of the world to come. Their action sprang from a deliberate choice; and, although individual Jews sought to persuade individual Gentiles to adopt this course, there was no general religious policy, much less a religious organization directed to this end. In the second century A.D. the would be proselyte in Palestine was even asked his motives and warned of the penalties and obligations incurred in becoming a Jew. Here proselyte was a technical term, used by the converts as well as of them. In spite of this, however, the description in *Matthew* xxiii: 15 of the zeal of the scribes and Pharisees in compassing sea and land to make one proselyte has given to proselytism its essentially derogatory connotation: the deliberate attempt to induce an individual to adhere to some sect or tenets other than those in which he was reared. Furthermore the term has generally come to imply individual or subterranean activities rather than overt organized missionary activity or propaganda and to denote in the main activities conducted in a man's own national milieu rather than among less developed peoples.

Missionary zeal is evoked only by religious ideas or institutions which by reason of their universal rather than their strictly national or social significance cause the believer to hold that the god or creed or church has a claim upon the unbeliever, that the unbeliever has a need of the god or creed or church, and not infrequently that the believer has a supernatural commission to convert the unbeliever. Accordingly, while certain other cults accept and even encourage the homage of new worshipers who are not born to them, the phenomenon of proselytism is confined almost exclusively to early Zoroastrianism, Buddhism, Judaism, Christianity, Manichaeism, Islam and to the various sects within these religions which have claimed to hold revealed

truth in a more primitive or purer or generally better form. Within this group of religions the impulse to proselytize is not found at all times or in all members. Many men have no desire to interfere with the lives of others, whatever their theoretical duty in the matter, and each of the religions in question has had static phases or has reached a static equilibrium. Although Islam reveals vigorous proselytizing energy in present day Africa, during most of its history it has been on the whole indifferent to any sustained efforts at persuasion; and, while occasionally coercing, has in general been content merely to assign an inferior status to non-Moslems. In Christianity, while the impulse to conversion was strong in the first three centuries and has reemerged at repeated intervals, the Greek Orthodox bodies have in general assumed the national and non-universal character of ancient Greek religion.

Proselytism flourishes in those religions which rest upon a systematic theology and body of revelation. The sacred literature in which this theology and revelation find expression plays an important part in their dissemination. Another factor conducive to proselytism is the existence of an organized hierarchy, as in Christianity, Manichaeism and Sassanian Zoroastrianism, or of a monastic class exclusively preoccupied with religious matters, as in Christianity and Buddhism. Propaganda may likewise be carried on by secular persons, notably in Judaism and in Islam, in which latter this function has been performed in the main by merchants.

Proselytism has sometimes been backed by force or by catering to interested motives, but in its essence it is an attempt to persuade. Like salesmanship it appeals to men in the mass as well as individually and uses addresses and the written word as well as personal talk. But as in salesmanship the address and the written word endeavor to strike an intimate note and to make the individual hearer or reader feel that the message is specially directed to him. Like salesmanship it professes to give a plain statement of important facts which are in danger of being overlooked; and like salesmanship it has to create many of the needs and desires which it professes to satisfy. Except where they have been suitably instructed, men do not fear either pyorrhea or damnation; both perils have to be depicted in colors which cause marked uneasiness. The success of both appeals results partly from the absence or vagueness of ideas in the hearer on the subject at issue, but partly also from the fact that the needs so indicated

often correspond to notions and feelings present in or under his level of consciousness. Thus Zoroastrianism touched the resentment of the honest farmer against the hillman bandit; Buddhism, the uncertainty and dissatisfaction left by scholasticism and asceticism; Christianity, the desire for security here and hereafter and for an understanding of the universe and of man's new status therein.

Methods vary according to circumstances. Persuasion depends on argument or on what passes as such, reenforced often by appeals to a sacred literature, by supposed miracles and their recounting and by works of charity. These modes of persuasion, as recorded, for example, in the religious dialogues of Buddhist, Jewish and Christian literature, are used by men who come from a group within the social group or represent such an alien group elsewhere. They may be either foreign settlers—rulers or soldiers or merchants or missionaries or slaves—or men whose religious loyalties mark them off from society as a whole. If they are persecuted or under social condemnation, they will usually operate in an unostentatious way, as the early Christians did in the Roman Empire; if they have an accepted or dominant position, as the Christians had after the time of Constantine, they will operate openly and according to circumstance will compel men to join them.

Much depends on the personality of the proselytizer; if he is dynamic enough, many will follow him whatever he says; *credo in Newmannum* was a phrase in Oxford in early Tractarian days. The conviction thus resulting is often emotional rather than logical, and the acceptance of the new faith may be general rather than specific. It follows that the religion so transmitted is not passed on intact; no man who has undergone even the most passionate conversion can jettison all his old mental furniture, and the man who adheres in a somewhat hazy conviction that the new religion is, generally speaking, better may part with very little. So religions change, sometimes through deliberate attempts of proselytizers to meet local needs and to talk a language intelligible to their hearers, but more often through the inevitable pressure of circumstances and the sheer impossibility of translating articles of belief. A neophyte has a new point of view and not unfrequently a new zeal, and in consequence he is often unpopular with the body which he has joined; adhesion may be actually discouraged, as in Judaism after the failure of Bar-Kochba's

revolt, when a proselyte came to be regarded as a potential traitor, the Jewish religion having become the one surviving expression of national unity and feeling.

Until fairly recent times corporate religion has been an aspect of tribal or civic or national life; in many primitive communities as in the civilizations of Greece and Rome there has been no divorce of civil and religious authority. Domestic worship was the householder's affair and, scandal apart, secure from interference. But the attempt to interest others in a new cult might be interpreted as a breach of social solidarity; the charge on which Socrates was put to death was in part that of abandoning the gods of the city in favor of alien deities. Ancient Rome often repressed what it regarded as attempts to play upon popular superstition and controlled firmly all new religious groupings within the community; this was a matter of public order, cared for by the Senate and magistrates and not by the priestly colleges. So when Christianity became the state religion, paganism and heresy appeared antisocial and their practise and propagation were made criminal.

Proselytism has thus evoked persecution. Even where this has not been the case, it has often engendered vehement hatred and a curious readiness to believe improbable stories about the proselytizers. Grave and serious men have stated in good faith that the High Anglican clergy include Catholic priests acting on secret orders from Rome. Proselytism like salesmanship encounters resistance, only much stronger resistance, inasmuch as men dislike to be disturbed in old ideas, suspecting in a queer unreasoning way those who would unsettle existing group attachments. And yet proselytism persists even into the predominantly secularistic modern culture, manifesting itself as clearly among the opponents as among the defenders of traditional credos.

PROSTITUTION may be defined as the practise of habitual or intermittent sexual union, more or less promiscuous, for mercenary inducement. It is thus characterized by three elements: payment, usually involving the passing of money, although gifts or pleasures may constitute equivalent consideration; promiscuity, with the possible exercise of choice; and emotional indifference, which may be inferred from payment and promiscuity.

The element of hire need not presuppose a gain by the prostitute herself. In primitive societies this was often not the case. Where the system of marriage by purchase flourished, a woman's body belonged to her parent before marriage and to her husband after. Along the Ivory Coast, among several American Indian tribes and among the Bakoko of the Cameroons, parents and husbands prostituted their women for gain to themselves. In the case of certain African tribes, although the terms of hire were not agreed upon in advance, the paramour, if discovered, was obliged to pay the husband for trespassing on his property right; enterprising Kaffir wives would seduce unsuspecting males in order that their husbands might profit.

The substitution of the rights of a god for the rights of a husband led many primitive and ancient peoples to the practise of religious prostitution. Among the Ewe and Tshi speaking peoples on the African west coast, for instance, the priestesses considered themselves the wives of the god whom they served, and their sexual excesses, dedicated to the god, were not regarded with reproach. In India from about the tenth century the "dancing girls" in the temples practised somewhat similar rites.

It was among the Semitic peoples, however, that religious prostitution seems to have been particularly prevalent. *Hierodouloi*, or inferior temple ministrants, expressed religious rites by sexual connection in the worship of Ishtar, Astarte, Mylitta, Baal, Moloch and other deities in Egypt, Babylonia, Syria, Phoenicia, Canaan

and Arabia. In theory at least union with these temple prostitutes was considered in no sense a private indulgence but a means of attaining intimacy with the goddess herself; money paid to the ministrants was not a payment for the service but an offering to the goddess. In some cases the *hierodouloi* were temporary: the sexual practises were associated with special festivals or with prenuptial rites to stimulate fertility in the women who offered themselves or to stimulate virility in the men who patronized them; or they were necessarily temporary because of nomadic pursuits. In Biblical times, however, there were certainly permanent *hierodouloi* consecrated to the service of the goddess. The *hierodouloi* were not always females. Among the Canaanites in particular there were male devotees, sodomitic connection with whom would, it was supposed, transfer blessings to the worshippers.

It was because of its religious significance that prostitution was so vigorously condemned among the Hebrews: it represented the worship of a foreign deity. There is a law in *Leviticus* (xix: 29) forbidding fathers to turn their daughters into prostitutes, and in *Deuteronomy* (xxiii: 17) forbidding daughters to become prostitutes. Since heathen priestesses were often prostitutes, the death penalty was prescribed for any Hebrew priest's daughter who became a prostitute (*Leviticus* xxi: 9). Particularly harsh were the Biblical condemnations of male prostitutes, or sodomites (*Deuteronomy* xxiii: 17). The severity of the Hebrew injunctions against both male and female prostitution was possibly increased by the difficulty in eradicating it from the worship of Yahweh. The verbal proscription of prostitution did not of course eliminate it: the story of Judah and Tamar in *Genesis* xxxviii: 14-26 indicates the conditions at the beginning of the Biblical period; at the end harlots were so numerous that they had a market place to themselves.

In contrast with the moralistic attitude of the Hebrews was the naturalistic attitude of the Greeks. Ritual prostitution as it flourished at Corinth in the worship of Aphrodite, although its expressions apparently were more gross than among the Hebrews, was not condemned. This difference in sexual morality was an outgrowth in part of the difference in marriage customs. Greek marriage had no connection with the emotions of love or sex; the Greek wife was a housekeeper and a bearer of lawful heirs, not a sexual companion. To supply this sexual inti-

macy there was the class of *hetaerae*, a word which means companions. In the best sense the *hetaerae* were Athenian girls of good but indigent families who revolted against marriage within their class. Some were Corinthian and Ionian adventuresses who came to Athens in search of fortune. The higher class *hetaerae*, being full citizens, were by no means common prostitutes; they formed free unions with men who maintained them. As such no stigma attached to their position, and they sometimes attained high estate. To be sure not all extramarital relations among the Greeks were on so lofty a plane. Slave women, prisoners of war, were subject to purchase and sale, and a traffic in them was carried on not only to supply individuals with concubines but to supply brothels (*porneia*) with licensed prostitutes. Unfortunately the euphemistic term *hetaerae* came to be applied also to this low class of prostitutes, who were hardly comparable to the free born "companions."

In Rome, even before the Christian era, the absence of sacred prostitution and the constantly increasing numbers of slave women combined to place prostitution on a relatively low level; the Roman *bonae mulieres* never held a position comparable in dignity to that of the Greek *hetaerae*, and Roman men generally carried on their meretricious relationships in seclusion. Prostitutes (*meretrices*) were legally required to register, and once on the register their names could never be removed. Compelled to wear distinctive raiment and bright hued wigs, they were subject to various civic disabilities. The registered prostitutes carried on their trade in *lupanaria*; but since the laws concerning registration were enforced laxly, there were great numbers of unregistered prostitutes. Their position became lower and lower as more stringent laws were passed during the later republic to prevent corruption of the blood by intermarriage of citizens with prostitutes, their descendants or relatives and to prevent women of the higher classes from becoming prostitutes. The conversion of Rome to Christianity had less effect upon prostitution than might be supposed, the emperors continuing to derive benefit by way of tax upon all persons subsisting by prostitution. The early church fathers, although they condemned unchastity in general, tried to reserve for the prostitute a road to repentance. They succeeded in inducing Theodosius and Valentinian to abandon the tax on bawds and to suppress brothels, but the tax on prostitutes

was not abolished until the fifth century. Justinian, aided by his wife, herself a reformed prostitute, undertook the work of redeeming prostitutes and punishing their exploiters.

Throughout the Middle Ages there was vacillation in policy toward prostitution. Although temporal as well as spiritual authorities often condemned and even punished it harshly, the profits which it brought to both made their efforts half hearted and spasmodic. In England during the Anglo-Saxon period the kings ordered prostitutes either to leave the land or to suffer death. In 1161, however, Henry II legalized houses of prostitution near London. When the church gained complete jurisdiction over moral offenses, it inflicted penance for breaches of the code and deprived prostitutes of consecrated burial. But since the minor church officials charged with the enforcement of ecclesiastical discipline were often corrupt and since the friars were among the best customers of prostitutes, the regulation of prostitution was usurped by municipalities, which sought to eradicate it because of its association with crime. On the continent the early mediaeval kings, while approving the system of concubinage, proscribed prostitution. Despite the enactment of repressive legal measures, however, other laws recognized the trade by requiring prostitutes to wear a distinctive badge. Everywhere the regulation was largely local and in part extralegal. In the Germanic cities, as in some of the French provincial towns, brothels constituted a sort of public service and even figured in the hospitality tendered to important guests. Brothels under municipal protection were found in the thirteenth century in Augsburg, Vienna and Hamburg. The occasional "reform movements" in the Middle Ages were limited in time and place and rested not upon social policy or sustained attitude but upon local feuds and jealousies over the profits accruing from prostitution. Paul Lacroix has likened the position of mediaeval prostitutes to that of mediaeval Jews: they were persecuted socially, civilly and ecclesiastically, yet all classes were glad to have recourse to them and recognized their indispensability.

The welter of mediaeval regulations may be understood only as an interaction of three separate social desires. The first related to the integrity of the family: for reasons of religion and property the wives and daughters of citizens had to be protected, and the brothel, satisfying vicious impulses outside the home, was one

means of protection. This explains why it was sometimes built at public expense, why provision was made for maintaining a sufficient number of inmates, particularly from abroad, why prostitutes were distinguished in dress and why visitors were entertained at these public houses. The second aim in regulating prostitution was to prevent the brothel from becoming a center of disorder. For that reason brothels were in charge either of some special official or of a responsible citizen; or licensed prostitutes, after the manner of other guilds, themselves protected their monopoly interests. The third interest in mediaeval regulation was financial. Secular and church authorities alike shared in the profits of this lucrative enterprise.

What the desire for virtue, order and money could not bring about was accomplished by fear. The beginning of the modern era introduced a new and dominating consideration in regard to prostitution. This was the epidemic of syphilis which broke out in southern Europe toward the end of the fifteenth century and swept northward in the sixteenth. Regardless of its time and place of origin—a much disputed point—syphilis had never been known in so virulent a form: it has been estimated that during the first decade of its prevalence one third of the population of Europe died from its effects. Added to this fear was the influence of the Reformation. The reformers had inveighed against the manner in which the church had handled the problem of prostitution and upon gaining ascendancy did what they could to remedy the abuses. This in turn spurred the church itself, in the Counter-Reformation, to further efforts. Fear, reenforced by a sturdier moral attitude, led at first to a sternly restrictive policy. Laws and decrees ordered the closing of the brothels in Ulm in 1531, in Basel in 1534, in London (i.e. in Southwark) in 1546, in Paris in 1560 and in Nuremberg in 1562. In addition to closing the houses, possibly because their closing did not diminish prostitution to the degree that had been hoped, laws were enacted for the more rigorous punishment of prostitutes, such as the Paris ordinance of 1635 providing that without formal trial they should be whipped, shaved and banished for life, and the Act of the Commonwealth in England in 1650.

Restrictions on the activities of prostitutes did not suffice to control the disease which they transmitted, and accordingly, toward the end of the seventeenth century, suppression began to give way to sanitary control. By an edict of 1684

Paris recognized the necessity of treating diseased prostitutes. In 1700 Berlin began to require that an official surgeon examine prostitutes fortnightly. The idea of registration of prostitutes, first suggested in Paris in 1765, was put into effect at the close of the reign of Louis xvi; but the system of medical examination of prostitutes, begun in 1798, was not administered satisfactorily until 1810. By the second decade of the eighteenth century the Paris police had developed the plan of confining prostitutes in houses specially licensed for the purpose. Since 1843, when the morals service was reorganized, prostitution in Paris has been limited to licensed brothels or to houses of accommodation where prostitutes at large are compelled to resort. Clandestine prostitution is punished with such severity that notoriously debauched prostitutes find it advisable to register.

By the opening of the twentieth century systems of regulation, not unlike the Paris system, were established by the police in all the large cities of France. There was official regulation of prostitution, rather as a matter of police administration than as legal enactment, in the cities of Belgium, Austria, Hungary, Russia, Italy, Spain, Portugal, most of Germany, two Scandinavian countries and in many cities of the Orient. Despite its wide development the system of state regulation was not without opposition. This opposition emanated in the beginning from England, a country which from the time of Henry VIII had suppressed brothels. In 1864, however, Great Britain enacted the Contagious Diseases Prevention Act, which provided among other things for the compulsory medical examination of prostitutes in certain military and naval districts in order that the presence of venereal disease might be detected. At first considered an ordinary measure for the well being of the armed forces, the real significance of this regulation was not realized until 1869, when an amendment provided for the more frequent examination of prostitutes and extended the system to London. Had the act applied to both sexes and had it been a community wide attempt to fight disease, some degree of success might have followed. As it was, its futility as a public health measure and its menace as an extension of police power were immediately apparent. A campaign of organized opposition was launched under the leadership of Josephine Butler, Harriet Martineau, Mary Carpenter and other prominent women, resulting in the abolition of the regulations in 1886. The opponents of the

regulative act in England became much incensed at the resolution of a medical congress in Vienna in 1873 which, in harmony with the almost universal opinion of physicians at that time, demanded an international law for the examination of prostitutes and the licensing of houses of ill fame. In 1875 therefore the International Federation for the Abolition of State Regulation of Vice was organized, which sponsored a series of international congresses. The opposition to state regulation was given another fillip by the exposure, in the late 1870's, of vast corruption in the system of regulation in Brussels, long considered a model. In 1899 the Belgian minister of health called a conference at Brussels, attended by representatives of thirty-three nations, which recognized the insufficiency of the whole system of administrative measures. Soon thereafter the International Society of Sanitary and Moral Prophylaxis was founded, and it in turn instituted national societies. Three years later under the same auspices a second conference was held at Brussels.

Except for a short lived experiment in St. Louis in 1870-74, official regulation of vice never gained a foothold in the United States. Many American cities, however, did tolerate districts in which prostitution flourished and was in effect regulated by the police. Beginning about 1905 "committees of fourteen" and "vice commissions" were organized in many of the larger cities, and their reports invariably recommended the abolition of segregated districts. Chicago is supposed to have led in the closing of its "red light district" in 1912, and during the next five years some thirty cities followed suit. Depending upon local politics and police administration, the abolition of segregated districts remains more or less complete.

The efforts of conferences and societies to abolish the state regulation of prostitution in the various countries were greatly fortified by a recognition of the international implications of vice. From the early Middle Ages the desire to protect women citizens from debauch had led to a demand for foreign prostitutes. In the eighth century St. Boniface, writing to an English synod to discourage English women from making pilgrimages, declared: "There is scarcely a town in Italy, or in France, or in Gaul where English prostitutes are not to be found." Migrations of women for purposes of prostitution were fostered by foreign wars and religious crusades; some of the female camp followers of secular and religious armies remained abroad to practise

their profession. Doubtless with the passing of the centuries the demand for foreign prostitutes developed and the means of satisfying it became organized. Not until the 1870's, however, was the theory enunciated that government regulation of prostitution promotes international traffic in prostitutes. This recognition of the international aspects of vice regulation led to two types of effort at control: national enactments against the so-called white slave traffic and world wide cooperation to eliminate it.

National enactments may be illustrated by the British Criminal Law Amendment Act of 1885 and the Mann Act (White Slave Traffic Act) in the United States. Allegations made in 1880 that English women were being consigned to continental brothels led to an official British investigation and to the enactment in 1885 of measures against procuration, which put an end to traffic from England to the continent. In the United States the Immigration Commission in 1907-09 made an investigation into the "Importation and Harboring of Women for Immoral Purposes," which established that many women and girls were being imported into the country and distributed throughout the states for purposes of prostitution, that some of the victims were unwilling but that most were willing, that they were purchased by letter or through agents abroad for prices ranging from \$200 to \$2000. This investigation led to an amendment of the immigration law and the enactment in 1910 of the White Slave Traffic Act, placing severe penalties on the transport in interstate or foreign commerce of women or girls for immoral purposes. These federal measures, which succeeded in breaking up the organized commercial traffic to and within the United States, were supplemented by state legislation inspired by the disclosures of the local vice commissions. Between 1911 and 1915 forty-five states passed laws prohibiting third persons from profiting financially from prostitution, and punishing those guilty of forcing women and girls into prostitution, those guilty of pandering and those subsisting on the earnings of prostitutes.

More direct cooperation for the suppression of the white slave traffic began in 1899 with an unofficial congress in London called by the National Vigilance Association. This congress led to the organization of national committees acting independently of the governments but in agreement with them; it led also to a preparatory conference in Amsterdam in 1901, a second unofficial congress in Frankfurt in 1902 and, more

important, an official conference summoned by the French government in 1902. This conference at Paris resulted in an international agreement, signed by thirteen nations in 1904 and later adhered to by others, providing for a central authority in each country to consider information concerning procurement of females for immoral purposes abroad. Six years later the French government called another conference, which went much further than its predecessor: thirteen nations promised to make the procurement of women and girls punishable, extraditable and subject to vigorous prosecution.

The World War emphasized anew the dangers of uncontrolled venereal disease and raised doubts concerning the effectiveness of official activity. Accordingly, in 1919 the League of Nations (Covenant, art. 23c) was entrusted with general supervision over the execution of agreements with regard to the traffic in women and children. The League not only appointed a permanent officer to keep in touch with all matters relating to the traffic but in 1921 summoned an international conference at Geneva, attended by representatives of thirty-four nations. This conference suggested a new draft agreement, requested that the League Council set up an advisory committee and urged that governments be invited to make annual reports of conditions. In September, 1921, a convention, supplementary to the previous international agreements and carrying into effect the recommendations of the Geneva conference, was signed by representatives of thirty-three states. An Advisory Committee on the Traffic in Women and Children (later a part of the Advisory Commission for the Protection and Welfare of Children and Young People) was thereupon established. It has made several reports, has integrated some of the official and unofficial activities in relation to the traffic and has made possible the publication of two elaborate inquiries by a special body of experts into the conditions of prostitution and the traffic in women and children in Europe, North and South America and the East.

Significant as these international efforts have been, the numerous and repeated resolutions of the Assembly, the Council and the Committee on the Traffic in Women and Children indicate how far short the measures fall. The point of national resistance is the governmental regulation of prostitution. The French government, for example, has frequently reiterated that "the system of prostitution . . . considered in its administrative aspect, remains . . . a purely domes-

tic matter." The League has therefore never directly and officially recommended the abolition of licensed houses, even after its special body of experts had declared that "the existence of licensed houses is undoubtedly an incentive to traffic both national and international. The inquiries made by us not only confirm this fact but show . . . that the licensed house becomes in some countries the centre of all forms of depravity." The main contributions of the League have been the information it has supplied, the impetus this information has given to bettering local conditions in certain countries and the realization of international interdependence in combating prostitution.

The limitations on the function of the League must not obscure the fact that through its activities and those of unofficial cooperating organizations the twentieth century has witnessed a swing away from the sanitary regulation of prostitution toward the development of a more effective type of control. According to the report of the Committee on the Traffic in Women and Children, which was made in 1927 and supplemented in 1930, thirty countries have no system of licensed houses of prostitution: Australia, Bolivia, Bulgaria, Canada, Cuba, Czechoslovakia, Danzig, Denmark, Dominican Republic, Estonia, Finland, Germany, Great Britain, Hungary, India, Latvia, Luxemburg, Monaco, the Netherlands, New Zealand, Nicaragua, Norway, Poland, Rumania, San Marino, South Africa, Sweden, Switzerland, the United States and Uruguay. Of these, three, Czechoslovakia, Latvia and the Netherlands, have not completely abolished licensed houses in all their towns or communes. Only eighteen countries appear to have a system of licensed houses: Albania, Argentina, Austria, Belgium, Brazil, Egypt, France, Greece, Guatemala, Italy, Japan, Yugoslavia, Panama, Peru, Portugal, Salvador, Siam and Spain. Three of these, Austria, Greece and Yugoslavia, were in 1927 considering abolition or limitation of the number of licensed houses. In Japan opposition to licensed prostitution has gained considerable headway during the past few years and several prefectures have taken steps locally to abolish the Yoshiwara, or prostitute quarter. A few countries which have no licensed houses, including Bulgaria, Estonia, Finland, Latvia and Poland, exercise some supervision over prostitution, usually through registration.

State regulation has the advantage of recognizing the hygienic dangers of prostitution and

of seeking to control them. The weakness of the system lies in its failure to attain the end for which it was designed and in the new set of evils to which it gives rise. At best, state regulation by no means achieves its aim of supervising all prostitutes. The younger and less debauched women, who are generally most averse to registration and who can easily escape detection, are certainly not likely to be free from infection, for a prostitute seems rarely to escape venereal disease for more than two or three years after entering the profession. In order to effect a satisfactory degree of regulation there must be a special body of police agents; to entrust this duty to the ordinary police provides opportunities for intimidation and blackmail, a temptation to which even special "morals police" are not immune. Moreover, registration, even when it is fairly extensive, has three inherent drawbacks: first, the system encourages continued prostitution, in that a woman once registered so loses caste as to find it more difficult to win her way back to respectability; second, the system of licensed brothels recognizes the pecuniary interest of third persons, an interest which itself makes for the increase of prostitution; third, the system discriminates against women who may be only the innocent carriers of an infection caught from a man who remains a free agent and a menace to other women. In fact elaborate surveys indicate that the frequency of syphilis and gonorrhea among women in the United States is only 4.86 per thousand; among men, 10 per thousand.

If sanitary control is not a satisfactory method of attacking prostitution, the problem still remains to be solved. The answer turns upon the causes of prostitution. It has been held by many criminal anthropologists, including Lombroso, that one important cause is biological, that prostitutes are of a distinct type physically, mentally and morally. Even if anthropometric knowledge were so precise as to show some biological basis of selection among women of the same social class who take up prostitution, there are yet many acquired characteristics which must be taken into account and which tend to vitiate the theory. The economic factors associated with prostitution suggest that prostitutes are recruited by attraction rather than by compulsion. One element may be wages that are below the level of subsistence, but case analyses show this to be but rarely a causal factor. The economic origin of prostitution manifests itself rather in women who are close to the economic margin

and who feel that the difficulty and monotony of their life can be lessened and their desires satisfied only through exploiting the sex function. This theory is supported by the fact that the number of prostitutes varies with seasonal and casual labor: in certain employments women look upon prostitution as a regular source of incidental income. Cyclical economic changes too seem to vary the volume of prostitution; it has been said that "morals fluctuate with trade." More subtle in their implications are what may be termed the social causes of prostitution, usually classified under the headings of housing, personal relations and public attitude, education and recreation.

Many practical suggestions have been brought forward to eliminate these causes, economic and social, and thereby to decrease prostitution. An aid in deflecting the economic bases of prostitution would be the improvement of the material conditions of the wage earning class, especially of young women. Many of the social causes are now in the process of elimination or mitigation. Living conditions have improved through modern housing schemes and the sanitary laws which have necessitated them. A growing recognition of the need of the community to supervise family and personal relations more minutely is manifest in the world wide interest in juvenile courts, in the gradual tightening of marriage laws and in the liberalization of divorce laws, and in the establishment of marriage advice bureaus. Moreover the very lack of supervision, the much discussed breakdown of authoritarian standards of right and wrong and the change in attitude toward the conventions of sexual morality may afford means of emotional gratification apart from prostitution. In the field of education and recreation much has been accomplished through such legal and administrative measures as the supervision of dance halls, cafés and other public places of amusement and through the work of the social hygiene movement with its program of sex education and sex enlightenment. Finally, the increasing establishment in all countries of venereal disease clinics has been an important factor in combating prostitution and its effects. An encouraging example of what can be done in this direction is Soviet Russia with its system of prophylactoria for the social and economic as well as the physical rehabilitation of prostitutes.

Most of the economic and social causes of prostitution, however, are associated with industrialism and urbanization. The problem of con-

rol was essentially different before the industrial revolution because in the small cities regular houses of prostitution and their inmates could be known. When London had a population of 35,000 and Paris a dubious 200,000, when many important towns had no more than 5000 inhabitants, the distinction between the vicious woman and the virtuous was clear and unmistakable. In the great modern cities there is no basis for singling out by abode or dress even the avowedly professional prostitute; the part time prostitute, the occasional or selective prostitute, although presenting the same problems as the professional, is seldom distinguishable at all. The city has not only concealed the supply but increased the demand. Young men drift to the city from the country or small towns or from abroad because of the greater comfort and vocational opportunity it offers. The breach of home ties and the anonymity of city life with its absence of the restraining check of neighbors' opinion, combined with low wages and loneliness, conduce to meretricious association rather than to marriage. Obviously in a struggle with these larger social forces law can play some part in eliminating the third party interest in prostitution and in damming the sources of international supply. Medicine can play an effective role in emphasizing and helping to exterminate the infectious consequences of prostitution. Education can make individuals aware of the specific dangers and the community conscious of the general evil. But the realization is growing that the economic origins of prostitution cannot be eliminated by the mere provision for physically adequate wages so long as there remain vast discrepancies between individuals in material wealth, that the social seeds of prostitution cannot be sterilized so long as they lie at the roots of an industrial society. Prostitution is not a disease of the social organism; it is merely a symptom of the disease.

PROTECTION. In economic discussions the term protection, when used without qualifying phrases, refers to a form of governmental interference with foreign trade. Opinions differ as to what specific form of interference is meant. The orthodox view, still widely held, designates as protectionist only those measures which are intended to change the course of trade as distinct from measures directed to other objects, such as the creation of revenue. Cobden, for instance, persistently pointed out that free traders "ask for nothing which involves any change of taxation of any kind," that free trade "does not require that one shilling of taxation should be removed, which goes solely to the Queen's exchequer" (speech of January 15, 1845; *Speeches on Free Trade*, London 1903, p. 127). According to this definition free trade is the only alternative to protection. Yet for certain purposes, such as the elucidation of the factors which have favored protection, it appears advisable not to lump together all types of measure intended to influence foreign trade. From this point of view the criterion by which protectionist commercial policy is distinguished from non-protectionist, but still active, policy is its bearing upon the supply of commodities in the community: the spearhead of protectionism is turned against the "danger" of a large supply.

Broadly speaking, the organized communities of antiquity as well as the cities and states of the earlier Middle Ages were eager to retain within their borders as large a commodity supply as possible; Francis Bacon aptly termed this a "policy of plenty." With regard to foreign trade it amounted to a restriction of exports, although imports were to some extent encouraged at the same time. During the Middle Ages there were innumerable export prohibitions, while import prohibitions were few and often entirely absent. Customs duties, not an important element of this policy, worked mainly in the same direction. Commercial treaties aimed at securing imports, granting exports only by way of compensation. The contrast between this policy and that which followed has made the former appear much stranger than is theoretically justifiable. The practical measures to which it led were, it is true, rather short sighted, but the essential underlying idea is the logical corollary of the view that the aim of economic activity is the satisfaction of human wants, through material things in the first place. This does not mean that commercial and industrial rivalries played no part in the pre-protectionist period; their effects, however, were different from those found under protectionism. In the field of commerce the old methods sought to make a community the "staple" for commodities, which of course favored their importation. Industrial rivalry might have been expected to turn against commodities, but in view of the prevalent opinion upon that subject craft guilds and municipal authorities usually confined themselves to measures against foreign artisans.

The rise of protection broke through this phase of commercial policy. If the older policy was found almost everywhere—in towns all over the European continent and in countries with strong royal governments like England or Sweden—protectionism ended by becoming even more ubiquitous. The fact that the change in opinion was so general suggests that it must be traced back to some fundamental economic transformation of universal import. Perhaps the most significant innovation of this type which could be expected to effect a change in the attitude to commodities was the spread of money economy. Indeed as long as trade meant the giving away of commodities in exchange for those received, it was scarcely conceivable that it would be considered advantageous to acquire as few commodities as possible in exchange for those given away. But when people began to

think in terms of money exchange, they came to look upon money as the aim and end of trade; imports then became dangerous as depleting the community of "treasure," while exports were invaluable as increasing the stock of money. Even where the accumulation of a stock of money was not the primary desideratum, foreign imports came to be regarded as a serious threat to home production and employment, once their importance to consumption had been lost to sight. It is virtually impossible, however, to trace chronologically the connection between the spread of money economy and the shift to protection; both processes were gradual, and the change in mental habits did not follow immediately upon the change in actual conditions.

The first clear manifestations of protectionism on which definite information is available date from the early thirteenth century in the towns of northern Italy, the most highly developed region of western Europe during the Middle Ages. Traces of protectionism can also be detected a century later in Belgium, another center of mediaeval industrial life. It appears to have gained a permanent foothold in England and France about the middle of the fifteenth century, while economically backward countries, like Sweden, remained upon the old basis throughout the sixteenth century. But from the seventeenth century on scarcely any country escaped the transition to protection, a development which constituted one of the foremost aspects of mercantilism. It must not, however, be assumed that protectionism completely displaced the policy of plenty; on the contrary, national commercial policy as a whole remained for a long time a medley of regulations based upon a variety of old and new principles or upon none at all. As late as the opening of the nineteenth century hundreds of export prohibitions were still on the statute books; it was only as a result of tariff reforms after 1815 that the professed policy of the mercantilist period was integrated into a consistent whole.

It has been suggested above that the pre-protectionist system was subject to criticism even upon its own premises. Hampering exportation was of course not at all conducive to a plentiful supply of commodities within a community, because such restrictions acted as a check on production. This objection was stated with remarkable clarity by the English writers of the mid-sixteenth century who made an important advance in the understanding of economic processes in recognizing that consumption draws

not upon a stock of goods, fixed once for all, but upon a continuous flow of production. This view did not of itself lead to a protectionist position, as is clear from the case of Adam Smith. Yet in stressing the importance of production it created a basis for protection; and when combined with the fear of an unsalable commodity surplus, this production emphasis was magnified into a hypostasis of production as an end in itself, a belief most characteristic of mercantilism.

In one sense, however, protectionism and 'productionism' are plainly incompatible. The most important method of stimulating production is to reduce the costs involved, to depress the prices of the elements entering into the production process. With regard to non-agricultural raw materials, which were usually plentiful, the achievement of this condition met with little difficulty but was under the circumstances comparatively unimportant. Much more far reaching was the maintenance of low wages. But an insoluble dilemma presented itself in the case of such elements as were themselves the result of a production process. Either the price of these elements must be kept down, with a resultant check upon their production; or their production must be encouraged through measures against their importation, so that the consequent increase in their price would raise the cost of other products.

The most important branch of production to which this difficulty would apply was agriculture. The pre-protectionist policy had embraced virtually all commodities, but it had everywhere centered upon foodstuffs, particularly wheat. It is not surprising therefore that it was retained for a much longer time in agriculture than elsewhere. After a while this discrimination was justified by arguments along protectionist lines; a plentiful supply of foodstuffs was viewed in the same light as that of raw materials and machinery, for it was a condition of low money wages. Few if any countries on the European continent changed their grain policy before the seventeenth century, and many retained it more or less unchanged through the eighteenth century, although a blending of anti-export and anti-import regulations was also very common. The most important continental power, France, was one of the most conservative in this respect. Until the middle of the eighteenth century the old export prohibitions applied in France even to the interprovincial grain trade; with regard to foreign exports the change in attitude came

considerably later. It is usually stated that the physiocrats undermined the old system, but it should be noted that in application to agriculture Napoleon accepted it emphatically; only in 1819 did the French grain policy definitely turn against imports instead of exports. The one notable exception to the persistence of pre-protectionism in agriculture was England. Already in the first half of the fifteenth century, before English protection acquired any importance for industry, remarkable official utterances attacked cheap corn, which almost everywhere else was at that time considered a great blessing. England gradually drifted into a policy of high agricultural protection, culminating in an export bounty on wheat established on a firm basis in 1689. Another, although much less important, instance of protection, which laid bare the internal contradictions of the system, was the encouragement to shipping, often detrimental to production for export.

While protectionism did not introduce the use of commercial policy as a weapon of international struggle, it multiplied and intensified the measures taken against the economic welfare of other countries. The prevalent view was that there could be no economic progress except at the expense of another country; and the new policy therefore laid the foundation for the trade and colonial wars which raged with few interruptions from the middle of the seventeenth century to the downfall of Napoleon. On the other hand, the prevalence of smuggling, made possible in part by the general inefficiency and corruption of the official apparatus, limited the practical effectiveness of the system; and the universal eagerness to export prevented the trade wars from interfering to any considerable degree with trade even between belligerents.

Although the thought of protection must naturally occur to those who live under a money economy, that fierce onslaught on protection, *laissez faire*, succeeded in achieving results which were long of very great importance. The new ideas emerged before the industrial revolution in England had radically affected the structure of society; and up to a point it was the sheer intellectual power and moral force of *laissez faire* ideas which made people doubt the value of principles followed for many generations. The final victory of free trade in Great Britain, however, was brought about in large part by that country's industrial superiority and owed much to the belief, studiously fostered by the Anti-Corn Law League, that only by admit-

ting foreign corn free of duty was it possible to reap all the benefits of the industrial hegemony of the country.

It was precisely this consideration which paved the way for a revival of protectionist ideas elsewhere. The notable advocates of nineteenth century protection on the continent as well as in the United States were united in their eagerness to ward off British competition by erecting tariff walls; they looked upon British free trade as a means of reducing all other nations to hewers of wood and drawers of water, and upon British sponsorship of international free trade as a Machiavellian trick of kicking down the ladder by which England had reached her supremacy. The only way to attain equal status with Britain was thought to be protection; and British industrial success therefore became one of the principal arguments for the new protection of the nineteenth century.

The really important reason for this new protectionism was the general reaction against the philosophy of laissez faire. Its economic tenets contained little that was new, and its practical methods were but a refinement of the old; but its basic political and social philosophy presented in some elements a direct contrast to much of the earlier thought. To the economics of protectionism the United States made the most notable contributions. In his *Report on Manufactures* (communicated to the House of Representatives December 5, 1791; latest edition in 1913 in 63rd Cong., 1st sess., Senate Document no. 172) Alexander Hamilton supplied an exceptionally able review of the arguments for protection, although he added few original ideas. A century later Simon Patten in his *The Economic Basis of Protection* (Philadelphia 1890) emphasized the dynamic view more strongly than had ever been done before and struck out along new lines in devising arguments for a permanent rather than a transitional system of protection. Neither these writers nor Henry Carey made much impression upon European economic thought as compared with Friedrich List, who had, however, been considerably influenced by his stay in America. Most of the leading protectionist writers merely restated mercantilist arguments, with the one significant difference that they stressed the importance of production more than had been done in the earlier period, when commerce and navigation were in the foreground partly because of the genetic connection between mercantilism and mediaeval town policy.

The social philosophy of the new protectionists merits much more attention. The general social ideas of mercantilism and laissez faire were to a large extent similar, inasmuch as both were based upon the concept of natural law and shared the mechanistic approach. In conscious opposition to the rationalism of the seventeenth and eighteenth centuries, the conservatism and romanticism of the nineteenth looked upon the state, not as a mere aggregate of individuals but as an autonomous entity governed by fundamental and more or less unalterable historical laws rather than by economic considerations affecting individual behavior. This view is most typical of List and constitutes the key to his influence. He was one of the first to construct a series of "stages" of economic evolution. In order that an economy might pass from the "agricultural" stage into the "agricultural-manufacturing" or the "agricultural-manufacturing-commercial"—by that time reached only in Britain—industrial protection appeared to him indispensable; before and after that transition it was pernicious, as agricultural protection always is. His objections to the "school"—the laissez faire economists—cut much deeper when he contended that they were concerned with exchange values instead of productive power and that the power of creating wealth was much more important than wealth itself. It was of course the infant industry argument in another garb; but it served also as the intellectual basis of all modern labor legislation and as such was one of the fundamental ideas of the nineteenth century.

Curiously enough the emergence of List and Carey coincided with the peak of free trade in Europe. At the beginning of the 1840's the British tariff was greatly simplified, and in 1846-49 the British corn laws were abandoned; in 1860 the Cobden-Chevalier treaty between England and France was concluded, and its immediate consequence was the introduction of complete free trade in Britain. It also paved the way for international developments: the great system of commercial treaties created in the 1860's under French leadership brought Europe, especially through the accession of the German Zollverein, nearer to free trade than ever before or since. Almost all the countries of the world, with the exception of the United States and Russia, were profoundly influenced by this movement, and it was felt even by them.

The following decade witnessed the rise of the new protectionism in practise; the turning

point came in 1878-79, when Austria, Germany and Italy went over to protection. The transition was prepared by two important developments: the downfall of Napoleon III, removing an influence which had for various reasons favored liberal ideas in the international field; and the appearance of American agricultural competition, a change at once more profound and swift in its action than the former. Protection thus came to mean agricultural duties in the first place, a situation indicative of the limited influence exercised by protectionist writers, most of whom, and List more than anyone else, had deprecated agricultural protection. It became necessary therefore to work out the principles of a "solidarity system," extending protection to both industry and agriculture; this was obviously an impossible task, for a system of uniform protection for all is theoretically nothing but a complicated and roundabout form of free trade. It is not surprising therefore that the arguments in its favor brought forward by Bismarck in 1878 were not very different from those advanced in England in 1549 for solidarity in export duties: "What reason is it that you should be at large and I to be restrained? Either let vs all be restrained together, or els let vs all be at like libertie" (Hales, John, *Discourse of the Common Weal of this Realm of England*, ed. by E. Lamond, Cambridge, Eng. 1893; reprinted 1929, p. 56). In practise of course the solidarity system was decidedly unlike free trade: it was impossible to balance the various duties so as to favor equally even forms of production for the home market; much less could the adverse effect of import duties on the volume of exports be entirely eliminated or distributed. Whatever else it accomplished, the solidarity system therefore impeded international trade; indeed the idea of national self-sufficiency gained more ground in the period preceding the World War than it had under mercantilism. The dominant idea of the new protectionism as of the old was, however, not national autarchy but the restriction of imports simultaneously with an expansion of exports. Far more self-consistent was another motif, especially noticeable in Germany around 1900—the attempt, contrary in spirit to List's teaching, to reverse a trend toward lopsided industrialism. The ideal of a many sided, harmoniously developed, national economy was very old; it had, for instance, a significant place in Hamilton's system. In view of the spectacular expansion of German industry, however, it was now brought to bear in favor of agriculture

somewhat on the lines of England under mercantilism. Although, generally speaking, protection never has impressed economists nearly as much as free trade had during the previous period, in Germany a good many of the professional economists, notably Adolf Wagner, upheld this view, defending the *Agrar- und Industriestaat* against the *Industriestaat*; their influence, however, counted for little in the adoption of the new policy.

The factors which brought about a shift in policy were of a different order from those considerations which are supposed to sway the judgment of the academic mind. The more important of the real factors can be observed quite clearly. To begin with, there occurred a change in the balance of the true or assumed interests of various social classes. In this connection must be noted first of all the almost universal absence of an organized consumer opinion. Although the great organizations of labor democracy, the trade unions and the socialist parties, have long adhered to free trade, their attitude has naturally been that of producers, so that their ability and later even their willingness to act as upholders of free trade have not been particularly strong. Agriculturists remained free traders so long as protection was confined to industry; and in general before the 1870's in countries other than Great Britain they had little fear of foreign competition and therefore small inducement to embrace protection. For this reason the rise of American agricultural competition, which converted one of the largest and most influential classes to protectionism, was of outstanding importance to the commercial policy of the European continent. On the other hand, the importance of independent merchants, who as distinct from industrialists were the natural upholders of free trade, diminished steadily from the middle of the nineteenth century. Most interesting of all was the position adopted by the industrialists. That representatives of such trades as stood to gain by specific duties should have asked for them was only to be expected; but that so little was heard from the export industries was surprising. Instead of demanding the abolition of duties which could not fail to damage them, their representatives usually confined themselves to requesting special favors of another kind, if any at all. To some extent this may be explained by the growing feeling of solidarity between business leaders in different branches of industry who wanted to show a united front, especially against labor. But the

question still remains as to why the interests of producers for the home market should always have prevailed among them, even in countries to which industrial exports were of vital importance. The answer appears to be that under a system of money economy the ordinary man, when not influenced by private or sectional interests, is at heart a protectionist. The *laissez faire* creed, strenuously, uncompromisingly, even intolerantly upheld as the only possible road to economic salvation, seems to have been the only force which could counterbalance this tendency; and when the general ideas of economic liberalism became undermined, free trade went inevitably by the board. It is scarcely fair to inquire whether an intensive and tireless propaganda imbued with the spirit of Cobden and Bright could have stemmed the tide, for the intellectual basis of free trade had ceased to exist.

Another factor in the rise of the new protectionism was the changes which supervened in international political relations. It is generally believed that economic causes have been the most fruitful source of international complications, but in actual fact the sequence has been more commonly reversed. It is international enmity and jealousy which engender the feeling that a competition is intolerable which would otherwise have been considered beneficial. Broadly speaking, the intensification of nationalism before and still more after the World War has led to economic antagonism and thereby to protection, which in its turn has aggravated political belligerency. In addition, protection, like free trade, is to some extent self-propagating. The adoption of protection by one important country induces an immediate reaction in almost all other countries, partly by force of example, but for the most part through the difficulties which it creates for them; and the next step is imitation, which wipes out part of the trade not already destroyed by foreign duties. Besides the reduction of both imports and exports as a result of protection may create for the products which still enter the channels of trade a somewhat more favorable exchange ratio than would have obtained if foreign protection were confronted with free trade; so that even upon theoretical grounds it is not always easy to say whether protection is better fought by free trade or by protection. In such a situation, however, theoretical arguments are quite immaterial, for elemental forces compel a policy of retaliation, of "not taking it lying down," of

trying to make other countries see the error of their ways by imitating them. Moreover under widespread protection commercial treaties draw country after country into the system: a free trade country, unable to grant tariff concessions, finds it difficult to secure important reductions in foreign tariffs.

This does not imply that all countries have become protectionist at the same time or to the same extent. Many causes have contributed to such national differences, political factors being perhaps paramount. Causes of an economic character have of course also been operative. Thus countries of a pronounced commercial cast, like the Netherlands and Denmark, have been slow to embrace protection. Partly for the same reason the smaller countries have usually been more interested in free trade than the larger ones. This is one of the few features in the entire history of protection which may be called reasonable; for, *ceteris paribus*, the importance of the home market increases with the size of population, so that a large country may enjoy many of the benefits of free trade without resorting to foreign trade at all. It has been well said that the greatest victory of free trade was the permanent elimination of tariff walls separating the thirteen colonies upon the creation of the United States.

The important developments of the protectionist period between 1878 and 1914 centered around commercial treaties, a whole network of which was erected under the leadership of Germany. The central European treaty system, inaugurated in 1891, reduced somewhat the duties imposed during the preceding decade and thus was to a certain extent free trade in spirit; it was followed, however, by a treaty system based upon the German tariff of 1902, which transformed treaty making into a powerful mechanism for protection. Tariffs were carefully framed so as to restrict what could be given away by treaty. Numerous duties were raised in order to allow at most a return to the old basis as compensation for reductions in the tariffs of other countries; but this was a game which everyone could and did play, with the result that tariffs rose all along the line. The use of maximum or minimum, or general and conventional, duties usually intensified the rise. The most-favored-nation clause, which in the 1860's was regarded as an instrumentality for the extension of free trade, was now so manipulated as to counteract that tendency as much as possible. Tariffs were made more detailed, in order to

prevent reductions accorded to one country from benefiting other parties admitted to the most-favored-nation clause. The same result was sometimes achieved by attaching special conditions to the reductions granted, as in the famous case where it was provided that butter must be made of milk coming from cows grazing at a specified minimum altitude above the sea level in order to prevent lowland countries from profiting by the reduced duty. When the special condition becomes a quota, so that the reduced duty is limited to a stipulated volume of imports, the clause is retained in little more than name. The same is very largely true of the reciprocity condition, by which reductions are extended to third parties only if they offer equivalent compensation.

Besides treaties many other measures were pressed into the service of protection. Railway rates were arranged so as to favor exports, either explicitly or implicitly; in Germany they were even used to shelter the eastern parts of the country from the competition of the western section. Veterinary control of imported meat and pork hampered or shut off their importation. To a very large extent trademark and patent regulations compelled production of the respective articles within the consuming country. Most important were drawbacks, operating as virtual export bounties and often supported by direct bounties. Of these the enormous bounties on beetroot sugar in the countries of continental Europe furnished a very strong stimulus to beetroot cultivation and sugar production but created at the same time one of the most thorny questions of international commercial policy in the 1880's and 1890's, when the opinion was widely held that this system was unfair; the Brussels convention of 1902 abolished many of these bounties.

While on the European continent few countries, apart from Belgium, the Netherlands and Denmark, remained outside the new protectionist movement, Great Britain continued to uphold the principles of free trade. Even here, however, strong influences were at work to reverse a policy of which Britain had been the foremost champion. The abolition of the old colonial system emancipated the British colonies from subservience to the ideal of a self-sufficient empire; but contrary to the hopes of free traders, the self-governing dominions turned increasingly toward protection for their own industries. Although by the end of the nineteenth century imperialism was gaining ground, they gave pref-

erence to British manufactures merely by raising the tariffs against imports from other countries. In Britain this move met with sympathetic response in many circles at the same time that foreign competition, especially from Germany, caused much uneasiness and antagonism. The Boer War tended to cement the union between the mother country and the colonies, and in 1903 Joseph Chamberlain called for a return to protective tariffs, including duties on foodstuffs. He based his appeal upon imperialist as well as protectionist arguments of the usual type, but for the time being his campaign was unsuccessful.

In retrospect pre-war protection appears to have been comparatively mild. Prohibitions had disappeared more or less completely, and customs duties were seldom entirely prohibitive. Although it no longer operated in the direction of free trade, the most-favored-nation clause as a rule prevented discrimination against particular countries; so that, despite the multiplicity of important protective measures, trade followed largely the same channels as would have prevailed under free trade.

The World War created a totally different situation. Since it was mainly a trade war, trade entered largely in the consideration of both parties; and since it was waged with unexampled ruthlessness, few measures of coercion in the economic field were left unused. In a sense the World War resembled the continental system of the early nineteenth century, but with one profound difference. The continental system was a trade war on intensely mercantilist or protectionist lines, in which an attempt was made to prevent exports from enemy countries and to "vanquish them by excess" through enforced imports. In the World War, on the other hand, the belligerents were bent upon literally starving their enemies. While "plenty" had been the bugbear of pre-war times, every war government was eagerly attempting to draw supplies to its own country and to stop leakages to enemies or even neutrals. In this respect the policy of the war years was remarkably similar to that of the pre-protectionist or mediaeval period. Export prohibitions became the order of the day; trade agreements granted exports only as a favor in compensation for imports; cargoes were seized on the high seas and unloaded in the ports of belligerents. Under the stress of an exceptional scarcity and an unprecedented rise in prices, both of which yielded enormous profits to business, humanity for a short time returned to the

view that goods are a blessing rather than a curse.

In the post-war period protection has passed far beyond its pre-war level; and since Great Britain's formal adoption of protection in 1931 virtually no country is on a free trade basis. A restrictive policy has finally been developed which has had no counterpart for a century; and almost every conceivable device has been used to check imports and to encourage exports. Import duties have been increased almost without interruption and have been changed without notice; they have been supplemented by a host of other measures—state monopolies of foreign trade, import prohibitions, import quotas and foreign exchange or "clearing house" regulations, which may be used to reduce the funds available for purchases abroad. On the other hand, exports have been encouraged by bounties and state credits. Repeated attempts have been made to remedy the situation through international conferences, but resolutions have proved of no avail; commercial treaties have frequently been made but have seldom been retained. In this period the obstacles to trade have not remained on paper, as was often the case in earlier times; for the increased efficiency of state administration has reduced smuggling to insignificance, and the power of the government over banking and foreign exchange has given it an influence unheard of before the twentieth century. The story of protection ends at the present moment with its victory all along the line, although it is impossible to say how long it will last.

The causes which have brought on post-war protectionism are on the surface. The international political situation has been an important factor. The treaties which ended the war set up a number of new states, each with its own economic vanity, with the result that customs lines were lengthened by 11,000 kilometers. A great country, Russia, broke away from the orbit of the western economic system and instituted a state monopoly of foreign trade as of most other economic activities. Political antagonism between former belligerents long prevented a return to the old forms of intercourse, while reparations and war debts relegated to the background ordinary trade considerations in commerce. Purely economic factors also were influential. All branches of production had flourished in the hothouse atmosphere created by the trade and monetary policies of the war years; an abrupt transition to freedom of trade would have meant short shrift to wartime industries. The drastic decline of prices in 1920 caused new difficulties

to industry; and when industry recovered, agriculture was severely hit. The great depression which set in with full force in 1929 affected every branch of economic activity more disastrously than any crisis in the memory of man; and the governments responded by trying whatever was nearest at hand to ease the situation temporarily, without regard for ultimate consequences. The result has been an unprecedented dislocation of international trade.

At present therefore the economic incidence of protectionism is an exceedingly timely topic. While there are numerous studies of the influence of protection on single industries, few attempts have been made to elucidate inductively the effects of a protective system as a whole. One of the few works in this field is that of the Swedish Tariff and Treaties Commission, some of whose conclusions may be of general validity. The study is based upon a comparison of the development of Sweden in the quarter century preceding the World War, under a solidarity system of the usual type with somewhat lower duties than the German one, with that of some of the neighboring countries, especially Denmark, which remained on a free trade basis.

The industrial expansion of Sweden, which in this period had been marked, is to some extent due to protection. This certainly was the cause of the growing preponderance of such industries as were the direct beneficiaries of protective duties. The importation of foodstuffs and manufactures was reduced and that of raw materials increased. Since imported raw materials went in the first place to protected industries they became largely dependent upon imports, while export industries remained on the basis of domestic materials; the connection of this development with commercial policy appears clear. There was a plainly discernible tendency to carry the manufacturing process further toward the finished products stage and toward greater diversification. More industries appear to have been working for the home market than would otherwise have been the case; the size of the market was thus reduced, as a result of both foreign and home protection, and the cost of production was raised. Not a few young industries may be regarded as the offspring of protection; but the number of cases where the infant industry argument has held good, that is, where protection fulfilled its object and became superfluous, was very small.

The conclusions with regard to agriculture are more clear cut. Production of vegetable

foodstuffs was increased in the south of Sweden, while similar districts in Denmark showed a different development; with regard to animal foodstuffs, which were exported and could scarcely profit by protection, the situation was reversed. In this field there can therefore be no reasonable doubt as to the effects of protection versus free trade. In the central portion of the country cereal crops declined, although probably less than they would have under free trade. In money value the total output of agriculture was probably increased less in Sweden than in Denmark, if the same prices are used for both countries; in other words, agriculturists considered both as producers and as consumers appear to have lost more than they gained by protection. It is not at all improbable that the effects of the pre-war solidarity system in other countries were similar.

PROTECTION, DIPLOMATIC. See DIPLOMATIC PROTECTION.

PROTECTORATE. A protectorate is said to exist when one state, by treaty, surrenders to a stronger state a considerable measure of the control of its foreign relations or a right of intervention in its domestic affairs in return for guaranty of protection. Actually the term is less a description of a status than a category for classifying a number of anomalous international relationships, and it has even been applied to some which are not governed by international law at all. The classic protectorate is conceived to be an international personality standing somewhere between the fully sovereign state, supposedly unrestricted in the control of its foreign and domestic affairs, and the vassal state, which is hardly more than an autonomous province with some vestige of international relations. In practice a neat differentiation is impossible and the term has been employed to cover the situation of a multitude of diverse communities, from Cuba to Kelantan.

Analogies to the modern protectorate have been sought in the alliances concluded by the Romans, particularly in the type called *foedus iniquum*. The terms of these *foedera* varied considerably, those with the *civitates foederatae* (Marseille, Utica and Rhodes among others) being closest to the modern protectorate. The subordinate states lost all control over foreign affairs, but they were exempt from the jurisdiction of the Roman provincial governor and retained their language and internal administration. In return they agreed to furnish war vessels to Rome. The first recognizable protectorates, however, are to be found in the fourteenth century of the present era. The feudal institution of suzerain and vassal influenced to some extent the legal form of these early protectorates. There was a tendency to confuse the ruler who held his lands of another with the state under protection, as in the case of the relationship between Genoa and France established in 1395, wherein France regarded itself as suzerain and Genoa as partner in an unequal alliance. Yet almost from the beginning a fairly clear distinction between the feudal relationship of suzerainty and the international relationship of protection is apparent. A small state, believing its independence to be in danger, would seek the protection of a larger state. The latter would extend it: by granting "letters of protection," sometimes in exchange for a guaranty of military support, as in the case of Florence and Monaco in 1424; sometimes without any expressed consideration, as in the case of Venice and the

Republic of Pogglizza in Dalmatia in 1444. This type of protectorate was not considered as infringing in any way upon the sovereignty of the protected state. It was regarded as a relationship of alliance rather than of subordination.

With the rise of the system of national states the institution of protectorate underwent considerable change. Beginning in the sixteenth century it was used by France as a preliminary to annexation. Treaties of protection were made by France with Cambrai, Metz, Toul and Verdun in 1551, the Duchy of Bouillon in 1606, Colmar in 1635 and Strasbourg in 1681; and all of these places were later absorbed into the kingdom of France. More widespread was the use of the protectorate as an important instrument in the politics of the European balance of power. Louis XIV employed it frequently, concluding treaties of protection with Transylvania in 1643, Württemberg in 1644, Modena in 1647 and Hamburg and Mecklenburg in 1663. It came into especial favor during the Napoleonic wars. Among the protectorates which were made and unmade were those of France over Genoa in 1797; of the French, Italian and Helvetic republics over Valais in 1802; of Prussia and Saxony over Danzig in 1807; of France over the Swiss Confederation in 1803; of France over the Confederation of the Rhine in 1806.

The treaties concluding the Napoleonic wars produced the two most interesting examples of the role played by protectorates in maintaining the balance of power. In order to prevent Austria from securing complete control of the Adriatic, the Ionian Islands were placed under the protection of Great Britain. The protectorate was terminated when Great Britain ceded the islands to Greece in 1863. A quarrel between Prussia, Austria and Russia over the possession of the city of Cracow was also solved by the creation of an independent Republic of Cracow under the protection of these three states; in 1846 the republic was annexed by Austria. One more example of the establishment of a protectorate in the interest of the European balance of power occurred in 1878 when the independent principality of Montenegro was placed under the protection of Austria in order to withdraw it from the influence of Russia.

These were the last true protectorates to be established in Europe. The unification of Italy and Germany eliminated almost all of the very small European states. The smaller states which were left had consolidated their territories; and where it was necessary to protect them either for

their own sake or for the sake of the balance of power, the institution of neutralization was resorted to. Switzerland, Belgium and Luxemburg were placed under this regime at various times during the nineteenth century. These states retained the fullest degree of external and internal independence and in addition enjoyed an international guaranty against invasion.

The break up of the Ottoman Empire brought about a new development. Various provinces in the Balkans revolted, were granted autonomy and were placed under the protection of one or more states. These situations were altogether anomalous. The provinces were nominally a part of Turkey and yet were protected by other powers. The provinces of Moldavia and Wallachia achieved this sort of status under the protection of Russia in 1829, were placed under international protection in 1856 and became the independent state of Rumania in 1878. Serbia was placed under international protection in 1856 and achieved independence in 1878. Equally anomalous were the situations in Egypt and Bulgaria; these were made vassal states under the suzerainty of the sultan, the former in 1840 and the latter in 1878. Whether either of them could be considered as international personalities was long a matter of dispute, but there could be no doubt that both possessed more attributes of sovereignty than many so-called protectorates.

In European politics the protectorate was generally a compromise measure and a stage on the road either to independence or to annexation. The game for the maintenance of the balance of power led to the invention of new devices for compromise. The World War produced only a single bit of European territory which could be regarded as a protectorate, the Free City of Danzig. The constitution of the Free City is under the protection of the League of Nations, but its foreign relations are conducted by Poland—a unique division of two of the usual characteristics of the protectorate. There remains but one state in Europe which can be definitely called a protectorate, the Republic of San Marino under the protection of Italy. Two others are sometimes put in that category: Andorra, a curious survival of the Middle Ages, a feudal fief rather than a state, controlled by two co-seigniors, the bishop of Urgel on behalf of Spain and the prefect of Pyrénées-Orientales on behalf of France; and the principality of Monaco.

But while the institution of protectorate

languished in Europe, it flourished in other parts of the world. The experience of the British in India and the Dutch in the East Indies showed it to be an excellent substitute for military action and occupation in furthering imperialistic aims. Well into the twentieth century the subjugation of vast areas in Asia and Africa proceeded by this means. Military action insufficient to effect a complete conquest was often enough to force a native ruler into concluding a treaty of protection. The danger of interference with the protected country by another European state was obviated by the assumption by the protector of the control of the foreign relations of the weaker country. At the same time a measure of control over its domestic affairs was assured by the appointment of a "resident," or "adviser." This was the course taken with scores of oriental states—Oman, Nepal, Annam, Tonkin, Morocco, Zanzibar and many others. Inevitably these protectorates degenerated further and further toward the condition of annexed territories. The outstanding exception is Egypt, which became a British protectorate in 1914 and achieved substantial independence in 1922.

This use of the protectorate as a stage on the road to annexation was so effective that it tended to develop into habit. When the interior of Africa was opened up European states made treaties of "protection" with primitive tribes which were not states in any sense of the term. In the beginning these so-called colonial protectorates were intended to furnish an inchoate title to the region prior to effective occupation. This purpose is clearly reflected in the French term *occupation en protectorat*. Often areas inhabited by tribes under protectorate were designated as "spheres of influence" by treaties with other states. But even after occupation had taken place, the form of the protectorate sometimes continued to linger on in fictional guise. This occurred particularly in the French and German colonies, where the resulting status was known as an "administrative protectorate." Its announced purpose was to permit autonomy to the indigenous inhabitants. In reality it was used in cases where the benefits derived from a territory would not compensate the mother country for the costs of administration. The British colonial protectorates of Uganda and Nigeria possess no internal autonomy and are subject to the legislative power of the crown in Council under the Foreign Jurisdiction Act, 1890. It has been stated that one advantage of maintaining the form of protectorate in these

cases is that the mother country would not bear any responsibility under international law for the acts of persons residing in the territory. Since a colonial protectorate cannot be considered as an international person, this contention cannot be true. Perhaps the one reason for the survival of the British colonial protectorates is that annexation might result in the automatic application of certain British statutes which the Colonial Office would not care to see applied in these territories.

In America the protectorate has appeared in much more subtle guise and stripped of its traditional name. The Monroe Doctrine created a situation approximating the mediaeval type of protectorate, but by unilateral declaration instead of by treaty. The motivating force was fear of annexation by other powers. In the present century the United States has concluded treaties with several Central American states, and particularly with Cuba and Haiti, which many European writers have regarded as virtually establishing protectorates. In these cases the motive was neither fear of absorption by other powers nor the desire to proceed to annexation. The intention was to furnish a protection for invested capital and thus to further economic rather than political imperialism. It was enough therefore to impose a very small measure of restriction over the conduct of foreign affairs and internal administration by the weaker state.

The details of the various types of protectorate relationships may be best considered in three typical cases: a true protectorate, Morocco; a border line case between protectorate and colony, Kelantan; and a quasi-protectorate, Cuba.

By a treaty of March 30, 1912, a French protectorate was organized in Morocco, excluding the Spanish zone and Tangier. The French government possesses the right to maintain military forces in Morocco. It is represented by a resident general who is the sole intermediary of the sultan in relations with foreign states. The sultan undertakes not to conclude any treaties without the consent of the French government. French diplomatic agents and consuls are charged with the representation and protection of the subjects and interests of Morocco in foreign countries. The sultan may not contract any loan or grant any concession without the authorization of France.

The state of Kelantan in the Malay Peninsula is bound to Great Britain by an agreement establishing a regime denominated a protectorate but with greater limitations on its freedom of

action than exist in the case of Morocco. Under this agreement the British government may appoint advisers, whose advice the rajah of Kelantan must follow in all matters of administration other than those touching the Moslem religion and Malay custom. No officials other than natives may be appointed without the consent of the British government. The latter undertakes not to interfere with the internal administration of Kelantan "so long as nothing is done in that State contrary to the treaty rights and obligations that His Majesty's Government have with foreign Governments and so long as peace and order are maintained in the State of Kelantan, and it is governed for the benefit of its inhabitants with moderation, justice and humanity." The House of Lords has held that Kelantan is a sovereign state and cannot be sued in a British court without its consent [*Duff Development Co. v. Government of Kelantan* (1924) A. C. 797]. Several of the Law Lords expressed the opinion that they would not consider Kelantan a sovereign state but felt that they were precluded by a statement from the Colonial Office to the effect that the government recognized it as such.

Cuba is unquestionably a sovereign state, yet certain provisions of its treaty with the United States have led some writers to class it as a protectorate. Cuba may not enter into a treaty which impairs or tends to impair its independence. It may not contract any public debt for the payment of which its revenues are insufficient. The United States may intervene to preserve Cuban independence or to maintain a government adequate for the protection of life, property and individual liberty.

The essential characteristic of the true protectorate is that it is a relation under international law. As expressed by the Permanent Court of International Justice: "The extent of the powers of a protecting state in the territory of a protected state depends, first, upon the treaties between the protecting state and the protected state establishing the protectorate, and, secondly, upon the conditions under which the protectorate has been recognized by third powers as against whom there is an intention to rely on the provisions of these treaties" (*Publications of the Court*, Series B, no. 4, p. 27). The powers may be so extensive that the treaty of protection will be the death warrant of the international personality of the protected state. If, however, this international personality continues to subsist, certain legal consequences will result.

The protected state will not necessarily become a belligerent in a war between the protecting state and a third state [*The Ionian Ships* (1855), 2 Spinks 212]. Treaties concluded by the protecting state will not become applicable to the protected state unless especially made so. Even where the diplomatic relations of the protected state are carried on by its protector, the former will often grant the exequatur to foreign consuls. Nationals of the protected state do not possess the nationality of the protecting state.

Internally the protected state usually retains a fairly complete measure of autonomy. The most usual restriction is against contracting debts without the consent of the protecting state. Control over the appointment of administrative officers is often exercised in order to prevent the appointment of nationals of other states. Interference with cultural autonomy is rare. The revenues of the protected state do not flow into the treasury of the protector. Tribute has disappeared. But an important device for economic domination is found in the customary provision requiring the consent of the protecting state to any grants of concessions. By this means the latter is enabled to reserve the exploitation of natural resources for its own nationals.

Despite its recent use as an instrument of imperialistic expansion, the protectorate has at times fulfilled a useful purpose. In earlier times it often tended to preserve the independence of small states. The continued existence of Monaco is perhaps the best example. Often it has served for a time to effect a compromise of the conflicting claims of larger states. When brought about by such a situation, however, the relationship has proved particularly unstable, since, when some means of satisfying the claims on one side have been found, the protectorate has given way to annexation, as in the case of the Republic of Cracow. The protectorate has been especially valuable in furnishing the subject races of the Ottoman Empire with a means of transition towards independence. Even where protectorates have been set up as a form of annexation, as in Asia and Africa, the legal form has helped in some measure to preserve the cultural autonomy of the native populations.

Nevertheless, the protectorate seems destined to disappear. In Asia and Africa it has found a rival in the mandates system. In Europe it may still be revived as a solution of the minorities problem. The creation of a number of small states, Eastern Galicia, the Polish Corridor, Vilna, under the protection of the League of

Nations might be envisaged, although the example of the turbulent history of the Free City of Danzig would seem to discourage such action. Economic imperialism may perhaps continue to use the quasi-protectorate as an instrument of expansion.

PROTESTANTISM. While the term Protestantism is derived from the protest lodged by a group of German princes and cities against an edict of the Diet of Speyer (1529), it is generally used to designate all the religious movements and organizations in the West which reject the authority of the Roman Catholic church. It includes movements as widely divergent in time as Lollardy and American Unitarianism and as divergent in character as orthodox Lutheranism and Quakerism. A positive characteristic common to all Protestant churches is difficult to define. They possess no common doctrinal basis, although the tenets of the sole authority of the "word of God" and of "justification by faith" were widely held by early Protestants and although reliance upon the Scriptures as "the sole guide of faith and practice" continues to characterize the major part of the movement.

In the sphere of practise simplicity of worship, the right of private judgment in matters of belief and conscience and the principle of voluntary association are, despite significant exceptions, general features of Protestantism.

From the point of view of social history Protestantism may be defined as the religious phase of modern, western civilization. In its interrelation and interaction with other elements and forces in that civilization it appears both as a conservative and as a creative factor—conservative in its transmission of traditional modes of thought, conduct and social organization; creative in its liberation of human interests and in its provision of a dynamic sense of reality and life. It appears both as the product of other social movements, such as nationalism, individualism, democracy and capitalism, and as one of the sources of these movements.

The various types of Protestantism exhibit the conservative and dynamic, the passive and productive aspects in different degrees. Three main types may be distinguished despite the division of the movement into hundreds of denominations. In the institutional type represented by Lutheranism and Anglicanism the religious community is regarded as coextensive with the natural, family, racial or national group; the church has institutional character as the divinely established guardian and teacher of the faith and administrator of the sacraments, and it is subject to political control. In the sectarian type, represented in an extreme form by the early Anabaptists and Quakers but also by later Baptists, Independents and Congregationalists, the church is a voluntary association of believers, separated from the state, subject to democratic majority rule in matters of faith and practise and devoid of sacramental character. The Calvinist type exhibits some of the features of each of the others. It also conceives of the church as coextensive with the natural community but does not readily yield control of the church to the state; in its internal organization it makes some concessions to the democratic principle but subordinates the local congregation to the institution and the laity to the clergy. In later Protestantism the types are no longer so sharply defined as in the earlier years, since the democratic movement and the separation of church and state under political auspices have forced many institutional churches to approximate the sect type, while the growth of tradition and social habits has given the sects a somewhat institutional character.

The institutional Protestant churches have in general played a conservative role in western civilization. Lutheranism and Anglicanism intended to reform the Roman church, not to supplant it with a new type of Christianity, while Calvinism was only slightly more radical. The Protestant state churches of German and Swiss principalities and cities, of England, Scotland, New England, the Netherlands and the Scandinavian countries not only maintained the fundamental Catholic doctrines of the Trinity and of the deity and dual nature of Christ but also required the adherence of all citizens to these and to the additional Protestant tenets, as set forth by them. They invoked the civil power to secure theological and moral conformity and applied the principle of toleration only in so far as the tactics of their conflicts with Catholicism and sectarianism made it serviceable or in so far as they were forced to accept it as a result of that conflict. In the economic sphere institutional Protestantism was no less conservative, seeking to perpetuate moral, ecclesiastical and political control of commerce and industry. Variations of policy were due less to differences in fundamental attitude than to differences in the relation of the churches to the civil powers and in the economic character of the societies with which they dealt. Thus Lutheranism, which was more dependent than Catholicism on the state and which flourished in predominantly agricultural countries, committed the control of the economic life more completely to the state than did Calvinism, brought less pressure to bear on the state to secure this control and adjusted its own theories of economic and political morality more slowly to the interests of commercial and industrial classes. Yet in the case of Calvinism, no less than in that of Lutheranism and Anglicanism, Protestantism functioned as the medium through which the authority of the Catholic church was transferred to the state rather than as an agency through which the principle of collective authority was destroyed. While the process varied greatly in different areas, the results were similar.

In their later phases these institutional and semi-institutional types of Protestantism have exhibited the conservatism characteristic of established religions in general. As the religious functions of certain national cultures they have supported the authority of the prevailing governments, the rights of the dominant classes and the current social standards. Their resistance to political innovation is illustrated by the Angli-

cans and Presbyterians in seventeenth century England, by the New England Puritans in Jeffersonian America and by the Lutherans in republican Germany. They enforced the duty of obedience to the laws and to accepted moral standards through the addition of religious sanctions, as in the cases of the oath, the practise of slavery and the mores of national war.

At the same time institutional Protestantism, particularly the Calvinist type, has exhibited dynamic and innovative as well as conservative characteristics. In spite of its desire to do no more than reform the mediaeval church system it went far toward destroying the effectiveness of that system in the northern countries of Europe by its rejection of the papacy and of the authority of tradition. As a result economic, political and religious interests which had been held in check not only by external ecclesiastical authority but also by traditional modes of thought and religiously sanctioned customs were liberated. Furthermore the exigencies of conflict compelled institutional Protestantism to place greater emphasis upon the right of private judgment than was strictly consistent with its fundamental attitude and thus to open the door not only to sectarianism but to those secularistic movements which repudiated Biblical as well as ecclesiastical authority. Having rejected a part of the traditional system of thought and conduct Protestantism was unable to halt further disintegration.

Many of the radical effects of the Reformation which are ascribed to Calvinism are in reality due to the sectarian movement, either directly or through its influence upon the Calvinist churches in the Anglo-Saxon countries. Whereas the innovations effected by the institutional and semi-institutional churches constituted in the main a relaxation of older restrictions and a simplification of the system of collective control, the movement initiated by the sects was positive and dynamic. Freedom of the individual conscience, separation of church and state, elimination of direct or indirect church control of the social life, rejection of all but Biblical authority and free interpretation of the Bible under the guidance of the "spirit" or the "inner light" became not merely devices of social strategy but genuine expressions of an individualistic, anti-authoritarian temper. This temper may have been an outgrowth of the situation of the groups in which sectarianism arose, for these were largely lower class, had little hope of achieving political power and were profoundly suspicious

of all collective authority; but at the same time it was cultivated by the revival of the "inner life" which had manifested itself first in Catholic mysticism and had affected the Lutheran and Calvinist Reformation. Sectarianism was revolutionary rather than reformatory in character. It sought to destroy hierarchical organization and clerical authority in the church, to practise complete equality and democracy in the religious community and to substitute individual experience for collective creeds. Although its primary interest lay in the liberation of the religious life, it undertook, as Anabaptism upon the continent and as Independency in England, to reconstruct the state, largely for the sake of this interest but also under the impetus of millenarian expectations. It was quickly crushed in central Europe, surviving only in the pacifist Mennonite movement, but it developed great strength in England, where it deeply influenced habits of thought and reasserted itself after the Restoration in non-political forms, particularly in Quakerism. In the greatly modified form of Pietism and Methodism the sectarian tendency exerted influence upon the social thought of most of the Protestant countries. In America both the earlier and the later sectarian development came to be even more decisive in molding the religious life and organization and, indirectly, the political modes of thought. This was due to the character of the immigration, to the mode of settlement in small, independent units, to the continued influence of frontier conditions and to the separation of church and state which both sectarianism and the democratic movement demanded, and which forced even institutional churches to adopt semisectarian organization.

Despite its conservative continuation of Catholic dogma and mediaeval conceptions of heaven and hell, Protestantism in all its branches has tended to call forth or reenforce the modern concentration upon this-worldly values. The doctrine of justification by faith centered attention upon the present anticipation of future salvation, while the belief in predestination and election released men from the sense of pressing yet unfulfillable demands made for the sake of remote goals. In later Pietism and evangelicalism the immediate experience of salvation was emphasized, while in the revolutionary and mystical sects the hope of impending social as well as personal transformation of life was central. Furthermore the Protestant tendency to abolish peculiarly religious callings and to recognize all worthy labor as divine vocation lent new sig-

nificance to economic and other mundane pursuits. Common to all Protestants, this tendency was again most pronounced in the sects and least developed in the institutional type. A further positive element contributed by Protestantism to the break up of mediaeval and the rise of modern modes of thought was due to its concentration of interest upon the Scriptures and the consequent substitution of Hebrew views of the dynamic character of history and reality for static mediaevalistic conceptions, which had been derived largely from Hellenism. The Biblical conceptions of history as a progressive movement from creation to final redemption and of God as dynamic will rather than eternal perfection merged with other influences tending in the same direction to create modern attitudes of thought and to stimulate in Protestantism itself a zeal for the fulfilment of the divine will in time. These conceptions were doubtless more effective in Calvinism and sectarianism than in Lutheranism and Anglicanism and were partly responsible for the greater activity of the former.

The interaction of this religious phase of modern culture with other social tendencies within the modern period presents the mixed pattern observable in all similar situations. On the one hand, Protestantism appears as a function of the rising national state, which in establishing its autonomy through the rejection of papal and imperial claims required, first, the separation of the national churches from the Roman authority and, secondly, the subjection of the separated church to the state. This result, however, was gained partially in France without so complete a separation from Rome as would justify the application of the term Protestant to the Gallican church; while in the case of the Anglican church the aptness of the term remains a matter of dispute. Yet the Protestantism of Germany, the Netherlands and Scotland as well as of the Swiss cities was greatly encouraged by the rise of nationalism and was determined in its organization and character largely by the feudal or bourgeois interests which held the leadership in the state. On the other hand, the Protestant spirit played no small part in encouraging nationalism, partly through the influence of Old Testament conceptions of the chosen people, transferred from the Jews to the Christian nations, and partly through the fact that it supplied the national community with a sense of mission, as the democratic dogma was later to do.

The relation of the Protestant movement to

democracy is also highly complex. The institutional Protestantism of Lutheranism and Anglicanism has on the whole been inimical to democratic movements and has allied itself from the beginning with the remnants of the feudal order. Semi-institutional Calvinism was prevented from going far in the direction of democracy by its attitude of suspicion of the natural man and by its alliance in the countries of its origin with the middle, commercial classes. But in those regions in which the civil authority was favorable to Catholicism it supported popular revolts, and both its class character and its doctrine of original sin made it favorable to aristocratic or mixed aristocratic-democratic government, since in Calvin's words "the vice or imperfection of men renders it safer and more tolerable for the government of men to be in the hands of many." It was this attitude in Calvinism which led Lord Bryce to regard the Constitution of the United States, with its system of checks and balances, as largely a product of Puritanism. Both of these types of Protestantism tended, however, to resist democratic ideas based upon the conviction of the goodness and the innate rights of the natural man. Sectarianism, on the other hand, not only cooperated with the democratic movement but prepared for it to no small extent, as has previously been pointed out. It was partly responsible for the form which the democratic movement took in the Anglo-Saxon countries, in which no violent explosions like the French Revolution were necessary and in which a less rationalistic spirit than was evident in France guided the development of democratic institutions. As a result of the success of the democratic movement the institutional churches were forced to make major adjustments in polity and mode of support, while the sects were able to maintain their original form of organization.

The relation between capitalism and Protestantism is subject to diverse interpretation. The geographical, social and historical coincidence of the religious and the economic movements indicates a relationship in which, with the Marxians, the economic may be regarded as the dominant force or, with Max Weber and his followers, the religious may be assigned the creative role. From one aspect it appears that institutional Protestantism was slow to relax the mediaeval restrictions on commerce, trade and banking and that it was allied with great agrarian interests. Its attitude toward the new capitalism was only slightly less favorable than that of mediaeval Catholicism. Yet when the commer-

cial interests and the middle classes became the ruling groups in the state, it was forced to make its adjustment to them, and from the beginning it gave them as much liberty as its general principle of resigning all political and economic control to the state allowed. Calvinism, however, was not only interested in preserving moral and social control of the economic life but was far more aggressive in promoting direct and political measures for the exercise of that control. Yet indirectly it furthered capitalism by encouraging attitudes and practises which promoted capitalist development. The concept of secular calling as divine vocation encouraged business men to pursue their work without the inhibitions created by the view of commerce as inherently sinful and with a sense of divine and human approval. The practise of "intramundane asceticism," in Weber's phrase, prohibited luxuries and self-indulgence while calling for diligence and so promoted the accumulation of capital. The Old Testament doctrine of prosperity as the reward of virtue made commercial success an index of righteousness and poverty a probable badge of vice. Yet Calvinism with the aid of these doctrines and practises could at best produce the small capitalism of the petty bourgeoisie; the high development of modern capitalism must be traced to other sources, connected so far as the history of thought is concerned with the Renaissance and the Enlightenment. Under the influence of this capitalism Calvinism itself has been modified, yielding in Geneva to the demands of the commercial groups for the relaxation of restrictions on interest and in England to the demand that the clergy be excluded from meddling in civil affairs. Sectarianism, arising in lower economic groups, was in general more favorable to the development of capitalism than either of the other types, preparing for the rise of the principle of *laissez faire* by its consistent demand for the separation of church and state, for the elimination of all ecclesiastical influence in non-religious matters, and, more positively, by its espousal of the right of private judgment and of the authority of the individual conscience. Modern capitalism, which like democracy has been most highly furthered by eighteenth century rationalism, is associated more definitely with those elements of Protestantism which have also come under the influence of that rationalism; while Protestantism remains divided in its attitude toward this development, following the lines of class cleavage in its organization and its social ethics. In the United States Protestantism,

still rural to a large extent, is in general a middle class religion; this fact is doubtless traceable in part to its character, which in turn has been modified by its middle class leadership. The history of American immigration must also be held partly responsible for the situation.

PROUDHON, PIERRE JOSEPH (1809-65), French socialist leader. The son of a Besançon cooper, Proudhon is one of the few French socialists of genuinely plebeian origin. Through a scholarship from a local fund, the *pension Suard*, he was enabled to continue his studies after graduating from the *lycée*; but in accepting this aid he vowed that he would remain faithful to the cause of those whom he called his brothers and comrades.

His pamphlet entitled *Qu'est-ce que la propriété?*, which was published in Paris in 1840 (tr. by B. R. Tucker, Princeton, Mass. 1876), created a sensation. It was here that he declared that "property is theft" and that it was from any point of view "impossible." This declaration won him the hatred of bourgeois society and at the same time the admiration of the young revolutionaries who were then flocking to Paris, among them Karl Marx. Soon, however, Proudhon discovered that communism was repulsive to him, and in his *Système des contradictions économiques, ou philosophie de la misère* (2 vols., Paris 1846) he sought to find a middle course between the socialist theories and the theories

of classical economics. His solution might be called that of a "mutualist bookkeeper," seeking the road to utopia through the organization of free credit and equitable exchange. When the Revolution of 1848 broke out, Proudhon was chosen deputy and tried to start a "people's bank" as a way of realizing his scheme of free credit. He protested against the attempts of Louis Blanc to put the power of the state, acting through decrees, at the service of the working class.

What Proudhon feared above all was any meddling on the part of the state, even on the part of a democratic state; he was fundamentally antipathetic to the principle of authority. This explains the violent struggle he waged against the church—the school of obedience—in *De la justice dans la révolution et dans l'église* (3 vols., Paris 1858). Following the eighteenth century *philosophes* Proudhon showed how religion, by misusing the spirit of transcendental idealism, had prevented the producers of wealth from organizing justice on the earth.

Proudhon was, however, very much devoted to the institution of the family, being closer on this point to Bonald and to Auguste Comte than to Fourier or Enfantin. He believed that this institution was necessary for the rearing of just and honest citizens, who would in turn be able to organize equitable relations of exchange between groups of producers. He was thus sympathetic to the doctrine of federalism. "The twentieth century," he declared, "will open the era of federations." Proudhon's individualistic trend is surprisingly enough linked up with a sociological approach. He lists among his discoveries what he calls "the metaphysics of the group," which involves the idea that collective force is something more than the sum of the individual forces. Similarly, impersonal reason, which finds its field in history, may, according to him, proceed along paths which are accessible only with difficulty to individual reason.

Proudhon's paradoxical position in the history of sociology may be summed up thus: he forced collective reason to consecrate personal rights and assigned to the community the goal of protecting individual equality.

Toward the end of his life, upon the refusal of a group of workers to make common cause with the bourgeois candidates of the republican opposition and their justification of this secession in the *Manifeste des 60*, Proudhon believed that this group would be torchbearer of the idea which was so dear to him, mutualism. It was

then that he wrote his *De la capacité politique des classes ouvrières*, which was published in 1865 a few months after his death. It was especially through this book that Proudhon exercised an influence upon the French workers who took part in the first meetings of the International. Here they defended his solutions, which aimed at the organization of free credit and equality of exchange without the intervention of the state and without the dictatorship of the proletariat. These Proudhonian formulae were completely opposed to those which Karl Marx sought to have adopted. And it was Marx, who had at first admired in Proudhon the enemy of property, who later applied himself to demolishing Proudhon's prestige and counteracting his influence.

In the socialist parties after 1870 the influence of Proudhon seemed to have been totally eclipsed by that of Marx. But when Marxism itself was subjected to a revisionist criticism and the question began to be asked whether the dictatorship of the proletariat or the omnipotence of a class state could truly solve all economic problems, many remembered Proudhon and the federalist solutions which he had put forward. Thus French syndicalism under the leadership of Fernand Pelloutier, author of the *Histoire des bourses du travail* (Paris 1902, new ed. 1921), often fell back upon the traditions of Proudhon in order to shake loose from Guesdism and to defend the autonomy of the syndicalist movement. Also the theoreticians of revolutionary syndicalism, who are opposed to all compromise, often invoke *De la capacité politique des classes ouvrières* or even *La guerre et la paix* (2 vols., Brussels 1861) to justify appeals to violence, which are necessary, according to them, in order to burn the bridges between the bourgeois world and the working class. At the same time the cooperators, who are more pacifically inclined, declare that in trying to organize exchange in a more equitable fashion they are realizing part, at least, of the mutualist program cherished by the inventor of the people's bank.

PROUTY, CHARLES AZRO (1853-1921), American interstate commerce commissioner. Prouty practised law from 1882 to 1896 and during eight years in this period was reporter of decisions of the Supreme Court of Vermont. In 1896 he was appointed a member of the Interstate Commerce Commission, which he served as chairman from 1912 to 1913. The commission was being shorn of its powers by court decisions; Prouty saw the need for more effective regulation of railroad rates and the inadequacy of enforced competition to protect the public. In numerous addresses and magazine articles, distinguished by vigor of style and excellence of quality, he advocated arming the commission with greater authority—power to prescribe rates for the future, limitation of judicial review, and more effective enforcement provisions. He supported President Roosevelt's legislation of 1906 and the movement for federal valuation of railroads and regulation of their capitalization. The importance he attached to valuation induced him to resign from the commission in 1914 to become its director of valuation and he remained in charge of the work until his death. During the World War he served in the railroad administration; he favored a continuance of government operation for a period after the war in order to give that policy a fair test. Prouty was outspoken in demanding adequate public control of railroads, was fair toward the legitimate needs of the carriers and made a considerable contribution to the theory and practice of regulation.

PRYNNE, WILLIAM (1600-69), British political pamphleteer and legalist. Prynne's first interest, when on leaving Oxford he took up residence in Lincoln's Inn, was theology, particularly the defense of Calvinism against the Arminian doctrines then winning popularity. For writing the *Histriomastix*, the historic expression of Puritan disapproval of the stage, and other pamphlets attacking the bishops, whom he regarded as encroaching upon the prerogatives of the king and the liberties of the subjects, he was mutilated and imprisoned; but even in prison he continued to arouse public opinion against such menaces to liberty as the tax of ship money. Released by the Long Parliament in 1640, he put his pen at its disposal and by frequent pamphlets, in which he cited mediaeval precedents, he defended the ideal of the limited monarchy. His attacks on the army led to his expulsion from Parliament and brief imprisonment in 1648. During the Commonwealth he published tracts filled with historical lore directed against the rule of Cromwell, in defense of tithes and in protest against the readmission of the Jews into England. His advocacy of the restoration of Charles II and his reputation as a scholar won for him the post of keeper of records in the Tower. Here, to preserve manuscripts from further destruction, he worked amid great discomfort, sorting, deciphering and editing records. His interest in "venerable antiquity" was not that of an antiquarian: above all he wished to prove that Parliament and king were the historic co-rulers of England.

For while he believed that "the High Court of Parliament and the whole Kingdome which it represents may . . . be truly and properly said, to be the Highest Sovereigne Power of all others, and above the King himselfe," yet he considered it but "the great Councell, . . . originally called and authorised to sit by the King's Writ Alone." The king was "both the Head, the beginning, end, and the foundation of Parliament," in which he and the two houses formed coordinate parts. Monarchy, he found by diligent study of the past, was "the best of Government, whiles it keepes within the bounds which Law and Conscience have prescribed."

The zeal for precedents likewise characterized Prynne's views on the relation of church and state. Whether episcopal or presbyterian, the church must recognize the superiority of the civil government. During the 1640's, when the reorganization of the church's polity was discussed by Parliament and the Westminster As-

sembly, Prynne along with such other Erastians as John Selden declared Parliament the final authority in ecclesiastical matters; for, although he was called an anti-Erastian by Figgis, he resembled Erastus in his advocacy of a comprehensive church and in his belief that patriarchs had had power to make laws for the church not as priests but as rulers. His legalistic attitude found expression in Aristotle's dictum, which Prynne wished to apply to ecclesiastical affairs as well: "Men are better governed by laws, which continue constant, impartial . . . than by men whose passions, interests, and private ends for the most part bias them all along."

PSELLOS, MICHAEL (1018-c. 1078), Byzantine philosopher and statesman. Psellos by virtue of his great erudition, varied talents, catholic interests and prodigious intellectual activity was one of the most eminent men of the Byzantine Empire. He wrote on all subjects—philosophy, history, law, theology, medicine, astronomy, music, alchemy and the occult sciences. A poet and a prosodist as well, he was a good orator and was chosen to deliver the funeral orations for several patriarchs. He was admirably trained in the classic literature and thoroughly imbued with its spirit and was one of the most illustrious professors at the University of Constantinople, which was reorganized about 1045. "Consul of the philosophers," he was the first to teach there the philosophy of Plato, which he defended vigorously against the attacks of the partisans of Aristotle. His *Chronographie* (ed. with French translation by Émile Renauld, 2 vols., Paris 1926-28), which deals with the history of the

Byzantine Empire from the accession of Basil II in 976 to the end of the reign of Michael VII Ducas in 1077 and which is marked by a picturesque narrative style, keen observation and valuable information, is one of the most remarkable products of Byzantine historiography. Unfortunately Psellos' ambition and vanity led him into politics. He was the influential adviser of Constantine IX Monomachus and prime minister of Constantine X Ducas and of Michael VII Ducas, whose education he directed. His predilection for intrigue, his genius for being all things to all men and his unscrupulousness have detracted singularly from his glory. He loved the court and the world too much but had none of the qualities of a statesman.

PSYCHIATRY, long the art of observing and perhaps influencing the course of mental disorders, has recently tended to become the scientific study of peculiarities of personality and of interpersonal relations. It appeared as a medical discipline in the Pippocratic writings, about 400 B.C. The Greek physicians made good clinical observations and evolved some rational therapeutic techniques, but psychiatry as such survived the demonology and witchcraft of the Middle Ages only in Arabian medicine. It began anew in western Europe with the humanitarian reforms of Pinel and was furthered by his pupil Esquirol in France, by Rush, Bond and Kirkbride in the United States, by Tuke in England, by Fricke and Reil in Germany and by Morgagni, Chiarugi and d'Aquin in Italy. The first periodical in psychiatry, *Magazin für psychische Heilkunde*, was founded by Reil and Kayssler in 1805. The *Annales médico-psychologiques* appeared in 1843, the *Allgemeine Zeitschrift für Psychiatrie* and the *American Journal of Insanity* (now the *American Journal of Psychiatry*) followed in 1844. About this time Dorothea Lynde Dix was spreading humanitarian attitudes toward persons suffering from mental disorders. By 1860 nursing personnel was being trained in England and the era of the modern mental hospital had begun. Mechanical restraint of patients by chains, handcuffs and camisoles gave way to seclusion. Here and there a beginning was made in the classification of patients on the basis of their mental condition

and probable development, and special facilities were provided for patients in the early stages of mental disorders and those whose cases were considered hopeful.

What there was of treatment in the institutions of the nineteenth century was in principle physiological. The affiliation of psychiatry in medicine was with neurology, on the assumption that mental disorders manifested perhaps obscure but none the less definite diseases of the nervous system. Of late the association of psychiatry with physiology is also reflected in the work of psychiatrists who specialize in glandular therapy. As early as the seventeenth century Maxwell was accumulating data on hypnosis, which Mesmer expanded greatly in the eighteenth century and Bertrand Briand rendered reputable in the early years of the nineteenth. Charcot undertook to give a physiological explanation to hypnotic phenomena, an attempt which Bernheim successfully contested in favor of the hypothesis of suggestion, which is personal rather than physiological. Meanwhile Janet attacked the problem of the milder mental disorders by the experimental method and convincingly demonstrated the actuality of alternating (multiple) personality, extraconscious mental processes ("subconscious") and psychogenetic amnesias (specific losses of memory arising from factors significant to the person). This work was expanded, particularly in the matter of multiple personality, by Prince. Following the current medical ideals, much effort was wasted in attempting to square these phenomena with the terms of neurophysiology, the irrelevancy of which was first clearly indicated by Breuer and Freud in the *Studien über Hysterie*.

Shortly after the publication of this volume Freud invented the method of investigating by free association and began the elaboration of psychoanalysis, the effects of which on psychiatry, although still somewhat circumscribed, promise to be profound. The psychoanalytic work on the milder mental disorders paralleled a tendency inaugurated in the United States by Adolf Meyer, who enunciated in 1906 the dynamic conception of dementia praecox by emphasizing the explanatory importance of symbolic operations by the person rather than the physiological activity of his neurones. These developments, not fundamentally divergent, went far to raise psychiatry from a subordinate position in medicine. The emphasis placed on the crucial conception of personality then

brought psychiatry nearer to the social sciences.

These twentieth century changes, which include as practical consequences therapy of many mild and some severe mental disorders, also fostered the mental hygiene movement and a growing appreciation of the possibilities of psychiatry for individual and social welfare. The medical profession, however, emerging from a phase of biochemical investigations following on the failure of microscopic pathology to resolve its problems, has been rather slow to appreciate the new role of this discipline. Medical education, heavily biological in its foundations, has become depersonalized and medical curricula have little place for the social sciences and psychobiology. As a result well trained psychiatrists are largely products of postgraduate training, and their proportion among those dealing with mental disorders and related problems and among the teachers of psychiatry is still rather small. The American Psychiatric Association has recently taken active interest in the problem of training and competence for practise and is seeking to improve standards and to encourage appropriate modifications in the medical curricula.

The theoretical background of psychiatry includes all that is known of persons and their interactions. In practise, however, it has dealt largely with aggravated instances of personal disharmony, the social demand for its services being based on a desire to obtain security from dangerous persons and to restore the unusually aberrant to commonplace living. So far as psychiatry has been preoccupied with the mental life it has tended to follow the prevailing schools of psychology, with increasing interest in conative systems. Disorder of the emotional life in the mentally deranged is too striking to be ignored, but there are at present some who adhere to fundamentally cognitive approaches. The psychoanalytic and related schools, however, have accomplished such solid results by dealing with the evolution of motives in those who suffer from mental disorders that this principle bids fair to dominate the psychiatry of the future. Current dynamic psychiatry sees the person as the resultant of physiological, psychobiological and situational factors. Physiological factors include native endowment, the interplay of nutrition and needs, and disease and injury. The psychobiological factors comprise the evolution of differentiated personality; acculturation in successive epochs of personality growth; inhibitions and facilitations historically effective

and manifesting themselves in the present in conflicts of motivations; characterizing drives; energy partition in activities; sensitivity to events; ease of personal contacts; speech and gesture, including emotional expression. The situational factors include the actual interpersonal opportunities and handicaps in turn reflecting the interplay of culture and its participants, the changing institutional setting of life and the abundance or restriction of opportunity for new experience. Mental health, meaningful only when it refers to interpersonal adjustment, is that balance among these factors which permits a positive progression in terms of the total situations through which the individual lives. Mental disorder, an aberration from the state of mental health, can result from factors in any or all of the categories mentioned. Defective endowment may limit or arrest growth of personality or bring on premature senescence; defective nutrition may halt development or lead to recessive changes; disease may disable the organism. The psychobiological factors making for mental disorder arise from specific warping influences bearing upon the person at any time from birth onward; these may bring about such imbalance of growth by experience that unfortunate motivation may develop; and explicit and implicit interpersonal activity may cause lack of self-esteem, dissatisfaction with life, chronic anxiety or persistent fatigue and inertia, which may manifest themselves objectively in symptoms of mental disorder. The situational factors are involved most simply in the cases of defectively endowed individuals subjected to excessive demands and of superior individuals subjected to privation. They are present more obscurely in instances in which the adolescent finds himself incapacitated for the demanded adjustive growth because of powerful inhibitions incorporated in him beyond his remedy. As long as the culture configuration of a group is relatively static and the young do not leave its area, mental disorders from situational causes appear to be few. In the contemporary scene, however, particularly in the case of those who come from remote parts to the great urban centers or who undergo abrupt change of social status, the effects of personality warp and the new situational factors may be disastrous. Also because of factors in the culture pattern problems of adjustment of both heterosexual and homosexual motivations assume singular importance for psychiatry.

For many years psychiatry was largely pre-

occupied with humanizing the treatment of persons confined in asylums and mental hospitals, a work by no means finished; it has only gradually entered upon the tasks of public enlightenment and prevention. The experience of hospitals for convicted criminals suffering mental disorders turned the attention of psychiatrists to the problem of the personal origins of criminal behavior, and concomitantly, following pioneering work by Healy, juvenile delinquency became an object of psychiatric study. Correctional schools, penitentiaries and parole departments now seek the aid of psychiatrists, and child guidance clinics supervised by psychiatrists have spread rapidly. Specially trained social workers have become an indispensable part of these clinics, and mental hospitals and dispensaries are beginning to employ them to secure the extensive data needed by the psychiatrists and in some cases to aid in treatment. The field of general social work is being permeated by the psychiatric viewpoint; like all other fields of psychiatric endeavor it suffers from dearth of competent instruction and inadequate preparation of personnel. Education has evinced some curiosity as to the possible contributions of psychiatry and special schools and special classes for maladjusted children have been organized, with or without psychiatric direction. As a result of these developments the demand for psychiatric services exceeds the available personnel, the more so in that the specialty has become a fairly attractive field of private practise since the public has grown less superstitious about mental disorders.

Psychiatry has many limitations, not the least of which is the enthusiasm that has led to exaggerated claims as to current accomplishments. The best psychiatry is still more of art than of science; and however much this may be deplored, it can be remedied only by extensive research. Many disorders can be remedied by competent psychiatrists, but the process is difficult and the costs are often prohibitive. The prolonged interview method of psychoanalysis can scarcely achieve a durable result in the simplest problem under sixty-five to ninety hours, and in difficult cases of obsessional and parergastic disorders five hundred or even a thousand hours may be required. Much can often be accomplished in the way of improving maladjustments, without completely eradicating them, by methods derived from psychoanalysis, for example, "attitude therapy," and in the socialization techniques worked out in the insti-

tutional care of parergastic patients. But some of the problems which come to the psychiatrist arise primarily from the difficulties of gifted individuals in an unsuitable milieu, and these are sometimes insoluble because of factors inhering in the contemporary social and economic organization. Moreover it is often impossible to correct personality warp in the less gifted because there is nothing attractive to offer the sufferer. Therefore the psychiatrist, primarily concerned with needless wastage of human ability, cannot but envisage a changed social order under which these problems will no longer exist.

PSYCHOANALYSIS began as a device for treating various forms of "nervous" disorders. It developed into both a technique of exploring mental life and an explanation of its perceptions and findings by means of an elaborate theory

regarding the growth, the structure and the dynamics of the mind. This theory Sigmund Freud, the inventor of psychoanalysis, designates as metapsychology. It is "a dynamic conception which reduces mental life to the interaction of reciprocally propelling and repelling forces." Neither the theory nor the technique of psychoanalysis has been developed in a straight single line. At least two important variants from the Freudian scheme, and a number of minor ones, dispute some of its practical and most of its theoretical postulates. The important variants are those constructed by Alfred Adler of Vienna and Carl Jung of Zurich. Adler calls his variant "individual psychology"; Jung calls his "analytical psychology." All schools make use of a method of diagnosis and research in principle the same. This method might be called the essential psychoanalysis—Freudian and non-Freudian alike. It consists in bringing to mind feelings, events and fantasies that had been put out of the mind because they were disagreeable, and in replacing them, as Freud wrote, "with acts of judgment which might result either in the acceptance or rejection of what had formerly been repudiated."

Of the three major sects of psychoanalysis, the Freudian is prior in time and in importance, and richest in consequences for the social sciences. Its founder, Sigmund Freud, is a physician whose preliminary training was in chemistry, botany and physiology. Freud studied cerebral anatomy under Meynert, and began his professional career as a clinical neurologist in 1881. His own practise and his collaboration with the Viennese physician, Breuer, awakened him to the advantages of studying hysteria and other neuroses from the psychological point of view; and in 1885, shortly after he had been appointed docent in neuropathology at the University of Vienna, Freud went to Paris to study under Charcot. His findings led him to believe that sex was an unconscious but prime factor in neuroses, and that Breuer's method of using hypnotism to reawaken, and thus purge the patient of, his forgotten emotions was inadequate for permanent cure. In order to cure, Freud found, he must have the conscious cooperation of the patient. The latter could by means of his "free associations" recollect with more or less difficulty forgotten far off events of his life, most of them "purposely" forgotten, that is, repressed. When the patient could consciously remember and face all such events realistically he was cured. Ten years Freud worked alone with his

method, formulating his results into his psychoanalytic conception of human nature. About 1906 a number of others joined him—especially Adler and Jung, Ernest Jones, Sadger, Stekel, Ferenczi, Rank and Brill. In 1908 these and others formed the International Congress of Psychoanalysis, which has met biennially ever since. It now has branches all over the world, with hundreds of members who are specialists of psychoanalysis and pay a religious deference to Freud as their teacher and leader.

Into the making of the Freudian metapsychology there enter a number of components of variable importance. Psychoanalysis is much more an undirected growth than a rational construction, and its organization is by no means distinguished for logical consistency and strict scientific method. To those who identify science with precise measurement and rigidly controlled experimentation, psychoanalysis is not, and never can be, a science. Yet it regards the mental life as a strictly determined mechanism, and while it employs no quantitative formulæ, it makes constant use of the concept of quantity in regard to affect or emotion. Unable thus far to experiment as the biologist or even the conventional psychologist experiments, psychoanalysis has a procedure and a material which are not merely empirical, but are particularly empirical—personal, autobiographical. Its basic device, that of free association, was first used by Wundt for normal minds and extended to the abnormal by Kraepelin and Aschaffenburg.

The material which the psychoanalytic method elicited led to innovative inferences regarding its causes. These inferences under the conditions of psychoanalysis were then employed as agents in their own verification, judges of their own truth, and criteria of their own validity. Compounded, as they had to be, partly of verifiable insights into mental articulations, partly of analogies, guesses, chance fancies and figures of speech, and referring as they do to the submerged and opaque part of the human psyche, they naturally became objects of intense faith and subjects of bitter controversy, far closer to the dogmas of a cult than the theories of a science. Nevertheless, they have undergone continuous revision in the light of clinical experience as well as of study chamber reflection, and if Freud's followers are conspicuous for accepting his successive and often inconsistent deliverances somewhat as faithful Catholics accept the ex cathedra pronouncements of the

pope, Freud himself has never ceased to modify his own opinions.

In spite of this, the Freudian view of the structure and unfolding of the human psyche is, within its limitations, remarkably stable and consistent. Mind and body are to it separate and distinct, but interdependent, forms of "energy," interacting with each other in definite and determined ways. Somehow a transformation of the chemical energies of the biological organism, mental energy or the psyche manifests itself in "instincts." These instincts are urges seeking satisfactions appropriate to their natures, and avoiding frustrations. Satisfactions produce pleasure; dissatisfactions pain. The aboriginal psyche is a pleasure-seeking, pain-avoiding constellation of unconscious drives and urges, whose being and striving are thus governed by the "pleasure principle." They reveal phylogenetic traits and are perhaps attributable to the accumulations of evolutionary change. Various and distinguishable though they are, they fall ultimately into two contradictory modes of instinctual propulsion. One is Eros, or "the libido," the sexual impulse, the combining, constructive urge. It is coordinate with a human being's whole body, but focalized now at this organ, now at that; and it follows a definite order of focalization from birth through puberty. As such, Eros is neither exclusively male nor exclusively female; the human infant, having two parents, inherits sexuality from both and is bisexual *ab ovo*. The other propulsion is the Death or destructive instinct. This is the urge toward effortlessness, inertia and disintegration, the mental correlate of the tendency of non-living material energy to dissipate itself to the lowest possible level, and of the energy of organic life to fall back to "the peace of the inorganic world" and "restore conditions to what they were before life by its emergence upset them." Every backward trend, every destructive or aggressive impulse, whether directed toward oneself or outward, is an expression of the Death instinct.

All life is a tension and conflict between the polarities of Eros and Death. These two instincts are "active in every particle of living substance, though in unequal proportions." They are fused together in such a way that Eros dominates Death. For the most part Death impulses are discharged fusionally, through the libido. But fused instincts can be defused, and it is possible that the Death instinct may manifest itself as such. Perhaps the highest degree of fusion is

that of the unborn organism in the mother's womb. The womb is as nearly perfect an environment as can be found, where adjustment is utter and pleasure maximal. Birth is a hurt and a pang; with it, through the impact of the external world, come pain and consciousness. The intra-uterine psyche, the instinctual psyche, is unconscious. The substance of mental heredity, both transmitted and acquired, it is altogether affirmative, entirely without negation, hesitancy or doubt, without morality or restraint. It is without logic or consistency, composed of opposite yet fused strivings simultaneously seeking their contradictory gratifications. It is timeless, since "unconscious processes remain indestructible. Nothing can be brought to an end in the unconscious, nothing can cease or be forgotten." And it is un verbalized: "the unconscious idea is of the thing alone." Freud calls this primordial elemental mind stuff the Id.

With birth two basic modifications of the Id begin, the first of which is the Ego, the second the Super-ego. Both are consequences of the impact of the external world upon the Id. Adjustment to this world involves the operation of "the reality principle," which is the opposite of the pleasure principle. The world imposes itself upon the unwilling, intransigent Id. First and last the world consists of the mother, father, sisters and brothers of the newborn, then of the things and ideas associated with them. The Ego is constructed by means of the developing infant's perceptual responses to all these. Hence the Ego is the locus of the Id's adjustment to the world, the seat of anxiety, repression and dreams, the substance of sanity and reason, the finder of the Id's safe way to satisfaction in the world, through controlling or transforming the one or the other or both. Consciousness, though transitory and changeable, is an attribute of the Ego. It receives ideas from the Id itself as well as impressions from the external world which comes to it through perception.

Personality takes form in terms of the dominance of some one phase of the libidinal relationships of the growing human to itself and to the members of its family. Normally, there are three phases of the movement of the mobile libido. The first is that of infancy and lasts from birth to the fifth year. In this phase the child's field of response is its own body and the libido, first generally distributed, focalizes at the various points of its own body which Freud calls erotogenic zones. This focalization constitutes auto-erotism. It occurs at the mouth, the anus

and the urethra; sex pleasure is attained in sucking, swallowing, kissing, or biting the thumb, the toe, the hand, the arm, and the like and in expelling, retaining, showing, handling, faeces and urine. The child is said to be anal erotic or oral erotic, and its activities are said to have a sadistic color. Its stage of development is at this time "narcistic." Later, the genitals (penis or clitoris) take precedence over mouth, anus and urethra as erotogenous zones. Gratification is won not only by masturbatory manipulations, but by exhibiting, comparing, inquiring and imagining. The child enters the allo-erotic stage when it makes use, actually and in fantasy, of whatever accessible objects it may find to replace its own bodily parts. Especially, its libido is turned to the mother and father.

It is during this "early genital" period that the Oedipus and castration complexes become manifest. These complexes are universal, and foremost among the individual recapitulations of race-life of which the Id so largely consists. In boys the Oedipus complex comes first as an unconscious incestuous mother love with corresponding feelings of rivalry and hostility toward the father. This is followed by a fear of being robbed of the penis by the father, and perhaps by an awakening of an inherited incest tabu through fears aroused by actually-experienced threats of punishment for masturbation and the like. The condition is called the castration complex. In girls the sequence is reversed; the castration complex leads to the Oedipus complex. The girl tends to interpret her lack of a penis as a punishment and an inferiority which she endeavors to overcome by declaring she has a penis. Finally she acquiesces in her lack of a penis and wishes instead for a child. At the same time she turns against the mother, whom she holds responsible for her deficiency, and toward the father in unconscious incestuous love.

Both sexes form their Super-egos first as transformations of the Oedipus and castration complexes. In its final form, the Super-ego is the same thing as conscience. To a great extent unconscious and in contact with the Id, independent of and inaccessible to the conscious Ego, it is nevertheless an outgrowth and modification of this Ego. This comes about by the Ego's taking over to itself the parental attitudes toward libidinal gratifications. The child identifies itself with one or another parent and makes his or her attitude its own. In the degree that this attitude condemns instinctual urges it arouses and main-

tains a sense of guilt. The intensity of this sense will vary inversely with the number and variety of symbolic and substitutive outlets for the Oedipus urge that the Ego can set up.

Thus, by the end of the fifth year, the unconscious libidinal Id, under the impact of the external world, has differentiated into a partly conscious, partly unconscious Ego and an unconscious Super-ego. Id, Ego and Super-ego together compose three dynamic systems whose confrontations and conflicts make up the subsequent life history of the individual. The individual now enters upon the "latency period." This period sees a steady strengthening of the "incest barrier," a modification of sexual aims into affection and respect for the forbidden parent, and an extension of these sentiments to the formerly opposed parent of the same sex. Friendships are formed beyond the immediate family circle. Auto-erotism and narcissism diminish further. "Psychic dams" in the form of loathing, shame and moral and aesthetic ideation-masses build themselves up, and sexual energy becomes enchanneled in impersonal activities.

With the thirteenth year, the pubertal period sets in, and lasts until the nineteenth. At puberty, not only is the libido newly focalized in the genitals and copulation made the sexual aim, but the old infantile sexuality is reawakened and normally finds a place as preliminary to the sexual consummation. The whole formation of the Ego during the latency period is shaken by the new insurgence of libido. The Oedipus complex is reanimated and conflicts arise both in the Ego and the Id. But auto-erotism and narcissism are also reawakened, and work toward the detachment of the adolescent from the parent. Homosexual trends manifest themselves in the form of crushes, gang organizations and the like, reenforcing this detachment. These are succeeded by genuine focalization of the libido on a member of the opposite sex. Now the personality has reached normal adulthood, and the Id, the Ego and the Super-ego have found an equilibrium, involving a maximum of pleasure and a minimum of pain which should endure throughout life.

But such an equilibrium is always precarious. It is an inner condition which the Ego maintains against the undue pressure from the Id and repression from the Super-ego, amid changing demands of the outer world. Even in the most normal personality its upkeep involves the establishment of a variety of behavior patterns

which need only become a little exaggerated and dominant to cause abnormality. These behavior patterns are in effect the Ego's defense mechanisms against upset. They are processes establishing substitute channels for the discharge of sexual energy or transforming the energy itself, inhibiting its flow and damming it up. So they terminate or avoid "pain."

Seventeen such mechanisms have been distinguished. One is "fixation." It consists of an arrest of some part of the developing libido at one or another of the foci of infantile sexuality. It may result from undue strength or weakness in the libido, or a deficiency in the Ego coupled with difficulties of adjustment to reality which provoke a clinging to the infantile stage. Fixation is usually accompanied by "regression," which consists in the recoil of the libido to an earlier or lower level of development, as a rule, to a fixation. At such a level it gratifies itself in fantasies rather than through persons and things, and lives in a state of "introversion." But the most fundamental and central of the mechanisms is "repression." Not only does repression thrust conscious ideas out of consciousness; it also keeps what never was conscious from becoming so. Its appearance is coincident with the differentiation of the Ego from the Id, and its function is to defend the psyche from pain and danger. Sometimes repression is reinforced by "reaction-formations." These are conscious ideas and actions opposite in nature to the repressed ones. They are to be observed in such traits as oversensitivity to pain and suffering among unconscious sadists, as undue anxiety about the well being of a person one wishes dead, as exaggerated concern about sexual "purity," and the like. Generally repressed ideas arising from the level of the unconscious Ego or of the Id seek to reach consciousness in other ways than the closed one. Most of the remaining mechanisms consist of such ways.

Of these one is "displacement," which occurs whenever the emotion or affect attached to a repressed idea or activity passes over to another, not repressed. Displacement is recognized by the disproportion between the intensity of the affect and the character of the idea. "Symbolization" is a displacement in which the emotion shifts from the repressed object to another unconsciously recognized as similar to it. "Transference," the shift of the libido from one person to another, is also a case of displacement. "Projection" consists in externalizing repressed

wishes and ideas whose acceptance by consciousness would be painful; persons who see everywhere obscenity, dishonesty or the like, project.

"Isolation" is a process of so dissociating an idea from its dynamic context that it may remain in consciousness without pain. In the same mode may be set "undoing," which consists in treating some painful experience as if it had not happened; the Christian Science attitude toward disease is a form of undoing. "Conversion" transforms repressed drives and the action repressing them into bodily symptoms, such as tics, hysterical paralyses and the like. "Condensation," on the other hand, is the compenetration and fusion of all sorts of experiences into a single configuration. This mechanism is especially characteristic of dreams.

The reverse of projection are "introjection" and "identification." The first is a sort of psychic assimilation of an object by the Ego. The second is the self-definition of the Ego in terms of some other person, initially the father or mother. If identifications are too numerous and incompatible, the result is "multiple personality." Identification is the mechanism underlying grouping. The primal relations are jealous and hostile; but as these relations involve pain and danger, they are repressed, whereupon "just" and other friendly social attitudes develop as reaction-formations. Each member of the group identifies himself with the others, via the prior identification of himself with the leader, who thus replaces the parent of the family group. Through identification the Ego is enabled to withdraw libido from the Id and enchannel it in non-sexual activities. Such enchannelment is "sublimation," which "desexualizes" or "inhibits the aim" of the instinctual urge, directing it toward "higher" social ends. In "rationalization" the Ego disguises the Id's pursuit of libidinous pleasure by attributing to it motives and purposes which would be acceptable to the Super-ego and describing them as so conformed to reality as to make the illogic and inconsistency of the individual's conduct and opinions appear rational to himself. Rationalization is a component of "idealization," a process of "sexual over-estimation," basic to "the peculiar state of being in love," endowing the love object with every excellence and subordinating the Ego to it.

These seventeen mechanisms delimit the manner in which the configuration of psychic energies constituting the Id, the Ego and the

Super-ego are adjusted to one another and to the external world. Throughout life their action patterns enter into the essential "unconscious fantasy," and give dreams their peculiar structures. Unconscious fantasies begin at about the third year. Many are universal and typical, and are lived through, like the Oedipus and castration situations, regardless of actual experience. They involve unconscious idealizations of realities, like "the mother imago," and the unconscious sense of guilt. Other fantasies turn on procreation, birth, seduction or assault, and prenatal well-being. They are inherited ideas, by which every individual "reaches beyond his own life into the experiences of antiquity" and possesses "prehistoric truth." In addition to such unconscious inherited fantasies each Ego has environmentally stimulated conscious ones, which may be repressed like experiences of the actual, and with the same consequences.

These and all other unconscious mental activities come to light through the study of neurotics and particularly through the analysis of dreams. In dreams repressed wishes are released and receive a vicarious gratification. The function of dreaming is to protect the sleeper from being awakened. This is accomplished by reshaping painful external stimuli, and relaxing the Ego's vigilance against the drives of the Id. Such relaxation is never complete. The Ego "censors" the original urges, and thus distorts their form. The process of distortion constitutes the "dream work." That involves, in addition to the mechanisms of displacement, condensation and symbolization, dramatization (in which the sequence is prevalently visual), and secondary elaboration—a sort of rationalizing of the basic dream so as to harmonize it with the conscious Ego. Dream work goes on even after waking. The part of the dream which the dreamer remembers is called the "manifest content." Its meaning, the unconscious wishes it fulfills, is called the "latent content." It is deciphered by means of psychoanalytic free association. Many dream symbols are so constant and recurrent as to be racial. They are found also in folk and fairy tales, and in myths.

The dream is the foremost avenue into the unconscious and thus a prime instrument in determining the dynamic ground-plan of personality. Others are the "absences of mind," the forgettings, the accidents, the mannerisms, the slips of tongue or pen, the mistakes, irrelevancies and the like, which compose "the psychopathology of everyday life." Still others are wit

and humor, with their dreamlike mechanisms and their equally wish fulfilling purposes.

In all, Freudian psychoanalysis discerns four basic types of adult character, permanently set by the end of the fifth year of life. Each is a reconstruction of the form of libidinal behavior prevailing up to that time—anal, oral, urethral or genital—especially through reaction-formation, symbolization, identification and sublimation, under pressure from the Super-ego. The "anal character" exhibits orderliness, parsimony and obstinacy; in the "oral," optimism and generosity predominate as a result of the transformation of well-defined and unbroken sucking pleasure, while pessimism, impatience and social dependence follow from the reverse. A "urethral erotism" develops later into ambition, envy and the like. The "genital character" is one well-adapted to society and ruled by the "reality principle." It is the character of normal adulthood. Although traces of both the Oedipus and castration complexes and sets from the anal, oral and urethral levels survive in it, they are properly subordinated, and the character is "stable." Neurotic or unstable character is formed by the presence of one or more dominant fixations with the consequent regressions and their bodily and mental character-symptoms.

If individuals escape this instability, society as a whole has thus far not escaped it. For its constitutive culture depends upon imposed self-denial and forced labor, both of which are accepted by the exploited classes for four reasons. The first is religion. Freud describes religion as the "universal obsessional neurosis of humanity," which began in the Oedipus complex and consists of neurotic survivals rooted in infantile repressions. The second is narcotics, which render men anaesthetic to the pangs and pains of life. The third is art, which supplies a substitute decreasing their intensity. The fourth is science, which distracts us from their hurt. These assuagements are servants of the pleasure principle, but cannot overcome the reality principle, which brings us suffering through our own bodies, through the outer world and through the social order, even though these are recreated by Eros into the forms of culture. What with the basic conflicts between Eros and Death, between the personal Super-ego and the Ego, between the cultural Super-ego and the personality, civilization must always be a burden and neuroses its frequent consequence.

Carl Jung's "analytical psychology" sets the psychoanalytic material in a framework at once

more conventional, abstruse and hypostatic than Freudianism. It takes over many of the Freudian mechanisms and concepts but interprets them with a more agreeable metapsychology. For Jung, as for Freud, the driving force in human conduct is libido, but Jung's libido is the entire stream of psychic energy of which the sexual is only a part. Its movement is a flow between the two poles of the unconscious and the conscious, which are opposites, one gaining what the other loses, and vice versa. The unconscious is to consciousness the background without which the latter can be neither distinguished nor defined, the reservoir of ancestral memories whose contents are general, timeless possibilities of individual and racial experience, related to the course of the sun, the rotation of the earth, the rhythm of the constellations and the goal of the instinctual drives. This content possesses forms which mystics contemplate and to which schizophrenics turn inward. They are gods, saviors, demons, animals, embodied in the myths of the race and appearing in the dreams and fantasies of the individual. They are the archetypes and *imagos*; collective images which enter individual experience. Their totality Jung calls "the collective unconscious."

The flow of the libido, which is the unfolding of life, involves movement and stoppage, direction, and expansion or contraction. Up to the third or fourth year of life its goals are nutrition and growth and the child is in a pre-sexual stage; from the fourth year to puberty its stage is pre-adolescent; after puberty its flow is that of maturity. Development consists in a continuous widening of the libido's range through critical points of struggle by the old against the new. Movement and stoppage in this development are defined as "progression" and "regression"; direction as "introversion" and "extraversion"; critical struggle as "transformation" and "symbol making." So long as the range of the libido widens continuously and flexibly, there is progression. Should, however, the libido become fixed by deficiency or excess at some phase of its movement, should it be dammed up or inflated, regression exists. Its signs are stereotypy of conduct, irritability, the feeling that life is empty. These disappear when the libidinal flow is again liberated and life pursues its goal. Its direction may be inward toward the unconscious or outward toward the world. Jung's name for the inward flow is "introversion," for the outward, "extraversion." Both are normal, the extravert being daring, open, ready, adjustable,

and the introvert cautious, reflective, shy, withdrawn. Either may become abnormal by excess or defect. Then these qualities become exaggerated, and their possessors are regressive and neurotic.

The function of analysis is to reinstall the individual life-stream harmoniously in the general stream of life and so restore its direction and goal. This task the analyst approaches by attacking the mannerisms, the family relationships, the dreams and the fantasies of individuals, through "conscious fantasy" or introversion. Such introversion brings to light symbols wherein the arrested movement and the lost direction of the libido are restored. The symbols are in fact "psychological mechanisms for transforming energies" which bring back the free confluence of the conscious with the unconscious. Symbols thus are unifications of opposites, "images in which all parts of the soul exist."

The fantasy which attains these images is the "transcendent function" of adjustment to the unconscious. It is the reverse of what by analogy should be called the "ciscendent functions" which Jung uses to define his psychological types. He distinguishes four such functions: sensation, intuition, thinking, feeling. Each function, in so far as it dominates, characterizes a type, and each type may be either introverted or extraverted. The thinking and feeling types are rational, the sensation and intuition types, irrational. There is also a mixed type composed of rational and irrational elements. The defining dominant function in each draws the libido away from its opposite, which Jung calls the "inferior function." Thus, where the dominant is intuition, the inferior is sensation; where the dominant is sensory thinking, the inferior is intuitive feeling, and so on.

Taken together, the functions are the soul, the dynamic complex within the psyche which is the totality of all mental *quales*. Among its significant contents are the "anima" or female component of the male unconscious, the "animus" or male component of the female unconscious, and the "persona," which is the system of adjustments to the environment corresponding to the Freudian Ego. Normal development calls for the projection of anima and animus outward, upon persons of corresponding sex. Lacking such projection, the persona is projected and homosexuality obtains. If none of the three is projected, images from the unconscious flow up into the personality and inflate it. Such inflation

is a sign of inadequate adjustment to the life situation. The fantasies, as always, serve to compensate for the inadequacy, which consists in too little libidinal attachment to reality.

In the first instance, none of these processes is individualized. Individualization, the creation of conscious personality, is the process wherein the persona, anima, and animus define themselves, and the functions of mind distinguish themselves as such from their objects. It comes about in the course of normal growing up, and its health is conditioned by its vital connection with the unconscious, from which it is an emergence and into which it returns.

To Alfred Adler the metapsychologies of Jung and Freud are abhorrent. His inferential structures do not wander so far from their origins in observation, are comparatively free from hypostases, and quite from personification. His system of individual psychology is simpler, more logical and more one-sided than Freud's or Jung's, and at first blush more plausible. Like Jung, he employs many, but not the same, Freudian conceptions of the mechanisms of conduct, but gives them still another meaning. He sees psychology as an interpretation of the interaction of the individual with society. With the unconscious he has no concern, and libido does not figure in his theories. His dynamic units are "feelings of inferiority," "organ inferiorities," "compensations" for such inferiorities, "purposes," "goals," "life plans," "feeling of community." Character and conduct, normal, peculiar or neurotic result from the interplay of these units, and their interplay follows from the relation of the individual to his group.

This relation begins as an inferiority. Adler had shown as long ago as 1907 that weakness in some organ of the body and its consequent functional inferiority may be psychologically compensated and even overcompensated. By training or exercise a functional superiority may be attained without modification of the organic deficiency. The growing child is among its elders as a weak organ in the body. It is helpless, dependent, the inferior of its elders in every respect. The female holds, in our man's world, a position like that of the child. In both the position generates feelings of inferiority which initiate compensating movements of self-assertion, demands for acknowledgment and for attention. These movements and demands are focused at the point of felt inferiority. They are self-centered, self-regarding and self-gratifying.

Their sum is a will to power regardless of the social order or its values. Their end justifies their means to them, and their consequence may be neurosis.

They are only a special case of the generally compensatory character of human behavior. For man as such is an inferior organism—this is why he has a mind which functions basically to compensate for sentiments of inferiority and insecurity. In this compensation consists the masculine protest. Among neurotics it takes the form of pretenses and fictions and inertias and evasions of reality (such as the Oedipus complex). It delimits perception and understanding, defines ambitions even in the sexual life, making Don Juans of men who feel sexually inferior and prostitutes of women who desire revenge for being females.

Often conscious, the masculine protest is usually not realized as the cause of its effects. Nor can its endeavor to disregard society succeed. The individual comes into dynamic relations with society principally at three points: his chosen calling, his friendships, his sex life. Failure at any of these points is intolerable and is excused or nullified by a system of self-justifying pretexts or subterfuges which compose neuroses so long as they are due only to egotism and fear, and become psychoses when these sentiments degrade to complete discouragement. The causes of discouragement are summative. They begin in early childhood and are functions of the child's family relationships: orphanage, being an only child, a girl alone among boys or vice versa, may easily lay the foundation of a neurosis. The relationships often determine the choice of a goal. This choice of a goal is not a realistic one, but reflects an imaginative fiction. Nevertheless, it is the "principal conditioning factor in life," at once the urge toward perfection and the enemy of reality. Often hidden even from consciousness, the goal or life-plan manifests itself in posture, carriage, expectations, memories, fantasies and dreams. It causes intolerance, dogmatism, avarice, envy and pleasure in the misfortune of others; it may grow far beyond the requirements of self-preservation.

Protection against these hypertrophic trends can be accomplished only by liberating and strengthening the "eternal, real, physiologically-rooted community feeling"—the true source of love, tenderness, friendship and love of neighbor—and by consciously destroying the will to power. This is the task of education. All educa-

tion is really mental hygiene. To do its work it must assume that every character possesses purposive unity and then must examine its earliest memories not only for their fictions and power drives but for their greatest social value, and interpret its dreams and fantasies so as to lay bare their relation to reality.

PSYCHOLOGY. Contemporary psychology may be approached through a retrospect of its origins, for psychology has a long past, if only a short history. Of scientific psychologists in the modern sense there have been at most three generations. But the antecedents of the problems with which they deal appear clearly in Greek speculation and less clearly in all stages of primitive soul lore. To emerge as an independent discipline psychology had to be freed from the dominance of theology and philosophy, to await the maturity of the biological sciences and finally to become differentiated from physiology.

Although the most prominent fact in psychological experience is the physical basis and conditioning of mental life and although the body has always been an object of observation, yet it is not surprising that much time elapsed before psychology reached scientific maturity. The body is definite and palpable, but what goes on within the body is sufficiently obscure to invite conjectural and fantastic interpretations. These tend to be conditioned by the prevalent conception of mind or psyche; for to his reflective self man is psyche. This "spirit" principle, by whatever name it is known, is conceived as a fusion of urges and emotions, as intelligence, as a mystic essence, as a soul with a future or a past. Psychology thus begins as soul lore, as "psychosophy." The psychosophic stages continue under the theological tutelage and through long centuries develop dialectic subtleties; these strongly influenced the pioneer thinkers of the Renaissance, and their echoes are still heard. Until this stage was superseded, there could be no naturalistic psychology.

Despite persistent spiritualizing the bodily conditioning of psyche was never altogether neglected. Aristotle defined psychology as the study of the soul and its "accidents." He postulated a "nutritive," a "sensitive" and a "rational" soul. For the longest period of its development psychology was shaped by the needs of philosophy. To the philosopher mind was the rational endowment, through which the world becomes knowable and reflection possible. Such knowledge or intuition, or belief or faith, usually

regarded as transcending the worldly premises, posited a "spirit" behind the scenes; even the bodily processes were referred to "animal spirits." The increasing recognition of the bodily structure led to a collateral mechanistic view of mental action. This position is represented by Descartes, who stands at the most distant portal of approach to modern psychology.

Descartes' solution is mixed. He accepts corporeal animal spirits communicating with an incorporeal soul which he locates—since mind must be unitary—in the obscure pineal gland, as the only single organ in the bilaterally symmetrical brain. The "spirits" there seek memories which the mind desires. For him, as for Geulincx, Malebranche, Leibniz and others, God becomes an acceptable cause where physiological explanation stops. Such mingling of observation with mystic interpretation seems unintelligibly foreign, offering but a meager hint of future orientation.

The more progressive English psychology followed an empirical bent. Hobbes appears indeed as the precursor of modern social psychology. Living an active life in turbulent times, he developed a psychology to explain human nature on a large scale. To him the "natural" state of man was "solitary, poor, nasty, brutish and short." The transformation by the processes of civilization proceeded by control through fear and the desire for honor and regard. Competition led to cooperation, to refraining from robbery in order to avoid being robbed. Self-interest he regarded as the dominant motive of human conduct, as did likewise in later days Bentham and the utilitarians. While mainly concerned with the social complication, Hobbes considered the physiological sources: the primal impulses of hunger, thirst and sex and the bodily basis of the mental movement. This last he conceived to be a form of physical motion; as the motion died out, the sense impression faded into a memory. Memories were organized by the coherence of ideas; the "cohering" came to be known as "association." Back of the coherence is intent; there is guided and unguided thought, the latter the freer imagination. Although fragmentary, there is here the groundwork of an empirical psychology.

The associational clue gave direction to British psychology, which was concerned less with the ultimate nature of the mind or its relation to body than with its observable processes. This tradition began with Locke and became explicit and mature in Hartley. Two problems were

uppermost: how contact with the world was established, and how on the basis of sensation ideas were developed. Both involved the issue as to what was innate and what acquired. The solution was sought, not in a hypothetical entity but within the body-mind, yet with interest focused upon the upper level conscious processes. There was as yet slight recognition of a genetic series from reflex to reason.

Opposing the then current doctrine that certain ideas were inherent, Locke saw the mind as originally a *tabula rasa*, a blank slate. What the mind came to know or believe or feel or do, depended upon its experience. There were two sources of knowledge: sense, and intellect or reflection. There was nothing in the "intellect" that was not previously in "sense." Sense impressions supplied the data for perceptions and, by reflection, for ideas. The "repeating" and "joining" composed the mental movement—what generations later James called "the stream of consciousness"—in which the "association of ideas" sets the central flow.

Berkeley's *An Essay towards a New Theory of Vision* (1709), appearing just after Newton's *Opticks* (1704), may be regarded as the first treatise dealing in a modern manner with a specific psychological problem. Berkeley demonstrated that "distance" was a judgment based upon the sense feelings in the muscles of convergence; that secondary criteria, light and shade, entered; that relations of size and distance were likewise the result of experience and not, as Locke thought, an immediate datum; that the perception of a coach was the joint issue of hearing it, seeing it, entering it, by "natural, necessary or customary association"; that by extending the same process to sets of perceptions and ideas—the perception particular but the resulting concept general—the content and meaning of experience emerged.

Hartley developed the implications of associationism. He was groping for a physiological psychology. The nerve processes he described as vibrational ("vibratiuncles"), and their dying out as giving rise to images, including the after-images. He described the "laws" of association as bonds established through contiguity in space, succession in time and contrast in relation. He applied these fusions to the elements of sensation, to perceptions of objects, to actions, to emotions and to concepts and ideas, from simple to abstract. The indefinitely complex content of the psychic life he explained as composed of pleasures and meanings by way of secondary

associations and affections. Hartley's psychological method consists throughout in deriving the complex from the simple.

Associationism held its influence upon systems of psychology well into the nineteenth century. It was elaborated into a complete and systematic formulation by the utilitarian philosopher James Mill; it was transformed into a "mental chemistry" by John Stuart Mill; and finally Alexander Bain assimilated it into the developing trend of physiological psychology.

Leadership in philosophical psychology passed in the eighteenth century to Germany. The most notable philosopher-psychologist had been Leibniz, whose conceptions of mind were abstract and theological. His solution of the body-mind relation, in opposition to Descartes' dualism, was a parallelism: mind and body keeping time like two clocks, through a divine "preestablished harmony," without further intervention or control. There is but one substance—hypothetical monads—from a material particle to a complex state of consciousness, or God Himself.

Although Wolff was but a generation later than Leibniz, whose parallelism he followed, he regarded mind far more empirically. He is considered to be the father of "faculty" psychology. He pictured the mind, although ever a unity, as functioning in distinct capacities, now remembering and then imagining, each being a power (faculty) as well as a process. Knowing and feeling were the primary faculties. Wolff's psychology was the dominant one of his day and gained prestige through its acceptance by Kant, who, however, glorified reason and opposed the reduction of higher mental processes to simpler functions in the British manner. Although he shared practical interests, Kant sought always for the philosophical ultimates; on the whole his views sent psychology back into the fold of philosophy.

A later and extreme issue of faculty psychology appears in the thirty odd cranial "organs" of Gall, which his associate Spurzheim called phrenological. Although the scheme was as grossly false as it was ambitious, it made articulate the assumptions underlying faculty psychology. Incidentally, this ready diagnosis—a forerunner of applied psychology—resuscitated the pseudo-psychology which has ever led a parasitic life upon the universal interest in the unusual manifestations of mind and the delineation of character.

Gall's work was influential in bringing the body-mind issue to the test of physiological

proof in the functions of the cortex. Flourens had developed as early as 1825 a technique of extirpating portions of the animal brain and noting the resulting losses of function. His conclusions seem amazingly correct a hundred years later. Although he recognized divisions of function (*action propre*), he insisted on the unity, or integration (*action commune*), of cerebral function and opposed with vigor Gall's wholly unscientific conclusions. The active period of "brain localization" was inaugurated by Broca's discovery of the speech center in 1861; this was followed by a rapid increase in the understanding of the cerebral organization, particularly the differentiation of the motor zones and of specific sensory areas. Today the topic is once more prominent under refined methods combining psychological and physiological techniques. That mental action is determined by neurotic organization is a cardinal principle of all modern psychology. The solution of the problem first answered in terms of souls or animal spirits lies in neurology.

The early nineteenth century saw a distinct advance in all the collateral disciplines upon which psychology depends and in psychology itself, including the ever influential academic tradition. The leading psychologist was Herbart, who developed a mathematical form of exposition, perhaps in answer to Kant's challenge that psychology could not become a science until it became quantitative. His formulae were such in form only; they were based on assumptions, not on findings. Ideas, Herbart maintained, not only followed one another but competed for recognition, for what later was called the final pathway. They had different measures of vigor: some were active, well above the threshold; others weak and near or below it, to all intents "subconscious," in later terminology. An important value in Herbartian psychology is this recognition of the dynamic, urgelike processes animated by a search for meaning and purpose as set by experience. The apperception mass, embodying that experience, guides the learning process; and learning receives attention, for Herbart's was the first explicitly educational psychology, formulated in theory and applied in practise. The reform of teaching by object lessons, by emphasis upon meaning rather than rote information, by the study of growth levels, and the naturalistic pedagogical methods of Pestalozzi and Fröbel all derive from Herbart.

Likewise a pioneer contribution was the work of Fries, who introduced the fertile idea that

anthropology, as an exhibit of how men think and feel and live, is itself a demonstration in psychology, showing in varied stages of culture both the empirical source and the empirical expression of the psychic life. The ethnological reports of world travelers, of Humboldt particularly, presented a picture of how variously the common psychic nature may be expressed. Here as elsewhere the group life is recognized, a partial foreshadowing of the later "folk psychology" of Steintal and Lazarus. The latter movement inaugurated the racial and anthropological psychology, including the study of cults, customs and belief systems, of which the English counterpart appears in Tylor and later in Frazer's *Golden Bough* (1890).

The two dominant sources of present day scientific psychology are the experimental method and the principle of evolution. The nucleus of investigation was in the physiology of the senses. The pioneer psychophysicist, Johannes Müller, summarized his position in an epigram: "No one can be a psychologist who is not a physiologist." The notable discovery in 1811 that the posterior roots of the spinal cord contained sensory and the anterior, motor nerves afforded an insight into the plan of function. There followed the principle of "specific nerve energy," developed by Müller in one direction, by Bell in another; the determination of the rate of travel of the nerve impulse, which Helmholtz measured shortly after Müller declared it beyond human capacity to determine; and a wealth of investigations into the sensory mechanisms. Each stage in the formation of the visual world was studied minutely. Wheatstone's stereoscope (1838) demonstrated the principle of binocular depth perception; the functions of the eye muscles were plotted; the kinaesthetic sense was recognized; the unique working of the auditory mechanism in speech and music was analyzed. This thorough survey of sense capacity reached its climax in the two brilliant works of Helmholtz on vision and hearing (*Handbuch der physiologischen Optik*, Leipsic 1867, 3rd ed. 3 vols. Hamburg 1909-11; tr. by J. P. C. Southall, Rochester 1924-25, and *Die Lehre von den Tonempfindungen als physiologische Grundlage für die Theorie der Musik*, Brunswick 1863, 4th ed. 1877; tr. by A. J. Ellis, 2nd ed. London 1885), which finally established what was native and what acquired in the sense data. All these accomplishments formed important data for the psychology which was then clearly in the making.

Through the exploration by E. H. Weber of

the dermal senses (1834 and 1846) the skin, with its abundance of temperature, texture, spatial and motor data, became a recognized psychological organ. The same investigations developed the measurement of sensibility, which Fechner called Weber's law, and upon which in 1860 he developed an elaborate system of psychophysics.

Fechner experimented endlessly with lifted weights, determining the "just perceptible difference" in proportion to the initial weight. An ounce in a pound he showed to be an "equally perceptible" increment with two ounces in two pounds. He determined next a graded series of "equally perceptible differences" and announced the general psychophysical law that proportional amounts of stimulus are needed to produce equal units of sensation. Fechner, a curious combination of mystic and scientist, thought or hoped that he thus had found a common measure of the physical and the psychical which would make psychology mathematical. He also applied experiment to aesthetics—another pioneering enterprise. The immensity of labor expended on the elaboration of this problem seems out of all relation to its intrinsic importance; but it did establish an experimental technique. What it neglected was the vital fact that senses have developed for biological use. Little more was proved than the existence of a relativity of value—a relativity applicable equally to physiological effects and to psychological impressions.

In the transition to a distinctly modern naturalistic psychology two influential psychologists deserve mention—Beneke and Lotze. Beneke, whose views accord with those of Herbart but are more cogently naturalistic, used the expression "psychology as a natural science" as the title of his opus (1833). He emphasized the "wholeness" of the mentally reacting organism and accepted the associational procedures as valid but not adequate for explanation. Mental life consists of inherent, basic functions; these include emotional as well as intellectual trends. Experience develops and modifies their expression, each reaction leaving its traces, which affect the next response. The "faculties" were rejected by Beneke as abstract creations. Lotze was medically trained and had the physiological data at his command. He covered a wide range in his *Medicinische Psychologie* (Leipsic 1852) but in his later years turned to philosophy. His contributions to physiology are notable; he seems to have been the first to use the term physiological psychology. Lotze's best known contribution is the doctrine of "local signs,"

demonstrating how the registry of impressions is correlated with the control of movement. His pupils, notably Brentano, Stumpf and G. E. Müller, became leaders in the experimental movement. Of all the psychologists in the philosophical tradition Lotze stands closest to the moderns.

The physiological emphasis, the experimental approach with its rich implications and the coordinating idea that the scattered and comprehensive mass of data concerning mental action were all contributory to a unified psychology met in the determination of Wilhelm Wundt to establish a physiological psychology. The Wundtian renaissance turns upon a technique: the establishment of the experimental method, which has subsequently been extended far beyond its original employment. This contribution remains its permanent distinction. Wundt's work contains also a project of organization: a confederation of the several provinces covering the many sided interests and phases of mind. But the program of psychology in Wundt's day was academically limited. It has grown vastly and in unforeseen directions, dividing psychologists into specialists, particularly in applied fields. There have come to the fore active conflicts of opinions and issues not then on the horizon.

Wundt's own psychological doctrine has long been superseded. It is now classified in the museum of historic systems under the rubric of structuralism. Its central idea was that psychology was to be prosecuted as a technical analytic study, directed by controlled introspection and reduced to quantitative form, of the structure, or existential content of consciousness. Because of its emphasis on existential content, Woodworth speaks of the system as existentialism; since it reduces all psychic processes to their elements, Boring calls it elementarism. Even the feelings were introspectively analyzed into a paradigm of six qualities in oppositely paired dimensions. The mental life was conceived as a matter of compounds, blends and reactions and the set up of a psychological experiment was patterned after one in physics or chemistry, with the Hipp chronoscope in the place of honor instead of the test tube.

Wundt's activity recognized another source of psychological knowledge besides experiment. He studied the psychological record, which he called *Geschichte*, and late in life prepared an extensive *Völkerpsychologie*, a study from the psychological angle of the evolution of the cul-

tural stages of mankind. The Wundtian influence is, however, represented chiefly in the publications issuing from the Leipsic laboratory. The contributions of Wundt and of his school are far too rich and detailed for summary. They represent the transformation of psychology under a new technique, comparable to the transformation of biology following the introduction of the microscope. The studies in sensation in which physiologists had encroached upon the psychologist's domain gave the keynote; they provided the impetus for new methods in the investigation of mental processes as they appear in consciousness: discrimination, imagery, memory, comparison, judgment, concept forming and every variety of mental product and process. The later Gestalt psychology is a laboratory product.

The innovation of the Leipsic laboratory attracted two such diverse and gifted psychologists as William James and Stanley Hall and through their following transferred the active center of psychological research to America. Yet each of these leaders, and each distinctively although both in a spirit of liberalism, moved away from and beyond the Wundtian program, even as they spread the message of its significance. The literally loyal follower was Titchener, Oxonian in habit of mind, Teutonic in method, American by residence. To Titchener psychology remained a pure laboratory science devoted—as was physics to the laws of matter—to the establishment of the principles and data of the introspective domain. Surrounded on all sides by the applicational extensions, he held firmly to the technical pursuit of analytical problems, confident, with an a priori conviction, that there alone lay the secret of the mental structure and the proper occupation of a psychologist.

Of the second dominant source of modern psychology, biological evolution, it may be said that if the concept of evolution is recent, the biological approach to psychological problems has always existed. It is in fact the core of all naturalism. But this biological motive was overshadowed in the past by other doctrines, mainly moralistic in temper, and in later thought by the mechanistic and abstract conceptions into which a primarily academic psychology sought to imprison the psyche. Aristotle, Descartes, Hobbes, Hartley, Herbart, Müller, Beneke, Lotze, all gave varied emphasis and expression to the biological motive. Indeed even the term physiological psychology incorporates the broad view that psychology is but the biology of the

mind. Yet the biological viewpoint never dominated and only occasionally became directive; the psychologist was not wholeheartedly a naturalist until the insight of Darwin established the principle of evolution and the wide implications of that enlightening principle had become a common possession. Within a remarkably short period all the sciences of life were recast in a biológico-genetic mold, particularly psychology. Herbert Spencer anticipated Darwin in applying evolutionary concepts to psychology. Spencer presented theoretical generalizations; Darwin patiently supplied the evidence. The latter's *The Expression of the Emotions in Man and Animals* (London 1872) represents an evolutionist's solution of an intrinsically psychological problem. Postevolutionary psychology is in every way distinctive and itself completes the naturalistic evolution of psychology. From then on the biological criterion and reference claim consideration in every problem, even though the actual investigation is experimental or sociological.

The biological emphasis centered upon function through the leading idea that behavior, like endowment, is an expression of the adjustment of organism to environment, in which the better adjusted survive. The movement away from structuralism has come to be known as functionalism; it leads directly to an adjustment psychology—which is a more cogent name for it—finding what the mind is in what it does.

This pragmatic view characterizes the American movement in psychology. It was above all William James' *Principles of Psychology* (2 vols., New York 1890), with its sweep and power and vivid vitality of presentation, which spread the doctrine of the mind as an active moving power—what Woodworth later called “dynamic” psychology. James was a naturalistic analyst, interested in the fauna and flora of the mind and their interpretation, ready to find his data in space perception, in instincts and emotions, in reservoirs of energy and in the varieties of religious experience or in mediums and revelations.

The neglect of the biological clue led to a protest against the Wundtian psychology. James found it dull and meaningless from the beginning. Hall definitely regretted that psychology had taken its model from physics and not from biology. Dewey and Angell by precept and practice gave the functional view currency, and substantially all current psychology is functional in scope and purpose.

The biological postulate which holds that the

clue to mental behavior lies in the genetic series, from infusoria to man, infant to adult, reflex to reason, is most directly expressed in the modern study of animal behavior, which at the same time affords a convincing example of the convergence of evolutionary concept and experimental method. It has made the white rat a psychological property, but does not imply that rat psychology can be transferred to human behavior. In the shifting concepts of animal behavior the entire succession of views of the psychic life may be found reflected—from Aristotle's naïve views of animal powers to Descartes' theoretical automata, to the anecdotal assemblage of “animal intelligence” of the Victorian period, down to the experimental studies under a biological interpretation initiated by Lloyd Morgan and Thorndike and giving the animal laboratory a parallel place with the human.

The results of experimentation upon animal behavior appear in the revision of the accredited views of two leading problems: instinct and learning. The criteria of instinct—primary urge, specific trend, pattern, fixity, innateness—have become more flexible. The demonstration that the ready-to-act “instincts” of the infant are few and that the effect of early experience is decisive, the questioning of the validity of any enumeration of instinctive tendencies—by Thorndike in terms of concrete responses, by James in one set of urge trends, by McDougall in a more socialized set, by Freud in a quite divergent scheme—indicate that a unified concept is still to be sought. Instinct is involved in the problem of learning. Animal as well as child psychology supplies the data. The stages of response—impulsive reaction, trial and error, insight—bridge the gap between reflex and plan; the approach of simian patterns of solution to human ones is demonstrated. The awaiting of maturation before instinctive tendencies can find motor outlets at command is demonstrated in Gesell's investigations. There emerges a far more complete and correct picture of mental evolution than was ever before available.

Evolution placed the emphasis on origins; it introduced comparative psychology; it sponsored child psychology—Darwin himself wrote the biography of an infant in 1877; it provided direction for racial and social psychology; it gave the genetic a richer meaning, from hierarchies of neurones to stages of civilization. Among the issues of naturalistic psychology is the substitution of “behavior” for “consciousness.” Behavior had already been accepted as the sum-

mary of psychic activity when Watson's behaviorism emphasized the importance of carrying the objective attitude as far as possible. The attempt totally to eliminate conscious behavior from consideration and the rather startling pedagogical and social consequences which Watson drew from his premises are extreme interpretations; they may be dismissed without affecting the core of behaviorism. A naturalistic psychology is inherently behavioristic.

The Darwinian influence, which was so potent in the theoretical orientation of psychology, also furthered the practical phase of modern psychology. Directly under Darwin's inspiration Galton introduced the study of human variations and the ranges and distributions of human qualities derived from them. Their extension by Cattell inaugurated the entire psychology of individual differences, a problem which Wundt pronounced *ganz amerikanisch* when Cattell proposed it to him.

Mental testing arose jointly from Galton's "anthropometric" scheme and from the need in education of separating normal and subnormal children by a reliable method; the latter was the starting point of Binet's investigations.

These many aspects of human variability developed under the rapidly increasing knowledge of the mechanism of heredity. Galton's *Hereditary Genius* (London 1869) was an early contribution. In an attempt to gauge human intelligence and qualities generally the need of a measure to determine rank in one proficiency in its relation to another led to the method of correlation under the leadership of Pearson, an associate of Galton. The curve of distribution and the criterion of correlation have come to represent the quantitative temper of psychology; they provide an instrument of wide application to social as well as individual relations.

Applied psychology, once established under the auspices of the pragmatic temper, pursues its own varied course; it has resulted in a psychotechnic, notably in the industrial field. But whether in the rating of school children or in so specialized a problem as the psychology of advertising or so general a one as fitting a job to a man or a man to a job, it is the presence of the personal factor of adjustment which defines the general nature of the problem. Presumably the complex stresses and specializations of modern life would have developed an applied psychology even had no theoretical psychology existed; its rapid growth to a professional vocation has profoundly influenced the scope of

psychology. It may prove, as Yerkes proposes, that the future will recognize two types of specialists: psychologists and psychotechnicians.

Closely allied to applied psychology but possessing a distinctive source in the pathological phases of psychic behavior is the clinical approach, or the approach of abnormal psychology. Like general psychology this discipline has a long past and a short history. Its temporal span reaches from explanations by demon possession to demonstrable changes in cortical cells. The modern viewpoint is neurological. The clinical approach is opposed to, and is in a quite different camp from, the academic approach. It recognizes that the abnormal is but the extreme of the normal. Psychological principles find their confirmation in the abnormal, and the abnormal itself contributes important demonstrations to psychology. Mental disorders are at once human liabilities and nature's experiments. The enrichment of modern psychology through the inclusion of the abnormal is distinctive of twentieth century advance.

In the same progressive years which marked the establishment of the neurological basis of psychic variation—the discovery of the influence on behavior of the endocrine glands and the related basic functions of the autonomic nervous system is a notable contribution—appeared the new approach of psychoanalysis. Where the apostle of determinism by the autonomic nervous system approaches mental function "from below," through the influences exerted by the rudimentary structures, the psychoanalyst approaches it "from above," through the internal complications associated with the highest cortical layers. The principles of psychoanalysis are equally significant in clinical psychology and in the shaping of the concept of psychology itself. Psychoanalysis challenges the adequacy of the entire accredited approach, posits a motivation of the total psyche as the mainspring of behavior and proposes an entirely novel set of mechanisms and intimate psychic relations (complexes). It focuses upon urges and the emotional life. Although acceptance of the various parts of the Freudian system by psychologists has been limited, its influence upon popular thought has been pervasive.

Clinical psychology should not be dismissed without an indication of the parallel development of psychiatry. Mental disorders and abnormal manifestations of mind have insistently demanded attention. There is a parallel problem of deciding how far disorder of mind is mental

or physical. The psychological approach in diagnosis and treatment has been established without abandonment of the as yet unknown physiological origin of the functional nervous disorders, the psychoneuroses. The modern era begins with Charcot, who utilized the hypnotic condition which Braid had rescued from the misleading conception of Mesmer. Charcot together with Janet, his successor, gave a clear exposition of the play of psychological urges and mechanisms in the disordered mind. Kraepelin, Bleuler and Freud represent the development in Teutonic lands of a similar approach. The convergence of these points of view is responsible for the institution of clinics in the service of the law and for the vigorous "mental hygiene" movement.

Both in clinical and in normal psychology the question constantly arises as to how far the explanation of individual conduct can be complete without reference to that vast system of social institutions and traditions which envelops individual life and in which individual life finds its dominant expression. Whether or not a fully developed individual psychology would account for all of the collective relations and manifestations which react upon the individual, a special social approach is necessary for a grasp of the reactions of the individual in the concrete social context as well as for an understanding of the psychological impact of social institutions upon the individual. It is this approach which has created the discipline of social psychology, which places a new emphasis upon the various branches of psychological investigation (abnormal psychology and applied and educational psychology in particular) but which serves to mediate between psychology and the specifically social sciences. An analysis of the concepts and methods of this discipline is elsewhere considered (*see* SOCIAL PSYCHOLOGY). This discipline leans heavily upon the biological and functional approach discussed above. Experimental methods, although they have been slow to develop, are now also finding fruitful application in this field.

The shifting concept of the human psyche forms the core of the history of psychology, the determinant of its present status and its future career. It is now possible to view the retrospect and prospect alike from the position of clarity and so much of unity as may be established by a resolution of the apparent and real conflicts of present day psychologies. The result of the emergent evolution in this concept is that psy-

chology has been established as the scientific study of the motives and mechanisms of behavior and their organization according to a naturalistic scheme. Certain phases and specialties within the psychological domain are predominantly studies in motivation, others in mechanisms of low and high degree; and still others are focused upon organization. But it is all one endeavor—to see the psyche soundly and to see it whole. As inevitably as there is one physics, there is one psychology.

Recent systems of solution offer conclusive demonstration of this trend. Behaviorism proposed the S-R (stimulus-response) formula as the simple pattern of all behavior and assumed that this formal statement was adequate. It ignored the vital factor of the organism, which decisively, and in each type of organism distinctively, determines which of all the physical and generally environmental forces shall act as a stimulus (S), and what the manner (including the absence) of response shall be. The true formula is S-O-R, stimulus-organism-response. The "Gestaltist" recognized that the integration pattern—which is the Gestalt—is present from the outset. Accepting the same emphasis, others speak of an organismic psychology; still others emphasize that since all behavior is active, the "act" psychology, the completing motor phase, is the proper point of approach and the consummation of behavior is the unit of response. The behaviorist in common with all genetic psychologists finds the clues of the psychic pattern in the beginnings, in "primitive" primary psychology. But to assume that the "conditioning" which there takes place remains the pattern of complex behavior is a fallacy and is so rated by the Gestaltist.

The Freudian psychology is clearly a motivation system; it seeks the motivations in the intimate primal drives, tracing their issues in the most complex and disturbing of cerebral functions. Accepting this as the leading idea of psychoanalysis, it appears valid and far reaching, in some respects the most transforming of all the recent contributions and by far the most comprehensive in its vast implications and applications. The doubt arises—and it is a crucial one—whether the Freudian mechanisms are real or only the hypothetical fictions assumed in support of one very specific theory of origin. The enlargement and correction of the motivation scheme by Jung, the complementing of urges in goals by Adler and the emphasis upon the social competition and personal status, dom-

inant in recent literature, are in line with progressive psychoanalytical insight and point the way to a comprehensive summary of behavior in terms of motivation.

Despite the crisscross of opinion, the conflicts in definition and method of contemporary psychologies, the unitary purpose and even a consistent formulation are increasingly apparent, indeed imminent. In contrast to the irregular and handicapped course represented in the historical development, the present outlook is clear and unhampered. The major battles have been won, but no sooner have they been won than other dissensions have appeared, some as disturbing interludes of aggressive or uncompromising movements, far too cultlike in their singleness of aim; others as constructive critiques leading to corrected concepts and more profitable modes of advance.

The shifting scope of psychology is unique as compared with the accredited unity of the basic sciences, but not if its proper parallel is in the social sciences, subject from base to apex to human complications. Psychology is both basic to the social sciences and one of them. As a basic science it must come to terms with its unprofitable contentions and its obsolete "isms." Because of its comprehensive scope and its applicational field it will inevitably, like medicine, divide into specialties, but with a common scientific naturalistic basis. Psychology is both made and in the making; its future, once its interludes and extravagances are overcome, seems promising if not secure.

PUBLIC ACCOUNTS. *See* ACCOUNTS, PUBLIC.

PUBLIC ADMINISTRATION. *See* ADMINISTRATION, PUBLIC.

PUBLIC CONTRACTS. In earlier times, when governments were almost entirely law enforcement agencies, their very limited expenditures were confined largely to the cost of personal services. Modern governments, however, which spend vast sums for supplies, materials and equipment, are usually the largest business corporations within their territories. Included in the governmental budgets are appropriations for such purposes as the housing, clothing and feeding of the public wards in penal, correctional and eleemosynary institutions; the construction and upkeep of school and university buildings and the purchase of textbooks and educational supplies; the building and maintenance of great hard surfaced highways; the operation of playgrounds and recreation centers; the purchase and servicing of huge fleets of all types of motor equipment used in public works activities, law enforcement, fire extinguishment and, in the federal government, in the operation of the postal system; the maintenance of the water supply system and any other public utilities under government control; the purchase of food and clothing for the relief of the unemployed; and, finally, the huge expenditures for military or naval establishments.

The governments of the United States—federal, state and local—spend in normal times more than one billion dollars a year for material

goods. The average government normally allocates from 20 to 30 percent of its current operating budget for supplies, materials and equipment. As might be expected, the handling of contracts for materials has long been one of the bulwarks of the spoilsman. Consequently it has been necessary to buttress the award of public contracts with every possible legal safeguard in order to prevent the dissipation of public funds. The federal government and practically all states now require, by constitutional or statutory provision, that competitive bids on all contracts be solicited by advertisement in newspapers "of general circulation" for a stated period before the bids are opened and the contract is awarded; that the bids must be submitted sealed and must be opened and announced in public at the time and place stated in the advertisement; and that the contract must be awarded to "the lowest bidder" or the "lowest responsible bidder." Such legal restrictions are intended to open competition to all interested parties and to close the door to "the faithful few," who may belong to the inner circle of the administration in power or who may be liberal contributors to campaign funds. Because relatives of awarding officials have often been involved in scandals, practically all governments as a preventive measure now prohibit contracts to individuals or corporations in which the awarding officials are interested financially or otherwise.

The awarding officials do not always have full discretion in determining which is the lowest responsible bid. Some states grant by law a price differential as high as 5 percent in favor of "local bidders" or "firms doing business within the state." This restriction, while helpful to local contractors who are also taxpayers, sometimes penalizes all taxpayers for the benefit of a few. Many states also stipulate by law that the state government and all local governments must purchase the products of penal and correctional institutions at the prices fixed by the institutions, regardless of any more favorable prices from private producers. This situation has been aggravated since the passage of the federal Cooper-Hawes Act subjecting the interstate shipment of prison made products to control by any state which wished to bar them; thus each state has practically been compelled to consume its own products through distribution and sale to its local governments.

Another set of restrictions, devised by most governments to protect the public against irresponsible contractors, require that all bids on

public contracts be accompanied by cash, certified check or surety bond in a stated percentage of the amount of the bid, as a guaranty that the bidder will sign the contract if it is awarded to him. When the successful bidder signs the contract, he must offer new or additional security as a guaranty that he will fulfil his contract obligations. As an additional safeguard against default on construction projects, most governments make only "progress payments," whereby a part of the amount due the contractor at each stage of construction is withheld until the project is completed. Since the public is almost invariably the loser through delay and extra cost in cases of default, many governments now require prospective contractors to "pre-qualify" before they can submit bids for the construction of buildings or highways. Under this method each interested bidder must answer a questionnaire relating to his past construction experience, the extent of his financial resources and the type and adequacy of his construction equipment and must also supply satisfactory references. Pre-qualification of contractors is required by a number of state highway departments and by some local governments in Pennsylvania and New York and has recently been legalized for use by state or local government in Wisconsin.

One of the abuses most difficult to control is "collusive bidding," which usually occurs in connection with contracts for commodities. When competitive bids are opened and announced, it is sometimes found that all bids are the same, indicating that the bidders have agreed upon the price in the hope that the government will apportion the business or rotate the present and future contracts among the various competitors. As a safeguard against collusive bidding the majority of laws on public contracts reserve to the government the right to reject all bids and to readvertise. "Balanced bidding" is another device whereby certain contractors may secure an unfair advantage over their competitors. This type of bidding occurs when the government is contracting for a large number of items and a wide range of commodities for repair and maintenance purposes, and when a government official may notify a favored contractor that certain items in the list will be needed in small quantities or not at all. By quoting a low price on such items and a relatively high price on the more important items, such a contractor may submit the lowest bid for the total lot of items and thus secure the award. To prevent balanced bidding many governments

reserve the right to award separate contracts for each item and to the lowest bidder on each.

All materials entering into construction and all goods delivered on commodity contracts are subject to inspection by the government's representatives before payment is made. Although this requirement tends to increase the cost of construction and the cost of government services, it has proved necessary to insure that the public shall receive what it contracts and pays for. But this safeguard, like many others, is difficult to enforce. Many scandals have arisen as a result of the acceptance of inferior goods by dishonest inspectors, who split the differential profit with the contractor.

The political strength of organized labor is reflected in the provisions, commonly found in all public contracts, that the contractor must pay his working forces at the prevailing rate of wages. The established wage rates as fixed by labor unions are usually paid also when public works construction is carried on by government employees. In some cities, for example, Chicago, the labor unions wield such political strength that the government can employ only union members and is prevented in some cases from using labor saving equipment. Under the National Industrial Recovery Act of 1933 federal contractors were required to conform to the codes established by the administration as to hours of labor and rates of wages.

The restrictions on the methods of award and administration are almost universally applied to all types of public contract. In the most common type of construction contract the government agrees to pay the amount fixed in the contract when the project is completed satisfactorily, and the contractor furnishes all labor and materials, subject to inspection by the government. In another type the government furnishes part or all of the materials, while the contractor furnishes the labor and assumes responsibility for carrying out the specifications of construction under government inspection. Commodity contracts, by which the government purchases material for use in carrying on any public service, are also of many different kinds. That most frequently used is the lump sum contract, by which the government agrees to accept a fixed quantity of a certain commodity as specified in the contract and to pay a definite price. But commodity contracts may be indefinite as to quality, quantity, price, length of contract or place and frequency of delivery. By the use of contracts which are indefinite as to quantity and

time of delivery governments may drastically curtail the space requirements and the expense of maintaining warehouses, since the contractor furnishes the storage space and delivers as the government requires.

"Cost-plus" contracts came in for much criticism during and after the World War. Because of the extreme urgency of securing vast quantities of commodities without delay, the federal government authorized many contractors to furnish goods or to complete construction projects at cost plus a certain percent of profit or at cost plus a fixed sum. The cost-plus contract is conducive to extravagance and waste; since the contractor's profit is in direct ratio to the cost, he is encouraged to spare no expense. This type of contract is now seldom employed and in some governments, for example, in the state of Montana, it is prohibited by law; at present its use is confined almost entirely to payment for extra work on a construction project not included in the original contract and specifications. Such extra work is furnished on a "force account," by which the contractor places his forces at the government's disposal, being reimbursed for the actual costs of his labor, use of machinery, insurance and other overhead expenses, plus a certain percentage of profit.

Centralized purchasing has been widely adopted as a means of centralizing the responsibility of awarding public contracts. It has been introduced by forty-two states, by approximately fifty counties and by more than two hundred cities in the United States. By executive order of the president of June 10, 1933, an Office of Procurement was to be established on January 1, 1934, to contract for all the requirements of the federal government, including public works construction projects. By the centralized purchasing plan the supplies, materials and equipment needed for all or the majority of the branches of a government are purchased and contracted for by one office instead of by each department separately. The need for specialization is recognized, however, by the appointment in the large and well organized government purchasing office of a special buyer for a given commodity line, whose function is to keep informed on sources of supply, market conditions and other factors so that he can most advantageously meet the needs of all branches of the government. Contracts for public works construction are usually exempted from control by the central purchasing office and are instead awarded by the public works department in

cities, by the state highway department in states or by that department which is to supervise and maintain the project after its completion. The purchasing of equipment and supplies for the public school system and for educational institutions is also generally removed from the central purchasing office, although the school authorities usually maintain such an office for their own requirements. Cincinnati has successfully demonstrated the benefits of coordinated purchasing by combining the needs of the city, the board of education and the county and by buying more than one hundred commodities common to the needs of all three governments on joint contracts with standard specifications. Cooperative purchasing also has great possibilities for future economy, as is shown by the record of the Michigan Municipal League in buying fire hose, lamp bulbs and other staple articles on joint contracts for many of its member cities.

A long and extensive experience with centralized purchasing has proved conclusively that this method will reduce the cost of material on an average from 10 to 15 percent, thus leading to proportionately reduced expenditures for supplies, materials and equipment or to the procurement of more commodities for the same outlay of public funds. In order that this end may be achieved the administration of the purchasing office must be free from political control. Many governments have adopted centralized purchasing in theory, only to flaunt its observance by the appointment of a political partisan as purchasing agent, by discouraging the adoption of standard specifications or by crippling its administration through interference with the award of contracts. The situation in this field of public administration is, however, improving definitely and the present trend is decidedly in the public interest.

The regulation of public contracts in other countries has likewise advanced considerably. A few isolated instances of the letting of contracts for public works by competitive bidding have been traced to ancient times. Plutarch records that the temple works, waterworks and the repair of the walls of Athens were let in this way. There was no provision for the competitive award of public contracts in the economy of the Middle Ages; but it began to come into use as early as the sixteenth and seventeenth centuries, although it did not become common until the destruction of the guilds established the freedom of commerce and industry. In the transition to

modern times there was employed a form of oral bidding in a sort of public auction. Colbert, who introduced the submission of written bids on work on the royal domains, has been hailed as the founder of the modern method. The French law of 1833 is generally regarded as the earliest continental national provision.

The tendency of subsequent legislation has been to depart from the requirement of award to the lowest competitive bidder. In some countries, however, there are no national laws regulating the letting of public contracts. In Belgium and Denmark the various governmental ministries establish their own regulations; and in England also there are no rigid legal restrictions, the usual practise being the issuance of invitations to tender to firms on the government lists. In no country of the world has centralized purchasing been adopted to so great an extent as in the United States. In some governments of England and in other countries the central purchasing authority for a given commodity is entrusted to that branch of the government which is normally its largest user. In some countries, for instance, France and Italy, government contracts have been awarded to groups of workmen who have organized for the purpose of obtaining this work.

PUBLIC DEBT. The term public debt, as used in fiscal literature, refers to those financial obligations of the state which have their origin in

an act of public borrowing; that is, in a voluntary transaction between the state as borrower and the private holder of capital as lender. It does not therefore include debts originating from other obligations, as, for example, debts in the form of unpaid salaries of public officials, retirement pensions, amounts owed on contracts for public works and for supplies and indemnities due for damages. Nor does it cover obligations arising out of forced loans, issues of paper money with compulsory circulation or any other financial operation which lacks the essential characteristics of an act of borrowing. It is advisable moreover to confine public debts proper to the so-called commercial debts; that is, debts contracted between the state and the private lender. Financial commitments of one state toward another, such as war indemnities imposed by a victorious state upon the conquered or loans made by one state to another in the pursuit of a common war or of any other common political goal, do not constitute a part of the public debt proper. These are political debts and by reason of their origin and character are subject to a treatment different from that accorded the debts owed to private lenders (*see* LOANS, INTERGOVERNMENTAL). These distinctions are not always observed in the official financial accounts, and before valid comparisons of the relative rate of public indebtedness of the respective countries may be undertaken, a clear conception of the particular meaning various governments attach to the term public debt is of the utmost importance. Finally, it should be observed that it is incorrect to use the term loan in the sense of extraordinary revenue or receipts; a loan involves simply a cash entry and necessarily creates as its counterpart a corresponding item of indebtedness.

Of the numerous occasions which induce states to contract debts the three outstanding are the covering of a budgetary deficit, the construction of public improvements and the pursuit of war. It is the prevailing opinion among fiscal writers that the covering of deficits should not be effected by resort to public borrowing. It is held that current public expenditures arising in the ordinary course of state activities within the fiscal period should be met by the ordinary receipts of taxes, the revenues derived from public domain and public enterprise within the particular period. To this end most states draw up an annual budget of expenses and receipts; a balanced budget is regarded as the fundamental condition of sound

financial administration. If in the course of the year the yield of the public revenues is not sufficient to meet the commitments which fall due, governments frequently resort to borrowing for very short terms, such loans to be repaid immediately with ordinary receipts.

It is difficult to lay down general principles as to the social and economic soundness of public loans contracted for the purpose of construction of public utilities or for provision of funds in times of war. The general division of such loans into productive, when used for construction purposes, and unproductive, when used in pursuit of war, is frequently untenable. Under a democratic regime many public works are undertaken for opportunistic political reasons; they are without social utility and hence unproductive. On the other hand, a loan contracted for the purpose of waging a defensive war which assures to a people political independence and cultural continuity must be regarded as ultimately productive.

In periods of economic depression many suggestions have been put forward to the effect that public borrowing should be used to combat unemployment through the construction of public works, a device which would at the same time exercise a steadying influence upon national production. With the latter purpose in view others have advocated the use of government bonds as a means of managing the national currency and thereby of controlling the price level. The central bank would be authorized to purchase the bonds in the open market and thus increase the quantity of money in circulation. On the other hand, if it were deemed advisable to reduce the volume of money in circulation, the central bank would sell the government bonds in its portfolio and retire from circulation a certain quantity of paper money. These considerations, however, lead into the major problems of managed currency and controlled economy, which go beyond the scope of this discussion.

Financially a public loan is nothing but a technical device. Whenever a very considerable expenditure must be made in a short time, it becomes practically impossible immediately to assess the individual citizens with the full charge through the method of imposts and taxes. It is more practical and more equitable to divide the total charge into several fractions, one of which will be paid off each year through annual revenues. By the device of a loan the government at once procures the resources requisite

to the expenditure. For a certain number of years the government will pay through the annual imposts and taxes the costs for interest and for the amortization of the capital. Borrowing is thus a financial device whereby receipts of imposts and taxes are anticipated.

Moreover, as the proceeds from public loans are ordinarily applied to the construction of improvements whose usefulness extends to future generations, it is only just that the financial burden involved in such operations should be borne by future taxpayers. This is a legitimate procedure, provided it is not abused so that future generations are saddled with a burden of which the present generation should bear its share. In practise most governments tend to misuse the device of the public loan; and for this reason financiers are frequently at loggerheads with the government authorities about the use of loans and the determination of circumstances which justify the appeal to public credit. In times of war the loan device—to which recourse must be had—presents the inconvenience of ultimately putting the heaviest financial burden of the war on the shoulders of the non-possessing classes, which have not subscribed to the war loans. It should be mentioned, however, that following the World War the general bankruptcy of the borrowing governments caused the holders of war loan bonds to suffer enormous losses and thus deprived them of the initial advantages accruing to them as a result of war loan policies.

Public loans may exercise a great influence on the national economy of a country. If the loan is contracted within the country, it absorbs capital funds which might have been used for economic production. The important thing then is to bear in mind the purpose for which the funds are borrowed. The creation of public improvements by means of a loan is advantageous to the national economy in spite of the diminution in the capital funds available for production. If the loan is contracted abroad, it may exercise a favorable influence upon the balance of payments in putting at the disposal of the borrowing country resources of gold or foreign exchange which may be necessary, for example, for carrying through a scheme of monetary stabilization. In time, however, it may exercise an unfavorable influence upon the international balance of payments by reason of the charge for the interest and the repayment of the capital. External public borrowing is of great importance to new countries which have great natural

wealth to exploit but which do not have the mobile capital for the construction of public improvements indispensable to the exploitation of the natural resources.

Juridically a public loan is a contract in the proper sense of the term; that is to say, a meeting of the minds setting up a juridical obligation on the part of the state to pay the interest and to restore the capital at the rate, the time and in the money agreed upon. A government is not authorized to modify of its own will, unilaterally, the conditions stipulated. Monetary devaluation, if undertaken with a deliberate view to reducing the burden of indebtedness, or any repudiation of a formal juridical promise, such as the unilateral reduction of the rate of interest, the modification of the conditions of amortization or the refusal to pay in the kind of money stipulated, constitutes state bankruptcy.

The establishment of an effective system of public credit presupposes, from the economic side, a developed industrial and commercial organization, the availability of liquid capital in considerable amounts, a wide diffusion in wealth among the various classes of the population, an abundant monetary circulation and a well organized capital and money market. From the social and political point of view it presupposes internal and external peace, an advanced constitutional and administrative organization capable of making a distinction between state and king, between the public finances and royal finances, between the public credit and the personal credit of the governing heads, and a high morality on the part of the political and administrative personnel. From the financial standpoint it involves the recognition of the fundamental principle that taxation is the normal source of public revenues, a well ordered fiscal system to inspire the confidence or the investing public, a regular administration of expenses and receipts (a budget), a detailed control of this administration and wide publicity for financial affairs generally.

It is thus clear that public credit is essentially a product of modern times. With the exception of the small Italian commercial republics, the German trading cities in the Middle Ages and the Netherlands in the early modern period the general political and economic prerequisites for the development of an effective system of public borrowing were almost wholly lacking up to the end of the eighteenth century. There was, to be sure, occasional borrowing by the state in the preceding centuries; but as the state was

personified by the ruler, such borrowing was based exclusively on his personal credit. The monarch was free to dispose of the borrowed funds and he used them for waging war, for displays of lavishness or, very rarely, for public works. The personal credit of the rulers was as a rule weak; the loans were consequently very difficult to negotiate and were of very slight importance, usually running for short terms and with very irregular service. Kings arbitrarily went into bankruptcy. The successors of a monarch did not consider themselves juridically bound by the commitments of their predecessors. In the absence of a regular flow of royal revenue to assure the repayment of the loans the lenders incurred great risks and frequently insisted on obtaining tangible securities from the king in the form of crown jewels, the royal domain, provinces and sometimes even the physical surrender of a great personage. The loans were contracted from private individuals or from banks with limited resources. The public did not subscribe directly. In order to attract lenders the ministers inserted all sorts of complicated and onerous provisions in the terms of the loan. The interest rates were always very high and the prices of issue very low.

The loans were very unpopular with the economists and financiers, who condemned them as extravagant, and with the general population, who resisted the usurious rates and other burdensome terms. In France in the eighteenth century bankruptcy was demanded by public opinion, advocated by the courts of justice and recommended by political philosophers, such as Montesquieu. It was as a reaction against these proposals of bankruptcy that the French constitutions of the end of the eighteenth century proclaimed that the public debt was sacred. In England the kings, in order to carry on the wars of the eighteenth century, frequently borrowed abroad, ordinarily giving as security the proceeds of a tax; or else they borrowed from the great financial or colonial establishments, like the Bank of England and the South Sea Company, in exchange for privileges. The American War of Independence was financed for England as well as for the United States by Dutch bankers. It was only in the course of the Napoleonic wars that Pitt established British public credit by declaring that the only solid basis of public credit was the will and ability of the people to pay taxes. England was followed by France, where the system of public credit was established after the restoration of peace, po-

litical stability and sound financial administration after the fall of Napoleon. With the development of the proper economic, financial and political conditions other countries followed the example of England and France in establishing public credit as a more or less permanent feature of their financial administration. In the nineteenth century there developed also the fundamental principles which are today universally accepted: separation of the personal credit of the sovereign from the credit of the state; permanence of the debt regardless of change of government; use of loans exclusively for expenditures of a public nature; regular servicing of the loans through the creation or increase of imposts and taxes; simplicity of the bonds (a central register for the public debt and negotiable form of certificates); facilities for trading (stock exchanges); improvement of technique (security guaranties, conversions, amortization and the like).

The expansion of public credit from the early nineteenth century was prodigious. It made possible the carrying out of enormous public works and the construction of public utilities. The trust in public loans was unlimited. The regularity in the payment of interest stimulated the thrifty to place their savings in government funds, the preferred investments of the public. During the World War enormous loans were contracted not only by the belligerent powers for war purposes but also by the non-belligerent states for meeting economic difficulties created by the state of war. These loans were a staggering burden to the taxpayers. With the exception of Switzerland and the Netherlands the burden of indebtedness was lightened in all countries through monetary depreciation or outright default, with disastrous results for the credit standing of some of the defaulting governments.

The expansion of public credit has led to the development of a set of definite methods and practises surrounding the business of floating of public loans and the management of public debt. These concern the type of money in which the loan is to be repaid, the interest rate, the due dates, repayment premiums, tax exemptions, guaranties and securities, the form of the bonds, the size of denominations and the methods of issue, conversion and amortization. The selection of the proper practises is not only of immediate importance in assuring the success of the loan but is also guided by the major consideration involved in public credit; namely, that of reconciling the interests of the lender in

terms of security of his principal and interest with those of the taxpayer, who is ultimately called upon to meet the burden of the public indebtedness.

It is both good tactics and honorable on the part of the borrowing state to promise and to assure to the lenders the security of the capital and a reasonable interest paid at set intervals which are not too far apart. In order to protect the creditor against the effects of inflationary currency depreciation the government may promise to meet the service of the debt in stable money through inserting a clause, "payable in gold coin" or "at the value of gold." This has been the practise in the United States, where the monetary experiences following the Civil War caused the widespread use of the gold clause in long term debt agreements. The gold clause was

revoked by the Roosevelt administration in 1933 as part of its policy of lightening the burden of indebtedness made so much heavier by the drastic deflation in prices which commenced in 1929. In the absence of such a promise the debtor state may satisfy its obligations by payments in national currency, even though the money is depreciated, provided that the monetary depreciation is not carried through for the deliberate purpose of reducing the public debt. England and France, whose currency seemed safe from any depreciation, wrote their loans in the national currency. After the World War the currencies of nearly all the countries were devaluated. Yet most countries continue to borrow without a gold clause.

The rate of interest ought to correspond to the rate prevailing on the private money market

Patriotic loans, those with very small interest or without any interest at all, have been largely a failure. A patriotic loan has a demoralizing effect: it is an invitation to good citizens to carry a loan which the less socially minded refuse to assume. Occasionally, however, the appeal to patriotic sentiment may help to obtain a reasonable interest rate in time of crisis. The interest rate depends on the state of public credit; it is high in periods of crisis and instability, varying with the magnitude of the sums borrowed, the date of repayment and other terms. Interest is paid ordinarily at fixed and not too distant dates: payment every six months seems preferable to quarterly payments, which involve too much administrative work for the public treasury; annual payments do not attract the capitalists of the middle ranks, who comprise the most desirable clientele for government securities.

It is idle for a government to attempt to borrow at a rate lower than that which prevails commercially. Where such attempts are made the governments are usually obliged to offer to the lender special inducements, which generally prove very burdensome for contemporary taxpayers and for future generations. The most important provisions of this type are various forms of redemption premiums and tax exemption of government bonds. A redemption premium may be offered in the form of a loan issued below par; as, for example, when a 5 percent loan with a nominal value of 100, issued at 90, is redeemable at 100. The real rate of interest is not 5 percent but 5.55 percent $\left(\frac{100 \times 5}{90}\right)$, without counting the premium of 10 percent. A more proper form of redemption premium is presented when, for example, a 5 percent loan with a nominal value of 100 is issued at 100 and redeemable at 110. The interest is calculated on 100 and not on 110; the redemption premium is 10. Both devices are attempts at disguising the true cost of the loan. The former, however, is more objectionable, as its nominal interest rate is lower than the real one, and conversions are rendered more difficult. In practise the United States is virtually the only nation which has not resorted to redemption premiums; in some cases it has even issued loans above par, as in 1821 and in 1911. The policy of England under Pitt was for issue below par; it still follows this policy today, but more infrequently than formerly. The traditional policy of France is that of issue below par. The same was true of Italy up to 1914. Dur-

ing the World War the Italian loans were issued quite close to par.

Another device used by a government in its effort to stimulate the sale of bonds is the practise of attaching various money prizes to the loan issue. These are in effect very high redemption premiums, which are accorded not to every bondholder but to the holder of certain bonds chosen periodically by lot. The cost of the prizes is provided either through payment of a lower rate of interest than that prevailing in the private money market or by making the loan non-interest bearing. Such loans are in reality forms of lottery. They raise the same objections as the lottery: the subscriber is a player who ventures a stake. In the United States and England the floating of such loans is prohibited as tending to encourage the spirit of gambling. It is, however, frequently resorted to in other countries; for example, in Germany, Austria, Belgium, France, Italy.

Still another form of inducement held out to the investing public is the practise of exempting the holders of government securities from taxation. The exemption may apply only to certain specific taxes, such as a tax on securities, or to general taxes, such as the general income tax and the inheritance tax. From a social and financial point of view tax exemption violates the rule that individuals should be treated equally in the matter of fiscal charges. No doubt tax exemption is very often accompanied by a lower rate of interest than would have to be paid if there were no exemption. But this is not a proper defense. While the difference in the rate of interest is invariable, the benefits of tax exemption grow in proportion as the rate of taxation is later increased. Moreover in the case of a progressive tax, such as the income tax or the inheritance tax, the benefits resulting from tax exemption are all the more considerable if the beneficiary has a large income or a large fortune. This represents both an unjustifiable privilege and a considerable loss for the public treasury. For loans floated abroad, however, tax exemption is a defensible procedure. It is a guaranty against the establishment of discriminatory taxation of alien bondholders as a means of escaping the burden of meeting the interest and principal by the borrowing government. England since 1803 and Switzerland do not grant tax exemption although France and most other states do. The United States has made its war loans tax exempt.

Public loans may be secured on a personal basis, when a state undertakes to pay in place of

the borrowing state in case the latter defaults; this was true for instance of the Greek loans of 1833 and 1898, which were guaranteed by several of the great powers, and the Czechoslovak loan of 1932. Or the security may assume the form of real security, as when the yield of certain taxes or of certain monopolies is pledged for the payment of debt service. This was the current practise up to the beginning of the nineteenth century and is still followed very frequently, particularly by countries whose public credit is none too sound. But even in the case of personal security, the guarantor states demand that there be set up real securities sufficiently solid to render it improbable that they will have to make good on their personal guaranties.

The setting up of a real security for an internal loan, however, by no means guarantees the payment of the debt service. A parliament seldom hesitates to suppress this guaranty and go into default, under the pretext that necessity forces it to revoke the guaranty; in most of the states the courts cannot refuse to apply such legal revocation. When real security is provided for a foreign loan, the pledging of the receipts is usually accompanied by the setting up of a foreign control over the administration of the debt. But as a matter of fact no control organization can function if the debtor state desires to be rid of it. For it is accepted today that states should not intervene by force to collect even contractual pecuniary obligations for their nationals. In short, the respect for securities depends on the good will and good faith of the governments; there is no incontestable guaranty. In England up to the end of the eighteenth century a pledge of revenue receipts was arranged for every loan: the receipts pledged constituted the fund for the loan. Sometimes several loans and several guaranty funds were consolidated into one fund. By abbreviation the bonds of public loans are called public funds or consolidated funds (consols).

In order to maintain the selling value of the bonds the debtor state frequently provides for the organization of a maintenance fund in the form of a sinking fund, which supports the market for the bonds or else by legislation grants to the bonds special legal privileges. Among the latter may be mentioned the privilege given to taxpayers to pay certain taxes by turning in bonds at their face value. This, however, leads to an inopportune amortization of the public debt. Most often when this privilege is granted it is surrounded with limitations as to the character

of the bonds, the amount of taxes payable with the bonds and the length of possession of the bonds by the taxpayer. Most of the states make use of this device when a crisis affects public credit. Very common also is the privilege of legal investment: obligations of the public debt are included in the securities which may be used for bonding or bail purposes or are put on the list of legal investments for trust funds. The collapse of government bonds in many countries after the World War ruined the persons for whom this type of legal investment had been prescribed by law. In certain countries, like France and Italy, the law provides that government bonds are unattachable by creditors: the creditors cannot take either the accumulated interest or the principal of the bonds held by their debtors.

In contracting a loan the borrowing government hands over to its lenders certificates of debt; these either are issued in the form of bonds registered in the name of the owner and thus protect the holder against loss or theft or are issued to bearer, which facilitates considerably the negotiability of such bonds. Occasionally in England no certificate is given: the name of the creditor is simply inscribed on the books of the public treasury. Payment of interest is usually provided through coupons detachable from the bonds and payable to bearer on presentation. In England when the creditor is simply inscribed on the books, he receives payment by check. In certain countries the registered form of bond is very much in vogue; in France the form made out to bearer is preferred by the public. The registered type offers advantages to the treasury with respect to collection of income and inheritance taxes; the negotiable form facilitates concealment and tax frauds.

The size of the denominations of government bonds varies in accordance with the class of investors to which the government appeals in soliciting subscriptions. For a very long time the states addressed themselves only to the large investors and issued large denominations. With the exception of the war period this has been the case in England up to the present. In France during the course of the nineteenth century the government sought to "democratize" public loans and to put out small denominations. Middle sized denominations are the most advantageous, for they provide an active market for bond transactions. This is the system followed in the United States. Whenever the government wants to promote the habit of

saving among the working class, it issues bonds in small denominations of 10 and 20 dollars. The small denominations bring the loan very close to paper money: the bonds become in effect government banknotes bearing interest.

There are two principal methods for the placing of loans: through direct appeal to the public or through the aid of the bankers. In countries enjoying a sound public credit system the method of public subscription is preferable: it is less burdensome to the treasury and lends itself less to speculation on the stock exchange. According to the needs of the treasury and the state of the financial market, subscription may be open for a certain time or it may be permanent. Public subscription may take place with preferential allotments for those who make the best offers; this is the system prevailing in England for the sale of treasury bills. Where the aid of the banks is invoked, their cooperation may take the form of bond selling at a definite price to the bankers, who in turn resell the bonds at their own risk to investors; or the bankers simply act as intermediaries in bringing together, through their offices, the investor and the treasury. The commission paid to the bankers varies with the nature of the services furnished.

In all modern states the public treasury maintains registers which list the loan issues; frequently only the long term issues are listed. It was England which first started these registers. They have existed in France since 1793. In France, Italy and some of the other countries they are called the Great Book of the Public Debt and assure not only the regular accounting of the loans but also uniform bookkeeping for the various categories of bonds. Ordinarily the registers are books with stubs; that is, the certificates given to the creditors are detachable and recorded on individual stubs. The registers are usually kept in duplicate in order to avoid any danger of destruction.

The fact that loans do not always carry a definite date of redemption gives rise to the distinction between perpetual and amortizable debts. In the former no date is fixed for the repayment of the capital. This does not imply that the state is legally entitled not to repay the capital; such an obligation would be regarded juridically as null and void, as are all perpetual obligations. It simply means that the government is free to fix the date of repayment at its own discretion. The perpetual form of debt would seem to be theoretically preferable; it

allows the government to amortize at the time most convenient to the state of the public finances and to regulate the amounts which fall due in accordance with budgetary resources. In practise a perpetual debt is rarely repaid; there results such an accumulation of perpetual debts as to invite ultimate default or some form of repudiation. On the surface the perpetual form of debt seems advantageous in that it appears permanently to guarantee the creditors a certain rate of interest. This, however, is an error. If the cost of money on the market surpasses the interest rate of the loan, the sale value of the bonds drops. If the cost of money on the market is lower than the interest rate of the loan, the debtor state will carry through a conversion. In both cases the calculations of the lender are disappointed. Perpetual bonds are preferred by speculators because their market quotations on the exchange are subject to greater fluctuation. England and France have for a long time followed the method of perpetual loans; the former has now renounced the practise; the latter has remained more faithful to it.

In distinction from the perpetual debt an amortizable debt is one for which the loan contract fixes a date of repayment. This does not mean that there will necessarily be a true amortization; it may happen that the state will borrow the money with which to repay. There is then a repayment of the debt but not an amortization. Most of the states repay when the debt falls due but do not amortize. The date of redemption may be definitely fixed, undetermined or uncertain. It is undetermined when the government reserves the right to fix the date of redemption in the course of a certain period, for example, not before five years or later than twenty years; this arrangement is very advantageous, since it allows the state to choose the best time for amortization in accordance with the economic conditions of the country. The United States follows such a system. The date of redemption is uncertain in the case of annuity loans and tontines. These methods, which were practised in the seventeenth and eighteenth centuries by England and France, are very burdensome to the treasury; today they are out of use. The date of redemption should be chosen rationally in accordance with the period of usefulness of the expenditure covered by the loan. Naturally there are exceptions to this principle, arising particularly from the state of the financial market at the time of the loan. If at

such a time the lenders do not want to make long term loans, the government must be satisfied with short terms, standing ready to consolidate them when times are normal.

The flotation of short term loans running to one year as a maximum gives rise to a distinct form of public debt, the so-called floating debt. The floating debt answers a genuine necessity, that of meeting temporary shortages of cash in the course of the year. If the receipts of ordinary revenues do not synchronize with the disbursements, a revolving fund is necessary in order to sustain the treasury. This is the true purpose of the floating debt and short term loans, which are in fact often called ways and means advances, treasury bills or certificates of indebtedness. Because of the great facilities which it gives the treasury through its ready disposability on the capital market and also because of the low rate of interest paid to the lenders, the floating debt is often misused. The danger lies in the tendency to transform the treasury into a great deposit bank for the public, to the great injury of the commercial banks. When there is a considerable floating debt the treasury is open to sudden demands for repayment, which it does not know how to meet and which may involve it in serious difficulties. In periods of crisis the existence of a large floating debt leads usually to very severe measures, such as compulsory consolidation or the issue of paper money. It is better therefore to pay a higher rate of interest and to borrow for intermediate or long terms than to have recourse to a floating debt, except of course for the covering of temporary shortages of cash. Usually governments do not appreciate the dangers of a floating debt until it is too late.

There are various financial methods of amortization. One way is for all the certificates of a debt to be amortized in part at every interest date; thus each creditor receives periodically a sum which includes interest and a fraction of the capital. At the end of a certain period the creditors will gradually have been repaid. Under this method of repayment the creditor is faced with the task of reassembling his capital out of the periodical sums he receives—a task which is simple enough in the case of the institutional or large individual investor, but which may frequently result in the consumption of the capital of the small creditor.

A more frequent method of repayment is the total payment of certain bonds. The selection of the certificates to be amortized is made either by

individual drawings or by drawings of series, a more simple and preferable way. Repayment may also be made by direct purchase on the stock exchange.

The financial resources for amortization arise exclusively from taxes. The use of the sinking fund with compound interest, as elaborated by Price at the end of the eighteenth century, in no way obviates the necessity of using taxation as the only source of amortization, as both the original grant with which the fund is created and the accumulated interest on the bonds purchased by the sinking fund are provided by the revenue from taxation. The only valid assurance of amortization is thus the tenacious and persevering desire on the part of the government, the parliament and the people to pay taxes for this purpose. Where such an intention exists, the sinking fund is superfluous; where it does not exist, the device is useless since it has no funds at its disposal. The taxes with which a government amortizes the debt may be either ordinary or extraordinary taxes; as, for example, a capital levy or a forced loan. Properly only ordinary taxes should be used. The capital levy and the forced loan are heroic although legitimate measures, but their use will meet with insurmountable obstacles. These methods may be regarded in fact as impracticable under the present capitalist regime. Where they have been employed, as in Germany, Italy and other countries, they have ended in failure.

The United States is the only nation which has followed rigorously a policy of amortizing the public debt. It has no perpetual debt: all its debt is amortizable in periods of five to twenty and ten to forty years. Its floating debt has always been quickly consolidated. After having yielded for a time to the mirage of a sinking fund with compound interest, the United States has followed since 1802 the only correct method, that of amortization by taxes. After all the great crises (the War of Independence, the Civil War and the World War) it has applied itself to extinguishing its debt almost entirely within twenty or twenty-five years. After the World War the only question discussed in this connection was how fast the redemption should be carried through.

England, which for a long time followed the policy of perpetual debts, adopted the type of amortizable debt at the beginning of the twentieth century. Here debts are either contracted as an amortizable debt or converted into such a form as soon as possible. Amortization is

carried through regularly by means of taxes. For the floating debt, which was frequently used during the World War, the English government adopted after the Armistice a skilful policy of consolidation and redemption. None the less, England resorted to partial repudiation in 1931 through the voluntary devaluation of the pound sterling and in 1933 through the rejection of the gold clause in the 5.5 percent 1945 loan.

In France amortization has never been practised save under exceptional circumstances and then through defective methods. Recourse has been had chiefly to loans in the form of perpetual rents, which still remain most favored. Even since the war the government has borrowed, every time it could do so, in perpetual rents, with the hope that it would never have to amortize. The sinking fund created by Napoleon was only a stabilization fund to maintain the value of the bonds. In 1816 a sinking fund with the device of compound interest was established, but it did not function regularly except for a few years. In reality it did not amortize the debt. In 1926, after the great financial panic, the necessity for amortizing in order to maintain the public credit came again to the fore. A sinking fund was organized and given a constitutional status with obligatory stated grants, but without compound interest. Little by little, however, this fund was robbed of its resources and deprived of effective power. France has misused the floating debt at all periods of its history, often bringing on severe financial crises as a result. During and after the World War it abused the floating debt to such an extent that this debt became for a time the most serious menace to the public finances of France (1926). The great accomplishment of the sinking fund of 1926 was the consolidation of the floating debt, a work which was, however, almost entirely undone in 1932-33.

The German Empire before the war preferred recourse to loans in the form of perpetual debt. Although amortization was declared to be obligatory for the government, this did not apply to the holders of the bonds; in other words, the government had to amortize when the bondholder asked for it, but not vice versa. During the war the floating debt was used to a great extent, but with consolidations every six months into a perpetual debt. After the war the debt was summarily wiped out with the collapse of the mark.

In the attempt to lighten the burden of the debt service governments frequently resort to

the practise of converting the existing loans into loans carrying a lower rate of interest. It is obvious that the process of conversion is possible only when the existing interest rate is lower than the rate that had prevailed at the time the original loan was contracted. It is obvious also that the rate of interest fixed by the act of the loan cannot be reduced unilaterally by the treasury. The unanimous consent of the lenders is necessary, and in order that this operation may be legitimate the state must make it possible for its creditors to choose between the redemption of the obligation or the acceptance of the new bonds at a lower interest rate. The government must thus have the right to redeem the loan at any time. This right exists incontestably in the case of a perpetual debt, unless the act of the loan has stipulated a period before which redemption might not be effected—the so-called period of inconvertibility. In the case of an amortizable debt, except in the event of a contrary rule in the general civil legislation relative to the beneficiary of the term of a debt, the term must be interpreted in favor of the creditor as well as of the debtor; hence the date of redemption cannot be advanced unless there is an express provision in the loan act to this effect. This question has long been discussed in many countries. Only in rare cases can it be settled by the courts as far as the state is affected; conversion is decided by a law of parliament and most of the countries do not permit the courts to pass upon the validity of an act of parliament. In some countries, however, the courts have this power, for instance, in the United States, Rumania and Greece, and there this problem is of practical importance.

Granting that conversion is juridically feasible, certain conditions of a financial nature must be met before it can be successful. Conversion must be sufficiently advantageous for the holders of the bonds which are to be converted, otherwise they will demand redemption. The public treasury can increase the chances of success for the operation by putting pressure on those who hesitate: the period of the option might be made very short (eight to fifteen days, for example) and silence could be considered as an acceptance of conversion. Success is all the more likely when conversion is very simple: bond for bond, with reduced interest. Anything which the wide public cannot easily understand is calculated to cause the conversion to fail. When the public credit is very strong, the treasury might offer a deferred conversion, that

is to say, a conversion realized in several stages; for example, the immediate conversion of a 5 percent bond into a 4 percent bond and an automatic conversion at the end of five years into a 3 percent bond. In any case the treasury must not offer such future advantages to the holders as would cancel all the benefits of the operation for the state.

The practise of conversion is quite old in some countries. In England it is used frequently—and in a manner both simple and correct; the usual confidence of the English people in their governing authorities has made even very daring conversions successful, as, for example, the conversion of 1932. In France the first optional conversion was made in 1825. The first compulsory conversion dates from 1852, when the government resorted to it very timidly and with extraordinary complications. The most recent conversion, that of 1932, aroused considerable criticism. Conversion is practised also in the United States, Italy, Switzerland and Prussia.

Another but rarely used type of subsequent modification of the interest rate may take place under the following circumstances. In the course of a great crisis (a war or economic reconstruction) the public credit is weak and repeated loans are likely to be made. It may then be advisable for a government to promise the subscribers of a loan that if the interest rate on any of the later loans is higher, the higher rate will be given to them also. This is a means of inducing the investors, who otherwise might adopt a waiting attitude in the hope of securing better terms in later issues, to subscribe immediately. Such a promise was made during the World War by England and by France.

Government defaults form an important chapter in the history of public credit. Up to the end of the eighteenth century default as a means of wiping out public debts was the rule rather than the exception. During the nineteenth century a few great states, like England, France, the United States, took care scrupulously to respect their commitments. Most of the other countries, such as Austria, Spain, Greece, Portugal, Turkey, Russia, a number of South American states and several states in the United States, resorted to default. After the World War most nations lightened the burden of their debt either by monetary depreciation, as in Germany, France, England, Italy, Belgium, Austria, Hungary; by frank repudiation, as in Russia; or by partial repudiation through the depreciation of the currency and the abrogation of the gold

clause, as in the United States in 1933. It was often the taxpayers who urged this step upon their governments. The creditors cannot enforce their claims against the state by recourse to the courts. A court can merely recognize the existence of the debt; a judge is not empowered to decide in what measure the state should sacrifice a particular public service for the service of the debt or to prescribe that the parliament shall raise taxes in order to assure its regular servicing.

The settlement of the claims against a state in default can be effected by a voluntary offer of a settlement by the debtor state to its creditors or by a friendly agreement between the debtor governments and the creditors, which may be brought about through the mediation of various associations of bondholders, such as exist in many countries. The latter seems to be the most advantageous method for all the interested parties and is most frequently used. In many countries "national associations of bondholders" have been formed for the special purpose of such negotiations. The first model is the Corporation of Foreign Bondholders, established in England in 1868; in France since 1898 there has been an Association Nationale des Porteurs Français de Valeurs Étrangères; in Switzerland there is the Société Anonyme Fiduciaire Suisse; and steps were taken to form a similar association in the United States in 1933.

Another method of resolving the difficulties arising out of a state default is that of arbitration. A clause calling for arbitration may be written in as part of the contract; such clauses are becoming more and more frequent. Arbitration cannot, however, provide a definitive settlement. It can simply determine the legal status; for example, the meaning of a gold clause, as in the opinion of the Permanent Court of International Justice at The Hague in July, 1929, in regard to the Brazilian loans and the Serbian loans. But with regard to making effective a certain payment arbitration is quite inadequate: the debtor government may always allege that it does not have the resources necessary to assure the execution of the decision of the arbitrator. The parties must then fall back upon a friendly agreement. Still another way of settling the claims of creditors is the intervention of a power in favor of its nationals who are the creditors of the defaulting state. This method was formerly very common, as in the case of Egypt in 1876–80, Turkey in 1878–81, Greece in 1893 and 1898; since the beginning of the twentieth century

it has been virtually abandoned. The coercion used is purely moral but at times quite effective. It may be in the form of a threat by the government to prohibit the official listing of the bonds of the defaulting state on the national stock exchange or the refusal to authorize the floating of loans on the national market or to admit new loans to the official listing.

The distribution of the public debt among the successors of a dismembered state presents enormous practical difficulties. This practise, which was frequent before the World War, as in the division of the Ottoman debt after the creation of Bulgaria, Montenegro and Serbia in 1878, the division of the Swedish-Norwegian debt in 1905 and of the Transvaal and Orange Free State debt in 1901, grew in importance after the dismemberments resulting from the peace treaties which followed the World War. The task is one of the most difficult in international finance. The legitimate interests to be reconciled are those of the creditors of the dismembered state, who hold the certificates of the debt; those of the taxpayers of the dismembered state; those of the taxpayers living in the annexed territory; those of the taxpayers living in the annexing state. If the dismemberment has been for the benefit of several annexing states, the problem becomes more complicated: it is necessary to determine the share of each and the juridical responsibility of the succession states toward the creditors. Other factors which are frequently taken into consideration are the origin of the public debts, that is, whether they were debts contracted for economic or for political purposes; whether the debts are secured or unsecured; the economic significance of the annexed territories as compared with that of the total territory of the dismembered state. Only after careful study of the various factors involved in each particular case can a solution be attempted. In the event of a friendly redistribution of territory an equitable settlement can be obtained by negotiations and can be written into the treaty which brings about the redistribution. The difficulties will be far greater in the case of a dismemberment following a war: the victorious annexing state is little disposed to aggravate the enormous burdens which it must bear as a result of the war.

Characteristic of the modern period is the development of local public debts by provinces, cities and other political and administrative subdivisions. With a few exceptions, as in the case of the very large cities, the flotation of local

public loans was scarcely resorted to until the middle of the nineteenth century. The rapid expansion of local public borrowing since then is closely connected with the process of urbanization and with the widening scope of municipal functions, which impose new financial duties upon local communities. Local public debts have thus arisen almost exclusively from economic and not from political causes, such as war or national defense. They are most often carefully controlled by the national governments. Limits are fixed beyond which the local authorities cannot go either through statutory limitation upon local indebtedness or through a system of individual administrative authorization of each loan. In the United States the state constitutions and the laws of the local legislatures have established strict regulations for the issuance of local loans. The local public debts are always amortizable, the form of a perpetual debt is reserved for the national government and the period of amortization is short. Amortization is genuine and not merely apparent as when debts are redeemed by means of new borrowing. The service of the local public debts is very often guaranteed by the pledging of local revenues, which may be organized for the particular purpose and conclude with the particular debt.

Except in the case of the large loans by individual federated states, by provinces and by large cities, all of which enjoy personal credit, local credit is arranged through financial institutions organized by national legislation and enabling the localities, large and small, to borrow on easy terms. Sometimes the state lends to the localities funds which it has itself borrowed. This is the English system of public works loans, and it has also been practised in France. In some countries special financial institutions with a strong credit backing are formed, which place large loans by means of public subscription and thus get funds which they in turn lend to the localities. This is the system followed in France through the *Crédit Foncier*, in Italy through the *Cassa dei Depositi e Prestiti*, in Belgium through the *Crédit Communal* and in other countries through similar institutions.

PUBLIC DEFENDER. The term public defender characterizes a practitioner or organization rendering specialized legal aid (*q.v.*) to poor persons accused of crime. According to varying usages in different communities such lawyers may be either public officials or representatives of private professional or beneficent groups. By the regularity of their practise for criminal defendants they are to be distinguished from casual volunteers or assigned counsel serving in particular cases by court order.

While the barbarous English criminal procedure still followed in the early nineteenth century largely deprived prisoners of counsel in felony cases, it was sooner perceived elsewhere that any penal system seeking just determinations must permit legal assistance to all defendants and should by some means furnish such assistance for those who lack funds. There has been in Scotland for over five hundred years a scheme for gratuitous defense of the needy, and officers who may fairly be termed public defenders have served in Spain for almost as long a period. Belgium, Denmark, France, Germany, Holland, Norway, Mexico, Argentina and other civil law countries provide more or less adequately for defense of the poor. After several rather unsuccessful experiments, England has put into operation, under legislation effective since the beginning of 1931, a broad discretionary plan for the assignment of barristers and solicitors, who receive moderate compensation from public sources.

In the United States it has been obvious that constitutional guaranties and statutory provisions urging equal justice are not self-executing. This has been emphasized by the strongly partisan attitude of public prosecutors, who often act under the belief that number or percentage of convictions will be taken as the measure of their successful public service. Consequently the plan of assigning defense lawyers to poor people has spread widely through the country. This plan still has supporters and certainly possesses merit in rural areas where regular public defenders could not be kept busy. Nevertheless, better opinion holds the assignment system to be unreliable in areas of congested population. Where this system provides adequate compensation, the judges manipulating it have more than once been accused of

favoritism in the making of assignments. Where, as is more common, no compensation or paltry compensation is prescribed, assignment of inexperienced or incapable practitioners frequently results, and there are likely to be gross violations of professional ethics in extraction of remuneration from relatives or friends of the clients. Incidental to this sort of temptation are playing for delay, presentation of unmeritorious defenses and fabrication of evidence. Further, where an assigned lawyer finds that he can get nothing for himself out of a case, he tends to lose interest and render perfunctory service or no service at all.

The first public defender system in the United States was established in Los Angeles county in 1914. Its operation promptly evoked warm approval. New York City, long a legal aid leader, followed in 1917 with its first definitely successful plan for defense of poor persons accused of crime. Connecticut, which previously had used compensated assigned counsel, adopted in 1917 a state wide system of public defenders, since bettered by careful amendment. Cook county, Illinois (for these purposes synonymous with Chicago), having failed in painstaking efforts to devise an effective plan for assigning defense counsel, instituted a public defender in 1930. According to most recent reports active public defenders are to be found from coast to coast, although many important communities have not yet joined the movement.

This newer method of safeguarding the poor in criminal cases has obvious potential advantages. Experienced men, working on adequate salaries and with proper personnel for thorough preparation of cases, can be expected to render more disinterested and competent service than volunteers or lawyers fitfully assigned to conduct criminal defenses. The businesslike public defender plan is calculated to give needy culprits real equality before the law. Attainment of this end has immeasurable importance in gaining popular approval and support.

But institution of public defenders is still often opposed with sincere vigor, as, for instance, at Cleveland as lately as 1931. One old objection, rarely voiced nowadays, is that a poor defendant is adequately safeguarded by a solicitous judge, a high minded prosecutor, the privilege against self-incrimination and so on. Experience has refuted this optimistic notion of semi-automatic justice. Another objection, applicable only where the defender is a public officer, points to a supposed anomaly in having representatives

of the state on both sides of criminal litigation. Such dialectic proceeds from a false premise. It is not to be assumed that the state primarily desires conviction. The real aim is truth and justice, which can be at least fairly approximated under a properly balanced adversary system of litigation. The public defender supplies proper balance. Clogging of the criminal courts also has been feared, and the suggestion is put forward that long usage would make a public defender hard and unenthusiastic. Actual experience yields little evidence to support these objections. Far from causing delay and congestion, the public defenders have generally helped to clear dockets expeditiously. While their interposition tends to prevent ill advised or despairing pleas of guilty, they do not hesitate to urge these pleas in proper cases. Clients follow their advice because of confidence in the advisers' intelligent good faith and in their presentation of proper considerations for mitigation of punishment. This would scarcely happen if the lawyers came to lack human sympathy. Where a case must be tried, the public defender has no reason for dilatory tactics or sharp or overtechnical practices. He easily establishes and maintains good working relations with the prosecutor. Few or no complaints have been made, however, of any subservience by the defender. On the contrary, his honest advocacy tends to curb a prosecutor's undue partisanship. It is noteworthy that modern prosecutors when standing for reelection often emphasize the fairness of their records instead of the mere quantity of convictions. There is a substantial showing, statistical and otherwise, that the work of public defenders has actually made for celerity, economy, justice and satisfaction with criminal procedure.

Certain problems of detail should be noted. It has been urged with some soundness that public defenders are needed only in prosecutions for serious offenses and may be dispensed with in trials of minor charges before inferior courts. But investigations show that venal police, magistrates and lawyers sometimes combine to exploit large classes of alleged minor offenders. Such wholesale abuses might be detected and more promptly thwarted if a public defender's office exercised at least general scrutiny over lower court activities. A serious apprehension is that the position of public defender may become subject to such malign political influences as frequently affect the prosecutor's office. Already in the defender's brief history in the United States this apprehension has been realized to

some degree. It seems particularly well grounded where the position is elective. In New York City, in part at least for this reason, the defenders are lawyers employed by a reliable private legal aid organization. Private employment, however, suggests philanthropic assistance, which is highly distasteful to many self-respecting poor people; for this reason the Connecticut plan whereby public defenders are appointed by the judges of a strong superior court has much to recommend it. Yet the risk of burdening judges with anything which may be looked upon as patronage is by no means slight.

By and large the public defender innovation has so far proved to be a hopeful practical move in the faulty system of criminal procedure in the United States. Much good and no harm have been attributed to it. The institution is still

young and requires careful critical scrutiny and adjustment. It seems likely to gain wider adoption and great permanent influence.

PUBLIC DOMAIN

GENERAL.....	FRITZ HEICHELHEIM
NEW COUNTRIES.....	HERBERT HEATON
LATIN AMERICA.....	GEORGE MCCUTCHEN MCBRIDE

GENERAL. The relation between state and privately owned landed property at any given time is conditioned historically less by geographical factors, notwithstanding their importance, than by political and socio-cultural considerations, which exercise a determining influence on the land system in any particular culture and epoch. Conquest and political usurpation, legal confiscation, purchase, abandonment and voyages of discovery all have contributed to produce fluctuations in the extent of public domains, which have ranged from the most limited territories, sometimes only in part public property, to boundless areas subject to the absolute prerogative of the sovereign power. Garden land, fields, woodland, pasturage, mine regions and waste lands tend in varying degrees to come under state control. State ownership is favored moreover by certain topographical conditions; for example, countries in which agriculture depends on flood control and irrigation, as in Egypt, require a centralized land regime. The nature of the administration of a public domain is, in the last analysis, determined by its purpose, which is not always purely fiscal; frequently the profit motive is completely subordinated, consciously or unconsciously, to the achievement of some program of social reform or to the purpose of safeguarding the welfare of subjects, of a ruling caste or of a religious system.

Public domains antedate privately owned landed property. As early as the palaeolithic hunting and nomad culture individual hordes occupied territories set aside for hunting and plant collecting. Even today many hunting, fishing and pastoral tribes utilize landed property in this collective fashion. Among the Indo-Germans, Semito-Hamites, eastern Mongols and all agricultural peoples since the neolithic age, except under "wild field grass" husbandry, collective tenure persisted only in woodlands, pasture lands, water, mines and, sometimes for short periods, conquered territory in general. Such property was known as *ager publicus* in Rome and *Allmende*, or *Mark*, among the early Germans and was organized according to diverse schemes among the ancient Hellenes, Slavs, Indians, Arabs, Israelites, Aramaeans, Babylonians, Egyptians, Sumerians, Japanese, Aztecs and Incas. Vestiges of the institution are still extant. Fields and gardens and analogous permanent allotments of land under wild field grass husbandry became through utilization the special property of clans and, more rarely, of individuals. The ownership of state lands (*temenos* in Homer) was an inherent attribute of rulership and was regarded and generally accepted by all the above mentioned peoples as a primordial institution.

The ancient oriental urban civilizations of the

Egyptians and the cuneiform peoples were founded by warrior priest kings. Following the law of conquest the ruler and simultaneously a central state authority obtained almost all lands as a patriarchal domain to be administered according to a given scheme. Thereafter dues in kind or money had to be paid for the use of such lands as were not worked by compulsory labor under the bureaucratic system usual in mines and quarries, by slave and wage labor or by peasants and shepherds who, without capital of their own, were established as entrepreneurs on royal property and assisted with cash, seed and stock loans at high interest rates. The royal title to a piece of land, with or without dependent peasants, might be transferred in precarious tenure to nobles, temples or soldiers. In Egypt this practise often led to enduring hereditary feudal possession of great territories, while in Mesopotamia private ownership developed in this way. An extensive official organization using written bookkeeping methods administered state possessions in connection with local and central state granaries and workshops for the finishing of raw products. This system, which had its sanction in religion, obtained in so far as it could withstand crises and particularistic feudal trends. In contrast to the principles of the ancient Orient, Romans, Hellenes, Iranians, Israelites and all other descendants of the Indo-Germanic-Semitic migrations of the second millennium B.C. divided conquered arable territory among their own nobles and freemen. There remained as public domain only uncultivated land and the chief's share. In Israel under oriental influence both became royal possessions centrally managed. In early Hellas and Italy the king's share generally disappeared with the elimination of the monarchy by the nobility; Sparta and Macedonia were exceptional in this respect. Down to the fourth century B.C. uncultivated and conquered land was allotted whenever possible among citizens or colonists for their private use. Sooner or later these allotments led to private ownership with rights of alienability, as in the cases of the Spartan and Attic *kleroi*, the land settled under the so-called west Locrian settlement law and the Roman *ager publicus*, sometimes on the payment of taxes. Generally there remained as public domain only mining regions (Attic Laurion), salt deposits (Ostia), forests, pasture land and the quasi-public temple properties (Delos, Delphi, Eleusis).

In the area stretching from India to the mouth of the Rhine and from the Sahara to the Danube

the period beginning with Alexander and ending with Augustus created conditions whose consequences may still be observed. The domains of Persia, which had retained the character of an ancient oriental empire, and the conquered territories of the Roman Republic served extensively as a base for the Hellenic city-state colonies and military villages and for Roman colonies and allied cities. The colonizing impetus was especially pronounced in the centrally administered state domains of the Seleucids in Asia and the Antigonids in Macedonia and Hellas, in the revolutionary Sparta of Agis, Cleomenes and Nabis and under the Ptolemies in Palestine and Transjordan. On the other hand, the Ptolemaic empire in Egypt reestablished thoroughly the land monopoly of the pharaohs, excluding gardens, vineyards, orchards and building sites as well as the Greek communities of the Nile. Simultaneously the old indigenous system of state ownership and regulation of cultivation through an official hierarchy was perfected. All Egypt became one enormous estate administered on capitalistic principles and including royal lands, temple lands, military fiefs, pasture lands, brush, mines and quarries. Isolated land concessions (*doreai*) remained for short periods under individual capitalistic management, but the sale of land to private owners arose only with the administrative chaos of the first century B.C. Syracuse, Carthage, Pergamum and the Bosphorus approximated in the order given the land policy of the Ptolemaic empire, except for urban regions. The Parthian empire and that of the Sassanids, which developed from it in the third century A.D., usually distributed as fiefs the public domain inherited from the Seleucids and extended by the annexation of territory formerly belonging to Hellenic cities. As a rule such fiefs were not permitted to become private property.

Rome gave to colonists the extensive conquered territory (*ager publicus*) available in Italy or turned it over to large entrepreneurs from the ruling castes for their occupation, use and possession. Only a very small portion of the land was worked on the basis of regulated leaseholds or allotted as remuneration for service. The inalienable hereditary fiefs created by the Gracchan peasant colonization movement soon became alienable private property. The wars of the first century B.C., which ended with wide scale military colonization under Caesar and Augustus, resulted in the partitioning among private owners of almost all the *ager publicus* of

the Italian peninsula. In the provinces Rome at first maintained the land regime existing at the time of conquest. In Africa and southern Gaul from the middle of the second century B.C., in Spain a century later under Sertorius, in the eastern Mediterranean region under Pompey and Caesar and finally throughout Gaul and the Danubian provinces under Caesar and Augustus, there began the establishment of urban colonies and the resettlement of natives, chiefly in semi-agrarian towns but in Africa also in villages. Simultaneously there was a general sale of public domain to large scale private entrepreneurs. Augustus transformed the Egyptian military fiefs into private property and permitted the sale to private owners at a low rate of most of the unreclaimed public domain, so that latifundia developed. The state retained the rent paying public domains, with the addition of conquered territory and the temple lands, which had become independent of the state in the Ptolemaic era; they were divided into two categories—crownlands and public lands—under state administration. Nevertheless, the tenant fellahs were soon more deeply obligated for rents than ever before, while they no longer could benefit from systematic directions for cultivation which had obtained previously.

The decline of the Roman Empire was protracted through the first three centuries A.D. At first public domains, administered successively by the senatorial *aerarium* and the imperial *fiscus*, continued to be very extensive, despite widespread colonization and the settlement of conquered barbarians (*laeti*, *inquilini*), bound to the soil in military communes. Numerous mining districts were added to the public domain, and confiscations, especially under Nero and Septimius Severus, brought under state control most of the new large estates. At first the public domain was leased out for operation to both small and large entrepreneurs largely on a capitalistic basis. Beginning with the Flavians and especially under Hadrian the small tenants (*coloni*) were given a more substantial organizational basis in order to protect them against officials and the larger landholders; nevertheless, in the revolutionary epoch of the third century the great landholders contrived to usurp extensive portions of the public domain.

The late Roman Empire, displaying a greater resemblance to the ancient Orient, bound the peasant to the soil. Only rarely, however, did it hinder the transfer of the land of its serfs to the great proprietors. The state maintained its

hold on little more than those crown domains indispensable for its support; among them were mines, farms to supply the imperial court, estates equipped with factories or stud farms and leased lands of religious foundations. Ordinarily such domains were managed by officials in the state service; in exceptional cases they were allotted under copyhold to private operators or to communities. After the fourth century, incidentally, all communities were compelled to administer as crown property lands hitherto considered communal property. As a defense against Persia, Heraclius in the first half of the seventh century endeavored to establish on a large scale permanent settlements of military farmers upon state and confiscated lands and to give them legal protection against the land grabbing policies of the nobility and the church. Similar attempts directed against Islam by the Macedonian dynasty in the tenth century met with as little permanent success. The heirs and in a general sense the organic successors of the land regime of the Eastern Empire, and perhaps of the ancient Orient, were Islam in the Mediterranean region and the Slavs in eastern Europe.

Under the first caliphs all landed property of non-Moslems was forfeit to the state. Owners were obliged to pay a tribute (*kharāj*) in return for an extension of precarious tenure. The land regime which prevailed in the former Sassanid-Byzantine provinces, in which there were now state latifundia and church lands, was maintained in principle and developed special aspects in various regions. The acceptance of Islam by the native peasantry soon ceased to be accompanied by an abolition of ground rent, which was in fact extended to include the older Moslem peasants, except in regard to waste land which they had reclaimed. Public domain with dependent peasants was allotted to important personages as fiefs (*ikṭāʿ*) and to lesser ones in return for specified services. As in Byzantium, the manorial system reached into the public domain when peasants sought the protection of powerful nobles. Charitable foundations (*vakuf*) holding former state land in perpetuity displaced to a considerable extent the Christian ecclesiastical foundations. In Egypt the lease supplanted the *kharāj* system and public domains including waste lands (*kitāʿi*) were leased quadrennially at auction. Subsequently the whole public domain was divided into military fiefs (*ikṭa āt*) except such as remained the privy estate of the sovereign. More or less analogous

developments may be traced from India as far west as Spain. The Ottoman Empire added to the public domain military fiefs (*spahilak*, *chiftlik*) with dependent peasants and tenants. Although theoretically such fiefs were hereditary only where the heir possessed military qualifications, they tended to be transformed into private latifundia. Attempts were made as late as the nineteenth century to recapture these fiefs for their original purpose. Privileged Christians (*raja*) also were allotted small hereditary fiefs for military, police or special services. Like waste lands (*mowat*) and property devoted to public purposes (*metruké*), their land remained part of the public domain (*mirié*) but the users enjoyed well defined property rights over it. Mehemet Ali reestablished state ownership of almost all the lands of Egypt early in the nineteenth century. In the latter part of that century there began under European influence a decline of the charitable foundations and of hereditary fiefs, whether sovereign or suzerain, in all Islamic countries from Afghanistan to Morocco. Especially since the end of the World War state domains and estates under feudal tenure have been broken up for large scale colonization.

The predominantly Slavic east of Europe, which followed the Byzantine feudal pattern, reveals an analogous trend. Crownlands, lands allotted to the church by the state as well as the fiefs attached to the knightly office (boyar), with their dependent peasants generally organized along ancient Slavic lines and with their tendency to develop into private possessions, often reflect in their technical names their origins in late antiquity. When the Serbs, Bulgarians, Greeks and Rumanians attained their freedom in the nineteenth century, state land was allotted for farm colonization. Russia as compared with other Slavic countries showed a distinctive development. Noble and ecclesiastical estates became private property beginning in the fourteenth or the fifteenth century. In the sixteenth and the seventeenth, certain of the crown domains were still worked by a state bureaucracy, while a portion of land occupied by peasants was allotted to retainers and monasteries as hereditary possessions (*votchina*) or for life occupancy (*pomest'e*) under conditions of service. Under Peter the Great the latter were finally converted into private latifundia with peasants bound to the soil. As in Byzantium and Turkey, there remained crownlands with hereditary serfs for the provisioning of the court, the breeding of horses and falcons and the satisfaction of the

czar's personal needs. There were besides the royal domains extensive public domains manned by peasants bound to the soil. The first great break in the Russian system was the abolition of serfdom in 1861. Large portions of the state lands and of lands belonging to the imperial family were allotted to the peasants or opened to colonization, while other parts were exploited by being rented to peasants. Since the Bolshevik revolution land once again is in principle state property. For a short time agricultural concessions to foreign entrepreneurs were tolerated, but land is now administered under centralized, planned control of giant farms and state directed peasant collectives. Independent peasant agricultural economy is subjected to many restrictions, and the ultimate object is to wipe it out completely. All Russia has become a sort of vast public domain, organized as far as resources permit on European technical principles, with the result that despite its peculiar economic forms its agricultural system bears a resemblance to those of western and central Europe.

These last named regions built their land regime on the foundations laid by late antiquity as did Byzantium, Islam and eastern Europe, but their subsequent development followed different lines. Originally as a result of the Germanic migrations enormous quantities of land including a large portion of the state territory of the late Roman Empire, the lands belonging to the cities and the private latifundia were divided among the nobles and the freemen as in early antiquity, so that the German land regime was introduced into the Western Roman Empire. Unusually extensive crownlands with their dependent coloni were excepted, particularly in the Frankish empire, where they were organized centrally as in Byzantium. Through the assimilation of the late Roman-Islamic service fief to the old Germanic retainer system there developed a system of enfeoffment (*beneficium*) by the king and the great landlords. After the conquest by the Franks the system was extended to old Germany by means of an increase of royal and ducal property through the acquisition of unclaimed lands and of considerable church and noble property and its gradual conversion into various service or honor fiefs for the upper and lower nobility. In France, Germany, Italy and Christian Spain the service fiefs soon became hereditary and quasi-private property. The possibilities of reversion to the crown were limited, while new political donations to churches and the enfeoffment of new vassals steadily decreased

the crown domains. The same development took place in England, had some influence upon Scandinavian evolution and penetrated Poland, Bohemia and Hungary from the tenth to the twelfth century. In the late Middle Ages moreover the feudal system developed in England and eastern Germany into the manorial system, which became increasingly differentiated from both the state and the communal land regimes. It gave way in turn to other forms of tenure, including capitalist exploitation of ground rents through individual lessees, a form of agrarian enterprise which also obtained generally on the remaining crown domains down to the decline of the mercantilist economy.

The principle of the inalienability of the public domain was adopted in France, beginning in 1318 and culminating in Charles IX's ordinance of Moulins (1566). Most European countries followed suit, until by the nineteenth century the validity of the principle was recognized widely. As far as possible public lands which had passed into private hands by usurpation were recaptured, and secularized ecclesiastical property was added to the state possessions, which were administered increasingly from a purely economic point of view. While in the Middle Ages the distinction between state domains and those of the prince or ruler were as a rule not clear, controversies lasting into the nineteenth century led to the conversion into public domain, first in the great and later in the lesser states, of all except a small residue of the princely holdings of various monarchs. On the other hand, extensive regions where serfdom held sway were transformed by the emancipation movement of the eighteenth and nineteenth centuries into free peasant land. Model farms and peasant colonies on uncultivated state lands were characteristic especially of seventeenth and eighteenth century Austria and Prussia.

The French Revolution and all subsequent victorious republican revolutions down to the present have resulted in changes in the public domain. A considerable portion of the private landed property of princely houses became public domain, partly through bilateral treaties, as in Germany, and partly through simple legislation, as in the new countries of eastern Europe after the World War, in France and Spain. In all these countries church lands and noble estates also were for the most part converted into public domain. It has been and still is the intention, however, to turn these lands, except for some communal property in France, into free-

hold farms or urban leaseholds by means of the emancipation of peasants and by land sales. The establishment of small farms rather than of large estates has been a growing tendency in European agrarian policy, especially in the last century. In recent years consequently the alienability of farm holdings throughout Europe has been substantially limited in many ways and farms have been subjected to more rigid state supervision in respect to both cultivation and sale. This trend is evidenced by Fascist colonization and corporative organization in Italy and by National Socialist inheritance legislation and agricultural organization in Germany and appears to be a collectivistic reaction against the steady movement toward a separation of private possession of land from state ownership or control which marked a millennium of history in western and central Europe. As a result of the tendency toward organized land settlement the leasing of the public domain in small plots to peasants in return for a portion of the crop or on hereditary lease has become less frequent. Even leases to capitalist proprietors are being gradually cut down through new settlement. There remain model farms under state administration. Since the economic crisis of 1929 this form of management has been applied also, either by agreement of lessees or by the state, to latifundia excessively burdened with debts.

Outside the region bounded by India, Britain, Scandinavia and the Sahara, which is marked by a certain unity, there are only two highly developed regions of the Old World with distinctive land regimes. Eastern Asia, which originally had all the characteristics of a pure peasant civilization, developed a system of state feudalism beginning with the third to the second millennium B.C.; from the time of the Chou dynasty (eleventh century B.C.) it was perfected through intensive agricultural colonization, although subsequently overrefinement caused its disintegration. Between the fourth and the third centuries B.C. China was unified under a central bureaucratic state, which except for brief relapses distributed only service fiefs, for military or bureaucratic service, or honor fiefs, in recognition of family rank. Tenure was precarious and without sovereign rights. Colonization was pushed steadily in eastern Asia. Between 9 and 22 A.D. both private ownership and the alienability of land were abolished by Wang Mang, who was unable, however, to enforce his edict. Subsequently a state land reserve was established in order to safeguard the peasantry from

falling into bondage to great proprietors; feudal labor for the cultivation of state lands was done away with, and from time to time, as in an earlier epoch, land was partitioned among peasants on a fixed scale, some of it in hereditary tenure, while other allotments reverted to the state at the death of a holder (*k'ou fen t'ien* land). At the same time the sale of allotments was either prohibited or restricted, while fiefs for services were maintained. Gradually the peasant holdings broke farther away from the state. With the revolution of 1912 China adopted a European land system, and most of the public domain became the property of the peasants and great proprietors.

In ancient Japan families (*uji*), among them that of the mikado, with their dependent retainers were the only landowners. The investiture by the mikado of new *ujis* introduced a kind of feudal system of dependence. The Taikwa reforms (645) introduced into Japan the Chinese bureaucratic state system with a general state land reserve, equalitarian land partition, restrictions on the sale of allotments and fiefs for services and honor. Great landholders (later called daimios) free of tributary obligations and having vassals and bondsmen cut into the public domain materially by taking up fiefs, which steadily became more and more independent. The Taiho legislation (c. 700) provided a hierarchically perfected system of service and honor fiefs and an extension of the policy of regulated partition of fields among peasant families. Waste land newly reclaimed by private enterprise became private property with unlimited alienability. In addition extensive imperial domains were either rented to peasants or cultivated by forced labor. After 1192 the disintegration of the empire into suzerain provinces under feudal lords was prevented by the shogunate, which gave to its warriors (*samurai*) semipublic service fiefs or rents. The public lands, however, continued to be absorbed or deserted. The shogunate brought the feudal daimios under its own sway as far as possible, keeping them down after 1600 by means of a police system. After 1868 the European land system penetrated Japan, although to a considerable extent imperial properties were maintained.

India is distinguished from all countries of high civilization by the fact that here the state, the governmental apparatus and the personality of the prince occupy a relatively low status in the popular view. There still exist side by side without conflict the most varied state forms and

shifting types of public domain organization, each of which has been characteristic of one country or another. Originally the peasantry predominated in India. After Alexander the Great there developed individual great states whose influence is still effective today. These states, like Hellenistic Egypt, utilized the royal supertenure of land methodically and rationally. The Moguls brought into the northern regions of the country the influence of the Islamic feudal land regime. Later units of landed property (*zamindaris*, *jaghirdars*) with dependent peasants obtained their independence of the public domain by paying a regular fixed revenue. England's influence was to increase the variety of the Indian system by bringing about in many districts, especially in the provinces, an approximation of European land law, although it did not attempt here, any more than in other regions under British control, a genuine Europeanization of the land regime.

Fritz Heichelheim

NEW COUNTRIES. The acquisition and disposal of the public domain in non-European countries opened to European settlement provide the background for the redistribution of population of European stock during the last three centuries. That domain attracted settlers and capital and was largely responsible for an outflow of at least 50,000,000 people from Europe between 1815 and 1914. It also kept the native born white population within these new countries moving toward new economic frontiers and even attracted it from one newly opened country to another.

Geographical and political factors gave public land policy peculiar features in each of these countries, but there were and are many common characteristics. The building up of the public domain consisted of the transfer of land from native ownership to that of a European ruler or to some person or company to whom that ruler had delegated power to take the land. The seventeenth century state did not hesitate to appropriate and grant land not already claimed by "any other Christian prince." Where natives could be brushed aside or beaten down, their interests received scanty consideration; but where the occupants were strong enough to offer resistance or when respect for native rights was recognized under pressure of humanitarian agitation or political wisdom, some *modus operandi* had to be adopted by which the native received payment for what he surrendered and protection

for what he retained. New Zealand offers the best instance of the latter procedure. In North America and south Africa there were subsequent transfers of land from one state to another by conquest, treaty or purchase. In the former the public domain became consolidated by transfer from one immigrant power to another. When Canada became a dominion, the existing provinces retained their crownlands, and the federal government had no domain until it acquired the Hudson's Bay Company territory by purchase in 1870. The public domain of the United States grew by a series of large acquisitions. The thirteen original states ceded about 270,000,000 acres; the Louisiana Purchase added approximately another 430,000,000 acres; then came the purchase of Florida, the purchase from Texas, the establishment of title to the Oregon territory, the acquisition of large territories from Mexico in 1848, the Gadsden Purchase in 1853 and the purchase of Alaska in 1867. In all nearly 2,200,000 square miles of public domain were accumulated, at an average cost of about \$.06 an acre.

The zeal with which new countries added to their domain was equaled only by the energy they applied to getting rid of it. Until within the last fifty years few voices were raised to suggest that the domain should be held in trust for posterity, that resources should be conserved, or that money received by selling land should be put into permanent capital improvements and not spent to meet the ordinary costs of government. Wakefield and his group of enthusiasts in London might convert ministers and officials to a belief in "systematic colonization" and thus impose checks and safeguards on the settlement of distant colonies. An alert governor in Cape Town, Wellington or Sydney might try to chart a middle course between the commands of doctrinaires in the Colonial Office and the clamor of hungry colonists or greedy speculators around him. Laws, orders and ordinances which seemed both wise and water tight might be framed; but in the long run political aims bowed to geographic and economic forces, good laws failed through bad or inadequate administration, a hole was found in every legislative fence, and either through legislation or in spite of it the frontiersman, the man on the spot, got his own way. There is perhaps no aspect of public policy in which the gulf between aim and result is so wide as in the handling of public lands.

Of the two outstanding methods of alienation

—sale and gift—every country opened for development has had some experience. The choice has depended upon prevailing political and social ideas and needs as well as upon the character of the land itself. The central aim was to get the land occupied as quickly as possible; the rate of a country's progress was measured by the speed at which its frontier was advancing. Unoccupied land was a liability rather than an asset, a lurking ground for wild natives, a temptation to other powers: an empty Australia might be menaced by Asiatic rulers eager to relieve the pressure of population on their own soil; a settled south Africa would reduce to a small extent the preponderance of the native population; a settled Canada could look southward with greater equanimity; and if the American prairies were filled with devoted Republicans, the south would be more amenable to control. Rapid settlement was desirable also where railroads, canals or irrigation preceded it. Finally, the greater the settlement, the larger the markets for industrial produce, the man power and the taxable resources.

If the need for settlers dominated land policy, so also did prevailing ideas concerning the character of the society it was desirable to create in the New World. The seventeenth century might hope to instal feudalism along the Hudson or the St. Lawrence, but the democratic nineteenth century preferred small owner farmers to big landlords and molded its land policies with a view to achieving this result. The big ranchers who secured favorable leaseholds over vast stretches of Australia in the 1840's had to bow to the ideas and wishes of the "radical rabble" which swarmed into their preserves during the gold rush of the 1850's; there was introduced the policy of "free selection before survey," which was expected to make serious inroads into the pastoral holdings. North America Free Soil Democrats in the middle of the nineteenth century carried the doctrines of natural rights and equality of opportunity into the land discussion and found there a cure for poverty, a way to check land speculation and the accumulation of large estates with their resultant landless proletariat.

Under such circumstances free grants seemed the more desirable policy (*see LAND GRANTS*), especially if hedged round by conditions demanding residence and improvement. The settler would pay for his land in the sweat and discomfort of frontier life; his capital would be spent in equipment and stock, and thus the

country would attract men who were rich in willingness to work but poor in worldly goods. At the same time land grants could reward those who had suffered for or served the government, as, for example, the United Empire Loyalists in Canada or the ex-servicemen in all countries; they could be used to endow education or religion, to subsidize colonizing ventures or to aid railroads, canals or other necessary internal improvements. British policy recognized these considerations and followed a land grant policy in every colony until the 1820's; the French did the same in the St. Lawrence region, while the Dutch in south Africa wanted food and supplies for their East Indianmen and therefore granted settlers small freeholds for agricultural purposes and encouraged other settlers by "lending" them cattle farms, subject to annual renewal of the lease, of about 6500 acres each at a nominal quitrent. In 1813 the British substituted perpetual quitrent grants.

The alternate policy of land sales was urged on the ground of need and of unfortunate experience with the land grant system. The need was for revenue to meet the costs of war and to defray the expenses of general government, of land administration or of public works to open up or serve new areas. Tax collection, apart from customs, is difficult in pioneer areas; revenue from land sales is therefore a line of little resistance, excelled in this respect only by oversea borrowing. When the settlement of an area depended upon some large outlay on public works, especially on irrigation, payment for the land was really a refund of the capital which had made arid land productive. Hence the United States began its land policy with sales in order to meet the cost of the revolution and now pays the expenses of reclamation by sales of reclaimed land. Experience in the British colonies led from grants to sales of public lands for different reasons. The grants, usually subject to quitrent in Canada and Australia, brought little revenue and few settlements. Vast areas passed into private hands but lay idle and undeveloped, awaiting buyers who were willing to pay a high price. Bona fide settlers had to go far back behind these locked up lands and were scattered widely. Free land prevented settlers from keeping laborers and depressed the value of territory already settled. Meanwhile the quitrents were not paid. To remedy these defects Wakefield proposed sale at a "sufficient price"—sufficient to provide passage money for laborers, to pay for public works and to prevent laborers

from buying land until some years of selling their labor and thrift had put money in their purses.

This doctrine influenced British policy in all its colonies: free grants were discontinued about 1830, sale by auction at a minimum price or private sale at a fixed price became the rule, and South Australia and New Zealand were settled by companies working on the Wakefield plan. When the colonies gained control of their own lands in the 1840's and 1850's, local pressure broke Wakefieldism in many respects: the minimum price fixed by London might be reduced, settlers with small capital were offered easy terms of payment, public works were paid for by borrowing; and in New Zealand, after control of the public lands was given to the provinces, some of the latter provided for homestead grants—Auckland did so as early as 1855. Some Australian states granted free lands toward the end of the nineteenth century; but here, as in New Zealand after 1876, when the administration of the public domain became centralized, sale was the normal method of alienation. Only Canada, influenced by the competition and example of its neighbor, departed seriously from this practice; and its policy for the prairies was one of land grants to railroads, free homesteads, pre-emption rights, and cheap land to almost anyone who wished to buy. Canada had to be at least as generous as the United States.

North American policy concentrated on complete alienation of the public domain; but in the antipodes leasehold has played an important part as a temporary or permanent method of handling crownlands. This is due partly to the early importance of the pastoral industry there and to the unsuitability for agriculture of large sections of the land. Leasehold made legal the pastoral occupation of crownlands pending their complete alienation in smaller farms, it regularized the relations between squatter and government, offering security of tenure for a fixed number of years to the former and yet keeping the ultimate disposal of land in the hands of the latter; the rancher did not for the moment have to spend his capital in buying territory, while the government received some income. The leasehold thus provided a firm basis for the development of the cattle and sheep industries and for the exploitation of lands which would never be fit for anything but large scale pasturage; and although the leaseholder was able to resist eviction by buying the key areas of his land and thus to render the rest of his ranch useless to anyone else, the

transfer from pastoral leases to freehold agricultural farms probably progressed as quickly as was economically desirable in view of the relative advantages of wool and wheat production during the last four decades of the nineteenth century. In the United States no system of leasehold or license was ever adopted for the national domain, with the exception of the national forests and non-metalliferous mineral lands and water power sites; but some of the cattle states and the railroads have established leasehold tenure for lands they own. About half of the area of Australia and over a quarter of that of New Zealand is held on lease from the crown. The Australian fraction is large, partly because of geographical conditions and partly because of the opposition of the Labour party and other schools of land reformers to further alienation. In the 1880's, under the mixed influence of Henry George and the advocates of land nationalization, the state was urged to keep what was left of its domain and to lease it either in perpetuity or for a long time, with a periodical revision of rent or a graduated land tax on its unimproved value, so that the state coffers might receive a share of the unearned increment in land values. In New Zealand the Liberal-Labour governments after 1890 strove to settle a crown tenantry on the public domain and on repurchased land; but when these tenants became prosperous after 1900 they demanded and won the right to buy their holdings in order to be free to sell them in a rising land market. In Australia the Queensland Labour government stopped granting freehold in 1917, but with the fall of the ministry in 1929 this policy was reversed. In Northern Territory the federal government grants only perpetual or long leases. The Canadian provinces lease lands which are unfit for agricultural settlement. South Africa leases new farms for five years, after which the tenant may begin to buy; Australian governments offer many varieties of leasehold with right of purchase. The main criticism of the pastoral lease is that the holder makes no attempt to conserve the natural grasses and shrubs and leaves a blighted land at the end of his tenure.

Behind every general policy lies a mass of difficult detailed problems. One is concerned with imposition of conditions of residence and improvement upon the recipient or purchaser of government lands. The United States called for residence during five years on a homestead, Canada required only three years, and in 1912 the United States adopted the Canadian figure.

Planting a specified acreage with trees, irrigating a certain area, plowing a fixed number of acres, building a home, clearing a defined area of prickly pear—these are some of the conditions imposed. Another question is what unit of area shall be given or sold. The United States originally did not wish to peddle land, hoping instead to sell it in large blocks; it was driven, however, to reduce the unit gradually from 36 square miles (a whole township) to 80 acres and even to 40. On the other hand, the problem of the maximum unit emerged; given the democratic dislike of large holdings and the difficulty of getting hired help, the ideal of the "family farm" emerged and was enshrined in the homestead unit of 160 acres; but the right to preempt another 160 acres and other factors resulted in the growth of many larger farms, while the inadequacy of 160 acres to provide a livelihood west of Iowa led belatedly to the grant of 320 or 640 acres in the dry western states. There was also the issue whether selection of land should be permitted in any part of the public domain or be restricted to certain areas declared open for settlement. Controlled selection was desirable: it simplified the establishment of title and made possible the defense and government of a compact population, but it was impossible because it clashed with the centrifugal forces at work wherever there was unoccupied land, and governments had either to treat the squatter as a trespasser or to recognize that unauthorized occupation was inevitable. Preemption was the concession made to the squatter in North America; South Africa and Australia legalized the pastoralist's position by granting licenses or leases. Finally, when a policy of sale was decided upon, there was the question of how land should be sold, whether by auction with a minimum upset price or privately at a fixed price and at what price and by what form of payment. The United States sold land by auction until 1862, with a minimum price of \$2 until 1820 and of \$1.25 afterward; it sold preempted land privately at \$1.25 after 1841; but when in 1850 it began to make railroad grants, it sold its own land along the track at a minimum of \$2.50. The "sufficient price" in Australasia sometimes went as high as £2 an acre. Credit sales up to 1820 were so unsatisfactory that the United States abolished them; when the other countries turned to the policy of helping small settlers, however, they all accepted payment by instalments, while most railroads worked out excellent systems of extended payments in selling their lands. Today

payments in South Africa and Australia may be spread over twenty, thirty or even more years. The ability of the creditor to collect instalments depends upon the weather and the price trend; during the years of rising prices between 1896 and 1920 payment was satisfactory, and governments did much financing of the farmer as well; but the falling prices since 1920 have made the collection of instalments a dreary business.

Behind the general and detailed questions of policy there has been the problem of administration. An ideal system of alienation would call for an adequate central and local office staff and corps of surveyors, a body of information concerning soil and climate, a variety of laws fitted to the different classes of land and of prospective settlers, with an army of policemen to prevent or regulate trespass, check fraud and see that conditions were observed. No country has had or could have such equipment. The data for land classification could be accumulated only slowly: no surveying staff has ever been big enough to keep up with those always pushing further out; and no army of legislators and officials could anticipate or check the devices by which ingenious persons evaded conditions and turned laws to purposes opposite to those at which they were aimed. New countries succeeded in learning how to handle the public domain by the time there was virtually no domain left to handle; it was only in the late nineteenth century that widespread surveys and classifications began to furnish the basis for public land policy in respect to different types of land. The schemes for conservation came too late to touch more than the fringe of the problem. In actual area the fringe still looks large, but the quality is poor. In Australia and New Zealand it was found necessary to add to the public domain by repurchases from large landholders in order to make good lands available for close settlement. In 1931 the United States had about 179,000,000 acres vacant, unappropriated and unreserved, but nearly half of it was desert land in Nevada or Utah. It had almost 136,000,000 acres in national forest reserves, about 60,000,000 acres reserved as mineral lands, stock driveways and water power sites and about 350,000,000 acres in Alaska. The bulk of the Canadian dominion lands was transferred to the prairie provinces in 1930; the Dominion of Canada in 1933 had 936,000,000 acres of domain, the southern boundary of which is 60° N., while the provinces held chiefly land unfit for agricultural settlement. Australia has 40 per-

cent of its area "occupied by the crown or unoccupied," and 50 percent in crown leases; New Zealand has one third unoccupied and nearly one third under leasehold. In none of these areas is such settlement as characterized the nineteenth century possible; reclamation may do a little here and there, and new wheat varieties may allow the plow to go a little nearer the arctic or the desert; water power and minerals may bring the state some revenue from leases and royalties; but the day has definitely gone when the public domain can be a home for a stream of settlers or a source of great income to its owner.

In the tropical areas of Africa and Asia unfit for European settlement three problems had to be faced: first, the demarcation of native reserves and the absorption of the rest of the land in the public domain; second, the collection of wild produce on the domain and on the reserves; third, the development of plantation agriculture. The native claims to tribal ownership of large areas were gradually recognized, and tribes were forbidden to dispose of land to white men except with governmental approval. The domain was made available to Europeans by the grant of concessions. These grants usually gave the sole right to exploit the natural produce of a large area for a long period; the Lever concession of 1911 covered 3000 square miles in the Belgian Congo, and France in 1899 had conceded over 300,000 square miles to various companies in the French Congo for thirty years. The concessionaire paid some rent and possibly a royalty on the produce or a fraction of his profit; he might be bound to pay a minimum wage, build factories, provide medical and educational facilities, plant a certain area and obtain some of his equipment and white labor force from the country which gave the concession. When the grant expired he might, if he had fulfilled the developmental requirements, be granted title to a portion of the area, subject to quitrent.

The generosity of some early concessions, especially French and Belgian, raised difficulties and roused popular hostility. Too much land had been tied up, and abuse of the natives stirred much indignation. After about 1910 therefore greater stress was placed on safeguards and on the development of cultivation. France especially sought to change the exclusive right to gather wild produce over a large area into ownership and development of a smaller area.

In 1910 eleven concessionaire companies agreed to surrender 17,000,000 hectares in return for a ten-year concession of all the rubber

within the same territory. This concession was to be renewable for another ten-year interval to the extent of ten times the amount of land which they had brought into cultivation or systematically exploited in the first period. At the end of each concession period the companies were to receive full proprietary rights to all lands which they had cultivated or exploited, in amounts not to exceed 10,000 hectares of forest land for each company. In British areas leasehold is the usual tenure, with rents subject to periodical revision; no freehold is granted.

From 1870 in the Dutch East Indies the government claimed ownership of all the lands to which no one else could prove title. These crownlands were granted on emphyteutic leases in Java, Madeira and the directly governed areas of the outer islands; in the self-governing districts they were distributed as concessions (*land-bouw-concessien*). The lease, generally for seventy-five years, is, however, the standard tenure; concessions are being converted into leases, and much of the land given or sold by the Dutch East India Company is gradually being bought or expropriated by the government. The leasehold area is limited to 550 *bouws* (964.5 acres), except in the outer islands, where it may be as large as 5000 *bouws*.

In Africa permission to prospect and exploit mineral areas has been granted subject to certain conditions and payments. But the Dutch from 1910 on seriously restricted the exploitation of mines by private interests and in 1918 reserved for the crown the right to exploit coal, oil and iodine in their East Indian possessions; they also made the production and sale of salt a government monopoly and reserved the rich tin deposits in Banka. Some gold and tin are obtained from government mines; those in Banka produce about one seventh of the world's tin output. But much production is in the hands of companies in which the government has a partial interest and control or which work under license or agreement.

HERBERT HEATON

LATIN AMERICA. The aboriginal systems of land tenure in different parts of Latin America have left their mark upon the concept of public lands. Ownership of land among the Indians, both civilized and uncivilized, was mainly communal or tribal. In pastoral regions, as, for example, in the southern highlands of the Andes, the unclaimed areas were public range. Among the hunting tribes such lands were common

hunting grounds. In central Mexico, Yucatan and the northern Andean plateaus the sedentary farming peoples who had no domestic stock drew upon the unoccupied areas for wood, grass for mats or thatching, building stone, salt and other materials. It was from these unclaimed districts too that land was obtained for the founding of new settlements. In some cases there seems to have been little or no political control over unused lands or little claim to exclusive rights within them; they were free to any who wished to utilize their resources; in other cases tribes or villages insisted on exclusive rights within more or less clearly defined limits. This concept of unoccupied land as open to all has had its influence, particularly in the predominantly Indian districts, so that it has been difficult for the constituted authority to prevent unauthorized free use of and even permanent settlement upon the public domain.

With the advent of the Spaniards and the Portuguese all territory explored and conquered by their respective representatives came under the sovereignty of the crown. Land in actual use by native agriculturists was generally recognized as private holdings, but it was frequently seized illegally by Europeans or given to them in contravention of the law. All other land was considered to belong to the crown itself. From this royal estate, or *realengo*, were made the grants to the conquerors and settlers. In such alienation of the royal lands there was often expressed and probably always implied a right of the crown to withdraw the grants as well as a clear reservation of subsoil resources as an exclusive possession of the king. Since only a very minor part of South and Central America was occupied by farming peoples, the public domain was very extensive. Land was bestowed generously and in enormous blocks upon virtually all applicants who could show any record of service to the crown. In the Spanish colonies land was acquired also by purchase. Since the extreme uncertainty of land boundaries and the appropriation by proprietors of lands adjoining their own holdings led to many encroachments upon the royal domain as well as upon the Indian communities, the government, in order to protect the latter and provide revenue for itself, adopted at various times measures calling for the examination of deeds. Confirmations of titles were known as *composiciones*, theoretically involving the measurement and demarcation of the property in question as well as the correction of any flaws in the title; detailed measurements,

however, were seldom completed. On the whole at the end of the colonial era only those areas most desirable as to soil, climate, water supply and available native labor had been occupied. Moreover the colonies were small and mainly self-sustaining, and there had been little demand for agricultural lands to be devoted to production for export, and great sections, destined later to yield enormous quantities of wheat, corn, flax, coffee, sugar and cotton, were still unclaimed. Probably not over a quarter of the land in most of the colonies had been brought under private ownership. The rest constituted an immense expanse of crownlands waiting to be occupied.

With the creation of independent republics at the beginning of the nineteenth century the respective national governments declared themselves the legal successors of the Spanish or Portuguese crown and thus came into possession of the extensive *realengos* in each colony. In the new states the control of the public domain was a bone of contention between unitarians and federalists. The federal republics in most cases recognized the public lands within states as belonging to these smaller political units, while they regarded those in territories and unorganized regions as national property. The unitary republics took over all the crownlands for the central government. In Argentina the provinces assumed control of the lands within their borders despite the opposition of the Unitarians, who dominated the national administration, and this arrangement was sanctioned under the federal regime inaugurated in 1853. In imperial Brazil certain lands were ceded to the provinces for colonization purposes in 1848; in 1888 the proceeds of sales, together with extensive tracts of the public domain, were also granted them. Under the republican and federal constitution the public lands belong to the states, while the central government is entitled only to the land necessary for the defense of the frontiers, for fortifications, military constructions and federal railways in addition to the lands in the territory of Acre. In Mexico the ultimate authority over the public lands appears always to have been vested in the central government, although during part of the period before 1857 administration and revenues were entrusted to the states. The former crownlands were a potential source of great wealth to the new nations—in the early period they constituted in fact the only important resource. Mexico, Brazil and Argentina in particular held

large areas of public lands. The population of this last state had expanded little beyond the immediate vicinity of its principal towns, and both within and beyond a line of forts which held the pampa Indians in check there were many millions of acres of excellent farming and grazing land. Most of Brazil's public domain lay in the Amazon forests, but there were in addition millions of acres of good agricultural and pasture lands. Much of Mexico's public lands consisted of the semi-arid plains in the northern part of the plateau; but still farther north were the good grasslands of Texas, the fertile valleys of the southern Rockies and the recently explored basins of California, all of which were capable of development. The Andean republics held extensive mountain areas and vast expanses of low plains along the eastern base of the Andes. Chile claimed as public domain all the wooded land stretching southward from the Bío-Bío River (about a third of its present territory) and an area of great extent between its northernmost settlements and the undefined boundary in the desert of Atacama. In Central America most of the low, forested littoral of the Caribbean as well as much of the interior mountain country was still unoccupied. A great part of this public domain was known only as *terra incognita* and on the whole was never properly explored and surveyed despite the adoption of legislation similar to that in North America.

The new republics promptly began to draw upon their great resources of public land, compensating the heroes of the wars for independence with huge grants in lieu of pensions and rewarding other public servants in similar fashion. Various enterprises, such as the railroads, were encouraged by subsidies in the form of public lands. Whatever the mode of disposal, it was the fixed policy of most of the countries that "the government should not retain the public domain for itself." The governments sold lands at ridiculous prices to pay public debts and also used the domain to guarantee such debts. Along with other inducements they offered free homesteads or cheap land to native and especially to foreign colonists and to promoters of colonization. Nevertheless, the champions of rural democracy, although in many cases very successful, were frequently defeated by the influence of treasury deficits and by the political dominance of great landowners and speculators. Leasing of public lands was not highly favored and such tenures were insecure. In disposing of

them, however, the governments frequently faced the competition of private holdings.

In Brazil land grants known as *sesmarias* were prohibited in 1822 and 1827. The general public land legislation, first enacted in 1850, remained, although poorly enforced, the basic land law of the empire. It provided for the division of the public lands (*terras devolutas*) into rectangular lots of 500 *braças*, before disposal at public auction or by direct sale at a low minimum price payable in cash. Free grants were to be permitted only within 10 leagues of the national frontiers. The law failed to limit the size of alienable areas. Part of the receipts from sales were to be applied to the transportation of immigrants. Official immigrant colonization began in Brazil even before independence and was continued by both national and provincial governments. About 1850, when the importation of slaves was checked, subsidized colonization companies to whom tracts were sold at low prices began to function, but their projects proved less successful. In 1907 the federal government instituted a land settlement program, using in part public lands turned over by some of the states.

In Chile a law of 1824 provided for free grants of land to foreigners settling for industrial or agricultural purposes, while in 1845 provision was made for free grants in government colonies made to natives and foreigners, according to the size of the family and region of the country. Under such measures and with the breakdown of aboriginal resistance the wooded southern region was slowly but steadily occupied by colonists, especially after 1900. An act of 1866 provided that public lands were to be alienated by public auction in lots not exceeding 500 hectares. Land speculation developed, stimulated by the system of long term instalment purchases and by the act of 1874 which provided large grants to concessionaires for immigrant colonization. In pastoral Magallanes the early policy was to lease vast regions at public auction to large companies who then sublet them; after 1900 sale by auction was substituted. The demand for land for small native proprietors found a response in a law of 1898, which was sabotaged, however, by the administrative officials. Since about 1920 the interests of the small scale agriculturist have received more consideration; provision has been made for direct alienation or leases, and government land settlement schemes have been launched. The lack of knowledge concerning the public lands made their technical administration extremely un-

satisfactory. Public land was often sold as private property and vice versa. The wide prevalence of squatting, the frequency of illegal grants through political influence, the withholding of titles from those who had a right to them, the high percentage of violations of conditions of alienation, created a state of chaos in the titles of lands acquired from the public domain. Efforts to regularize this situation have been influenced by the conditions affecting the ordinary modes of alienation.

In Mexico by legislation of 1855 holdings in violation of law or contract were subject to nullification. The law of 1863 provided that peaceful possession for ten years of bounded or cultivated land would entitle the holder to ownership upon payment (in instalments if desired) of one half the official price; legitimization of other types of occupation was likewise facilitated. Under Díaz the surveys, rights of denunciation and *composición* were utilized against small holders and Indian communities, although the land monopolists were forgiven the violations of important conditions on their holdings. The constitution of 1917 subjected many of Díaz' alienations to revision; the amount of publicly owned land increased over 60 percent between 1912 and 1929, but a large part of the increase is of slight importance for agrarian purposes.

In Argentina the national law of 1876 bestowed a 100-hectare lot upon each squatter. The confirmation of deficient titles in national territories was later made possible, and many who had occupied public land for over five years became entitled to full ownership on terms ranging from free grants to full payment. In practise this law gave rise to the usual abuses. After 1890 the national government recaptured considerable land. Although the law of 1903 denied preferential rights to occupiers, the authorities maintained the rights of those who were in genuine possession before the enactment of the law. J. G. Velarde, writing in 1923, reported that government assisted settlement had been practically abandoned and that squatting was the chief method of acquiring public lands. From pastoral Patagonia, however, have come complaints that no security of tenure and no rights of compensation for improvements exist either for squatters or for lessees, who are entitled to the privileges accorded by the law of 1903.

In Brazil as far back as the colonial era the acquisition of crownland in the interior took

place by simple occupation; after the cessation of grants of *sesmarias* squatting became almost the only means of acquiring public lands. The law of 1850 provided for validation of title upon survey by the possessors of *sesmarias* who had not fulfilled all conditions and for confirmation of peaceful possession under conditions of cultivation and residence; the size of a holding which might be acquired equaled that of the customary *sesmaria*. Third parties occupying *sesmarias* were entitled to indemnity for improvements and in certain cases to more extensive rights. The law failed, however, to end large scale usurpations of public land; when the states assumed control of the public domain they were compelled to take measures to regularize titles. Squatting continues, however, to be widespread.

Settlement in southern Chile far outran government provision for it. Foreign groups received their land in orderly fashion and generally enjoyed full security of title, but in many cases the native settlers merely took possession of lands. Among both groups there were many who received holdings and then occupied adjoining areas. The willingness of the Indians to dispose of their loose claims to ill defined lands further complicated the problem. For a long time squatters and lessees were liable to expulsion with or without indemnity, a situation which aroused loud protests. Noteworthy efforts to deal with the problem of the *propiedad austral* were made in 1908 and 1925. The legislation of 1928-29 validated numerous titles and under varying conditions gave to occupiers who were in possession before 1921 free grants of small areas, the size of which was proportioned to the number in the family; squatters and holders of unsatisfactory titles who had been in possession for ten years received purchase rights to 2000 and 4000 hectares respectively.

By the beginning of the twentieth century some countries had disposed of most of their public land, while all had greatly reduced it. By 1912 there were no public lands in twelve of the states of Mexico, and six others had little left. The Argentine states too had parted with almost all their holdings. In some of the smaller republics, such as Salvador, Paraguay and Uruguay, virtually all the government domain had been alienated. In a number of the countries, however, there are still very extensive areas of state lands awaiting settlement or even exploration. Some of these lands have been surveyed inaccurately, most of them not at all. But estimates for certain of the countries give the

following figures as approximately correct. The national domains as distinguished from the domains of the provinces in Argentina in 1916 contained 67,346,768 hectares, or about 260,000 square miles, the equivalent approximately of the area of Oklahoma, Kansas, Iowa and Nebraska combined. Brazil's public lands constitute by far the larger part of the national territory, a recent agricultural census showing that only about one fifth of the total area of the country was classified as occupied land. Bolivia still retains some 250,000 square miles of public domain; Peru has an area of about equal extent; while Colombia, Venezuela and Ecuador have slightly less. A large part of the areas of many of the smaller republics, such as Panama, Costa Rica and Honduras, are government lands.

Most of the Latin American countries are still eager to colonize their public domain now generally called *baldios*. Much legislation has been enacted looking toward the alienation of these lands, particularly for colonization purposes. Until final disposal they are sometimes leased in huge blocks to cattlemen, sheep herders or, in the forested regions, to lumber or rubber companies. The usual methods of alienation are commonly followed: public lands are offered to individual settlers at a nominal price, in small farms of from 10 to 100 hectares or in large blocks to colonizing agencies who will contract to find settlers, either native or foreign. Instalment purchases are permitted also. Bolivia offers land in large or small parcels for 10 centavos per hectare. Between 1905 and 1919, 13,426,550 hectares were disposed of, for the most part in huge blocks; one concern alone secured approximately a third of the total. Most of this land is on the great Amazonian plain in the eastern part of the country, some of it valuable for its rubber trees. Peru, Ecuador, Colombia, Venezuela and Paraguay offer lands on similar terms. Some of these countries offer free transportation, exempt immigrants from taxation for a period of years, as also from payment of duties upon important equipment, and even pay to each family who will occupy these lands a small sum yearly until crops can be grown. Such offers have attracted many colonists from Europe and a few from the United States. Settlements established on public lands were frequently very successful but have been decreasingly so with the passage of time. The best lands were taken up long ago; those remaining are usually far from railways, roads or markets, and many of them are covered with

forests which are costly to clear or are semi-arid if not entirely desert. Moreover they lie for the most part in the tropics where the climate is almost prohibitive for the white man. In most cases the native has not been inclined to occupy these frontier lands, although he has not infrequently seen the advantage of acquiring title to them for future speculative purposes.

PUBLIC EDUCATION. *See* EDUCATION, section on PUBLIC EDUCATION.

PUBLIC EMPLOYMENT. A striking social phenomenon of the last half century has been the remarkable growth of public employment throughout the civilized world. In proportion as organized society has felt the double impact of science and technology its institutions of political government have expanded their activities and consequently have required the services of increasing numbers of officials and employees. Far from functioning, as a century ago, primarily to protect its citizenry against external dangers and internal disorders, the state has in fact evolved into a far reaching congeries of public social and economic services, administered in large part by full time staffs recruited on a systematic, competitive basis and enjoying relative permanence of tenure.

While no country has escaped this development entirely, public employment has attained its widest extent in the great western industrial nations, notably the United States, Germany, Great Britain and France. Next in importance come the more recently and partially industrialized countries, Italy in Europe and Japan in the Far East; while among the smaller states Belgium, Austria, Switzerland, Canada and Aus-

tralia are conspicuous for the extent and variety of their public services. The very special character of public employment in Soviet Russia precludes comparison of its problems with those of non-communist states.

Partly because of the lack of any uniform terminology relative to what constitutes public, in contradistinction to quasi-public and private employment, partly because of the inadequacy and non-comparability of official statistics, it is difficult to indicate more than a rough approximation of the recent spread, present extent and occupational distribution of the publicly employed. Except where otherwise stated, the data here presented cover all full time personnel. They include administrative, clerical, technical and manipulative employees and public educational staffs, receiving a fixed weekly, monthly or yearly wage or salary; they embrace also the staffs of industrial enterprises and establishments owned and operated by central, provincial or local governmental agencies; but they exclude military and naval personnel and the employees of corporations, notably public utilities operating under public franchises or concessions or performing public work under contract.

In Table 1 an attempt is made to present in a comparative form figures for the aggregate number of public employees in the five western states of major importance and for the personnel of the central, or national, governmental services in a somewhat larger group of countries. In view of the marked variation in type of governmental organization, scope of state activity and administrative efficiency which characterizes the five countries in the first group, it is striking that the ratio of public employees to the mass of the population should be so nearly uniform. On the other hand, comparison of the ratios of central personnel to total population, ranging from less than 5 to over 18 per 1000, affords a rough measure of the relative degree to which governmental functions are centralized: the unitary structure of France and Italy appear in sharp contrast to the federal systems of the United States, Canada and Australia, with Great Britain, unitary but still strongly attached to decentralized local administration, and Germany, federal in form but evincing pronounced centripetal tendencies since the World War, standing in intermediate positions. The full extent of public employment is not, however, revealed by this tabulation. In addition to year round and temporary full time employees large numbers of part time workers are to be found on government

TABLE I
NUMBER OF FULL TIME EMPLOYEES OF CENTRAL AND LOCAL GOVERNMENTS IN SELECTED COUNTRIES*

COUNTRY	DATE OF ESTIMATE		TOTAL GOVERNMENT EMPLOYEES		CENTRAL GOVERNMENT EMPLOYEES	
	FOR CENTRAL GOVERNMENT	FOR STATE AND FOR LOCAL GOVERNMENT	NUMBER	NUMBER PER 1000 POPULATION	NUMBER	NUMBER PER 1000 POPULATION
United States	1932	1926-30	2,500,000	20.0	578,000	4.6
Great Britain	1930	1921	1,045,000	23.0	445,000	9.7
Germany	1932	1932	1,290,000	20.0	627,000	9.7
France	1932	1926	1,100,000	26.3	785,000	18.8
Italy	1931		560,000	13.6	560,000†	13.6
Japan	1928				691,000	11.6
Canada	1930				44,000	4.3
Australia	1930				30,000	4.6

* Excludes persons in the military services except for the non-career personnel of the military establishment, but includes employees of enterprises operated by the government or government corporations (postal service, telegraph, telephone, railways, etc.). The figures for Great Britain and France contain a scattering number of part time employees.

† Since the Fascist centralization reforms of 1925 removed virtually all provincial and municipal employees from the jurisdiction of local governmental units the figures for total government employees and personnel of central government are identical.

Source: The figures represent the author's estimates based on data from official sources and estimates of other authorities. The more important references to specific sources are: United States, Civil Service Commission, *Annual Report*, no. 49 (1932) p. 155; Great Britain, Royal Commission on the Civil Service, 1929-31, *Report*, Cmd. 3000 (1931) p. 4-5; *Temps* (Paris), issue of February 20, 1933; Italy, *Gazzetta Ufficiale* (1931) no. 210, supplement, p. 4; *Japan Yearbook* (Tokyo 1931) p. 97; Canada, Dominion Bureau of Statistics, Finance Statistics Branch, *Statistics of the Civil Service of Canada . . . Year Ended March 31, 1930* (Ottawa 1930) p. 13; Australia, Commonwealth Bureau of Census and Statistics, *Official Year Book*, no. 25 (Canberra 1932) p. 76.

pay rolls the world over. It is conservatively estimated, for example, that in the United States, where in 1926 nearly 1,000,000 persons had part time public employment, between 3,500,000 and 4,000,000 persons appear more or less regularly on the public pay rolls; that is to say, 1 out of every 11 wage earners in the country. Similarly, if in France all those beneficiaries of the central and local treasuries who simultaneously carry on other occupations were added, every sixth family would contain one or more recipients of governmental salaries, wages, fees or commissions.

Although the rate at which public employment has expanded during the last half century has varied greatly in different countries, it has grown everywhere more rapidly than the general population. Thus for the period 1881-1930 the increase in the number of government employees may be roughly estimated for the United States at 440 percent, for France and for Germany at 190 percent; for the same period the percentage increases in population were 145, 11 and 42 respectively. This rapid growth in the size of national and local governmental bureaucracies has taken place mainly because of three factors: first, a widespread development of public educational and social welfare services, resulting, broadly, from the processes of democracy and urbanization; second, an unprecedented expansion of public works, especially, since the advent of the motor car, of highway construction; and, third, the growing activity of governmental

bodies in regulating and operating on a national scale such industrial enterprises as telegraph and telephone systems, railways, munitions plants, match factories and parcels post and on a municipal or regional scale waterworks, gas and electricity supply companies, trolley lines, food markets and similar undertakings. Specific illustrations of the distribution of public employees in various countries in terms of type of work or occupation reflect the impact of this *étatisme* upon the character of governmental employment.

In Great Britain, for instance, the national civil service was in 1930 divided into the following major categories:

	NUMBER IN EACH GROUP	PERCENTAGE OF TOTAL
Public works employees (including industrial work in the P. T. T., marine construction, arsenals, etc.)	122,000	28
Manipulative staffs	178,500	41
Messengers, porters, etc.	16,500	4
All other grades (general executive, fiscal, professional, scientific, diplomatic and consular)	117,000	27

Nearly half of the employees of British local authorities consisted of public school teachers, and over a quarter were industrial workers on municipal tramways and other public utilities.

In Germany over 40 percent (534,000) of the entire full time public personnel of the Reich, *Länder* and municipalities combined are em-

ployed in the postal, telegraph and telephone services and the state railway system; 22 percent (290,000) in educational and other public "cultural" institutions; 8 percent (108,000) in the administration of health, housing and social welfare activities; and only 30 percent (390,000) are concerned with all the other functions of the state, including revenue collection, police, justice, diplomacy and research.

The situation in centralized France is comparable. The administrative bureaucracy of the central government was distributed in 1932 as follows:

	NUMBER IN EACH GROUP	PERCENTAGE OF TOTAL
Postal, telegraph and telephone services	192,000	25
State railway and other "industrial" enterprises	158,000	20
Public education, health and welfare services	174,000	22
All other services (fiscal, judiciary, statistical, diplomatic, etc.)	261,000	33

The largest single group in the mass of French municipal employees included industrial and technical workers engaged in operating city owned utilities and public works departments.

Public employment in the United States, at the three levels of government—federal, state and local—shows a similar trend. Almost 50 percent of the 578,000 persons in the federal civil service (1932) were attached to the Post Office Department, and over half of the 2,000,000 employees of the forty-eight states and thousands of local units (counties, cities and villages) were engaged in educational administration and instruction. Street, highway and sewer maintenance required the next largest local personnel group, estimated in 1930 at 400,000.

Everywhere the scope of governmental operations has so expanded as to demand increasingly the systematic classification of both staff and line positions in terms of the type of training, kind of duties and degree of responsibility involved. With a view to eliminating gross inequalities of compensation for equal work, resulting from the haphazard determination of salary scales by pressure bargaining and special legislative enactments, classification plans have invariably involved the consolidation of salary and wage scales by grades, or classes, with minimum and maximum rates for each grade, pay increases normally being granted by a definite succession of fixed increments. The German

civil service, for example, contains twenty salary classes, the four lowest covering minor and manipulative grades; the next seven, clerical staffs; the following five, the inspectorial and executive classes; and the four highest, administrative and scientific officers. In the United States federal departmental staffs (in the District of Columbia) are classified broadly into five groups—custodial, clerical-mechanical, subprofessional, professional and scientific, and clerical-administrative-fiscal—each group being subdivided into grades and each grade being assigned a fixed salary range.

Aside from problems of classification, the determination of the rates of compensation for public employment involves special difficulties arising from the exemption of governments from the operation of those competitive principles which still control labor policy in the majority of private industries. In civil service and labor quarters the view is widely held that the state should act as a "model" employer and adjust the pay of its administrative staffs so as to provide an equitable standard of living even for the lowest classes. Although lacking a comprehensive wage policy, capitalistic governments tend generally to approximate the prevailing wage paid by the better private employers for comparable work. In effect this usually means paying just enough at each salary level to attract the required personnel. For routine clerical or manipulative work governmental salary scales are likely to be somewhat more liberal than those obtaining in private industry; but as the administrative hierarchy is ascended, the differential against the public official mounts steadily. The remuneration of managerial personnel in industry as well of the upper strata of the liberal professions ranges from three to ten or twenty times above the scale for upper grade public officials. On the other hand, the latter normally enjoy a much greater security of tenure.

In certain important respects governmental labor policy tends to act as the spearhead for advance in the domain of private industry. This fact is exemplified by the relatively early adoption of the seven to eight-hour workday for governmental offices and by the provision of liberal sick leave and vacation privileges, of accident and disability compensation and of joint-contributory retirement systems. Since the World War moreover the granting of supplementary allowances for dependents, which has become a typical feature of governmental compensation systems in Europe, although not as

yet in the United States, has set an example for a number of private industries. Moreover the existence of widely fluctuating price levels since 1914 has caused certain countries to provide cost of living bonuses and dwelling allowances for civil servants. The basic pre-war salary rates in the British civil service are adjusted every six months if the price index moves as much as five points up or down. The French *fonctionnaire* receives a small bonus which varies with the size of the town in which he resides. Where devices similar to these are not employed, government pay levels inevitably lag behind rising costs of living. Thus the purchasing power of federal employees in the United States declined 50 percent during the period 1893-1919, and it was not until 1931 that salary schedules in the French civil service were substantially restored to their pre-war real values.

In the aggregate, personnel costs at present absorb from 40 to 70 percent of the operating budgets (military expenditures excluded) of most national governments. The total outlay for public salaries, wages and pensions in the United States was estimated in 1927 to approach \$5,400,000,000, or slightly over one half the entire cost of government at all levels. In 1931 the pay roll of the federal government alone (including military pay roll) accounted for \$1,500,000,000 out of an aggregate federal budget of \$3,850,000,000 (minus debt charges). On the other hand, for France, where the *fonctionnaire* is less well paid, the pay roll of central government in 1932 amounted to only 12,000,000,000 francs out of a total budget of 39,000,000,000 (less debt service).

The distribution of public employees in terms of salary levels shows how greatly their numbers are concentrated in clerical, manipulative and custodial work involving low pay. The distribution for civilian employees in the United States federal service in 1931 was as follows:

ANNUAL SALARY	NUMBER IN GROUP	PERCENTAGE OF TOTAL
\$1000 or less	125,000	17
1001-\$2000	292,000	40
2001-3000	281,000	38
Over 3000	34,000	5

Only 212 officials were receiving salaries of \$10,000 or more a year and only 31, salaries of over \$15,000, the average for departmental personnel located in the District of Columbia being \$2146.

For the employees of the German Reich (including the post and the national railway system)

in 1932 the salary distribution (in marks) ran as follows:

ANNUAL BASIC SALARY	NUMBER IN GROUP	PERCENTAGE OF TOTAL
2400 or less	277,000	45
2401-3600	221,000	36
3601-4800	102,000	17
Over 4800	16,000	2

Fewer than 500 German officials were paid an annual salary of more than 9600 marks, or \$2400.

In times of falling prices and reduced governmental expenditures, such as have generally prevailed since 1930, public authorities almost everywhere have been confronted on the one side with constant pressure from taxpayers for drastic reduction of government pay rolls and on the other with an equally determined opposition of organized employee groups to emergency horizontal cuts. Reductions in pay have commonly been effected by rule of thumb methods, the flat percentage cut serving as the typical procedure. For example, the 1933 economy program of the federal administration in Washington entailed a straight 15 percent reduction in pay for practically all federal employees regardless of salary status; while the German Reich, after 1929, inflicted upon its personnel three successive horizontal salary reductions of 6, 5 and 9 percent respectively. Local authorities in the United States have not only followed this line of least resistance in reducing salaries, but the "spoils" sections of their administrative services have tended to feel the economy axe considerably less than have the "classified" personnel.

Acting upon the recommendations of staff groups and civil service bureaus some governments, notably the British and French, have recently employed a graduated scale of reduction based upon the principle of "equality of sacrifice." Thus in 1931 the base pay of British civil servants receiving less than £2000 was cut a maximum of 10 percent; those in the salary range of £2000-5000, 10 percent or whatever amount was necessary to bring their annual compensation down to £4000; while high officials with salaries of £5000 or over were cut 20 percent. Similarly in France the national budget of 1933 called for a progressive cut beginning at 2 percent for the salary bracket 12,000-20,000 francs and increasing by increments of 1 percent to a maximum of 8 percent on all salaries over 100,000 francs. Nevertheless, it cannot be said that any government has yet evolved a wholly

feasible and equitable plan for systematic adjustment to falling prices of the salaries of its employees.

With reference to the problems of recruitment and management, there have been since the middle of the nineteenth century a series of reforms by which political patronage has progressively given way to professionalization of the public service. Although the decline of patronage has not proceeded at the same pace in all countries, everywhere the increasingly technical character of modern government, calling for greater and greater specialization of social controls, regulations and fact finding devices, is tending to eliminate the spoils system.

In this evolution Prussia affords the earliest example of the establishment of a permanent state bureaucracy organized on a hierarchical basis, dating from the end of the eighteenth century. But it was not until the 1860's that western Europe, led by England, undertook seriously to erect rules and regulations to insure recruitment by merit. A little later, in the 1880's, the United States and Japan initiated similar measures; while the British dominions followed the lead of Great Britain in setting up civil service commissions with power to devise a technique of competitive examination for civil service. The legal procedures introduced to effect this change have varied in form. In England it was achieved by successive orders in council; in France by a few special statutes and innumerable executive decrees; in Germany, the United States, Canada and Australia by general civil service acts as extended by subsequent administrative ordinances.

The cumulative result of these developments may be noted briefly. In Germany virtually all administrative posts of a permanent character, below the rank of cabinet minister, come within the jurisdiction of the National Civil Service Act. In Great Britain all but a few scattering crown offices (and the staffs of certain miscellaneous boards and commissions) in the permanent "established" service are filled by open competitive examination. In the highly centralized system of the French Republic appointments on grounds of politics, personal friendship and blood relationship still occur for a somewhat larger portion of high officialdom, including prefects, ambassadors, colonial governors, departmental division chiefs and the secretarial attachés of cabinet ministers. The great bulk of the federal civil personnel in Canada and Australia is subject to civil service rules and

regulations, although a third of the total Canadian service is still exempt.

In the United States, because of its deeply rooted tradition of "democratic" rotation in office, dating from the frontier period, a half century of sustained reformist effort has been necessary to bring all but a fifth of the federal civil service under the protection of the merit system (see Table II). Included in the 111,000 positions still outside the scope of civil service regulations are 25,000 direct presidential appointees, of whom 15,000 were postmasters, the rest consisting chiefly of upper grade officials—assistant secretaries of departments, bureau chiefs, district attorneys, customs and internal revenue collectors and United States marshals.

TABLE II

POSITIONS IN EXECUTIVE CIVIL SERVICE SUBJECT TO EXAMINATION, UNITED STATES, 1883-1932

YEAR	TOTAL POSITIONS	POSITIONS SUBJECT TO EXAMINATION	
		NUMBER	PERCENTAGE OF TOTAL POSITIONS
1883	131,208	13,780	10.5
1903	301,000	154,093	51.2
1924	554,986	415,593	74.9
1932	578,231	467,161	80.8

Source: United States, Civil Service Commission, *Annual Report*, no. 42 (1925) p. viii and no. 49 (1932) p. 10.

Subaltern custodial employees, unskilled laborers and seasonal workers, whether central or local, are ordinarily not subject to competitive selection. Nor, except in the strongly bureaucratized states of the continent, like Germany and France, have civil service principles of recruitment, although they are continually winning ground, advanced so far in local as in central governmental units. In the United States, for example, only 10 out of 48 states, 12 out of over 3000 counties and some 250 cities out of several thousand had by 1932 established independent personnel bureaus or commissions with effective authority. Powerful party machines controlling the politics of metropolitan centers like New York, Chicago and Philadelphia have gained their dominance in large measure by being able to reward the rank and file with jobs. At the same time the adoption of the city manager form of government by 400 American cities since 1912 has been conducive to a more professional administration of municipal personnel.

The last generation, especially in Germany and the United States, has witnessed a significant improvement in the technique of testing applicants for entrance and promotion in the public service. In lieu of the simple question-answer or essay type of examination standard-

ized short answer, completion and aptitude tests, possessing greater "predictive power," have been widely developed by civil service commissions and psychological laboratories. Where competitive examinations cannot feasibly be employed, as in the selection of technical and scientific personnel, a systematized procedure involving a careful scrutiny of professional credentials and recommendations together with an interview of the candidate is commonly used.

Certain special considerations which affect the area of selection for the public service remain to be noted. In the first place, until a generation ago, except in the Anglo-Saxon democracies of the New World, educational and social requirements for entrance tended to make the public service virtually a closed domain to all but the aristocratic classes. Concomitant with the process of democratization and the spread of popular education these bars have largely disappeared. Today most European states have closely correlated their systems of recruitment at the various levels with their public educational establishments. The French and the Germans in particular have set up special schools and courses for the training of candidates for the administrative, diplomatic and engineering branches of their public services. In Great Britain and the United States a closer cooperation between public authorities and the regular universities for the training of public officials bids fair eventually to effect analogous results. A further development has been the establishment of opportunities for post-entrance, or continuation, training; for instance, through the administrative academies in Germany, the School of the Postes, Télégraphe et Téléphone in France and the Department of Agriculture and foreign service graduate schools in the United States. Staff associations in many countries have also set up useful training schools for their members. All of these developments have had the effect of broadening greatly the social and economic area of recruitment.

In the second place, the sex barrier, once formidable, has been weakened, if not entirely removed, by the political and professional emancipation of women. Although Germany had gone furthest in this direction, with some exceptions clerical and instructional public employment is now open to women upon approximately the same terms as for men throughout western Europe, America and Australia. In Great Britain marriage still operates as a bar; nor can women supervise male employees. Fur-

thermore salaries for women employees still tend to range appreciably lower than those for men engaged in comparable work, and a strong prejudice against admitting women to executive posts effectively prevents most from securing advancement. Comparative statistics on the public employment of women show, at the lower end of the scale, that women constitute only 6 percent of governmental staffs in Italy but, at the upper end, that they account for 40 percent of the federal employees in Washington. Over 1,000,000 women (mainly teachers) are employed by all units of government in the United States, 150 or more occupying executive posts carrying salaries of \$4000 or over. Two women, Margaret Bondfield in Great Britain and Frances Perkins in America, have attained cabinet posts.

Another restrictive factor in public employment which has become acutely important since the World War has been the granting of preference to military veterans. This practise has assumed two forms: certain types of positions have been reserved outright to ex-service men (or their widows); and they have been allowed to compete for positions on more favorable terms than other candidates. In Britain, with widespread unemployment chronic since 1921, the result has been to fill up 15 percent of the civil service with disabled war veterans; almost half of the total number of governmental employees have had military records. In the United States 25 percent of all appointments to the federal classified service from 1919 to 1932 were granted to veterans benefiting from preferential examination ratings. Even though this practise can be justified on humanitarian or patriotic grounds, it has hardly been conducive to the maintenance of efficient standards of recruitment.

A fourth limitation arises from the statutory requirement in federal countries that appointments be apportioned among member states according to population. That such a regulation has not proved practicable is evidenced by the substantial inequalities in apportionment which have accumulated in the federal classified service at Washington. In Germany the rule has been that the personnel of the field services of the Reich must be citizens of the state (*Land*) in which their branch or unit is located.

Still another cluster of perplexing problems centers around race and nationality as criteria for admission to governmental employment. By and large the advanced states of the western world may be said to observe the policy of

extending the opportunity of public employment to all citizens (or subjects). In Germany, at any rate until the advent of the Hitler government, citizenship was not a prerequisite to admission to the civil service, although appointment automatically conferred citizenship upon the appointee. But shortly after the National Socialist revolution all persons of "non-Aryan" descent were barred from appointment as public officials. While this action was admittedly directed against Jews, a further requirement that officials must offer "a guaranty of national reliability" was obviously designed to exclude "unconverted" socialists and communists from public office.

In the United States, until recently a country of great immigration, federal employment has been restricted to citizens, except when insufficient applicants present themselves, in which case aliens may be employed. Local authorities have pursued a less restrictive policy and considerable numbers of Irish, Polish, German and other unnaturalized immigrants have been on public pay rolls.

Certain areas under foreign control, like India and the Philippine Islands, have been the scene of bitter and prolonged struggles by native leaders to win for their own people the right to hold governmental positions. Since 1870 the British have gradually allowed Indians to compete for the Indian civil service, and the time is now in sight when at least half of its total personnel will be "Indianized." By a more rapid process a generation of American control in the Philippines has resulted in filling over 90 percent of the local administrative services with natives. In periods of tension the change to native administration in colonial dependencies is likely to cause practical difficulties, but it appears to be inevitable.

As rotation in office has been abandoned for permanence of tenure, promotional and dismissal procedures have come to have a vital bearing upon the morale and efficiency of the many sided public service. Advancement in rank now tends to be granted on the basis of quality rather than seniority of service. Newer devices which have recently come widely into use—systematized qualifying or aptitude tests and efficiency or service ratings—operate to reduce to a minimum the demoralizing effects of arbitrary selection and the deadening results of automatic advancement. In many jurisdictions advisory promotion boards, representing both appointing authority and staff, have been estab-

lished in order to insure greater fairness in the choice of individuals for promotion. Broadly speaking, the tendency is to set up a closed system of promotion, although personnel experts admit the desirability of a judicious penetration of fresh blood into the upper strata of the official hierarchy.

Where civil service rules apply, appointments of full time employees are ordinarily for indefinite periods; that is, until a prescribed age of retirement ranging from sixty years upwards. Prior separation from the service may occur only by death, resignation or dismissal "for the good of the service." Except when governmental staffs are undergoing quantitative expansion, this fact makes for a comparatively low annual rate of personnel turnover, rarely exceeding 10 to 15 percent for large units and frequently falling to 2 or 3 percent in small jurisdictions. In practise dismissal is coming to be restricted to two situations: violations of the disciplinary code and enforced layoff in order to effect a numerical reduction of staff. The discharge of a public employee for disciplinary reasons usually involves a definitely fixed procedure allowing him the right to know the nature of the charges levied against him as well as to have his case heard before a disciplinary court or council. Unfortunately these safeguards against unjust dismissal have had the unintentional effect of placing a premium upon mediocrity, laziness and indifference in the public service. The selection of personnel for layoff to effect staff contraction is ordinarily made in inverse ratio to length of service, subsequent reemployment being governed by the same principle.

Public employees stand in a dual relationship to the state: they are at once citizens and workers for a material livelihood. As citizens they have demanded and everywhere won the right to vote in democratic countries; but, except in Germany prior to the conquest of power by the National Socialists, they must resign or secure a leave of absence from their posts either upon nomination for or election to executive or legislative office. In most states they are not allowed to participate in partisan political activity. Nor, as formerly in the United States, may they lawfully be assessed for contributions to party campaign funds, although the efficacy of this rule in actual practise is open to grave doubt.

Civil servants have not hesitated to follow the lead of the labor world in organizing for the defense of their economic and professional interests. By so doing they have become a powerful

factor in the "pressure politics" of countries where, as in France, Germany and Great Britain, they constitute from a fifteenth to a tenth of the voters.

The rise of civil service unionism dates from the 1880's. Beginning with teachers, policemen, postal employees and workers in governmental industries the movement has spread both horizontally and vertically until at present more than half of the entire number of public employees are organized along vocational lines. Employee organizations range in type from the benevolent society to the trade union; some are departmental in scope, others include entire grades or classes of employees regardless of departmental barriers. The latter type is the more prevalent. Local, functional and departmental employee groups have federated themselves regionally and nationally, and in Europe five large international federations of public employees are now in existence. The most extreme example of national consolidation of employee associations is found in Germany, where the *Deutscher Beamtenbund* has since 1918 absorbed all other groups and become the exclusive organ of professional representation for public personnel. In Great Britain there are nearly 300 different staff associations, with the Union of Post Office Workers and the Civil Service Confederation (chiefly clerical classes) dominating the field. The French *fonctionnaires* are organized into three main groups: the teachers, the *Postes, T'élégraphe et Téléphone* employees and the general *Fédération des Fonctionnaires* (representing the majority of all other classes). Although the association movement among public employees is somewhat less advanced in the United States than in the foregoing countries, a bewildering variety of organizations of federal, state and local officials has developed during the last generation. The most important federal group is the National Federation of Federal Employees, which had 50,000 members in 1930.

Without exception all democratic states have been compelled, frequently against their will, to accord de facto or de jure recognition of the principle of freedom of vocational association for civil service groups. Nowhere, however, is the right to strike legally permissible. Nor do many governments allow their staffs to affiliate organically with the industrial labor movement. A limited degree of affiliation is permitted in the United States, Canada and Australia, but none whatsoever in Great Britain (since 1927), France or Germany (since early in 1933). The non-

democratic character of the political organization of Italy and Japan precludes state employees from maintaining group relations with private labor.

Despite the universal legal prohibition of the right to strike there have been since 1900 abortive attempts to organize strikes by subordinate employee groups, particularly among advanced syndicalist groups in France and to a lesser degree in the United States, Germany and a few other countries. Except for the great French railwaymen's strike in 1910 and a similar attempt by German railway workers in 1922, most of these strikes have been only local in scope; and none of them may be said to have been successful in securing their professed objectives, although some have apparently aided specific staff groups in securing improved employment conditions. At the forefront of militancy stand the postal workers, elementary school teachers, dock hands and the like. In a few dramatic instances metropolitan police forces have threatened to strike or, as in Boston in 1919, have actually struck. Contrary to popular belief, there is good reason to believe that the Boston police strike would not have occurred had it not been for conditions, brought on by prolonged maladministration, which had become intolerable to the harassed personnel of the police department. Taken as a whole, civil servants the world over do not view the strike as a proper means of enforcing their claims upon the employer-state. Their dominant attitude is well illustrated by the refusal of the British staff organizations to join the general strike of 1926.

Public employee groups are, however, exerting a profound influence not only upon the material conditions under which their members work but upon administrative methods and habits. They engage in many different forms of propagandist activity—lobbying, petitioning legislative candidates and committees, mass demonstrations, publishing professional journals and so on—and concern themselves more or less with the cultural and social interests of their members—by operating mutual aid enterprises, providing vacation tours and setting up training courses and adult education experiments. More important still, from a general point of view, has been their constant insistence upon better facilities within the service for adjusting disputes over pay, hours, conditions of work and disciplinary infractions. In virtually every important civil service unit in democratic countries there now exists some form of staff advisory

committee, council or court through which officialdom and staff may negotiate the settlement of grievances. Perhaps the most notable examples of this development are the Whitley councils in the British civil service and the public service arbitral procedures in Australia; but an expanding cluster of bipartite staff committees are to be found in France and the United States as well. As a result the "authoritarian" tradition of sovereign control appears in fact to be merging into something akin to "cooperative" determination of personnel policy.

With equal force the better organized staff associations in every country are compelling the adoption of more efficient office methods and equipment, better accounting and reporting practises and labor saving devices and, for the most part, are instilling into the mass of state employees a stronger sense of courtesy and obligation toward the public they serve.

The only way that the serious dangers arising from a concentration of power in a ubiquitous army of public officials may be avoided would seem to be through the continued development of professional standards and devotion to the public weal in the mass of employees themselves. This is what the majority of officials' associations are consciously attempting to achieve. The vices of red tape, waste, undue formalism, unimaginativeness and officiousness, which have been popularly associated with public employment, are by no means peculiar to it; in varying degree they operate in large scale business and educational organization as well. The difference lies in the fact that in government the profit motive, being absent, must be supplanted by non-pecuniary incentives, most of which have not yet been fully explored. It is the task of enlightened personnel management to discover ways and means of realizing the immense potentialities of cooperative human effort as much in the affairs of public as of private institutions.

PUBLIC EXPENDITURES. See EXPENDITURES, PUBLIC.

PUBLIC FINANCE. The term finance as applied to individuals and private institutions is restricted to the purely monetary aspects of their economic activities, but when used in reference to public bodies it denotes the entire public economy. This practise of using the part to describe the whole may be traced to historical circumstances. In the continental countries of mediaeval Europe financial provision for war, which was the normal condition of society, was of such paramount importance that public housekeeping was virtually identified with war finance. Similarly the growth of the police state called for such increased resources that police, the continental term still used by Adam Smith to denote general control, finally became a synonym for finance. Through this emphasis on the financial aspects of government activity the entire realm of public economy came to mean

finance. Moreover the overwhelming predominance of the financial operations of the public treasuries as compared with the slow development of private finance invested the term finance, at least on the continent, with a distinct public connotation. In England, where banking and private credit had attained considerable proportions in the eighteenth century, the term finance was retained to designate the general field of monetary and credit organization, so that the term public finance was necessarily employed in reference to the governmental field.

It was quite natural therefore that with the emergence of the scientific treatment of the problems relating to public finance the appropriate discipline should come on the continent to be called the science of finance, while in England where it developed at a much later date it was necessary to coin the awkward term science of public finance. Both terms are obviously defective. Science of finance is too broad and fails to emphasize the public connotation, while public finance is too narrow, identifying a part, finance, with the whole, economy. Accordingly, for reasons of both brevity and precision, the term fiscal science (*q.v.*) is suggested as more accurate and more suitable. For fiscal, unlike financial, is never susceptible of a private connotation; on the other hand, the concerns of the fisc, or public treasury, are not limited to merely monetary matters. Fiscal science then is the discipline which deals with the public economy—the material provision for the wants of the state, and the relations of the individual to the public treasury.

Like all economy public economy rests substantially on the wants of the individual. In the bewildering variety of wants whose satisfaction is essential to the survival and well being of the individual some can be satisfied by his own isolated efforts, others only by the joint action of a number of individuals. The wants of the second group, still individual in origin, become common, or collective, by virtue of the common effort applied in the course of their satisfaction. Among the many common, or collective, wants there are some, such as protection of life and property or defense against the attacks of an outside enemy, whose satisfaction clearly transcends even the power and life span of the private voluntary associations and requires the collective, compulsory and sustained effort of all members of society. The satisfaction of this third group of wants leads to the formation of the most fundamental and comprehensive social

and political organization, the state; and it is the sum total of activities undertaken by the state in furtherance of the obligations vested in it by society that constitutes public economy, the subject matter of fiscal science.

Public economy is usually contrasted with private economy whether of individuals or of groups. Some of the alleged differences between the two are illusory. Thus it is stated that the private group deals with material ends, the state with immaterial. Private groups, however, are often formed for immaterial ends; while, on the other hand, the state also needs material support. Again it is asserted that while in private finance outlay must be gauged by income, in public finance the reverse is true; after the expenditures are fixed, it is the duty of the legislature to provide the revenue. But the state like the individual must in the long run cut its coat according to its cloth. The economic basis of the relations is the same: in both cases a protracted budgetary deficit brings its nemesis with it.

The real differences between the public and the private economy are all differences in degree, although in some cases they are so marked as almost to become differences in kind. These marked differences are three in number. The first involves the fundamental character of the purposes for which the state was originally formed—the protection of life, property and liberty. Compared to these ends all the other common wants satisfied by private groups are of minor significance. The second important difference is the comprehensive nature of the state. Instead of including only a few or even a large number, as do the private groups, the public group embraces virtually all the members of the community. The third point is the coercive nature of the state. While in many a private group a member must pay his dues or be dropped, the greater degree of compulsion in the public group lies in the indissolubility of membership. Thus fundamentalism, universalism and compulsion represent well nigh essential differences between the public and the private group.

The other set of differences are more distinctly differences in degree. The first of these concerns the reciprocal relations between the individual and the group. While in all groups, private and public, a distinction is drawn between the essential activities leading to the satisfaction of the common, or mutual, wants, in which the benefits are not separately measurable,

and the subordinate activities conducted for the purpose of supplying the needs of particular individuals and paid for in accordance with the special benefit conferred, in the modern state the former are of overwhelming importance. The state may indeed carry on business enterprises or afford special services to the individual. But the total of such receipts constitutes an ever dwindling fraction of what is exacted from him by compulsion. Prices and fees today play a very minor role as compared to taxes. In the protection of life, property and liberty, in the administration of justice, in the provision for the general welfare, there is little if any concern for the individual as such. The reciprocity is between the state and the community as a whole. As a consequence there follows, secondly, the indivisibility of benefits. A continually greater share of the public activities deal with phenomena of so tenuous a nature that a separation or division of the particular advantages becomes difficult. Even where incidental benefits accrue to the individual from the primary activities of government, they are for the most part incapable of accurate weight or measurement. Immeasurability and imponderability no less than indivisibility increasingly characterize the public group. Thirdly, the public economy differs from private economy in the time range of its activities. In most private groups the period of activity is restricted. Even in private corporations, where there is no time limit, the interests of each existing set of stockholders must be regarded. But the state is eternal and considerations for a future generation often take precedence. Thus non-reciprocity, immeasurability and perpetuity constitute undoubted differences between the public and the private group. They are, however, differences only in degree. Reciprocity is found in public prices and fees; special benefit can be discerned in some taxes; the interests of the actual taxpayer are often decisive.

The practical consequences which flow from the differences between public and private economy may be formulated as follows. In the private economy the chief objective is wealth; in the public economy it is welfare. The contrast is indeed not clear cut, for the justification of private wealth consists at bottom in considerations of public welfare. But in the one case ultimate consequences predominate; in the other, immediate purposes. Whatever the results may be, the chief incentive to action in the private economy is self-interest; while the public economy is primarily motivated by considerations of

maximum social utility, in which material wealth may play only a minor part. In the private economy the primary consideration is the principle of profits; in the public economy, while the activities may be either self-liquidating or lucrative, there is a much larger field for the principle of gratuitous service. In the private economy the reciprocal obligation of individuals is entirely measured by benefits received. In the public economy the criterion in the far more important fields of activity is that of ability to pay. In the private economy the governing principle is that of *quid pro quo*, or bargain and sale; in the public economy the far more weighty consideration is that of compulsory acquisition. In the private economy the annual balance sheet is of first importance; in the public economy more significance is to be attached to the capital account and to the perpetuity of the debt.

The analysis of the nature of public economy throws light on the nature, the scope and the relations of fiscal science, more particularly on the much controverted question as to what constitutes the real subject matter of fiscal science. Is it the state as such or the individual? Does it deal with the public economy or only with public aspects of the private economy? The answer is both. Fiscal science deals with the public economy; that is, with the material provision for accomplishing certain activities of government. But in so doing it is inevitably concerned with the members of this public group, with certain mutual relations of individuals. These social relations are affected by every fiscal activity. Thus the public economy, the economy of the group, necessarily deals with certain aspects of the private economy, the economy of the group member.

The tangled situation may be unraveled by consideration of the relation of fiscal science to the sister disciplines. In one sense fiscal science is only a subdivision of economics. For public finance is a part of finance in general, and finance is a part of economics. But in a more important sense it is an independent or separate discipline. While economics deals primarily with the individual, fiscal science deals primarily with the state. To put it in another way, while economics treats of the material relations of individuals to each other, fiscal science treats of similar relations of individuals to the state.

There is, however, a certain reciprocity. Every public activity affects private activity; every fiscal transaction of the individual modifies his economic relations to other individuals.

Thus even if fiscal science is a separate discipline, it stands in the closest relation to both economics and politics: the former because both economics and fiscal science deal with problems of value and the wealth relations of individuals; the latter because both politics and fiscal science deal with government activities and the relations of the individual to the state. Fiscal science is thus an intermediary between economics and politics. It should not be understood, however, that it stands exactly midway between them. For inasmuch as it deals primarily with material conditions, it is above all economic; only in so far as these material conditions affect the relation of the individual to the state does it become political.

Since the public like the private household is concerned with income and expenditures and the balance between them, the chief constituents of fiscal systems are public revenues, public expenditures and the budget as the means of coordinating and balancing the two. By reason of the greater complexity of government affairs, fiscal organization and administration, accounting and public credit play a larger role in public than in private economy. Because of the intimate connection between economic and political phenomena and public finance fiscal systems vary with the changing levels of economic and political development. The nature of economic organization and the degree of economic well being determine the source, volume and forms of public revenue; the type of social and political organization determines the distribution of the fiscal burdens among the various classes of population; and the prevailing conception of the nature and function of the state, reflecting the constellation of economic and political forces, will influence the scope and purpose of public expenditures.

In the development of public expenditures two phenomena are outstanding: warfare and the widening scope of government functions. In the early stages of political development warfare was almost the only cause for public expenditure. Later when wars became fewer in number they grew wider in scope and intensity and called for ever increasing financial outlays. Even in modern times expenditures connected with the preparation, conduct and aftermath of war still claim in most countries by far the larger part of public funds, at least for the central government.

Of even greater significance is the continually expanding scope of government functions. In tracing this development four distinct stages are

discernible. The first is the repressive stage. The activity of government is directed to stopping an evil after it occurs: to conclude war, to stamp out famine or pestilence, to check fire and flood. In the next stage the state turns its attention to the more costly methods of prevention. Better transportation and granaries help to prevent famine; dikes lessen the occurrence of flood. The third stage is that of amelioration, or improvement. Existing agencies are made more effective, as in the improvement of roads in prerevolutionary France and more recently throughout the world. Of a similar character are advances in hospital facilities and betterment of prison conditions. The final stage is that of creation or construction: the evoking of new, rather than improved, activities. This is typified by education as well as by the administrative devices calculated to engender new economic and social institutions. Each successive stage, superimposed upon that preceding, signalizes another step in the transition from private to public agencies in the supply of common needs: from self-protection to a police force; from mutual arbitration to courts of justice; from private schools to state institutions; from corporate hospitals to government organizations; from individual charity to social insurance. Public finance slowly encroaches on private finance.

While public revenues must increase to meet these expanding needs, their growth is even more closely associated with economic and political changes, as is clearly manifested in each of the three great classes of revenue: from public property and enterprise, in the form of prices; from services performed for individuals, in the form of fees and tolls; from compulsory contributions, in the form of taxes. At first the king is supported from his own possessions, gradually supplemented by gifts. This is the stage in which it becomes customary to speak of the public household, largely identified with the private household of the monarch. As the monarch gains more power, he is able to mask his exactions under the garb of return for protection or privileges. When absolutism gives way to democracy, lucrative prerogatives yield to freely granted taxes. Of more fundamental significance are the economic and social changes. As the center of gravity shifts away from land, the public domain shrinks and the land taxes are supplemented by other imposts. As trade and industry increase, excises develop. With the rising influence of the submerged classes indirect taxes give way to direct. When modern capi-

talism emerges, income replaces property as the norm of taxation. Finally, as economic obligation becomes more widely recognized, the sphere of impersonal taxation contracts and there arises a newer interpretation of taxable ability. Each economic and political stage has its appropriate form of public revenues.

Equally marked are the changes in public credit, the budget and fiscal organization. Formerly when private credit was still rudimentary, public credit was unknown and the needs of war were met, at the outset at least, by hoards and treasures. In the Middle Ages government loans were impeded by the prohibition of usury. Not until the capitalist era was the essentially productive nature of public credit recognized. Again, the farming of revenues long rendered independent state administrators unnecessary. Even after the king's privy purse was separated from the public treasury, parliamentary control of expenditures developed but slowly. The creation of the budget, as applicable to both income and outgo, was not achieved until the nineteenth century; while the forms of fiscal organization and accounting are often still imperfect as compared with the elaborate technique of business practise.

This general development is visible in the chief epochs of history. In classic Greece, as typified by Athens, the public expenditures were chiefly for army and navy, support of religion, upkeep of buildings, supervision of trade and provision for games and festivals. The revenues flowed from the public domain, including the silver mines, from war chests, fines, tributes, fees and tolls and the combination of burden and honor for the wealthier classes, known as the liturgies and the trierarchy. In only exceptional cases did the Greeks resort to direct taxes. Public credit was unknown, the budget was primitive in the extreme and fiscal organization was reduced to the simplest elements.

In Rome the growth of public finance kept pace with the thousand-year development from a pastoral community to a world empire. In the final stages the expenditures attained a scope comparable to that of modern times. During the later republic tributes and the public domain rendered unnecessary the continuation of the *tributum civile*, or general property tax. The needs of the empire, coupled with the disappearance of the domain, were responsible for the introduction of fees and tolls, indirect taxes, death duties, a whole range of imposts on land and trade, and finally the comprehensive local

burdens known as *munera*. The chief contrast with modern times consisted in the absence of public credit and a budget.

With the reversion of economic life to primitive conditions the public household again became merged with the private economy of the prince. In the Anglo-Saxon monarchy, for instance, expenditures shrank to almost negligible proportions, and the scanty revenues were derived chiefly from the kingly prerogatives, which slowly converted gifts into payments for protection and services. Under the feudal regime, where the expenditures were still largely for military purposes, the revenues flowed from the domain, the incidents of feudal tenure, fines and amercements. In the mediaeval towns, however, the early development of money economy and the concentration of large populations provided favorable conditions for the beginnings of direct taxation, public credit and more effective fiscal organization. Under the absolute monarchy, with its requirements of improved communication and more unified control, the fiscal prerogatives centered in the grant of monopolies, the sale of offices and the lottery; while the fees, tolls and indirect taxes grew apace and the feudal payments merged into general property taxes. In the industrially less developed German states the domain and government enterprise still yielded a large share of the public revenues.

In France the persistence of feudal charges and class exemptions, the extravagance of the court and the misuse of public credit were responsible for the revolution, which sought to realize the principles of equality of taxation, to create a budget and to develop a modern fiscal organization. With the advent of the constitutional state in the nineteenth century expenditures for economic and social purposes increased, and local finance soon rivaled the central outlays. Tolls and excises dwindled and the emphasis was now on direct imposts. The general property taxes disappeared, the levies on land and business became charges in rem, the income tax made its appearance, public credit attained importance and the budget developed.

The twentieth century witnessed almost everywhere the triumph of the industrial revolution and the democratization of society, accompanied by a changing conception of government functions and a rising level of political morale. The results were expansion of government functions, constant increase in expenditure, utilization of public credit for peace purposes, refinement of

fiscal administration and adjustment of taxation to the demands of a progressive social conscience. Finally the World War and its aftermath extended the scope of government as a creative force in social process and ushered in a new period of fiscal activity and civic obligation.

Just as some discussion of economic topics existed at an early period, so almost from the beginning fiscal concepts received some attention. The Greek writers limited themselves to a description of actual conditions, as in Xenophon's "Ways and Means to Increase the Revenues of Athens" (tr. by M. L. W. Laistner in his *Greek Economics*, London 1923, p. 10-27), or, as in Aristotle and Plato, to scattered references to the principle of equality in compulsory payments or to the choice between property and yield as the criterion of taxation. In Rome the discussion was still more restricted, being limited, apart from administrative considerations, to references to the need of moderation in imposing public burdens and to the interpretation of faculty in taxation.

With the advent of the Middle Ages and the emergence of direct taxation the discussion of fiscal matters became more animated. Five distinct stages may be noted in the treatment of the subject. The earliest was the preoccupation with the existing administrative machinery, as in the twelfth century *Dialogue of the Exchequer* (*Dialogus de scaccario*) by Richard Fitz-Neale (ed. by Arthur Hughes, C. G. Crump, and C. Johnson, Oxford 1902) and the *Liber censuum* (ed. by Paul Fabre and Louis Duchesne, 2 vols., Paris 1889-1910) in Italy. The second stage is found in the writings of the theologians, who were concerned with the new problems of revenue, expenditure and public credit but more particularly with the moral justification of the new public burdens. This type of discussion was conducted by the scholastics, the canonists and the moralists. Among the scholastics the chief figure was Thomas Aquinas. In his treatment of princely revenues he dealt with the domain, the hoard or treasure, the sale of offices, loans and taxes. Of the first two he approved; he was in doubt as to the third; he was bitterly opposed to loans; and he admitted taxes only as an emergency measure. Aquinas' views long remained authoritative; they were modified only in part by Gabriel Biel in the fifteenth century. Of the canonists the more important were Hostiensis and Durandus in the thirteenth century, Johannes Andreae and Oldradus in the fourteenth and Nicolas Tedeschi Panormitanus in the fifteenth.

Of the moralists mention should be made of Raymond of Penafort in the thirteenth century; Astesanus, Bartholomaeus and Henry of Langenstein in the fourteenth; and John Gerson, Johannes Nider and Thomas de Vio in the fifteenth. In the discussion centering about fiscal justice the treatment of the theologians comprised four divisions: the *causa efficiens*, or the power to impose taxes; the *causa finalis*, or the public purpose of taxation, with speculation on the relation of state and citizen; the *causa formalis*, or the limits of taxation and the criterion of ability to pay, involving the meaning of equality and of moderation; and the *causa materialis*, or the persons and things subject to taxation, including the relative merits of levies on wealth and on consumption. This last point was stressed at the beginning of the sixteenth century in special treatises by Spanish and Dutch writers, notably Luis Molina, Thome Sanchez, Juan de Mariana, Juan de Lugo and Leonardo Lessius. The dispute as to public credit came to a head in the fourteenth century controversy between Gregorius di Arimino, Bernardino of Siena and Antonino of Florence.

The third stage of mediaeval discussion is typified by the legists, who dealt primarily with practical problems, such as the extent of the fiscal prerogative, the limits of extraordinary imposts, the classification of taxes, the relative rights of local, state and imperial governments, the justification of exemptions and the criteria of double taxation. In addition to the discussion in the general legal treatises the outstanding special works were: in the fourteenth century, Gulielmus de Cugno, "Tractatus de muneribus," Petrus Antibolus, "Tractatus de muneribus," and Baldus de Ubaldis, "De exemptionibus"; in the fifteenth century, Johannes Bertachinus, "De gabellis, tributis et vectigalibus," Petrus de Ubaldis, "De collectis," Aegidius Thomatis, "De collectis seu muneribus patrimonialibus" and Nicolo Festasius, "De aestimo et collectis"; in the early sixteenth century, Giulio Ferretti, "De gabellis, publicanis, muneribus et oneribus" (all of these are collected in *Tractatus universi juris*, vol. xii, Venice 1585).

The fourth stage is represented by the statesmen and political philosophers. Their chief concerns were the inalienability of the domain, the superiority of the treasure to public loans, the farming of the revenues and the limit of the extraordinary war levies, which were threatening to become ordinary taxes. In the fifteenth cen-

tury the leading continental writers were Francesco Patricius and the Neapolitan Diomedes Carafa, who was one of the first to stress the dependence of public opulence on private prosperity. In England the *Speculum Regis* (ed. by J. Moisant, Paris 1891), the fourteenth century diatribe against purveyance and the faithful reflection of the current policy of Sir John Fortescue, should be noted.

The final stage is found in the short lived Italian democracies of the fifteenth century, where as a result of the industrial development an almost modern treatment was accorded to budget reform, control of expenditures, the advantages of direct taxation, the comparative merits of proportion and progression, the decay of the general property tax, the futility of the levy on personalty and the shift from property to produce and income as the criteria of ability to pay. Matteo Palmieri, Ludovico Guetti, Niccolò Machiavelli and Francesco Guicciardini were particularly noteworthy in this connection. With the downfall of democracy this entire discussion came to an end.

The weakening of feudalism in the sixteenth century together with the emergence of capitalism in the seventeenth was responsible in economics for what was later called mercantilism and in fiscal affairs for what began to be termed the science of finance. Both were reflections of the concept of national wealth and power. Since the earliest consolidation of royal prerogative occurred in France, where tax privileges also attained their extreme development, it was here that the fiscal reformers first made themselves known. In the sixteenth century the political philosophers from Claude de Seyssel to Bernard de Girard du Haillan and Innocent Gentillet paid increasing attention to finance; Jean Combes, Jean Macer and Claude de Bourg wrote special treatises. The most important figure, however, was Jean Bodin, who devoted to finance one of his *Six livres de la république* (1576). He posited three principles of finance: to follow a wise method in raising revenues, to expend them with prudence and to save a part for possible future need. Although he still stressed the advantages of the domain and the superiority of a treasure over loans, he grudgingly conceded the availability of public credit in great crises. Impressed by the appearance of regular taxes, he attempted a more philosophic classification and emphasized the need of equality and universality. He recognized the difficulty of making the wealthy pay their share, and sug-

gested taxes on consumption as the least susceptible of evasion. He urged economy and was far in advance of his day in calling for a detailed and periodic fiscal statement. Bodin long dominated his contemporaries and successors, among whom the anonymous author of the first *Traicté des finances de France* (1580) and Nicolas Froumentau, Nicolas Barnaud and François de l'Alouëte, critics of current abuses, deserve mention. His influence was felt also in Italy, where Giovanni Botero presented the outstanding discussion. In Germany, where the humanists were tolerant of absolutism and few of the writers had freed themselves from theological prepossessions, a somewhat more modern note was struck by Melchior von Osse.

The seventeenth century consolidation of princely power and the definite emergence of a national economy stimulated more advanced discussion. In France Jean de Beaufort, René Laurent La Barre and Lazare Ducrot wrote significant treatises; and the mid-century criticism of François de la Mothe le Vayer, Abraham Fabert and François des Maisons, the creative suggestions of Paul Hay du Châtelet and, at the close of the century, the more familiar analyses of Sébastien Le Prestre de Vauban and Pierre Le Pesant Boisguillebert were likewise important contributions. Germany, which witnessed a struggle of the empire for fiscal independence in the face of princely aggression, produced a ponderous and bewildering literature. The legalistic group, stressing the respective rights of subject and ruler, the limits of the newer forms of revenue and the criteria of fiscal justice, are represented by Georg Obrecht, Jakob Bornitz, Thomas Maull and Christoph Besold. The economic group, starting from a consideration of practical problems, emphasized the connection between government income and social welfare, weighing the situation from the standpoint of prevalent mercantilist doctrine; their chief spokesmen were Hermann Lather, Johann Wilhelm Neumayr, Maximilian Faust, Matthaeus Wesenbeck and Caspar Klock. In the second half of the century the outstanding writers were Veit Ludwig von Seckendorff, Hermann Conring, Johann Becher and Wilhelm von Schroeder. Attention may also be directed to the ample literature of the excise controversy in the closing decades.

In England fiscal problems were brought to the fore by the abuses of the Stuarts and the economic consequences of the two revolutions. After some early discussions of the customs by

Thomas Milles three contributions deserve particular mention. Thomas Hobbes formulated the exchange theory of public finance, declared that dependence on the domain was futile, proclaimed that expenditure was a better norm of ability than wealth and maintained the impracticability of a definite limit on government outlay. Sir William Petty wrote the first general work on public finance, including a vigorous treatment of the decaying property tax. Thomas Mun attempted to bring fiscal problems into line with the theory of the balance of trade. The development of the excises led to an impressive literature, while toward the close of the century appeared the striking contributions of John Locke and Charles Davenant. The former studied the problems of incidence, especially of the land tax; the latter devoted his attention primarily to questions of war finance.

The eighteenth century witnessed three significant developments in public finance. A real fiscal science was created as the product of the theoretical analysis of the physiocrats and the classificatory description of the cameralists. Adam Smith applied to public finance some of the important conclusions of his new treatment of economic questions. Finally the advent of the French Revolution created a fiscal literature which had never yet been approached in range or depth.

Although France was the leading country of Europe, it was suffering from progressively more aggravated fiscal excesses. It is consequently not surprising that suggestions for reform, many of which involved searching inquiries into fundamental principles, occupied the center of the stage. The works of Henri de Boulainvilliers and Charles-Irénée Castel de Saint-Pierre appeared at the beginning of the century. The calamitous experience of John Law led to a reaction, expressed in the writings of Paris Duverney and Duval. A little later the fiscal reflections of Montesquieu were subjected to rigorous and detailed criticism by Claude Dupin. The mid-century attempt by Jean-Baptiste Machault d'Arnouville to tax the clergy together with the projects of Roussel de la Tour and Richard des Glannières produced a noteworthy literature; scholars like François Véron de Forbonnais and J. L. Moreau de Beaumont published comprehensive treatises. The outstanding contribution was made by the physiocrats led by François Quesnay and Anne Robert Jacques Turgot, who endeavored to apply the new economic analysis to the effects of taxation. Their general attitude to gov-

ernment, however, involved the minimizing of public credit, which led to a reaction in the work of Isaac Pinto. In Germany efforts at recovery from the 'Thirty Years' War as well as survivals of mediaevalism, like the public domain, were responsible for government consolidation and the formulation of administrative precepts. The need of elaborating principles for these precepts led to the creation of a police, or cameral, science by Johann Georg Leib, Theodor Ludwig Lau and Julius Bernhard von Rohr, followed by Simon Gasser and Justus Christoph Dithmar. Before long the increasing fiscal connotations stimulated within this larger whole the development of a distinct science of finance at the hands of Joachim Georg Darjes, and especially of Johann Heinrich Gottlob von Justi and Joseph Sonnenfels.

In England the comparatively peaceful and independent situation was hostile to any decided activity. The utilization of public credit led to the theories of Francis Hutcheson and later of Richard Price. The excise controversy under Sir Robert Walpole yielded an appreciable literature, while the mid-century wars led to the discussions of Joseph Massie and Sir James Steuart. But all these developments were overshadowed by the appearance of the *Wealth of Nations* in 1776. Adam Smith devoted to the subject an entire book, comprising almost one third of the whole treatise. Marked by an inimitable felicity of expression and unusual common sense, his treatment dominated English thought for over a century. Although the book is entitled "Of the Revenue of the Sovereign or Commonwealth," the first chapter dealing with expenditures occupies nearly a half of the entire book. Limiting government activity virtually to defense, justice, education and the care of highways, he presented a fascinating account of their increasing fiscal importance. But as to "mercantile projects" he accepted only the post office, for "no two characters are more inconsistent than those of sovereign and trader." With regard to revenues he was somewhat less original. Adopting evidently from the cameralists the distinction between fees and taxes, he contrasted "particular contributions" resting on special benefit with "general contributions" according to ability. Characteristically enough he extended the scope of the former to education and even to the payment of judges.

In his treatment of taxes he leaned heavily on the French writers, borrowing from them not only the description of continental practises

but also the famous four principles of taxation. Here, however, he omitted the insistence of the foreign writers on a number of non-administrative principles. He was the first Englishman to present a well knit treatment of incidence, based on his division of the social revenue and influenced by antagonism to anything savoring of mercantilism. Among his notable discussions may be mentioned his description of "unthrifty taxes"; the evils of tax farming; the "absurd and destructive taxes on country labour"; the "miserable policy" of the French *taille*; "the extreme inequality and uncertainty of a tax on stock"; the desirability of a tax on ground rents, since "nothing can be more reasonable than that a fund which owes its existence to the good government of the state should be taxed peculiarly toward the support of government." Nevertheless, while it is manifestly unfair to criticize him for what he had no occasion to discuss, his treatment from the modern standpoint is, to say the least, inadequate. Thus there is no recognition of the breakdown of the property levies, no indication of the trend to the taxation of income, virtually no discussion of equality and uniformity, no analysis of ability to pay and only a bare mention of graduation; in short, Smith pays little attention, despite his sympathy for the "inferior ranks of people," to the social aspects of public finance. This is especially evident in his treatment of public debts, in which he was influenced largely by David Hume. Identifying public credit with war debts, which are due to the "want of parsimony in times of peace," he characterizes them as "a practice which has brought either weakness or desolation into every country." Finally, there is complete absence of any reference to the budget or to problems of fiscal administration.

In the last quarter of the century the significant contributions were made in France in the avalanche of discussion preceding and accompanying the revolution. In the prerevolutionary decade there were the important works of Jacques Necker and Charles Alexandre de Calonne, the memoirs presented to the Assembly of Notables and the productions of Guillaume François Le Trosne, Nicolas Baudeau, Mercier de la Rivière and Pierre Dupont de Nemours. The short interval before the revolution was marked by the contributions of Jacques-Pierre Brissot de Warville and Simon Linguet, Charles Casaux and Joseph Cerutti, Condorcet and Grouber de Groubenthal. The constructive achievements of the revolution are associated

with the works of Montesquieu and La Rochefoucauld, Charles-François Lebrun and Étienne Clavière, Antoine Lavoisier and Théodore Vernier, Dupont de Nemours and Le Couteux de Canteleu followed by the statesmen financiers Pierre-Joseph Cambon and Ramel de Nogaret. In this period firm foundations were laid, ... theory as well as in practise, for the accomplishment of equality and uniformity, the transition from personal to impersonal direct taxation, the control of expenditures, the creation of a budget, the utilization of public credit and the improvement of fiscal administration. This development was signalized in Italy by Carlo Antonio Broggia and Gian Carli; in America by Peletiah Webster, Alexander Hamilton and Albert Gallatin; in England by Pitt.

The nineteenth century ushered in a period of comparative calm. In England Ricardo applied his theories of distribution to a more thoroughgoing treatment of incidence and pursued somewhat deeper the analysis of public credit. John Stuart Mill gave a fresh start to the theory of faculty by his doctrine of equal sacrifice, which he applied also to differentiation. In the main, however, the classical attitude, as typified by J. R. McCulloch, was hostile to any social interpretation of fiscal doctrine. This was still more evident in France, where even in the second half of the century the outstanding contributions of Marie-Louis-Pierre de Parieu, René Stourm and Paul Leroy-Beaulieu were limited to one-sided historical research and fiscal technique. In the United States David A. Wells devoted himself to pressing practical problems which dealt chiefly with the aftermath of war finance. In Germany the cameralist doctrines were only slowly permeated by a more liberal attitude, and the abundant literature followed largely the old lines. The leading contributions in what was now commonly called *Finanzwissenschaft* were made by R. K. Kröncke, F. C. Fulda, L. von Jakob and Julius von Soden, culminating in the authoritative text of K. H. Rau. The last quarter of the century, however, was marked by three significant developments: the growth of the historical and socio-economic schools; the efflorescence of industrial capitalism and the emergence of pressing social problems; the creation of the empire with its urgent fiscal demands. These movements, exerting a marked influence on the attitude to the public economy, were responsible for the formulation of a modern fiscal science, liberated from the trammels alike of cameralism and of *laissez faire*.

These conceptions were represented in four leading works, each called *Finanzwissenschaft*. Adolf Wagner, after a fresh analysis of the legal aspects of economics, formulated the socio-political theory which ascribes to the state the function of smoothing out the inequalities of wealth with the aid of fiscal measures. Wilhelm Roscher, not so audacious in his departure from accepted teachings, displayed remarkable erudition and provided a wider approach to modern problems. Gustav Cohn gave an essentially democratic turn to the older philosophical concepts. Lorenz von Stein emphasized the doctrine of fiscal reproductivity and stressed the comparative and administrative points of view. These four treatises were supplemented by other epoch making works. Adolf Held made the first brilliant contribution to the theory of income taxation; F. J. Neumann presented acute analyses of impersonal levies and fiscal methodology; Albert Schäffle paid particular attention to the balance between private and public wants; Robert Meyer furnished an elaborate study of ability to pay; Georg von Schanz treated the concepts of taxable revenue, economic allegiance and death duties; and, finally, in Gustav von Schönberg's cooperative handbook, public finance attained a position of equality with the newer economics.

The newer ideas slowly gained acceptance in other countries. Italy, represented by the works of Maffeo Pantaleoni and A. Graziani, took the lead. In England C. F. Bastable made a somewhat hesitant beginning in what was for the first time called public finance. The United States followed with the works of H. C. Adams, who essayed in vain to introduce the term science of finance, and of E. R. A. Seligman in his initial studies of graduation and of shifting; Holland furnished a notable convert in N. G. Pierson. An endeavor to apply the principles of the new marginal utility school of economics was made by Emil Sax and subsequently by Knut Wicksell, Ugo Mazzola and A. J. Cohen Stuart. Although it has recently been revived by Erik Lindahl in Sweden, the movement has not yielded any lasting result.

The twentieth century is marked by two significant facts: the loss of influence of the classical school and the replacement of *laissez faire* by the newer conceptions of social economics; and the World War with its aftermath of the great depression which has revolutionized the relative importance of the private and the public economy. The net results have been the accepted independence of fiscal science and the wider

inquiry into the relation between the fiscal systems and the fundamental conditions of economic and social progress. Among the notable contributions of the first quarter of the century may be mentioned those of Josiah Stamp, Hugh Dalton and A. C. Pigou in England, Luigi Einaudi and B. Griziotti in Italy, Gaston Jèze and E. Allix in France, von Heckel, Walther Lotz and Wilhelm Gerloff in Germany, Béla Földes in Hungary, C. J. Bullock, T. S. Adams and R. M. Haig in the United States. Chairs of public finance are now found in virtually all advanced institutions of learning, and a constantly augmenting array of scholars more or less emancipated from the older traditions are dealing with the newer problems.

Among the topics which occupy the attention of contemporary writers are the following: the general character of the public economy; problems of classification; the relative merits of prices, fees and taxes; the nature of the quasi-private revenues and the choice between the principles of profits, cost or gratuitous service; the extension of the government into the field of private enterprise and the conditions of control versus management; the administrative aspects of the budget; the nature and technique of public debts; the distinction between credit for war and for peace purposes; and the extent of public expenditure. In the field of taxation, which has become the most important part of fiscal science, the chief problems are: the social versus the fiscal aspects; the measure of taxable capacity; the incidence and effects upon production, savings, investment and distribution; the interpretation of tax canons; the proper fields of benefit and ability; property versus proceeds as criteria of faculty; the relation of personal to impersonal contributions; the social interpretation of taxable income; the relative claims of wealth and expenditure; concentration as opposed to diffusion in indirect imposts; double taxation in national and international finance; and the coordination of local, state and federal revenues.

PUBLIC HEALTH. The earliest examples of practises designed to promote the public health are to be found, among primitive peoples, inextricably mingled with the ritual of religion. When the Dyaks of Borneo in times of epidemic

hung a string across the stream below their dwellings and fastened thereon red and white flags as a sign that no one might pass, they were practising what was in part a quarantine measure and in part a religious tabu. When the Magi in ancient Persia required that not only dead bodies but even the clippings of hair and the parings of nails should be buried "so that the hands of evil spirits might not make of them spears, arrows or sling shots and so that these impurities might not generate vermin, lice, meal moths and clothes moths," they were actuated by similar mixed motives. Disease was due to malign supernatural influences and must be warded off through the power of magic. When this magic was practised as a tribal custom for protection on a community scale instead of being limited to the well being of a single individual, it may fairly be called public health practise—within the limits of existing knowledge.

In Greece there were more rational and more fruitful efforts at community health promotion. Epidemic disease was combated by wholesale fumigation, not much more efficacious than the exorcism of demons; but general physical vigor was developed by thoroughly effective and well organized efforts. The role played by the gymnasium as a center for social and intellectual as well as physical activities is well illustrated by the fact that the Academy of Plato, the Lyceum of Aristotle and the Cynosarges of Antisthenes were all primarily gymnasia.

The Roman contribution was concerned chiefly with sanitation rather than with hygiene. It gave us the first great water supplies of the world—brought by the aqueducts whose arches still span the Campagna and the valley of the Gard—paved streets and baths and drains and sewers, building regulation and scavenging.

Mediaeval Europe, in reaction from the emphasis of classical civilization upon bodily well being, glorified through the early church uncleanness and disease as disciplines preparing the soul for eternal mansions. Greek hygiene and Roman sanitation were condemned or ignored and vast devastating epidemics swept across the face of Europe. For dealing with such epidemics there was an orthodox precedent in the Biblical practises of isolation and quarantine. Beginning with the Council of Lyons in 583 methods of this sort were applied to leprosy with apparent success and were later extended to bubonic plague, particularly in the fourteenth and succeeding centuries. When John Howard, philanthropist and prison reformer, wrote his famous

account of "the principal Lazarettos in Europe" in 1789 almost every important seaport had its quarantine station where passengers and crew were detained and cargoes were treated by procedures which were almost as ineffective as they were costly and burdensome. These somewhat futile efforts at maritime quarantine were practically the only vestiges of public health practise in existence, and an eminent authority wrote an essay to prove that if by chance the death rate from any one cause diminished, the death rate from other causes would automatically increase to fill the vacuum.

During the eighteenth century the development of the bases of modern science gave to man for the first time a confidence in his power to control nature; and the new spirit of humanitarianism furnished a compelling urge to utilize the weapons provided by science so as to make this present world a better place to live in. Black, Cavendish, Priestley and Lavoisier in chemistry, Franklin, Galvani and Volta in physics, Hutton in geology, Buffon, Linnaeus, Bonnet and Spallanzani in biology, the Bernoullis, Euler, Lagrange, Laplace and the Herschels in mathematics and astronomy, laid the foundations of a new world. In medicine Boerhaave, Haller, Morgagni and the Hunters played a similar role; and in the specific field of public health J. P. Frank in Vienna and Richard Mead in England outlined a basis for a scientific preventive program. Sir George Baker's study of "the Devonshire colic" was the first great modern contribution to epidemiology. Captain Cook's success in protecting the health of his crew in his voyage around the world by a dietary and hygienic regime won him the Copley medal; and, finally, Jenner's discovery of vaccination in 1798 produced a simple and completely effective method of controlling what was then the most deadly disease of mankind.

The pioneers in British public health were all primarily social reformers, not doctors or savants. John Howard led the way with his program for the sanitation of prisons in 1774. Lord Ashley, the earl of Shaftesbury, played a similar role in the middle of the nineteenth century with respect to the protection of the health of the industrial worker. It was Edwin Chadwick, however, whose influence proved most far reaching. In 1838, while serving as secretary of the Poor Law Commission, he was struck with the extent to which sickness was a factor in producing poverty and raised the question whether such sickness might not be preventable. For the

first time in history physicians were employed to study systematically those environmental conditions which might contribute to ill health. These investigations led in 1842 to Chadwick's *Report on the Sanitary Condition of the Labouring Population of Great Britain*, which made a profound impression upon the public, both in England and abroad. It initiated a world wide movement for water supply and sewerage and for the cleaning up of the almost unbelievable filth in the midst of which our forefathers lived—and died.

John Simon, as health officer of London from 1848 to 1855 and as chief medical officer of the United Kingdom for twenty-one years thereafter, was the leader in carrying out the reforms which Chadwick thus initiated and laid the firm foundation for future progress in administrative public health. In his report for 1868 he says: "It would, I think, be difficult to overestimate . . . the progress which during the last few years has been made in sanitary legislation. The principles now affirmed in our statute books are such, as if carried into full effect, would soon reduce to quite an insignificant amount our present very large proportions of preventable disease. . . . Large powers have been given to local authorities, and obligation expressly imposed on them, as regards their respective districts, to suppress all kinds of nuisance and to provide all such works and establishments as the public health primarily requires. . . . The State . . . has interfered between parent and child . . . between employer and employed . . . between vendor and purchaser; has put restrictions on the sale and purchase of poisons; has prohibited in certain cases certain commercial supplies of water, and has made it a public offense to sell adulterated food or drink, or medicine, or to offer for sale any meat unfit for human food. . . . Its care for the treatment of disease has not been unconditionally limited to treating at the public expense such sickness as may accompany destitution; it has provided that in any sort of epidemic emergency, organized medical assistance not peculiarly for paupers, may be required of local authorities; and in the same spirit requires that vaccination at the public cost shall be given gratuitously to every claimant."

Except for the practise of smallpox vaccination, however, the scientific basis for the great sanitary awakening was merely a vague consciousness of a relation between filth and disease, colored by the traditional Hippocratic doc-

trine of miasms. It was only in 1870, two years after Simon's report, that Pasteur established the microbic origin of a disease of silkworms; and it was only in 1882 that Koch described the tubercle bacillus, thus for the first time establishing the causative agent of an important human disease. After this, however, progress was rapid. In the 1880's discoveries in bacteriology multiplied, as Cushing has said, "like corn popping in a pan." In the 1890's the establishment of the public health laboratory (notably by Biggs in New York in 1892) crystallized the bases of public health procedures founded on science and not solely on empiricism. By 1900 it was clearly recognized that wise public policy demanded the creation of competent health authorities and the conferring upon them of ample police powers. These powers were exercised in the main along two major lines: the protection of the public against unsanitary environmental conditions and polluted or offensive foodstuffs—the public health of Chadwick; and the protection of the public against the dissemination from person to person of communicable disease—the public health of Pasteur.

The foundation of the modern public health movement was thus laid during the latter third of the nineteenth century, primarily as a result of the assumption that disease as an economic burden upon the community was largely preventable. The movement was given strength and impetus by the demonstration that certain kinds of disease were caused by microbes and that such diseases could often in fact be easily and completely controlled by simple scientific procedures. It is being accelerated and broadened in scope by recognition of the fact that the growing complexity of our social organization involves ever increasing health hazards to the individual. Modern transportation facilities, for example, vastly increase the danger of diffusion of communicable disease; the speed and complexity of modern industry involve accident and poison hazards of the gravest sort; and the entire pace of modern life places upon the physical and mental machine a strain such as it was never before called upon to bear.

Up to 1900 the public health movement was concerned chiefly with environmental factors, the germs of disease and those unsanitary conditions which might favor the spread of such germs; and its mode of action was chiefly the exercise of the police power of the state. By 1900 the diseases which could be controlled by environmental sanitation, such as cholera, plague

and typhoid, were already disappearing from civilized communities; and bacteriological and immunological methods were making rapid progress in the control of diphtheria. The leading cause of death at this time was tuberculosis, which obviously required a different line of attack. In the case of this disease the prevention of infection on any complete and comprehensive scale offered almost insuperable difficulties. Nevertheless, Brehmer and Trudeau and their successors had demonstrated that, in spite of the presence of the germ, clinical disease could be prevented or cured by building up the vital resistance of the body. The founders of the National Tuberculosis Association in 1904 desired to reduce the element of infection as far as possible by pasteurizing milk and isolating open cases of the disease; but above all they wished to establish an organized program for hygienic living, on the part of the infected individual and of the public as a whole. The concept of public health as the employment of police power to prevent the spread of disease was thus broadened to include a responsibility on the part of the state for the development of positive health practises in the daily life of the individual.

This new objective required new methods for its accomplishment. Water supplies and waste disposal, even vaccination against specific diseases, could be enforced by law. Daily habits of living as a rule, however, can be changed not through legislation, but only through the slower and more tedious processes of education. With the initiation of the antituberculosis movement the public health program became primarily an educational one.

The movement for the control of infant mortality followed exactly similar lines. It began with its major emphasis on pure milk, but it soon appeared that this was but one aspect of a larger problem, the training of the mother in the hygiene of infancy. "Milk stations" became "well baby conferences"; and when the first American Conference for the Prevention of Infant Mortality was held in 1909, its aims were clearly defined as educational. During the first two decades of the present century precisely the same types of organization were formed for dealing on a national scale with the education of the public in regard to the control of venereal disease, heart disease and cancer and with the promotion of mental hygiene. There grew up an elaborate new technique of health bulletins, health news services, health lecture bureaus and

institutions, health exhibits, health cinemas and health radio talks (see HEALTH EDUCATION). It was essential, however, to utilize some more direct and more individual agency to carry the gospel of health into the individual home, and this agency has been found in the public health nurse. District, or visiting, nursing had been first introduced on a modern secular basis in Liverpool in 1859 and in the United States in New York in 1877. As far back as 1886 the nursing organization in Boston was called the Instructive District Nursing Association, and during the first quarter of the present century new groups of nurses were employed under public auspices who were utilized solely as educational agents, giving no bedside care at all. Today there is being revived the ideal of a generalized district nurse, caring for the sick and teaching health, dealing with tuberculosis and child welfare and mental hygiene, even with the simpler social problems. Such a public health nurse should be provided for every 2000 persons in the population, and accepted standards set aside over one third of the total health budget of a community for public health nursing. Actually, however, this standard is rarely attained. Thus in 1929 the average number of nurses employed per 100,000 population in cities of 40,000 and over was 19.9. For cities with a population of 70,000 and over the average was 24.6, ranging from 8.7 to 61.6, and for the smaller cities the average was 19.8, with a range of from 2.2 to 45.

The new public health has effected a profound change in the conception of the function of the medical profession. "Preventive medicine" is an old term but it was formerly applied chiefly to problems of environmental sanitation, which belong rather to the field of engineering than to that of medicine. The development of health education has brought into being a real preventive medicine. In order to teach the individual how the principles of personal hygiene apply to his special case knowledge of his particular constitution is necessary. Hence along with the growth of health education has gone the development of a new type of medical service designed not for the treatment of active disease but for the detection of deviations from the normal in their very earliest stages by health examinations at frequent intervals. To meet this need there has been a rapid development of clinics for dealing with a wide variety of diseases and health problems on a largely preventive basis (see CLINICS AND DISPENSARIES). It is now

clear that there can no longer be a sound distinction between preventive and curative medicine. Every physician becomes in his daily practice more and more a hygiene adviser, and the health officer is making wider use of physicians in the early diagnosis and preventive treatment of disease on an organized basis.

Nor can the program of public health be dissociated from other basic public activities. Better housing, better zoning laws, systems of transportation which open up new residential districts in urban areas, better roads in a remote rural district, improvements in agriculture and in the handling of foods—all of these may promote health as truly as a full time health department.

It is becoming more and more clearly recognized that underlying the purely medical and sanitary factors which govern health and disease there are other influences, more subtle and more universal, which must be taken into account. A whole complex of social and legal educational factors, for example, underlie the extent of irregular sexual intercourse and thus directly control the incidence of venereal disease; the same is true of the problems of alcoholism and of drug addiction. Above all the grave importance of economic factors in relation to health and disease is now realized. Chadwick's conviction that people are poor because they are sick is now modified by the knowledge that people are also often sick because they are poor. Babies cannot be kept well in crowded tenements or in families where the mother is forced to work in a factory. Tuberculosis cannot be controlled in a household where there is overwork or not enough to eat. Any social or economic organization or force which helps to eradicate poverty is a contribution of primary importance to public health.

The complexity of the interrelation between economic forces and public health is indicated by the fact that during the depression which began in 1929 death rates in the United States continued to decrease, even including such sensitive indices as the death rates from tuberculosis and the infant mortality rates. This observation is in conformity with the earlier studies of Dorothy Swain Thomas (*Social Aspects of the Business Cycle*, London 1925), which showed that business depressions do not tend to cause an excess of mortality. On the other hand, in studies of mortality in a given area at a given time high death rates are found to be associated with low economic status. It is probable that

the influences involved differ widely in various sections of the population. Since a state of "prosperity" is associated with overwork, with high emotional tension, with increased industrial hazards and also with overeating and overdrinking and other forms of indulgence, a period of depression is likely to have favorable health effects on the economically fortunate and unfavorable effects on those at a lower economic level. Moreover during the depression years following 1929 the efforts of social agencies and the continuing public health program helped to check the harmful effects and the beneficial effects were more manifest. Undoubtedly, however, as was apparent in Germany after the World War, severe economic stress sufficiently long continued is bound to affect the entire population.

This broad view of the domain of public health and also a realization of the importance of adequate health protection for all classes in society have led many students to believe that fundamental changes in the relation between the physician and the public are necessary, changes which shall involve, on the one hand, organization of the profession itself for the delivery of adequate service at a minimum cost and, on the other hand, organization of the financial resources of the public to establish a collective reserve to be used in the payment for such service. In Europe the solution of this problem has generally been sought by the establishment of systems of compulsory sickness insurance under which all wage earners below a certain level, and their families, are provided with cash benefits and free medical care through a fund to which they and their employers and the state must usually contribute. This system of sickness insurance is supplemented by other forms of social insurance, such as mothers' pensions and the like, for special groups in the population. The principle of general compulsory insurance has not, however, been accepted in the United States.

Public interest in the broadening of the program of health protection in the United States and, in particular, concern with the high cost of medical care led to the appointment in 1927 of a Committee on the Costs of Medical Care, composed of leading physicians, health workers, economists and representatives of the public. On the basis of twenty-six reports of factual data the committee in its major report presented in 1932 made certain fundamental and far reaching recommendations. The most important of

these suggested a unification of all medical service, both preventive and therapeutic, by the organization of groups of physicians, dentists, nurses, pharmacists and other associated personnel, preferably around a hospital. Such groups were to render complete home, office and hospital care and to encourage the maintenance of high standards and the development or preservation of a personal relation between the patient and physician. The costs of this care were to be met on a group payment basis, through the use of insurance or taxation or both. In addition the report recommended the extension of all basic public health services, whether provided by governmental or by non-governmental agencies, so that they might be available to the entire population according to its needs; this extension would involve increased financial support for official health departments. Finally, it suggested as a function of every state and local community the creation of agencies for the study, evaluation and coordination of medical service, with especial attention to the problem of coordinating rural and urban services.

These recommendations were widely criticized by the medical profession, which considered them too drastic a step, even though nothing in the report precluded the continuation of medical service provided on an individual fee basis for those who prefer that method. On the other hand, a minority report was signed by one of the economists, declaring that the report was not sufficiently far reaching and recommending instead the introduction of compulsory health insurance.

A critical survey of the economic organization of medicine in the United States, however, must take into account the fact that in place of a comprehensive system of health insurance like that of European countries there has been an empirical development—under varied public and private, lay and professional auspices—of hospitals and dispensaries, group clinics and pay clinics as well as health promotion clinics along special lines, such as child welfare, tuberculosis control, school and university and industrial health services. In practise the work of the official public health agencies has been supplemented by various voluntary and unofficial agencies and associations as well as by the health activities of other governmental agencies. In the last analysis, however, it is the official health agencies which must be responsible for seeing that public health is adequately protected.

The fundamental unit of health organization

in the United States is the local health department of city, town or county. Usually such a department consists of a board of health and a health officer and his staff. In addition to its present powers of establishing general policies and controlling the budget it should be given power to establish a sanitary code having the force of law; the health officer should be a full time trained sanitarian and, ideally, should have complete administrative authority over the department; the size of his staff should be based on a certain minimum, varying with the population of the area served. Thus a minimum for really adequate service in a rural county of 10,000 people would be a health officer, five nurses, an inspector and a clerk. The Committee on Administrative Practice of the American Public Health Association has made exhaustive surveys of actual health services in hundreds of cities and on the basis of these surveys has prepared ideal programs, for which it has devised an Appraisal Form, for communities of various sizes, with a definite schedule of personnel and corresponding budgets. The Appraisal Form, devised to measure the quantity of service actually rendered in any given community, includes definite objective items, such as the proportion of children immunized against diphtheria, the number of visits of nurses on behalf of tuberculosis cases, the number of visits of mothers to prenatal clinics, the proportion of milk pasteurized and the like. There are in all 167 items in the Appraisal Form, grouped under 14 main activities. Each of these activities is scored on a basis of 100 points and each activity may be multiplied by a weighting factor to give a total score of 1000. The activities and their weighting factors may be cited as indicating the committee's estimate of their relative importance in the public health program. They are as follows: vital statistics .5, communicable disease control 1.6, venereal disease control .5, tuberculosis control .9, maternity hygiene .8, infant hygiene .8, preschool hygiene .3, school hygiene 1.2, food and milk control .7, sanitation .8, laboratory service .6, popular health instruction .4, cancer control .2, heart disease control .2. With the development of health programs along such more or less standardized lines it is easy for any city which is willing to appropriate the funds and employ an adequate staff to attain effective health service.

The cost of adequate health service works out at about \$2.00 per capita per annum, exclusive of hospitalization of communicable diseases, and

effective service cannot be expected for much less than this sum. In its report the committee found, however, that in 1923 the actual amount per capita spent by 92 cities surveyed was only 59.2 cents. By 1929, according to the findings of the White House Conference, this had risen to 76.6 cents for cities of 70,000 population and over, with a range of from 30.1 to 153.3 and a median of 69.1. The per capita expenditure for smaller cities (40,000 to 70,000 population) ranged from 17.6 to 132.6 with a median of 64.2. These findings were substantiated by the survey of 86 cities made by the American Child Health Association in 1929. They do not, however, account for the services which in many cities are rendered by voluntary health agencies and by school and other public departments. According to the figures of the United States Bureau of the Census (*Financial Statistics of Cities, 1929, 1932*) 10 percent of the average budget of municipalities was spent for public health (2.5 percent for conservation of health and 7.5 percent for sanitation and promotion of cleanliness). Public health expenditures are involved also in the 6.4 percent spent for charities, hospitals and corrections and in the 3.6 percent spent for recreation; but only the 2.5 percent for conservation of health corresponds to the activities cited by the American Public Health Committee.

The introduction of a modern health program in rural districts involves more difficult problems. The first essential is the establishment of an administrative unit sufficiently large to make possible the employment of a full time health officer. In general the county is the natural unit indicated; but in New England, where county government is nebulous, cooperation between towns or the establishment of special health districts may serve a similar end. The education of rural populations to the point where they desire adequate health service is a slow process. In 1929 of some 2500 rural counties in the United States only 467 had full time county health units, Alabama standing first with 80 percent of her rural population thus served and Ohio second with 58 percent. Even in the counties which have so-called full time county health departments the actual services rendered are often exceedingly meager. In 1926 out of 442 such counties 347 were spending less than 50 cents per capita and only 14 were spending over \$1.00, while it has been abundantly proved that rural areas must spend more and not less for an adequate health service, because of the dis-

tances involved. Before the rural health problem can be generally solved it will probably be essential for the states to recognize much more fully the principle of grants-in-aid to rural counties for health work, a principle already in use for road building and education. It seems certain that many rural counties are too poor to pay the full cost of the health service which they need.

Over the local health departments stands the state department of health. It also includes a state board of health or public health council to guide policies and a health commissioner and staff to execute them. In most states the actual conduct of health work is left mainly to local authorities (Florida and Pennsylvania being notable exceptions), the state department stimulating and standardizing local work, aiding it by appropriations, which sometimes, as in the case of New York, amount to 50 percent of the county health budget, aiding in special emergencies and dealing directly with problems involving two or more local communities. As a rule state departments include divisions of communicable diseases, food and drugs (dealing with milk production and the sale of products distributed on a large scale), sanitary engineering (dealing with water supply and sewerage problems), tuberculosis, venereal disease, maternity and child hygiene, public health nursing, laboratories, vital statistics and sometimes mental hygiene and industrial hygiene. The average budget for 48 state health departments in 1930 was 11 cents per capita as compared with 3.6 cents in 1915, the average for 41 states. Over half of the 48 states, however, expended less than 10 cents per capita; New York state's expenditure was 40 cents.

The United States Public Health Service, although a part of the Department of the Treasury, exercises essentially the functions of a federal department of health. It has direct control of quarantine at the seaports and of health problems of an interstate nature; it also serves as a guiding influence for the state departments of health, as they in turn stimulate and guide the local departments. It has done excellent work in fundamental research in the field of public health. Many special health problems are dealt with by other branches of the federal government; for example, food and drug control by the Department of Agriculture, vital statistics by the Department of Commerce, school hygiene by the Department of the Interior and child welfare by the Department of Labor.

The field of school hygiene offers an interest-

ing example of the way in which local, state and federal efforts and those of voluntary organizations are coordinated and illustrates also the increasing importance of preventive medicine in public health activities. It has been increasingly realized that the protection of infants, which involves not only the need of care and training of the expectant mother but also the need of expert obstetrical and postpartum medical and nursing care and weekly supervision and instruction at infant welfare stations, must be continued for the child during the period of school life and that public expenditures on the education of a child are wasteful if he is so handicapped by physical and mental disabilities as to be unable to profit by that education. A sound program of school hygiene should include at least two comprehensive medical examinations during school life for serious and not easily observable defects; far more frequent examinations for symptoms of skin infections, communicable diseases and the like, against the spread of which special measures should be taken; dental inspections; and a regular program of health instruction. Here again the extent to which communities live up to these standards varies with the size of the community. Only one third of the communities with a population of from 2500 to 30,000 provide for full or part time school medical inspectors, in contrast with one half of the communities of from 30,000 to 100,000 and about 70 percent of the cities of over 100,000 population. Special provision is made for school nurses in about the same proportion. In 65 of 92 of the largest cities the amount spent by the board of education for school health service constitutes 14.3 percent of the total spent for health services. Legislation relating to school inspection of children exists in all but 8 of the states, but in most cases this provides only for annual inspection and in only 24 states is it more or less mandatory for all districts. The work of the local and state authorities is supplemented by the educational and propaganda work of the Division of School Hygiene in the United States Office of Education; by the research of the United States Public Health Service and of such voluntary specialized organizations as the American Child Health Association and the Child Hygiene divisions of the American Public Health Association and of the American Association of School Physicians; and by the child health work of the Red Cross and tuberculosis associations.

Somewhat the same complexity of organizations dealing with the problems of public health

is to be noted in England, although there the work is somewhat more highly coordinated and the role of the voluntary organization is not as marked as in the United States. Thus the work of the Ministry of Health, which includes also the administration of sickness insurance, medical inspection and, in conjunction with the Board of Education, school hygiene, is supplemented by the Medical Research Council; by the Committee of the Privy Council; by the Board of Trade, which is responsible for health work in the mercantile marine; by the Ministry of Agriculture and Fisheries, with its control over food and milk; by the Home Office, which deals with industrial hygiene, drugs acts and the like; and by the health activities of the Pensions Department. In the field of local health activity it is supplemented by the poor law guardians. Local health departments were established before 1850 by Liverpool and London and by 1875 were compulsory for both urban and local areas. For all but the larger boroughs over half of the salaries of medical, health and sanitary officers are refunded out of the Exchequer of the central government, and block grants of health are now being discussed. The law requires evidence of adequate training in public health for both the public health officer and the sanitary inspector. The English system of school hygiene was established as early as 1907 and now provides for three examinations during the school life. Actually, for a portion of the school population, several medical examinations are given during the year. A large number of volunteer workers supplement the regular staff. Although certain specific problems, such as the pasteurization of milk, are less well handled in England than in the United States, England is noteworthy for the generally high level of its official health service; its personnel is better trained and better paid than that of the United States. American economic resources, as mobilized by public and private agencies in cooperation, give a better health program in certain cities and counties of the United States than any to be found in England, but the average English city has a sounder and better organization than the average American city.

Denmark and Holland are particularly noteworthy on account of their success in dealing with the problems of mortality in childbirth and among newborn infants. This end has been accomplished chiefly through well trained and supervised midwives, who care for normal deliveries and refer abnormal conditions to the

medical specialist. Denmark is also notable for its excellent system of dairy hygiene and for the work of the great state serum institute at Copenhagen. On the other hand, it is somewhat curious to note that public health nursing is almost wholly undeveloped in this otherwise highly progressive country.

Germany and Austria have in their state and local health departments excellent machinery for dealing with the traditional type of health work, sanitation and control of epidemic disease. Germany made the first efforts in the field of school hygiene by the appointment of a school doctor in Wiesbaden in 1895; a school nurses system was initiated in 1908 and thereafter a large staff of full time and part time school directors was established, most of whom were qualified as medical officers of health. In Prussia the aim in recent years has been to have one school doctor for every four or five hundred students with two full time school nurses to assist him. Thorough examinations are, however, given only once in two years for most cases, with special treatment of defects; children are sent in large numbers to sanatoria and health homes and in the summer to vacation homes; minor ailments are treated by the nurse and more serious ones referred to private doctors and polyclinics. There is also a system of school dental clinics. Vienna is noteworthy for its efforts in the field of child protection; all school children receive this service and no "poverty" test is given. In recent years more or less separate organizations have grown up in both countries in the newer fields of health promotion (infant welfare, tuberculosis and the like) as distinct from health protection. The sickness insurance funds cooperate to a very considerable extent in this work, and the various official and unofficial agencies concerned are more or less effectively coordinated through joint councils which are provided for by law. The system is more complex than that in force in England and the United States. If gauged by higher death rates it would seem less efficient, but here account must be taken of the effects of continued economic stress. In Switzerland the principle of compulsory sickness insurance includes in some cantons a unique system of school medical insurance in both public and private schools.

In France and Italy the public health program is less advanced. Prior to the war very little was done in either country along the newer lines, although the more purely medical aspects of communicable disease control were expertly

handled. As a result of the menace of tuberculosis revealed during the war France has organized a special governmental bureau of social hygiene, which is now making real strides in health promotion along modern lines. The lack of good vital statistics is still a serious handicap. In Italy notable progress has been made in malaria control, but lack of trained personnel limits the efficiency of local health work. An outstanding exception to this rule, in the field of school hygiene, is Milan, which not only provides two annual examinations but has a system of school polyclinics, public summer camps and open air schools.

Poland and Jugoslavia are examples of countries newly created or greatly enlarged by the war which have organized admirable centralized health programs. Jugoslavia in particular, under the leadership of Dr. Stampar, developed a nation wide system of institutes of hygiene and health centers, which are carrying the message of public health to some of the remotest and most backward regions of the Balkans. In such regions as South Serbia economic and educational handicaps limit the work to the barest fundamentals but the foundation of a national health program is being laid with vision and practical efficiency.

Greece is planning to follow along similar lines. In 1928 the Greek government asked the Health Organisation of the League of Nations to outline for it a national health program; and in 1929, after preliminary surveys, such a program was duly initiated and is being put into effect with the continuing aid of the Health Section of the League and of the Rockefeller Foundation.

The Union of Soviet Socialist Republics has adopted a comprehensive policy which involves general compulsory insurance, the provision of medical care for the insured through public health service and a widespread campaign of popular health instruction. The work of each of the federated republics is concentrated in a commissariat of public health, except for the health service of the army and the transport system, which, on grounds of convenience, are separately organized. The growth of this service is indicated in the number of medical centers throughout the union. In the period from 1929 to 1932 these increased from 2200 to 5400. The number of district health centers is estimated to be double that of the medical centers. Within Russia itself the number of hospital beds in towns increased from 111,000 in 1928 to 162,000

in 1932, and in villages from 43,500 to 82,000. One estimate gives the number of physicians within the area now covered by the Russian Socialist Federative Soviet Republic as 46,000 in 1930 as contrasted with 16,000 in 1913, and for the Soviet Union as 68,000 in contrast to 24,000. Present plans call for one physician for every thousand of population, which involves the tripling of the present force. In 1932 there were 36,000 medical students enrolled. A significant example of procedure is in the field of tuberculosis prevention and cure. Frequent examinations under the health service reveal early symptoms, and in all suspected cases the patient is referred to a special institute and if necessary sent to a sanatorium; while he is there his full salary is received by his family and, after he leaves, convalescent care and postconvalescent supervision are carefully provided. In this field figures comparative with prerevolutionary times are available. As against 350 beds for tuberculosis patients before the revolution, there were 35,000 in 1932. The program of maternity welfare and the vast reduction in prostitution are also important factors in the health service. The effectiveness of this service is shown in the remarkable reduction of the death rate. In 1913 this was 28.3 per thousand of population for all of Russia. By 1926, despite the hardships entailed by war, revolution and famine and the obstacles encountered by the low status of health education in the past, the death rate was brought down to 20.9. For cities the decrease was even greater; in Moscow it declined during the same period from 23.1 to 13.7. The infant mortality rate was cut from 270 per thousand live births to 120 in 1929.

In sharp contrast to such countries as those here listed is the situation in India, which still presents a picture like that of Europe in the Middle Ages. Here climatic conditions, economic handicaps, lack of education and certain highly deleterious social customs combine to render the health problem an extraordinarily difficult one. Thus in 1927 India reported to the League of Nations 350,000 cases of cholera, 58,000 cases of bubonic plague and 213,000 cases of smallpox—in each case far more than were reported by all the rest of the world put together. It is to be noted, however, that so far as smallpox is concerned the United States comes second with nearly 37,000 cases.

In China there is a lack even of statistical records to indicate the extent of the problem, but public health machinery is practically non-

existent except in the larger cities and conditions are probably more serious than in any other large area outside of India.

Three major agencies, the League of Red Cross Societies, the International Health Board and the League of Nations, have played an important role in promoting health progress on an international scale. The League of Red Cross Societies was organized after the World War to aid in fostering the peacetime health program of the national Red Cross societies. It has its headquarters in Paris and exerts a valuable stimulating influence upon the development, through Red Cross agencies, of public health nursing and popular health instruction. The International Health Board (now the International Health Division) of the Rockefeller Foundation plays a most important role by making grants to governmental health agencies on a temporary cooperative basis, the specific work in question being carried on by the government alone after a specified period of years. The most outstanding work of the foundation has perhaps been its world wide campaign against yellow fever, which has almost eliminated this disease from Central America and Mexico and from South America, with the exception of Brazil. The foundation is now working in northern Brazil and in west Africa, where the control of the disease is peculiarly difficult. It has also accomplished significant work in other fields of public health: reports for 1931 summarize malaria control projects in 24 countries; development of studies and demonstrations in hookworm control in 17 regions, from the United States (Alabama), Paraguay and Samoa to Egypt, Madras, Siam and Spain; specific aids to state and national health departments in 33 countries; and pioneer rural health work in the Mississippi valley of the United States, in Canada, Mexico, Porto Rico, the Philippines, Brazil, Panama, Poland, France, Italy, Austria, Czechoslovakia, Hungary, Rumania, Yugoslavia, the Irish Free State, Ceylon, Siam, Straits Settlements, China and India.

The whole program for a truly international war against disease was centralized and coordinated in 1921 through the creation of the Health Organisation of the League of Nations. Its activities have included the development of an effective system of world intelligence in regard to the prevalence of disease, with a subcenter on the tropical firing line at Singapore; the standardization of statistical and administrative procedures and of sera, vaccines and drugs;

interchanges of health personnel, which place the most advanced thought of each country at the disposition of all other countries; the concerted cooperative study of such problems as sleeping sickness, malaria, cancer and infant mortality; and direct leadership in dealing with emergencies, such as typhus fever in Poland in 1921 and malaria and tuberculosis in Greece and among Greek refugees. It has also made excellent surveys of public health organization in most countries. In 1931, together with the International Labor Office and the International Institute of Agriculture, it called a conference on rural health problems in which 23 European countries participated. In these and many other ways the Health Organisation of the League has mobilized the entire forces of humanity for service against the common foe; and it has materially aided other sections of the League in dealing with such problems as the protection of the health of seamen in foreign ports, the control of traffic in women and children and the restriction of the traffic in opium.

The results of the modern public health campaign during the past quarter of a century have been striking and spectacular. It is certain from the figures of mortality and morbidity that there has been a fundamental revolution in the conditions of human life resulting in the lifting of over one third of the total burden of disease and death which rested upon the shoulders of the human race fifty years ago. It is true of course that the decrease in the death rate has occurred almost wholly in the field of microbic diseases which affect the infant, the child and the young adult. In the United States at least the death rate at ages over fifty years from the so-called degenerative diseases has been apparently increasing, but this is largely to be explained by the changing age distribution of the population and by improvements in diagnosis. The control of the constitutional diseases of later life is by no means an impossible task. It demands, however, a far more widespread and intensive education of the public in regard to the principles of personal hygiene than has yet been attained; and it demands a more serious effort to secure the organization of medical service for the preventive treatment of incipient disease than has yet been visualized.

PUBLIC LANDS. See PUBLIC DOMAIN.

PUBLIC LAW. The term public law is an erroneous translation of the Latin *jus publicum*, i.e. *jus ad populum pertinens*. *Jus publicum* is therefore in its origin the constitutional law of the people. This meaning is no longer expressed by the modern legal terms "public law," *droit public* and *öffentliches Recht*, which imply the existence of a dualism of "public" and "private" law.

Such dualism was nevertheless already recognized in the Roman law. The Digest declares: *Publicum jus est quod ad statum rei romanae spectat, privatum quod ad singulorum utilitatem* (Dig. I. 1. 1. 2 (Ulpian)). *Jus privatum* held first place as a subject of study in Roman jurisprudence. *Jus publicum* never became a subject of instruction in the same sense; it developed rather in political practise. In contrast to the Roman law the dualistic separation of public and private law does not occur in the ancient Germanic law, which is dominated by a unity of the legal order manifesting itself in multifarious forms in various legal branches. This monistic conception still characterizes the mediaeval Germanic legal order. The division into public and private law was the result of modern social reorientation, which, begun in many mediaeval towns, was completed in the modern bureaucratic states. The continental reception of the Roman law in the fourteenth and fifteenth centuries played an important part in hastening the change. It made available in the developed forms of the Byzantine-Roman world law a suitable means for the regulation of the modern capitalistic commercial economy, and it facilitated the introduction of the monarchic-absolutistic form of government, relying upon late Roman-Byzantine principles of public law. As early as the sixteenth century the theoretical foundations of a constitutional law upon public law principles were laid in Germany and France. Today in the civil law countries the separation of public and private law is an undeniable fact of positive law. In the

countries of the common law, however, which have never or only to a slight extent experienced a reception of the Roman law, the original Germanic conception of the unity and indivisibility of the legal order has fundamentally been maintained, so that the continental dualism has played an inconsiderable role up to the present. Yet even in these countries it is easy to point to a corresponding differentiation of legal branches about which the whole legal order is crystallized: these are the private and commercial law on the one hand and constitutional law on the other.

The modern legal orders have become divided in the course of their historical development into various legal branches which are determined by the character of their social functions. Constitutional, administrative, criminal and canon law have long been regarded as branches of public law. Other legal branches, such as civil law and commercial law, are considered parts of private law. With regard to certain legal branches most recently evolved, such as labor law and social law, the boundaries are not sharply delimited. It is increasingly recognized that the law of procedure is impressed with a public law character. International law is usually classed as public law. Nevertheless, the dualism of public and private law in its true sense can be applicable only within the same legal order. International law, on the contrary, assumes a pluralistic, not a monistic organization of the legal universe, i.e. the existence of many independent legal orders.

It might be supposed from the enumeration of the branches of public law that its domain consists of their totality. Such an impression would be misleading. In the first place, there is involved here not an entity with an independent existence, but a dualistic concept. In the second place, there must be taken into account the doctrine of the primacy of the objective legal norms. In the domain of objective legal norms it is possible to speak at most only of the "potential" force of the dualism of public and private law. It is never realized, however, except in the field of subjective legal relations. Solely with reference to subjective legal relations can it properly be asked whether the rules of the public or of the private law are to be applied. For this is a question which always relates merely to the creation and termination, the legal content, the mode of realization and the protection of specific and concrete legal relations.

Every legal order determines according to its unlimited discretion the degree and the scope of the technical differentiation of its legal branches. The more consistently a positive legal order differentiates its legal relations with reference to their substantive content and enforcement as well as to the formal criteria of their legal validity, the more clearly must the dualistic structure of the legal order be revealed in its positive law. On the other hand, the more a legal order seeks to unify its several legal branches upon the bases of some prototype either of a private law character (Anglo-American conception) or of a public law character (the Russian Bolshevik conception), the less does the dualism appear in the positive law. In Anglo-American law, because of the lack of special administrative courts for the decision of public controversies, such as exist in Germany and most of the Romanistic countries, the maintenance of the illusion of a legal order constructed upon monistic and unifying principles is facilitated.

The emphasis upon the dualism of public and private law was in its origin fundamentally an invention of modern political liberalism, which in the struggle against the political domination of social life resulting from absolutistic government sought to create a politically neutral sphere for the career of the "free" individual, the "citizen." This sphere of social norms purged of political elements is regarded more and more as that of law in the strict sense. Thus begins the period of the "civil," or "private," orientation of the legal order, the expressions of which are the conceptions of the constitutional state, the separation of powers and the fundamental rights of man and the citizen. Originating in the natural law philosophy of the eighteenth century, the doctrines appeared on the stage of world history in the Federal Constitution of the United States and in the constitutional laws of the French Revolution, and triumphed in western civilization in the nineteenth century with the middle class domination of social life.

The conception of the constitutional state, however, is dominated by the primacy of private law. The methodology of the civilians becomes the whole of jurisprudence. As a consequence Roman law is identified with Roman private law. Nevertheless, a reaction has already set in against this civilistic conception and its political ideology of security through a complete private orientation of social life by means of the institution of contract. It is led on the one side by Asiatic Bolshevism, and on the other by Ro-

manistic Fascism and Germanic National Socialism. The result has been in all cases a restoration of the primacy of public law.

Since the dualistic division into public and private law is a historical product of a definite stage of social evolution, it follows that it is in no sense immanent in every legal order. Its dissolution occurs in any legal order which rests upon an integrated and organic community structure organized hierarchically upon a class basis, so that every individual has a definite political and social place determining the scope of the field of his social activity. In such an order the freedom of the individual is a definite and positive ability to work for the whole, not a mere negative freedom from a politically superior state.

The dualism of public and private law has been very important in modern political theory. Those theories which may be called monistic deny the existence and the justification of the dualism of public and private law. Apart from the special case of Anglo-American jurisprudence there is the "logical" theory of Kelsen, which identifies the legal order with the state and defines or postulates the former as a monistic system of obligatory norms. The traditional opposition between public and private law is eliminated from the logically constructed system of legal norms as a survival of a mode of analysis which is either unscientific and naïve or determined by considerations of political power. Another monistic theory is the "political" theory of Krabbe, which simply identifies the private law with the concept of law itself and attempts to disregard all interventions of public authority as unjustified political interferences in the sphere of true law. Both theories are political products of an extreme liberalism; they can be distinguished in method and partly in results but, while they illuminate the situation, cannot be regarded as adequate analyses.

Most theories which may be called dualistic, because they affirm the dualistic structure of the public legal order, attempt to explain this in various ways. There are those based upon external and formal criteria: the "subject" theory, the "object" theory and the theory of "legal protection." The first regards as public law all legal relations in which the state appears as a party. This theory is contradicted, however, by the fact that the state intervenes through its taxing power even in private legal relations. The second simply identifies private law with the law of property. Again, the form of public taxa-

tion is inconsistent with this theory. The third defines as private law every legal relation in the realization of which the ordinary courts are competent. But its opponents point out that the protection of rights is a secondary consequence, not a primary manifestation, of a legal relation.

Other dualistic theories which are of a teleologico-sociological character attempt to account for the existing dualism as a necessary social function. According to the "power" theory (Otto Mayer, Laband) every legal relation is of a public law character in which a relation of subordination obtains; in other words, in which the individual is opposed by the superior will of public authority. This typically imperative theory, which is at bottom nothing but the theory of Hobbes and especially of Austin, who regards as law only the commands of a political superior, is suggestive but incomplete. According to the theory of "interest" (Ahrens, Stahl, Georg Jellinek) public law consists of every legal category which is regulated in the interest of the body politic, or the state, while private law consists of every legal category regulated in the interest of the individual. This theory, which betrays obviously the influence of the Digest, also has elements of truth but again lacks completeness. There is to be considered also the "social" theory of Otto Gierke, which makes a distinction between an individual and a social law. The one concerns itself with the external legal relations of individuals, the other with the inner social structure of the group. The individual law is in essence private law; the social law is basically public law. In the positive legal system, however, parts of social law can be treated technically according to the rules of individual law.

It is best to attempt to understand the dualism of public and private law as a social phenomenon in terms of the fundamental social structure. Only a "socio-morphological" view can explain its existence. All social phenomena may be expressed in terms of three fundamental relations: as a relation of domination, as a liberalistic relation of tension resting upon coordination and as a relation of organic integration. The corresponding legal forms are: the law of subordination, the law of coordination and the law of inordination. Where the law of inordination, with its organic integration, rules, there is no dualistic division of the legal order, which does not offer a dualistic contrast but is integrated organically in a multiplicity of social forms. On the other hand, the dualism of public and private law appears in any legal order which is

determined by relations either of legal subordination or of coordination. The dualism of public and private law is thus a product of a period of social transition, a typical phenomenon of a legal order which on the one hand is in process of dissolution and on the other is being continually recreated.

PUBLIC LIBRARIES

History and Institutional Types. In a mature, literate society the care of its books is a complicated problem. The literary heritage of the past is enormous and cumulative. The functional value of each piece of literature varies with the intellectual status and interests of the generation that reads it; at any particular point in time some books are useless, some of slight value and some of immediate significance. And, finally, the texts that have an importance for coeval culture are, almost always, so numerous that the ordinary citizen cannot possess them all in privately owned copies. Two social mechanisms have been developed to meet these conditions: the book trade and the public library. The former is probably the greater in magnitude of operations but it is also less efficient than the latter. This is essentially a store of books from which any member of its special or general public may borrow temporarily any particular volume.

Library history shows that the institution is a spontaneous development from the conditions of a literate culture. The ruins of Rome, Greece, Egypt and Mesopotamia furnish unmistakably

evidence that these older civilizations all had their library systems, but the records are too scanty to establish their extent, their content or their organization. Moreover not one of these ancient libraries has left a lineal descendant. The later systems of the west are independent developments. The origin and evolution of the library must therefore be studied in such simpler forms as survive or else in comparatively recent historical records. The antiquarian literature on the subject is extensive—there are many histories of particular libraries—but the sociological history of the institution has not yet been written. Its main outlines, however, are apparent.

The most primitive form of public library seems to be a canon of religious scriptures of which a single copy is communally owned by each congregation. Its textual content is put into circulation through public readings and expository lectures. Nearly all such canons incorporate the writings of several authors, in a wide range of literary forms, and include not merely theology and ritual but also natural science, philosophy, history, politics, law and practical medicine. During many centuries in western civilization, the lectern Bible in the parish church or its equivalent was the only library accessible to the general lay public. A secondary type of canonical scripture is sometimes developed for the use of specialized communities of religious professionals. This is more bulky than the primary canon and more extensive in its range of subject material. For example, the Tibetan *Tanjur* and *Kanjur* together run to 325 volumes, the Buddhist *Tripitaka* to 7920. Each of these collections provides all the literature needed by the scholar from his elementary training through a lifetime of professional studies. In addition to the subjects already mentioned they contain grammar, lexicography, rhetoric, prosody, music, mathematics, astrology, magic, geography, biography, literary history and even bibliography. Although western monasticism never formulated such a standardized canon, it had a virtual equivalent. Surviving catalogues of the older monastic libraries show an approximate identity in their literary content and in their encyclopaedic scope.

With the spread of lay education and the rise of secular schools collections of books directly related to the curriculum were developed gradually. In a university, which embraced the whole range of knowledge, two phases may be distinguished: in the first, the library program

sought the best books on every subject; in the second, all that had been written. State recognition of the latter conception often gave to universities the prerogative of a free copy of every book published under copyright law.

A third type of library was developed by corporations and societies of practitioners in the secular professions. Colleges of physicians and inns of lawyers provided their members with working collections of technical literature, while royal societies and national academies made similar provision for advanced workers in general scholarship.

With the rise of democratic ideas came the establishment of national and local libraries of universal scope, open to any qualified reader irrespective of his membership in a particular professional group. In many instances such a general library obtained its basic materials from secularized monasteries. Usually it inherited the collections of defunct schools, scholars and societies. Sometimes it became the book depository of still flourishing academies. Ordinarily, however, the organized technical professions retained their own libraries for the exclusive use of their members.

It is evident that all four of these types operate by the same social method: the textual contents of books obtain general circulation in society through the mediation of individual specialists. Except in the acquisition of material the library performs only a passive function: its readers come to it on their own initiative, by the necessities of their profession. In recent decades, however, a fifth type of library has been developed, particularly in America and northern Europe. Here the institution has undertaken positive social activities, as an instrument for general adult education and propaganda of a rather elementary literary culture. This phase of librarianship is more fully discussed below.

PIERCE BUTLER

Modern Library Systems. The existing library systems of the world, which include survivals from all of these institutional types, exhibit a wide variety in their origin, development, administration, support and activity. In the main the library system in each country owes its existence at first to endowments of private citizens and later to governmental support. In some countries, as in Great Britain and Mexico, the institution is under national direction; in others, as in Germany and the United States, it

is controlled by the states. In every case the movement develops in the direction of more complete democratization: book collections are first provided for the privileged classes and are only gradually opened to the general public; the early establishments are in metropolitan cities, those of the smaller town and rural community come later; early libraries contain only learned treatises, modern ones popular literature.

Although the libraries of Europe are chronologically older, they are not always so fully developed as those in the United States. For this reason an examination of the American system will probably furnish the clearest picture of modern library trends. Here private bequests for the establishment of public libraries have been a favorite form of philanthropy. The experience of New York City illustrates the effect of such gifts. The Astor Library, established by John Jacob Astor, was opened to the public in 1854 as a reference library. The Lenox Library, opened in 1880, and the Tilden Trust, founded in 1887, joined with it in 1895 to form the New York Public Library, which in 1900 began to absorb most of the free circulating libraries operating independently in the city of New York. The Enoch Pratt Free Library (1882) of Baltimore and the Providence Public Library (1878) are also typical of the numerous public libraries originally endowed but having so expanded as to depend largely upon public funds for their support.

The free public library maintained by local or national government from the proceeds of taxation had its origin in the United States during the second quarter of the nineteenth century and has developed for the most part since the formation of the American Library Association in 1876, largely in response to demands from public organizations, such as women's clubs.

School district libraries, supported from public funds and housed in the local school building, were authorized by law in New York in 1835 and adopted in a number of other states; but by 1870 most of these collections had deteriorated for want of efficient administration. The Boston Public Library was the first public library in the United States to be established by state legislative enactment (1848). The act was extended in 1851 to embrace Massachusetts; other states followed and by 1933 none was without some form of library law. State acts now usually specify the amount and character of the tax to be levied and provide for the creation of a library governing body.

State or provincial library extension is carried on by three main types of agency: the library commission, the state library and the library division in the department of education. The state agency helps communities wishing to organize libraries and offers consulting service to those already established. The lending of books directly to individuals without access to libraries is part of the agency's work. Interlibrary loans among the state libraries are common practise.

The majority of American county libraries were established by the campaigning of state agencies. From the middle of the nineteenth century sporadic efforts were made to establish county libraries, but the first effectual system of county libraries developed in California, about 1909. The California library law of 1911 influenced legislation in other states. Yet in 1932, of 3072 counties in the United States, only 231 had county libraries. The county library seeks to overcome obstacles of distance and isolation by utilizing branches, stations, school deposits, mail service and book trucks. Library activities within the county are directed by a librarian who administers the central book collection and encourages the establishment and efficient management of town and village libraries.

There are now about 6000 public libraries of all types in the United States, reporting a total book stock of 66,000,000 volumes. Registered borrowers numbered 19,635,906 in 1929. Reports from public libraries in 33 cities representing one tenth of the population of the United States show that 81,591,423 loans were made in 1932, an increase of 37 percent since 1929.

The annual expenditure for public library service in the United States, about \$37,000,000, bulks large beside the figure for 1876, \$518,548. but small beside the annual cost of public schools, about \$1,580,000,000, or of colleges and universities, about \$128,000,000. The average per capita expenditure in cities with more than 200,000 inhabitants is \$.71 and for the general population (including non-library areas) about \$.32.

While there are no rigid requirements for employment in libraries, in general four years of college or university plus one year of library school training are required for senior assistants. There are now in the United States about 40 library schools, offering one or two-year courses. Some states require certification of library workers by state authority. Library schools have helped to systematize library procedure and to develop a professional consciousness.

Since its establishment in 1876 the American Library Association has promoted the founding and improvement of libraries. During the period 1876-1933 membership increased from 103 to more than 13,000. The association has served as a central bureau to which individual libraries might apply for counsel. Its activities are performed largely by volunteer committees. There are 68 state, provincial and regional associations in the United States and Canada (37 affiliated with the A. L. A.) and 40 library clubs.

With the democratization of library support the book collection has become accessible to all. At present, although public non-circulating reference collections still exist and many libraries find free access inexpedient, the general practise is to lend any book when the occasion seems to warrant and to grant accredited readers free access to the shelves. Public libraries have greatly simplified their systems of registration and lending. Many libraries, like those of Boston and Philadelphia, still hold the bulk of their book stock in a central unit; but there is a tendency to divide the collection among subject departments, as in Cleveland, Los Angeles and Baltimore.

In many towns and cities the public library supplies information to local businesses, industries, the local government, professional workers and the press. Some libraries offer special reference services for business men, and several, like those of Newark and Boston, have established special branches for their use. Agencies to extend the municipal library's work within its territory are of three general types: the branch library, the distributing or deposit station and the delivery station. A few libraries serve hospitals and prisons.

During the past forty years public libraries have attempted to provide for individuals whose requirements are not met by the traditional type of book collection. Some libraries have established collections of books for the foreign born; raised type books for the blind; music, including piano and gramophone records; pictures; maps; motion picture films and stereopticon slides. Systematic library service for children dates from 1890, when the Brookline, Massachusetts, library opened a separate children's reading room. In most large public libraries the children's department or building is independent of the main collection and in charge of a separate staff, supervised by a special librarian.

In many cities public libraries supply elementary schools with books approved by teachers.

The practise of sending library books into the classroom and the establishment of public library branches in schoolhouses led, about 1905, to the creation of school libraries. These have developed throughout the United States more rapidly than any other type of library, providing an increasing proportion of the teaching materials and seeking to stimulate reading beyond the curriculum requirements. School libraries are usually maintained by the school tax funds; in some cities they are administered by the library board, in others by the school board.

RICHARD H. HART

Social Implications of the Popular Library. The foregoing discussion suggests two major functions of the modern public library: to preserve publications useful to posterity which may soon be out of print, and to supply cheaply either the current publications which the patrons prefer or those which public officials consider best for them or both.

Any evaluation of the custodial function of the library must take into account the many fields of scholarship affecting social processes indirectly through the mediation of students who work with out of print books from public libraries. No such consideration can be attempted here. But the fact should be emphasized that the social importance of the custodial library function is not defined by the number of such students in each field. To have supplied but one creative scholar with necessary materials otherwise not available may abundantly justify the community in taxing itself to preserve books. The relative demands upon such collections in each field should, however, show how many of each are needed in a given geographical area.

Because its present implications are only now being scrutinized and because it affects the community far more directly, the second function of the library, that of circulating contemporary, non-technical publications, deserves special consideration. The nature and scope of the popular library as a social institution is best described in terms of popular reading. In most communities the library is but one of several distributing agencies. Hence an estimate of its social importance must attempt to answer such questions as the following: to what extent is the community a reading community; what proportion of the readers patronize the library; how fairly do the library patrons represent the different cultural groups constituting the community; how do the ratios between library reading and read-

ing matter obtained from other sources vary from group to group; and how do the current publications circulated most widely by the public library compare with those available elsewhere?

The status of reading in any community in relation to the status of other forms of information and recreation, such as the radio, motion pictures, lectures, museums, discussion clubs and educational institutions, has been found highly variable. Some communities in the United States, not conspicuously illiterate, do very little reading beyond the daily press, in which they turn to notices of positions to be filled, sport news and comic strips; this is largely the case, for example, in south Chicago, a community of 73,000 dominated by the steel industry. Other communities, even those in rural districts, show a high per capita consumption of reputable books, as, for example, the Fraser valley in British Columbia, populated mainly by British and Scottish immigrants. Other countries show much the same variation in the local status of popular reading.

Such variations inevitably affect the status of the public library, since they affect the patronage per capita and therefore the financial support. In themselves the variations interest the social scientist, since trustworthy indices of the amount and character of reading by different population groups in typical communities from year to year go far to explain both the direction and the rate of social changes that involve facilities for intergroup communication.

The public library, like other reading agencies, is greatly affected by the class consciousness of different social elements, which tends to produce a different literature for the groups in conflict. This fact is highly significant when the popular library is regarded from an international standpoint. It suggests that the public library, as known in the United States, may be most efficient in the small town, where all residents wish to read much the same publications and find it more convenient and less expensive to borrow them than to buy them.

Where class consciousness combines with a broad range in educational and vocational status to produce wide differences in the reading preferred by different social groups, the tax supported library tends to attract readers friendly or indifferent to the existing government and to compete with other popular libraries supported by the various minorities composing the opposition.

Such competing libraries were perhaps most numerous in Germany from 1925 to 1932, when several cities supported independent chains of popular libraries maintained by the municipality, by two or three religious denominations, by at least two political parties and occasionally also by labor unions. In the aggregate such libraries served a considerably larger proportion of the community than is usually served by the single public library in England or in the United States. The social tensions producing so many competing library systems in each large city were further emphasized by the number and activity of competing commercial distributors—witness several subscription book clubs, many specializing in a particular field of political, occupational or recreational interest; two or three magazine agencies delivering ten or more of the best magazines at club rates, the scale of payments running as low as one mark for magazines a month old; libraries maintained for their personnel by many commercial and industrial establishments; a dozen or more endowed libraries in special fields of art, scholarship and industry; a few private libraries supported by paid memberships; numerous rental libraries, ranging from the detective novel variety to those specializing in different non-fiction subjects; newspaper reading rooms in connection with unemployment insurance centers and as many news stands and bookstores per capita as are customary in the cities of western Europe.

Much the same complex of libraries and other distributors exists today in Austria, Belgium, Czechoslovakia, the Scandinavian countries and Switzerland. With so many sources available it is plain that the tax supported library supplies but a small part of what the community reads. From the standpoint of social organization the municipal public library faced with such competition is perhaps more important as a vehicle for official attitudes toward contemporary culture than as a source of information on problems confronting the reader at large.

The library, however, comes again into its own under one-party or totalitarian governments, which by the very rigor of the censorship imposed on minority factions tend to complete the cycle and restore to the library the social prestige that it sometimes enjoys in the small, likeminded town. Examples of such censorship are found today in Germany, Hungary, Italy, Yugoslavia, Soviet Russia and other states of similar political complexion. It should be noted that under such frankly partisan auspices the

public library, as in the Soviet Union, sometimes reaches its maximum efficiency and importance in the education of adults. Its purpose in the last named country is to familiarize the citizen with Marxist principles as applied to his particular vocation. Soviet libraries are organized on a strictly vocational basis and are attached to individual factories, farms, labor unions and other occupational organizations. Their singleness of purpose simplifies and renders more efficient the selection, advertising and circulation of publications to a degree that public librarians in other parts of the world may well envy.

To compare the status of the popular library in the Latin countries of France, Italy, Spain and South America with that in other countries of western civilization is to recognize the fact that certain folkways are friendly and others unfriendly to the public library idea. Generally speaking, the Latin peoples support libraries either to preserve and supply publications of recognized literary excellence or to supply books of religious or ethical import to readers who are too poor to buy what they may prefer. Those who can afford to follow their own choice buy their books in the stalls or import them, and value the privilege of exercising their individual tastes above the opportunity to obtain at lower cost the publications preferred by a majority of their neighbors.

Thus the popular library as a public institution is acceptable to any community in so far as it ministers to the community as a whole and supplies all the publications that the residents are disposed to read. It may therefore be asked how far this standard is met in typical communities and to what extent the public library should attempt to meet it.

The extent to which the tax supported library may serve the entire community is perhaps best shown by comparisons between the representation of occupational groups in the total population and in the library population. Such comparisons may be illustrated most aptly in large American cities, wherein the single, tax supported public library system has undoubtedly reached its largest dimensions. A study of library registrants by occupational groups in one district of a large metropolitan area revealed that in 1932, 57 percent of the registrants were students, although this group accounted for only 16.5 percent of the total population in the cities studied. Housewives, the next largest group, constituted less than 14 percent of the borrowers

and 27 percent of the population. The skilled trades supplied only 6 percent of the registrants but represented 17.2 percent of the population. Clerks, stenographers, bookkeepers and salesmen made up 11.2 percent of the borrowers and 12.5 percent of the population. Professional men and women accounted for 7.5 percent of the registrants but only 3.4 percent of the population. Unskilled labor represented 1.6 percent of the registrants and 6.8 percent of the population. An unclassified group accounted for the remaining 2.9 percent of the borrowers and 16.6 percent of the population.

The questionable validity of libraries' reports showing the percentage of the general population patronizing the public library is suggested by the wide variation in the proportions of the patronage borrowing different numbers of books per year. It has been found that 73 percent of the withdrawals in one year were made by 10 percent of the clientele. In the same year half of the registered borrowers were responsible for less than 2 percent of the withdrawals.

From the foregoing description of the contribution to community reading made by one of the most highly developed public library systems of the world it may be inferred that the library's social effectiveness as a vehicle for contemporary ideas varies inversely with the number, distinctiveness and self-consciousness of minority groups. The description suggests also the large benefit to social studies that may be expected from research in the problems of community reading as such, of which the public library is but one and seldom the largest source. Such research should serve to define the public library's role in communities forced by economic considerations, as most of them are, to base library appropriations either upon the distribution of community patronage or upon evidence of the library's usefulness to existing governments in maintaining the status quo.

PUBLIC MONOPOLIES. See MONOPOLIES, PUBLIC.

PUBLIC OFFICE. Any discussion of public office must begin by noting the confusion attending the use of the term and its equivalents in other languages. Public employment (*q.v.*) embraces office, but it is recognized that governments may have agents who are not officers. In all countries this assumption involves a problem of demarcation which varies in perplexity with the constitutional situation. Much of the difficulty arises from the fact that the terminology and the precedents relied upon in interpretation developed before public administration had acquired its present scope and complexity. It is necessary to exclude from the concept of public office the activities of those who, although designated by the state and in a measure supervised by it, serve ends which are essentially private, as is the case with guardianship and various relations in the administration of property. So far as concerns functions traditional in the civil law, the theory of separation is fairly clear; but in other directions the ramification of modern administration in autonomous and novel forms of management is likely to present afresh the question of distinguishing quasi-public and public positions. Within the fields which are patently public a realistic view must differentiate three categories of persons: first, the changeable group who, whether chosen by election or

appointment, are the means by which electoral forces control major governmental policies; second, the larger and more stable group of those who work under conditions standardized by laws and regulations; and, third, a heterogeneous fringe, ranging from experts to day laborers, who are engaged upon formal or informal contracts similar to those in private employment. The legal concept of public office in part follows and in part disregards these divisions. All of the first group and most if not all of the second are considered to be officers, so that persons who differ diametrically in their relation to shifting political power and partisan purpose are brought under a common term. The line of demarcation between office and employment runs in general between the second and third group and so far respects real distinctions in tenure, security and discipline.

Upon the exact drawing of the line depends the application of numerous constitutional and statutory restrictions, safeguards, privileges and penalties. Clarification is urgently needed in most countries. In general it must be sought in the careful phrasing of statutory definitions. There is little excuse, for example, for the incomplete thinking and slovenly draftsmanship which have sometimes thrown on the courts the task of deciding whether a workmen's compensation scheme applies to persons whose employer happens to be the state. In view of numerous constitutional allusions to office, especially in the United States, judicial interpretation can hardly be avoided. The constitution of Illinois is unique in carrying its own definition (art. v, sect. 24): "An office is a public position created by the Constitution or law, continuing during the pleasure of the appointing power, or for a fixed time, with a successor elected or appointed. An employment is an agency, for a temporary purpose, which ceases when that purpose is accomplished." Elsewhere the verbiage of constitutions implies a difference without indicating the distinction. Nowhere therefore has the definition of public office been more difficult than in the United States. Nowhere has judicial discussion of the matter been so recurrent, so prolix and in general so unsatisfactory. The question has frequently presented itself in the application of penal provisions which are subject to the rule of narrow construction. The resulting tendency to restrict the meaning of the terms public office and officer might be viewed as unfortunate, or at least as useless, if it were not for the fact that a narrow

definition may facilitate the avoidance of constitutional limitations which would otherwise inconvenience the building of a modern administrative system. This can be understood from a brief review of some of the constitutional elements involved.

The Constitution of the United States prescribes four ways of choosing "officers": by the president with or without senatorial confirmation, by the heads of departments and by the courts. As a result emphasis is placed upon the manner of selection as a criterion in distinguishing office from employment or agency; this formalism can be traced through leading cases like *United States v. Germaine* [99 U. S. 508 (1879)] and *Burnap v. United States* [252 U. S. 512 (1920)], although a looser view is evidenced in *Steele v. United States* [267 U. S. 505 (1925)]. Furthermore the importance of the distinction is intensified where it is desired to devolve the appointing power upon some departmental authority other than the titular head or to give a non-departmental body control over its own staff. The increasing use of semi-independent administrative commissions would have made this need still greater if legal opinion had persisted in the early view that an organization like the Civil Service Commission could not be considered a department within the meaning of the constitution (17 *Opinions of the Attorney-General*, 504, 1883). Even with a more liberal construction of the term head of department, a restricted definition of "officer" may be useful in validating various exceptions to the national administrative hierarchy.

Although the references to office in state constitutions emphasize other aspects more than mode of choice, some limit the ways in which officers may be chosen [*Dade County v. State*, 116 So. 72, Florida (1928)]. In the development of a civil service moreover constitutional prohibitions against the creation of offices having longer than a certain tenure [illustrated in *State v. McLaurin*, 131 So. 89, Mississippi (1930)] or carrying compensation greater than a stated sum (in Kentucky, \$5000) make it desirable to perpetuate verbal distinctions as a means of partial escape.

A second important occasion for judicial definition of office in the United States involves constitutional and statutory provisions regarding the incompatibility of positions. Since these refer prevalingly to office, narrowing the term is often the most practicable way to relax the restriction. Some of the inhibitions of double

officeholding result from the doctrine of the separation of legislative and executive authorities; another important class concerns the administrative divorce of nation and states. The existence of the first type of prohibition brings governmental practise in the United States into striking contrast with that of Germany, where at times since the World War as many as one fourth of the members of the national legislature have been simultaneously connected with public administration in various capacities. In the United States, to be sure, the interdiction is not so complete that it precludes a high school teacher (whose position is held not to constitute public office) from serving in a state legislature [*Leymel v. Johnson*, 288 P. 858, California (1930)]. The second type of restriction interferes with the interlocking of national and state administration. The Constitution of the United States is silent on this point. A presidential order of January 17, 1873, to which numerous exceptions have already been made, was held to be a mere indication of policy for the guidance of those who exercise powers of appointment and dismissal (4 *Decisions of the First Comptroller*, 486, 1883). State constitutions, however, abound in provisions forbidding simultaneous service under nation and states. Sometimes these can be qualified if one of the positions involved is held not to be an office. Fortunately other methods besides direct appointment are available for weaving the fabric of cooperative federalism.

Constitutional provisions such as these, in addition to the ambiguities of old and new statutes, engender an endless process of definition. The basis of decision frequently lies in the particular setting of the situation in question, but always there is a pretense of abstract delineation. Several traditional criteria of office are available to the courts; sometimes they are used cumulatively, more often alternatively. An early, widely echoed dictum was that of John Marshall on circuit, holding that in the case of office the duty is a continuing one, defined by governmental rules and not by contract [*United States v. Maurice*, 24 Myer's Federal Decisions 34 (1823)]. Much quoted also has been a laconic utterance of the Supreme Court which, having declared that "an office is a public station or employment, conferred by the appointment of government," added that the term "embraces the ideas of tenure, duration, emolument, and duties" [*United States v. Hartwell*, 73 U. S. 385 (1867)]. Continuity, it is seen, has been especially emphasized as a characteristic of office

For this there is a realistic basis. In the form in which it has been developed, however, the distinction has not aimed at differentiating the group of shifting political personages (whose places continue) from the permanent mass of civil servants; rather it has been directed toward excluding from the peculiar privileges and penalties of governmental service the members of the transient fringe, such as laborers or persons engaged for special professional tasks under bilateral contracts of employment. The fact that the Constitution of the United States expressly forbids the states to impair the obligations of contracts has properly made judges cautious with regard to imputing a contractual character to public employment. In general it may be said that the rule of law of the English speaking world has paradoxically brought those who work for the state less judicial protection than is afforded by continental systems.

A less satisfactory criterion of office frequently mentioned by courts and commentators in the United States is the possession of some share in the exercise of sovereign power. This standard was emphasized, for example, by F. R. Mechem (*A Treatise on the Law of Public Offices and Officers*, Chicago 1890, sect. 4), the opposite view being illustrated in F. J. Goodnow's comment in *Cyclopedia of Law and Procedure* (vol. xxix, New York 1908, p. 1361-67). This test is related to the more thoughtful but hardly more practicable distinction between *fonctionnaires d'autorité* and *fonctionnaires de gestion*, urged notably by Henry Berthélemy (*Traité élémentaire de droit administratif*, 10th ed. Paris 1923, p. 49 *et seq.*). To pronounce the latter untenable of course is not to deny the importance to administrative law of distinguishing types of action; nor does such a view overlook the significance of various attempts on the part of public undertakings of an economic or cultural nature to give their personnel a non-official standing.

In addition to the hackneyed criteria already mentioned legal discussions of office have drawn upon ideas which are even more vague. It has sometimes been suggested, for example, that officers "exercise a function of government in their own right and upon their own responsibility" (7 *Decisions of the Comptroller General*, 582, 1928). This notion, which is rendered increasingly inappropriate by the growth of an integrated administration, was not so groundless when the conduct of public affairs was compartmentalized in the hands of a small

number of directly mandated individuals, many of whose positions were elective. Such were the conditions under which the doctrines of public office in the United States largely took shape. (For a discussion of state and official liability, see STATE LIABILITY.)

It has been admitted that the existence of various constitutional references to office in the United States may give value to distinctions which would otherwise be pedantic. This assumes that courts will have a vivid sense of the changing problem of political control in relation to professional administration. Realization of this sort has been conspicuously lacking. An illustration is afforded in the treatment given to the manager plan of city government by the highest court of Arkansas [*McClendon v. Board of Health*, 216 S. W. 289 (1919)]. The enabling statute soundly followed the theory of the plan in providing that the manager, as the instrument of a politically responsible council, need not be a resident of the city. The court, however, confronted by a constitutional stipulation that officers must have the qualifications of voters, was led by the stale language of old definitions to rule that the manager was an officer and as such must be a local resident.

In other English speaking countries questions of terminology, although uncertain, have been less troublesome. British statutes have frequently hinted at a distinction, as in coupling "officer or servant"; and the rise of joint councils in the civil service is vitalizing the idea of a difference between official and staff elements. In applying penal and other provisions, however, the courts have shown little interest in hairsplitting. "A public officer," it was said in *Rex v. Whitaker* [3 K. B. 1283 (1914)], "is an officer who discharges any duty in the discharge of which the public are interested, more clearly so if he is paid out of a fund provided by the public"; and it was added that "every officer who is not a judicial is a ministerial officer." Despite the sweeping terms of this somewhat tautological statement it leaves room for types of public employment resting on contract [illustrated in *Carpenter v. Bristol Corporation*, 2 K. B. 617 (1907)]. In the self-governing dominions usage varies widely. In Canada it tends to imply that officers, in contradistinction to clerks and other employees, are relatively important members of the civil establishment. In Australia, on the other hand, the term officer is broadly defined; the Commonwealth Public Service Act (no. 21 of 1922) extends it explicitly

to "any person employed in any capacity in the public service" except those temporarily engaged.

In Germany and in the countries influenced by its administrative traditions and juridical analysis the nature of office (*Amt*) has been the subject of much discussion, although the distinctions at issue remain extremely blurred. It is assumed that official attributes may be attached to persons independently of office; hence the possibility of the condition indicated in Germany by the phrase *zum Dienst*. Officers may be of lay character (*Ehrenbeamte*) or professional (*Berufsbeamte*). The importance of the latter has shaped the leading conceptions of the official relationship. This is seen as a status voluntarily assumed and elaborately regulated, in which elements of obligation and discipline are blended with those of security, including pension. With regard to stability and in view of the fact that their compensation and other conditions of service are not subject to arrangement by contract, the members of the main official body (*Beamte*) are distinguishable from two important although less numerous groups of public personnel: *Angestellte*, or salaried employees; and *Arbeiter*, or wage earners, who differ in turn with reference to the vague but socially crucial line between non-manual and manual work. The theory has assumed that in employing *Angestellte* and *Arbeiter* the state acts through individual or collective agreements like any private employer. Actually, however, two tendencies have been weakening the contrast between *Beamte* and the common group of *Angestellte* and *Arbeiter*. First, pension privileges have been extended to some *Angestellte*. Second and more fundamental, an approximation to the conditions of public and private employment is resulting from attempts to universalize security through schemes of social insurance and compulsory consultation of interests.

The trend last mentioned is interesting particularly in connection with the economic undertakings of modern states. The search for non-departmental, autonomous forms of administration has been motivated in part by the desire to avoid both the fluctuations of political appointment and the supposed inflexibility of civil service systems. Government owned corporations (*q.v.*) may accomplish this end. In the United States, where the quest for autonomy might be embarrassed by a broad definition of office, it has been held that employees, high and

low, of agencies like the Merchant Fleet Corporation are not officers of the United States [Dalton v. United States, 71 Court of Claims Reports 421 (1931), following United States v. Strang, 254 U. S. 491 (1921)]. In other countries, by devices involving control through stock ownership or otherwise, a non-official personnel has been secured in the conduct of many public as well as of mixed undertakings. There are obvious political obstacles, however, which are fortified by the argument that governments are now seeking to inject the ideals of civil service into private employment. It is significant that despite many movements in the direction of semi-independent administration for the government owned transportation systems of Europe, none has abrogated the official status of the main body of railway employees.

The attractiveness of official status, apart from the aspect of power, has rested partly in security, partly in prestige. The latter has been composed of many ingredients. It has varied inversely to the opportunity for private exploitation. Even where it has seemed weakest, as in the United States, office has still been sought by the members of all groups as a means of social recognition and leverage. When cycles of conquest pass, security is prized and public service is a haven; while at the top its lure is increased by the larger role of government as regulator and participant.

The new role of the state introduces fresh uncertainties in the analysis of public office. The practise of government by discussion through alternating political parties in the nineteenth century engendered few theories more important than the idea of a distinction between the responsible agents of an ever changing electoral will and a permanent, non-partisan body of administrators. In the United States this separation was long confused by the direct election of numerous non-legislative officers as well as by a lack of sympathy for specialization and stability in the public service. Recently the widespread establishment of the city manager in local government has been hailed as an evidence of the practical acceptance of the distinction between administration and politics. Experience with analogous institutions in other countries leaves the matter in doubt. Particularly in point are the professional *Bürgermeister* and their associates in the collegial magistracies of continental cities, who are chosen by the popularly elected councils. Qualifications of training are seldom disregarded, but even in

times which are not revolutionary these professionals have been selected with reference to their implicit sympathy with certain tendencies. It remains to be seen whether the dual classification of office conceived in a liberal period is suitable either for revolution or for the types of heavily burdened states likely to be established through it or to evolve without it.

PUBLIC OPINION. Although the term public opinion was a coinage of the late eighteenth century, a number of approximate equivalents may be traced to much earlier periods. The Greek concepts *ossa*, *pheme* or *nomos* were familiar in Athens and were even accorded on occasion a niche in the Hellenic pantheon; the Romans spoke of *fama*, *fama popularis*, *rumores* and, in the closing days of the empire, of *vox populi*. The mediaeval *consensus*, modeled on the stoic *sensus communis*, was repeatedly cited by jurists of both papal and imperial

camp as synonymous with the prevailing body of traditional opinion. At the beginning of the modern period Machiavelli called attention to the force of *publica voce, e fama*, and Shakespeare's Henry IV in apostrophizing "Opinion, that did help me to the crown" anticipated the phraseology if not the temper of the eighteenth century revolutionists. The civil struggles of seventeenth century England represent the first step in clarifying the nature and function of public opinion. William Temple in his *Essay upon the Original and Nature of Government* (written 1672) traces the source of political authority to the prevailing "opinion" as to the wisdom, goodness and valor inhering in the ruler, while Locke in his *Essay concerning Human Understanding* (1690) first sought to supply a juristic and ethical orientation for the phenomenon of public opinion. "The laws that men generally refer their actions to," he writes, "to judge of their rectitude or obliquity, seem to me to be these three. 1. The divine law, 2. The civil law, 3. The law of opinion or reputation, if I may so call it." From England the concept spread during the eighteenth century to France. Montesquieu's *esprit général* and Rousseau's *volonté générale*, the prototypes of the *Volksgeist* of the German romantic schools, may be considered rough approximations of public opinion. On the eve of the revolution the term *opinion publique* began to gain currency, particularly in Necker's circle, whence it gradually found its way not only throughout France but into the most treasured rhetoric of virtually all western nations.

Repeated usage, during the century and a half of democratic consolidation, has robbed the term of much of its initial incisiveness. Invoked with little discrimination by the astute politician and by the special pleader in all lines of public and semipublic enterprise, it has lost not a little of its richness of overtone. Suspected by the systematic historian, who seeks a less exploited substitute in such partial equivalents as "popular sovereignty," "conventions," "mores," "climate of opinion," *idées directrices*, *Zeitgeist*, it has been taken over as a rule by the journalist and social psychologist and in the process frequently stripped of many of its historical associations.

In the absence of a carefully defined set of connotations a great deal may pass as public opinion which in reality is merely the publicly expressed opinion of an individual or small group that happens to possess the knack of making itself heard. In an attempt to reach a

working definition a distinction should therefore be drawn first of all between public opinion proper and opinion which is voiced in public. The latter, essentially personal in character, strives to impose itself on the collective mind of the community, just as poems of a folk character, although the work of an individual poet, are able under certain circumstances to develop into genuine folk *Lieder*. Public opinion, on the other hand, is a deeply pervasive organic force, intimately bound up with the ideological and emotional interplay of the social groupings in which since the earliest times gregarious individuals have come together; it articulates and formulates not only the deliberative judgments of the rational elements within the collectivity but the evanescent common will, which somehow integrates and momentarily crystallizes the sporadic sentiments and loyalties of the masses of the population.

Analysis of the particular forces and processes which are instrumental in shaping homogeneous group attitudes and pressures calls for emphasis upon such broader social factors as the general level of civilization and the cultural media of expression prevailing at a given period; the racial and national characteristics of the group; the framework of political, legal and economic institutions within which the process operates; and the particular set of objectives toward which it may be directed. There are two main types of public opinion, the static and the dynamic. The static, which need not imply rigidity, manifests itself in the form of traditional customs, mores and usages and bears the same relation to the dynamic as costume does to fashion or customary law to parliamentary enactments. The preponderance of the one or the other of these types is determined by the larger social and economic relationships prevailing at a particular period. The static form is found as a rule in most agrarian and barter economies, such as prevailed in mediaeval Greece, Rome, Japan and western Europe. This essentially irrational complex of opinion coincides closely with the relatively unchanging preconceptions and sympathies of the masses of people. It was a collective consciousness of this type, an irrational consensus of opinion, that the traditionalists and mediaevalists of the romantic period sought to reinvoke in their formulae of *Volksseele* and *Volksgeist*. Dynamic public opinion, on the other hand, being predominantly rational in character, is built upon the cultivated arts of persuasion and systematic publicity and draws upon definite

historical events or contemporary happenings as the material for its propaganda and agitation. This type of public opinion flourishes in the crowded streets and squares of the city, where the life of the masses unfolds under the pressure of common intercourse and exchange of opinion during the daily routine of association.

The absolutistic state, whether theocratic or secular, rests most comfortably upon the static type of public opinion; and when the forces of dynamic public opinion threaten to predominate the absolute monarch, the tyrant or the dictator seeks through ingratiating proclamations or control of the agencies of publicity and education to draw their sting and to lull public opinion back into its static indifference. The static form of public opinion binds the individual to the customs and mores and to convention, which at the same time may operate as a check on the ruler and his ministers.

Dynamic public opinion, the product of the city, is in its workings and forms of expression incomparably more incisive and obtrusive. It is in a sense the creature of all that it creates; a lover endlessly wooing himself. Each new adherent changes the form of that to which he adheres; and new foliage is grafted on to the older branches. This dynamic process, which proved such a significant force in the age of Pericles and of Cicero and Caesar, came to predominate once again in the Renaissance with the reappearance of urban culture in the city-states of Italy. The intensification of urbanization and industrialism during subsequent centuries has gradually, despite the lamentations of the traditionalists and the romantics, submerged the older type of irrational consensus which prevailed during the Middle Ages.

Analysis of the forces determining public opinion in remote historical contexts is made particularly difficult by the fact that the earlier civilizations must be reconstructed, and in a manner necessarily incomplete and abstract, on the basis of the fragmentary records which happen to have been preserved. The popular reaction, for example, to the overthrow of the "ancient kingdom" in Egypt by the increasingly powerful provincial bureaucracy must be inferred from a few scattered poems of lamentation which give a passing insight into the religion tinged sense of oppression obtaining among certain sections of the population affected by the overturn. Similarly in the displacement of the older Sumerian civilization by the theocratic empire of the Babylonians and Assyrians the

force of public opinion, although it would seem in the light of the elaborately publicized accounts of the king's prowess in battle to have been recognized as a factor of some importance in the long series of revolutions and wars which continued to disturb the lands of the Euphrates and Tigris, cannot adequately be gauged from the few literary remains that have come down.

Among the Israelites, however, the emergence of the religious group known as the prophets went far toward articulating and canalizing the scattered forces of public opinion. Intent on preserving the inner unity and individuality of the Jewish state, religion and nation, the prophets directed a public appeal to the community of believers—echoing and intensifying popular attitudes in so far as these recoiled from contamination at the hands of heterodox neighboring tribes, deflecting and restraining them when they pointed toward a relaxation of native cult and ceremonial. In the market place and at the gates of the temple the early prophets spoke directly to the people. It was not until a comparatively late stage, in the days of Jeremiah, that the practise arose of stimulating and controlling public opinion through the medium of written pamphlets, which in passing from hand to hand could reach a wider and less ephemeral audience.

Whereas in the early civilizations of Egypt and Asia Minor religion and the state were intimately bound together, Greek civilization witnessed at a very early stage a strong tendency toward secularism. Even in Homeric times the pronouncements of the seers began to arouse a certain amount of skepticism. The huge pan-Hellenic festivals, by bringing together the various tribes and races of Greece, provided an opportunity for exchanging opinions and sifting the scattered news of the day. With the introduction of a money economy in the seventh century and the rise of slavery in conjunction with the development of industry the inhabitants of the town, waxing strong from newly acquired wealth, set out to break the hold of the nobility. In their various struggles against aristocracy and tyranny as well as in their reaction against the mystical otherworldliness of such cults as Orphism the aggressive citizenry of the towns, particularly Athens, developed an atmosphere of individualism conducive to the unhampered competition of opinions and ideas.

All of these tendencies served to develop a richer content of public opinion. The free play of opinion was still further stimulated by the

rule of Pericles, who instituted the principle of publicity for the diplomatic as well as for the internal political relationships of the Athenian city-state. In the radical democratic regime which followed his death the various rival parties resorted to every variety of popular appeal to gain a political following among the masses. Although the particular media of appeal were radically different from those of modern times, the Greeks may be considered the first great forerunners, here as in so many other spheres, of modern publicity methods.

The rise of an urban civilization, which constituted the chief prerequisite of this new technique, occurred in the Greek colonies of Asia Minor, which in many cases took over older oriental cities. Then in the western part of Greece proper the struggle for political independence caused the separate garrisons and villages to unite in forming a common unit of defense surrounded by a protecting wall. In these newly formed city-states the citizenry deliberated together and reached joint decisions in the communal assembly known as the *ecclesia*. In the market place, where as a rule these assemblies convened, oratory rapidly developed as the technique best suited to the manipulation of public opinion and continued throughout later Greek and Roman times as the most powerful instrument of political propaganda and agitation. Speculation as to the possibilities of the spoken word and of verbal rhythms and combinations developed into the formal art of rhetoric, which under the sophists dealt in increasingly subtle psychological terms with the role of oratory as a vehicle of popular persuasion.

Second only to rhetoric in shaping the opinions of the Athenian public was the theater. The populace, given in the main to conservatism and identifying itself unreservedly with the dramatic events happening on the stage, demanded of the tragedian sentiments and situations hallowed by legend and tradition and was not slow to evince its suspicion and impatience with those innovators, such as Euripides, who sought to reevaluate and to remold popular sympathies. Comedy, on the other hand, was less shackled by traditional attitudes and could offer, as in the popular plays of Aristophanes, a satiric distortion of the skirmishings and rivalries of the contemporary bigwigs of the *ecclesia* and the Pnyx. In the neighborly atmosphere of the theater and the agora there was little room for pamphleteering, and although the existence of numerous undelivered speeches of the later

Hellenistic period would indicate that these were passed around in manuscript form, the stimulation and control of public opinion continued to remain throughout predominantly oral in its methods.

The same was true during the greater part of Roman history. As long as the Romans were an untutored scattered peasantry there was little scope for publicity, and with the infiltration of Greek culture the traditional oratorical technique of mass manipulation exerted a preponderant influence. But even in the period between the retirement of Sulla and the accession of Augustus (79–31 B.C.), when this influence was at its strongest, innovations of a kind more adapted to the Roman setting were beginning to be felt. Although, as is evident from the fame of Cicero, oratory continued to enjoy the highest prestige and although increasingly strenuous, if not uniformly successful, attempts were made to realize the full possibilities of theater and spectacle, the pamphlet literature, which by the time of Caesar was assuming rather sizable proportions, began to occupy a place which it had never held in Greece. At the same time the potential value of history as a means of swaying public opinion came to be realized to an unprecedented degree.

But above all there developed in the highly organized and centralized Roman Empire a sense of the importance of news as a factor in the creation and direction of an enlightened public opinion. The magnificent system of roads and waterways facilitated the gathering together of information regarding political, economic and other events, a knowledge of which was essential for a realistic administrative and political policy. The supplying of news to interested parties had developed by the time of Cicero into a specialized profession. Official publications, designed to be passed around among a small group of public servants, were gradually expanded into the *Acta diurna*, which at first were limited to information regarding the daily proceedings in the Senate and in the Assembly. In 59 B.C. Julius Caesar decreed that these news sheets should be published and made available to the public. Although under the empire the Senate news was considerably curtailed, the decrees and addresses of the emperors, news of the court and information concerning marriages, divorces, charitable gifts and the phenomena of nature reached a wide literate public; and while they had comparatively little direct influence on the essential character of

political life, they were an appreciable factor in shaping the general pattern of public opinion.

With the fall of the Roman Empire and the northward shift of the center of civilization the urban culture of classical antiquity gave way to a predominantly agrarian system, characterized by small scale community enterprise and virtual absence of a money economy. The prevalent illiteracy, combined with the breaking up of the population into minute, widely separated groups, eliminated the basic prerequisites of an articulate public opinion and allowed free play to the unhurried forces of organic tradition and custom. The modicum of news and comment was carried from manor to manor by the wandering minstrels. It was not until the controversy between the Germanic emperors and the papacy had reached a crucial stage that any coherent attempt was made to play upon and arouse the sympathies of the scattered population. The church, more conversant with the tradition of the urban culture of antiquity, took the lead, usually through the pens of its more literate clerks, in turning opinion against its secular rival. But with the rise of the Hohenstaufens the power of the pamphlet began to be employed effectively against the See of Rome itself, as may be discerned most clearly in the antipapal verses (*Sprüche*) of Walther von der Vogelweide, at once the most gifted of mediaeval German poets and the loyal adherent of the emperor Frederick II. Moreover with the decline of the mediaeval ideal of universalism warring factions within the church itself rapidly came to appreciate the value of the written word as a means of turning opinion against their adversaries.

The increase of tracts, pamphlets, sermons and satires, stimulated by the rapid process of urbanization which set in during the closing centuries of the mediaeval period, was multiplied many times over by the invention of printing, which opened the way to undreamed of possibilities in mass publicity. Through the printing and reprinting of pamphlets Luther and his adherents in the Reformation were able to reach an entire nation and even to penetrate to the remote quarters of a continent. At the same time the role of public opinion was magnified through recognition of its nature and through the development of a more precise definition and nomenclature for the various media of expression. In the form of sermons, dialogues, prophecies, letters—sometimes illustrated with woodcuts and etchings—pamphlets and books of varying sizes were peddled among the people

by traveling booksellers. As a result of the need for more comprehensive and active news on the part of the early capitalistic entrepreneurs a system of commercial news letters, reporting on commercial transactions at home and abroad, was evolved by the merchants. The function of supplying this information came to be assumed in many cases by a special professional group which in return for a stipulated sum of money dispatched this information regularly to their employers at home.

At the end of the sixteenth century such manuscript bulletins were familiar in Germany and Italy, and by the beginning of the next century they were being printed and made more generally available. The earliest known published news letters of this kind appeared in 1609 in the trade centers Augsburg and Strassbourg, whence they spread rapidly throughout Germany. The first English newspaper was founded in 1622; and nine years later, under the sponsorship of Richelieu, Théophraste Renaudot founded the *Gazette*. The great majority of these early news sheets were filled with a medley of items from abroad, since the censor was little disposed to tolerate any publicity regarding the internal policies of the home government; domestic news, in so far as it circulated at all, was confined to the surreptitious news bulletins which passed from hand to hand and were disseminated in the provinces by special messengers. A more widely influential factor in the shaping of public opinion in the early days of journalism was the rise of literary and scientific periodicals, such as the *Mercur galant* (1672), *Philosophical Transactions* of the Royal Society (1665) and *Journal des sçavans* (1665); while the moral weeklies which sprang up throughout Europe in imitation of the English *Tatler* (1709) and *Spectator* (1711) were of prime importance in forming the cultural taste and social attitudes of the rapidly growing middle class reading public. Another important stimulus to the development of a literate public opinion was the increase in the number of commercial news sheets, which assembled information on sales and purchases and which were accorded the patronage and protection of the mercantilistic statesmen in charge of public policy.

Public opinion in its modern democratic and parliamentary guise (see DEMOCRACY; PRESS; PROPAGANDA) first became manifest during the struggles for political and religious liberty in seventeenth century England. One of the early pioneers in this movement was John Lilburne,

the leader of the Levellers, who both as a pamphleteer and as a personal leader made repeated use of the tools of propaganda. During 1648 and 1649 the Levellers possessed in the socialistic *Moderate* one of the earliest periodicals devoted to political agitation and the stirring up of public opinion. The expiration of the Licensing Act in 1695, by inaugurating a regime of freedom of the press, still further prepared the way for the articulation of public opinion; while the partisans of Junius in their successful defense of freedom of the press against the ministers of George III were able, with the assistance of an aroused public opinion, to establish this principle as a sacrosanct feature of British political life. The dynamic power of a vigorous and self-conscious public opinion was fully recognized a few years later by the American colonists, who repeatedly invoked it not only as a means of cementing political sentiment in the early stages of their uprising but as a recruiting slogan and battle cry in the later campaigns, when morale showed signs of running low. The democratic movement in France in its prerevolutionary phases relied in the main on pamphleteering, which assumed unprecedented proportions; but after the removal early in 1789 of existing restrictions on freedom of the press, newspapers, supplemented by caricatures, theatrical spectacles, processions and orations, proved the most effective means of whipping up and directing the opinions of the restless Parisian masses. Just as no political leader could maintain power without strong newspaper connections, so, on the other hand, the editors of newspapers came to assume a dominant role in legislative deliberations and decisions. In the French Revolution public opinion was worshiped as a sort of beneficent deity, which in the mythology of both rulers and subjects was to bring them surcease from their social and political travail. Although this faith led to no little disillusionment, it contributed profoundly to the democratization of public life.

The driving emotional forces latent in the anonymous masses were exploited still more systematically by the counter-revolution, above all by Napoleon, who in the pages of the *Moniteur universel* and a few other rigidly censored gazettes sought to build up and harness for his own program the political and military élan of the people. A sense of the deeper significance of public opinion began gradually to be felt among the peoples overrun by Napoleon. Joseph von Görres, the most virulent of the anti-Napoleonic

publicists of Germany, sought in his *Rheinischer Merkur* to arouse the wrath of his compatriots against the foreign oppressor.

In spite of the manifold attempts of the Metternich regime to silence once again the restless forces of public opinion its vitality as revealed in the period of the bourgeois revolutions was too powerful to be restrained; the popular uprisings against the representatives of the Holy Alliance in Spain and Greece and Italy struck a sympathetic chord among the unprivileged, resentful masses of Europe. The abiding conviction of the masses as to the role they are destined to play as participants in the conduct of the state is a direct outgrowth of the bourgeois revolutionary emphasis on public opinion. This conviction has become so deeply rooted in the popular consciousness that even the conservative forces, which have clung desperately to the static tradition of community consensus, have been compelled, especially in the field of diplomatic relations, to make a compromise with the more dynamic forces. In the antidemocratic regimes which have sprung up since the World War in Russia, Italy and Germany the democratic myth of a dynamic, rational public opinion has been zealously and systematically exploited. It may thus be said that throughout the entire western world public opinion serves, on the one hand, to render the acts of the administrative authorities comprehensible to the body of subjects and, on the other, to impress upon the administrators the sentiments and will of the general public.

The popularization of the press, particularly in England and France, accompanied by the rapid spread of elementary education, gave to the newspapers a far greater hold on public opinion than they had enjoyed in the days when they had perforce divided honors with the cheap pamphlet. Although the revolutionary disturbances of 1848 provoked a momentary recrudescence of the older type of specialized newspaper agitation, the industrial and social development of the succeeding decades—especially as regards greater technological facility in output and dis-

tribution—has transformed the press into an outstanding agency of mass amusement and incidental edification. In an age of syndicates catering to mass consumption and of monopolistic gathering of news from the four quarters of the earth the older personal relationship between editor and clientele has practically disappeared, and the appeal to public opinion becomes increasingly abstract, taking the form of indefinite catchwords or evasive pictorial symbols. In the appeal to the ear of the masses the same process of abstraction and depersonalization has been made possible through the perfection of the radio, which is coming to assume more and more of the functions of mass direction hitherto associated with the newspaper.

PUBLIC UTILITIES

GENERAL.....	CARL BRINKMANN
UNITED STATES AND CANADA.....	JOHN BAUER
EUROPE.....	CARL BRINKMANN

GENERAL. The term public utilities is commonly used to designate industries whose services, particularly in supplying electricity, gas,

water, telephone, street railway and bus transportation, operate chiefly within municipal areas, under municipal permits or franchises. In a

broader sense, both practical and theoretical, the term has come increasingly to include railroads, telegraph and other enterprises to which special public interest may be ascribed. Covering some of the most important and most heavily capitalized industries, the public utility concept also involves some of the most fundamental theoretical aspects of the modern economic system.

As in pure economic theory the old concepts of "competition" and "monopoly" recede before the rising importance of "monopolistic competition," so in modern economic practice the rigid distinctions between "private" and "public" economy become blurred by the blending of forms and interests. The theory of cooperation already embraced the conception of an intermediate economic form which was neither private enterprise for profit nor state enterprise for public benefit (*Gemeinnützigkeit*). The modern concept of public utility shares with cooperative theory the idea that there are forms of business enterprise midway between the "pure" principles of private and of public ownership; but as they developed later, were wholly capitalistic and dealt with other economic tasks than cooperation, public utilities have been more modest in their ideology and more experimental in their methods. The emphasis has shifted from the claim of serving the common good to the matter of fact statement that the goods and services produced by certain types of enterprise are more or less indispensable to the community. This situation is described by the American term "affected with a public interest" and by the German terms public necessity (*Gemeinnützigkeit*) and primary supply enterprise (*Versorgungsbetrieb*). With the shift in emphasis the assumption that "private," or profit making, concerns are unfit to serve the common welfare lost much of its interest. The public utility field is generally open to the initiative of both private enterprise and public administration; and while private enterprise has at least proved amenable to public control, public administration has in many ways lost the "virtue" of being per se the most efficient instrument of maximum economic benefit.

It is not necessary, however, to displace theoretical analysis in favor of a mere assemblage of historical or geographical facts. On the contrary, an international comparative study of public utilities reveals basic theoretical correlations of aims and forms of activity. The contrast between the American method of government

regulation of privately owned public utilities and the European method of government ownership and management may seem most easily explained by differences in the history and concepts of government and freedom of economic activity. There is undoubtedly some historical truth in this explanation. Yet government ownership is relatively highly developed in Canada in contrast to the United States. A deeper investigation brings out differences in the factors dominating the primary supply services (most important in developing the public utility concept) in a large colonial area and pioneer economy and in a more developed country with a dense population and conflicting interests. The different forms of government intervention in public utilities are not so important as the essential identity of the underlying economic forces and the aims of intervention.

The problem of public utilities includes, under highly developed, or "late," capitalism, the two theoretical problems of monopolistic bargaining power and "social cost" in their interdependent aspects. The theory of monopoly has not recognized sufficiently that a public utility proper, such as those providing traction, water, gas and electricity in a limited urban or rural area, probably comes nearest to representing the "ideal" case of monopolistic supply of a very rigid demand. Here there is usually a blend of "legal" and "natural" monopoly in so far as the franchise or concession granted by government, even if not legally exclusive, becomes so economically because of the requirement of large initial capital, which discourages potential competitors. But it will not do to attach too much weight to the apparently arbitrary character of such monopolistic positions. Even apart from the danger of attracting the public eye to their gains or malpractices, these enterprises do not correspond to the primitive concept of the monopolist who occupies a piece of land or a well and forces society to pay tribute for its use. It was the United States, not without reason, which gave rise both to the vulgarization of the classical theory of rent in the teaching of Henry George and to the new research devoted to "land and public utility economics" conducted by Richard T. Ely and his school. The comparative weakness of government and the strength of individual pioneering enterprise, particularly in the public utility field, naturally resulted not only in the making of huge profits but also in the assumption of great sacrifices and outlays by entrepreneurs. Cost of "preparation" and "tran-

sition" in the development of the land, transportation and the generation of power must under "colonial" conditions comprise a large part of those "social costs" which in older civilizations are as a matter of course borne by public instead of private agencies. But on a smaller scale it is likely that in older countries as well a new division of burdens and risks between public and private enterprise may accompany a transition from an old to a new system of transportation or other fundamental economic activity. Although the "labor creating" plans of most modern governments show that this division may be altered also in favor of public enterprise, the recent extraordinary profits of private enterprise in new industries may surely be considered as indication of a shift in its favor.

Settlement in large urban centers and the corresponding agglomeration of industrial life have more than all other factors decided what enterprises should be considered public utilities. It is not so much the supply of certain goods and services as their volume and continuity which have created the special problems inherent in utilities, especially with regard to municipal transit and electricity. The exploitation of minerals and other natural resources, being closely bound up with the rise of private capitalistic enterprise, has not received much consideration under the theoretical and political aspects of public utility. However, the part played by mediaeval and mercantilistic governments, for example, in German mining and forestry, has since exerted a deep influence upon the national economy; and German cartels in the basic industry, as unjustly condemned before the World War as praised in the period of socialization experiments, have set useful examples to other countries in the conservation of coal and oil. The public utility concept was in a measure implicit in the American legislation to conserve natural resources; this has become more explicit in the controls established by the National Recovery Administration over the oil industry and in the increasing demands that coal be considered a public utility.

Railroads, telegraph, radio broadcasting and oil pipe lines are among other exceptions to application of the public utility concept. Probably the reason is that these services are much more difficult to deal with than the public utilities with municipal or at most regional scope, although the extent of government control over the American railroads has virtually given them

the character of a public utility. In a broader sense of course the exceptions present quite analogous problems. In a federal government like that of the United States or Germany the question whether national or state control is preferable for developing and regulating interstate transportation systems automatically involves public utilities in the narrower sense, as they transcend by extension of service or financial interdependence the limits of single municipalities or states. From this angle the regulation or control of public utilities tends to merge into the larger economic and political problem of the regulation or control of the whole of an increasingly collective economy.

The power of private capital massed in great enterprises, whose relations to public interest and control lie at the root of the peculiar phenomenon of public utilities, is on the whole a key to most of the economic and social problems involved. The flow of capital from economically advanced to backward countries and regions has naturally preferred investment in comprehensive and potentially well paying projects in the field of public utilities or similar developments. Consequently the governments have always stood in some danger of being overshadowed by the power of massed capital, whether national or foreign; this is true particularly of control of Latin American utilities by capital from the United States. Yet curiously it is not always the economically most enterprising type of government which proves most able to limit or to exclude the monopolistic influence of public utilities. German municipalities after the war, for instance, forced out private capital through "socialization" of public utilities but soon had to readmit it in the form of loans mostly of foreign origin. On the other hand, the financing of public utilities by the American method of customer ownership must lead, by virtue of the prevalence of large industrial and administrative consumers, to something like the mixed companies prominent in Germany, particularly in the generation of electricity.

Regulation strives to limit the rate of profit in public utilities to that prevailing in non-monopolistic industries; in other words, to a rate that it is assumed would result under conditions of competition. This can be done either by government confiscation of or participation in "monopoly rents" or by the direct limitation of prices to what is considered either a fair competitive level or a fair return on invested capital. A form of confiscation or participation,

the American recapture system, was practically nullified in its application to the railroads because of the complicated series of costs, services and customers, which seems to have made examination of accounts almost illusory in theory and worthless in practise. The method of governmental fixing of utility rates, either directly or permissively, also presupposes at least theoretically certain ruling conceptions of the conditions of supply and demand. But it can claim not only a greater measure of protection granted to consumers, whose benefits from recapture are doubtful, but also the value of government's assuming a sort of joint responsibility with the utility for its market policies. The overstressing of government ownership of public utilities has recently led to unexpected and paradoxical results, such as the policy of German municipal utilities of simultaneously securing tax privileges from state and federal governments and increasing rates to a level equivalent to a high measure of indirect municipal taxation. It remains to be seen whether a third method of public utility regulation, by means of general and special sales taxes, may not only prove superior in the levying of rates but also give the widest possible scope to regulation.

CARL BRINKMANN

UNITED STATES AND CANADA. Although railroads in the United States are public utilities in the broad sense, their rates, financing and labor relations being regulated stringently and effectively by the federal government, they are not commonly included under the term utilities. This is limited mostly to local services such as electricity, gas, telephones and transit. These utilities occupy an important place in the national economy; as shown in the accompanying table, their plant investment in 1932 was placed at about \$24,000,000,000. If to the total is added the estimated investment in water systems and in publicly owned utilities, for which comparable figures are not published, the aggregate comes roughly to \$30,000,000,000, or approximately 10 percent of the national wealth. Public utilities absorb as much as 6 percent of the expenditures of American consumers. In the United States utilities are for the most part privately owned and operated. There is a considerable number of publicly owned electric plants, but, with the exception of several large municipalities, their size is small. There are few municipal gas and transportation systems. The situation is, however, different in the case of

water, about 90 percent of which is supplied through municipal systems.

ECONOMIC IMPORTANCE OF PUBLIC UTILITIES, UNITED STATES, 1932*

	PLANT INVESTMENT† (IN \$1.- 000,000)	GROSS EARNINGS (IN \$1.- 000,000)	CUSTOMERS (IN 1000)	EMPLOYEES (IN 1000)
Electricity	12,800	1,979	24,250	232
Telephone	4,725	1,065	13,000	325
Manufactured gas	2,135	411	10,000	67

The utilities have achieved their significance largely during the present century. Before the Civil War they were limited to bridges, turnpikes, canals and ferries, for which American legislatures granted special charters and enacted special laws. The modern utilities developed after the Civil War and have had their greatest expansion since 1900. This is true especially of telephones and electricity, which are by far the most important from practically every public standpoint. In the case of electricity and telephones the growth has been particularly striking since 1912. The number of kilowatt hours of electricity generated in the United States rose from 11,569,110,000 in 1912 to 76,885,000,000 in 1932, the number of telephones from 8,730,000 to 17,547,000. The enormous rise of 570 percent in electricity has been due primarily to technological advances, which have greatly reduced generating costs and have made it increasingly available for industrial uses. Electricity is and promises to be more and more the universal utility upon which industrial advancement depends. The increase of 125 percent in telephones has made the service essential to all business and to almost all homes. It extends beyond the local community and has become a national and international utility; consolidation and centralization of control have advanced with expansion—approximately 80 percent of the telephones in the United States are in the Bell System under control of the American Telephone and Telegraph Company, while a subsidiary of this company, the International

Telephone and Telegraph Corporation, has far flung interests all over the world.

The manufactured gas industry has made great but less striking progress, its output rising from 178,229,000,000 cubic feet in 1912 to 358,872,000,000 in 1932. Although supplanted by electricity for lighting purposes, gas has come into ever greater use for cooking, heating and industry. In contrast to gas and particularly to electricity and telephones, street railways have receded in importance, revenue car miles declining from 1,921,000,000 in 1912 to 1,785,000,000 in 1932. Street railways were introduced rapidly in the larger cities as horse car lines in the 1870's and 1880's. During the following decade they were consolidated into systems and electrified. Since the World War there has been rapid automobile advancement and competition; practically all extensions of urban transportation have been motorized, and street railways have to a considerable extent been replaced by buses. The substitution has been moving forward rapidly and is likely to increase its pace.

The history of utilities in Canada has been similar to that in the United States, although expansion has been less extensive, since Canada has a smaller number of large cities and industrial centers. In 1930-31 there were 1,654,000 electric meters in use, 1,402,000 telephones and 520,785 gas meters, while street railways covered 140,014,000 car miles—the figures representing both publicly and privately owned systems. In Canada the public systems figure more extensively; this is especially true of electricity, which in the province of Ontario is almost entirely publicly owned and operated. Electricity is noteworthy not only for its rapid strides but especially for type of organization and extensive hydroelectric development, the horse power having risen from 1,700,000 in 1913 to nearly 7,000,000 in 1931. The form of utility organization is similar to that in the United States, except in Ontario, whose famous and much debated publicly owned hydroelectric system was inaugurated early in the present century.

The Ontario system owes its origin in part to the large amount of available power at Niagara Falls, which in order to be used extensively had to be brought to virtually all Ontario communities through a comprehensive system of transmission. It was found that such transmission would not be practicable without a unified system, economical construction and management and low rates to consumers to stimulate use. Its success depended upon long

run considerations, without quick profits. Because of this fact and the large capital requirements the undertaking was not alluring to private interests; its realization depended upon public organization as a permanent instrumentality for the service of the province. The system consists of a public corporation, the Hydro-Electric Commission of Ontario, which owns practically all the generating and transmission plants in the province, with a plant investment in 1930 of about \$260,000,000. Municipalities and specially organized districts receive power at cost, which includes interest on bonds issued for plant construction, their amortization on a forty-year basis, depreciation, maintenance and other expenses. Current is distributed locally through systems owned and operated by the municipality or district, mostly under local commissions. Rates are based upon a system of cost accounting prescribed by the commission, covering the payment for transmitted power plus all distribution costs, including interest, amortization and expenses. The basic efficiency of the Ontario system has been a subject of violent dispute. Its most striking feature has been low rates and high consumption for domestic purposes. The charge has been made that for political expediency residential consumers have been favored at the expense of industry, but the author's own survey of the accounting methods fails to support the charge. On the contrary, for like conditions and service the rates to all classes of consumers in Ontario appear lower than those of private systems in Canada and the United States.

An important factor influencing the development of utilities is their extensive importance in other industries, in governmental activities and in social life. This prerequisite of a utility was clearly expressed in a decision of the Supreme Court of the United States [*Munn v. Illinois*, 94 U. S. 113 (1876)]. Another factor is the extensive use by utilities of streets and other public places, for which they require special franchises and the exercise of eminent domain. Such grants or privileges cannot be conveyed to private business; the conveyance itself recognizes the public character or creates and stamps the business with a special public interest. At the same time the requirement of large capital outlay, in permanent or long lived structures and equipment, virtually necessitates monopolistic organization within a given territory. Competition is difficult to achieve not only because of the physical limitations of streets and

nighways but also because of prohibitive capital duplication and insupportable costs. Legal differentiation has followed the technological and economic factors. The special status of utilities was recognized by law only after the abuses of monopoly had produced wide and outspoken discontent among users and when corrective legislation had been enacted. It was the abuses which brought about regulation. Legislation to prevent overcharges, favoritism and poor service was upheld as constitutional because of the recognized evils and the unique economic status of the enterprise. Legal recognition of special public interest was essentially a subsequent rationalization of, not a prior and abstract cause for, the establishment of regulation.

The earlier methods of public regulation, which arose out of the monopolistic character of utilities and the absence of government ownership, consisted of direct legislation, limitations by franchise and control by commissions without rate making powers. By the close of the nineteenth century experience had demonstrated that the prior methods of control, especially with respect to rates, had not been effective. In 1907 a new type of state commission appeared first in New York and then in Wisconsin; it was assigned the duty of controlling rates and of otherwise protecting the public interest and was regarded as an expert body with special powers delegated by the legislature. The new system was rapidly established throughout the country and was considered the best means of preserving the advantages of the "initiative and efficiency" of private ownership and management, while at the same time establishing control for the protection of the public. But during its existence of over twenty-five years, marked by great shifts in the price level, technological advances and obsolescence and transformation of organization within the utilities, the commission system has developed obvious inadequacies.

Utility consumers are commonly classified into four categories: industrial, commercial, domestic and governmental. The significance of the classification appears in all utilities, but it applies most directly to electricity. In the United States in 1931, 43,625,000,000 kilowatt hours of electricity were sold to industrial consumers, 13,543,000,000 to commercial, 11,737,000,000 to domestic and 2,994,000,000 to governmental. By far the largest consumption, nearly one half, was industrial, which is still

advancing rapidly. Although for other uses electricity is furnished under conditions of monopoly, the industrial use has developed in a largely competitive manner. The prevailing rates are therefore low; the average for the United States is about 1.5 cents per kilowatt hour. Managements have been left largely free to offer such rates as would induce manufacturers to use electricity instead of steam or other power. Consequently there are variations in rates which are not justified by production costs and which involve discrimination between customers. Commercial consumption is distinguished from industrial as to difference in kind of business, smaller average consumption and greater dependence upon the service. Except in instances of large office buildings and stores, electricity is virtually the only source of power or light available. Rates therefore are on a higher level, averaging about 4 cents per kilowatt hour, or two and a half times those applying to industry. Residential consumption consists mostly of lighting but includes also power for domestic electric appliances. Residential lighting was historically the first function for which electricity was developed, when costs were high and had to be absorbed mostly by this single purpose. But despite great technological advances and lower costs rates have remained relatively high because the service is furnished essentially under monopoly conditions. Domestic rates average about 6 cents per kilowatt hour, or four times the industrial average. The final class of consumption, governmental, is largely for purposes of street lighting but includes also other uses. Rates are established mostly through agreements between municipalities and companies and consequently vary widely, with the average at about 4 cents per kilowatt hour. Municipalities have usually felt compelled to accept the rates offered by the companies without adequate technical assistance as to reasonableness; but in recent years there has been a movement toward the establishment of independent municipal lighting, which in some instances has effected a reduction of rates.

It is principally against residential rates that public criticism has been directed. These have not only been high but have checked the extension of use for important domestic purposes. The average consumption amounts approximately to 40 kilowatt hours monthly per customer, or about 500 kilowatt hours a year. This represents mostly lighting and small appliances. Electricity is as yet employed but

slightly for larger domestic appliances, such as refrigerators, cooking ranges and water heaters, although their use would be stimulated by low and specially designed rates and moderately priced equipment. The installation of a refrigerator results in about double the average consumption for lighting and small appliances and an electric range adds over 100 kilowatt hours a month. In Ontario the average residential consumption among the municipalities using hydro-electric power comes to about 120 kilowatt hours per month per customer, three times the average for the United States. In Seattle, Washington, the average in 1923 was 30 kilowatt hours monthly; then the municipal plant introduced promotional rates and efforts, average consumption rose rapidly to about 100 kilowatt hours monthly, and about 40,000 electric ranges and nearly 10,000 electrical water heaters were installed. There are in addition other possibilities of increasing the consumption of electricity, including the electrification of railroads, highway illumination and especially rural electrification; but they involve long run considerations without quick returns, which do not appeal to the initiative of private enterprise.

The fourfold classification of use, industrial, commercial, domestic and governmental, is less significant for other utilities; the classes are not so distinct and tend to merge into one another. They also have a less sharp subdivision between competitive and non-competitive use; there is less scope for distinct promotional effort, especially with respect to rate schedules; nor is the extent of future expansion apparent.

Among the chief characteristics of the utilities are large and permanent capital requirements. As a rough average the total annual revenues derived from the sale of services amount to only 20 percent of total investment, equivalent to a turnover on capital investment of only one fifth. These large capital needs influence organization, methods of financing and public policy. Capital is largely embodied in fixed structures which are useless except for their special purposes. Increasing density of use makes for greater economy and lower costs; hence duplication of capital is particularly wasteful. An exception is bus transportation, which does not require large initial capital; moreover the property can be shifted geographically from one location to another and operation is not necessarily limited to one operator. These conditions make regulation despite its interstate aspects essentially a local affair.

The large demands for new capital require ready access to the principal money markets, for which large organizations are necessary. It was during the period of rapid capital expansion after the World War that combination of utilities advanced rapidly. Where two or more independent companies had operated within the same territory, the advantage of consolidation for economy, especially in financing, was obvious.

The force of consolidation extended beyond contiguous territory. This was true particularly of electricity, which offered special economies in large central station construction and output. The areas over which power could be transmitted economically from ever larger generating stations and interconnected transmission systems were steadily expanded. This expansion of territory had a similar effect upon organization. Because of special franchises and established financial structure consolidation is more readily effected through a holding company which obtains stock control of the local companies. Control is then pyramided and centralized by the combination of several such groups through a holding company of holding companies, with special affiliated corporations to carry out particular functions of management and finance. The entire United States is subdivided into more or less independent holding company systems, each system extending over a large territory and often including widely separated localities. While the development of consolidation and combination was based especially on the technological advances of electricity, it carried along also other utilities, usually gas and street railways. Another development was the combination, under holding company control, of electric, gas, water and traction utilities to restrict competition, make better use of managerial talent and enlarge the scope of financial manipulations and control. The most common combination is electricity and gas; but many great combinations, such as the Cities Service Company with assets of \$1,282,000,000, control in addition traction, petroleum and natural gas enterprises. The separate technology of telephone brought about virtually country wide unification without inclusion of other utilities. The American Telephone and Telegraph Company not only dominates the industry but produces its own equipment supplies through a subsidiary, the Western Electric Company.

These projects have been financed principally through security issues, special types of holding

company bonds and other securities resting chiefly upon the subsidiaries. The capitalization of the operating companies consists on the average of 50 percent bonds, or long term debt, and 50 percent capital stock. Investment out of surplus has been relatively slight, and for the most part the properties have not been supported extensively by reserves. The capitalization of holding companies is based mainly upon bonds, stock issues being limited in order to concentrate control. Because of their financial needs and general character the large holding company systems are usually dominated by the great banking houses, such as J. P. Morgan and Company, the Chase National Bank and the National City Bank of New York. The expected advantages of holding company issues have practically disappeared since 1929; new capital is available only through securities of operating companies, whose bonds in general have remained upon a relatively high investment basis. With the exception of street railways the utilities have proved to be of great stability, but the situation has been different with regard to the holding companies. Besides instances when the system has actually collapsed, as in the case of the Insull properties, the securities have suffered badly in the market, partly because of the unusually severe character of the depression which began in 1929 but also because of the excessive previous expansion, unsound financial structures and the generally reckless financial policy of managements. In the future operating company issues will probably be relied upon as the chief source of new capital.

The holding company systems were doubtless conceived upon valid economic grounds. If properly organized with due consideration for public benefits, they should have advantages not only in financing but also in economy of construction and operation. Sound policies can be developed centrally; the best financial, engineering, legal and administrative talent can be obtained at lowest cost; materials can be purchased at a cheaper rate; better labor policies can be established; and there can be better organization, planning, control and operation. Notwithstanding these attainable advantages the holding company systems have come into ill repute. The inherent good which might reasonably have been expected was exaggerated. The gains to be derived, consistent with public benefits, never were as great as was claimed by zealous promoters seeking profits. Extravagant expectations caused the emergence of numerous

promoters who competed with one another for control of properties. The costs of overbidding, inclusion of uneconomical units, excessive purchase prices and the profits of promotion and financing were included in the financial structures. Moreover the organizers failed to realize that subsequent rate adjustments would be incurred, since the properties are affected with a public interest and their operation and rates are subject to public control.

The basic defect in the utility holding company systems was the inherent conflict between private and public interest; prices paid through security issues were based less upon permanent earning power than upon the securities which could be floated and the profits which might be realized through financial transactions. As to continuing operating policy, control rested usually with a small group, far removed from actual operations and from contact with the public. The immediate advantage to the absentee management lay in obtaining the largest possible share in the revenues collected by the operating subsidiaries. Charges therefore have commonly been placed upon the operating companies without regard to the need, cost or public justification, under the guise of operating expenses and capital outlay. These arrangements, which promised huge and permanent profits, aroused public opposition as soon as they became known. During recent years their extent has been reduced, and in the future they will be increasingly limited to the cost justified for public purposes.

Public regulation of utilities has been established primarily to control rates and service (*see* RATE REGULATION). It is in these particular phases of regulation—in the constitutional right of government to fix rates and control service—that public utilities differ fundamentally from other businesses. Other phases of regulation are incidental and secondary. The powers and responsibilities of regulation, exercised mostly by the states, are fixed by statute and are usually vested in a special commission, known as the public service commission or public utilities commission or by some similar designation. It is the duty of these commissions to fix reasonable charges, although without specific direction as to the basis of reasonableness. They proceed through the process of judicial inquiry. Action starts upon complaint or upon the initiative of the commission; hearings are held and orders are based upon official records. The companies affected have the opportunity to be heard; the

consumers' side is variously represented by special groups or municipalities or by the commissions themselves. The latter therefore act in a legislative capacity in issuing orders, as courts in deciding between two contending parties and as representatives of the public in preparing and presenting evidence. In addition they exercise the administrative functions connected with regulation.

Regulation of service is concerned with adequacy and proper standards. It seeks first of all to assure that service shall be furnished according to franchise and statutory requirements and reasonable needs. It may require extension of lines and other plant construction and such other measures as will preserve adequacy and constancy of service. The duty of furnishing proper service is an outright responsibility of a utility, without dependence upon financial ability or adequacy of rates. Most commissions also have control over accounting, and they authorize the classifications under which both the capital and the operating accounts of the companies are kept. Usually they require companies to file annual reports including balance sheets, income statements with supplementary schedules of details and other statistical information. Sometimes the reports are supplemented by field inspections and on rare occasions by special audits. Some commissions have responsibility over new security issues, the extent depending upon the statutes. In the state of New York, for example, no utility company may issue stocks, bonds or other certificates of indebtedness of more than one year without prior authorization by the commission. Its approval is limited to purposes specifically stated. The object is to protect investors and to furnish a medium through which rate control may more readily be effected. In most states, however, control is less extensive and more perfunctory. Holding companies frequently succeed in evading it, since, not being local in character, they may issue securities independent of the public service commissions.

The actual work of regulation falls principally upon the technical staff. Commissions consist mostly of three or five members, usually appointed, more for political reasons than for special fitness. In some instances commissioners are elected. Aside from counsel and secretaries the technical staffs are for the most part appointed from competent lists. No commission, however, has ever had an adequate staff; usually salaries are low, and in some instances the

entire responsibility of regulation rests virtually upon a single engineer and an accountant.

The prevailing system of regulation, based upon state action, has been widely criticized because of its ineffectiveness. To a large extent it has failed to furnish the expected protection to consumers, it has not prevented huge losses to investors and has not kept the utilities directed consistently toward public objectives. There has also been some measure of conflict between regulation and taxation; the great yield from franchise, corporation and capital stock taxes has often obscured the larger public objectives involved in the regulation of public utilities.

The commissions have jurisdiction only within the states. Wherever properties furnish service in two or more states, the business becomes interstate in character and passes beyond state control; but the federal government itself has not established regulation within the interstate area of service. There has been, however, federal intervention of a judicial character. While the systems of regulation depend entirely upon state policy and are concerned wholly with intrastate properties and activities, the orders issued come under the jurisdiction of the federal courts, under the "due process" clause of the federal constitution. Hence federal courts have really determined the constitutional scope and limits of state regulation and have greatly hampered systematic state action.

When the regulatory statutes were enacted, the companies were almost all local and independent in organization. Jurisdiction of the commissions was therefore limited to operating companies. But the holding company and its affiliates have since assumed many operating activities outside of commission jurisdiction. The statutes have been variously modified in recent years so as to reach the operating relations of the local companies. The problem is complicated by the fact that the holding companies are frequently incorporated in one state while their activities are spread over several states. This situation undoubtedly calls for more unified national regulation.

Utility legislation grants no power to commissions to regulate labor conditions. There is an obligation imposed upon utility managements to render adequate and continuous service, which makes stoppages because of labor disputes of immediate and direct concern to the public. Despite this situation the fixing of wages, hours and other conditions of labor has been left

entirely to managements, which are uniformly hostile to organized labor. Work in public utilities is highly specialized, whether in production, where machinery dominates entirely, or in distribution, where there is a union of machine techniques and personal service. This specialization limits the opportunities for employment because of the utilities' monopolistic character and renders competition in the labor market favorable to the employers. The bargaining power of utility managements is further strengthened by their refusal to accept unionism and collective bargaining. Company unions and welfare schemes are frequently offered as a substitute for independent unionism. Among the public interests labor requires consideration along with consumers and investors.

The chief defect of the prevailing system of regulation is its failure to fix definitely the relative public and private rights, to set clear public objectives and to establish exact standards and machinery through which rights and purposes may be systematically administered. Adequate yardsticks have not been determined. Most commission actions involve conflicts of interest between the companies and the public. This applies especially to rates, which have not been adjusted to changing conditions. The clash of interests in the existing regulatory methods has produced collateral results of an antisocial character. It has induced utilities to engage in unsavory political intrigues and propaganda, to prevent the reasonable use of experts and to thwart desirable public objectives. It has largely shifted the valid cooperative functions of national and state utility associations to the glorification of private as opposed to public ownership. These activities are a danger to the utilities themselves, because they lead to public resentment.

The task of regulation and control is to establish exact rights and duties, with definite standards and administrative provisions, so that rates may readily be raised or reduced without conflict and so that any other action on behalf of the public may be ordered without risk to the valid rights of the company. Commissions should be charged with the responsibility of formulating and administering public purposes, not of deciding disputes between contesting parties. Such provisions of public control require comprehensive legislation, not only to safeguard consumers and investors but also to promote organization in harmony with general public policy and objectives.

Future organization and control will probably be determined largely with respect to electricity, because of its paramount importance in practically all spheres of business and social life. It will be essential for every state to establish comprehensive power policies as a fundamental public matter. If this is to be accomplished through private corporations under state control, the internal motivation of the companies must be shifted from private profit to public service. They must become essentially public corporations, organized and managed with respect to public objectives, without divergence between public and private purposes. If this is not brought about, there is the alternative of direct public ownership and management. It may follow the Ontario pattern. Through a special corporation a state may acquire and operate the generating and transmission facilities for the benefit of the entire state, while the local communities take over the distribution systems used only for local purposes.

The Ontario form of utility organization is in harmony with the technological relationship of the properties to state wide and local purposes. It furnishes the direct means of attaining public objectives. In any case existing legal restraints on the establishment of publicly owned systems stand in the way of reasonable consideration of alternatives. The setting up, however, of any form of public organization involves legal, political and financial difficulties. Because of these practical complications the possibility of reconstructing the system of public control and leaving the companies otherwise undisturbed probably furnishes in general a better course for the immediate future. Meanwhile the possibility of instituting effective control would be strengthened materially if legislatures were to canvass the utility situation in the light of experience and changed conditions. Action on these problems may be facilitated by the fact that public utilities seem to have reached the peak of expansion, earnings, new projects and consolidation. Limits upon expansion and profits may possibly make easier the imposition of more stringent and effective controls, particularly as expansion must be mainly of a character which would not yield quick profits and would probably require government aid.

JOHN BAUER

EUROPE. Government assumes a larger share in the administration of public utilities in Europe than in the United States. This appears to be

a result of two main factors: a historical factor, whereby European governments have associated their policies, ever since the advent of democracy, more closely with the ideas of their mediaeval and absolutist past; and an economic factor, involving the narrower space, as it were, left to national and particularly to international economic expansion and competition before the World War and more markedly since, requiring the aid or at least the coordinating activity of the state. Questions of public utility regulation in Europe can hardly be discussed without entrance into the wider theoretical field of state intervention in economic life generally.

Since the age of mercantilism there have been rather marked differences between western and central Europe, that is, between Anglo-French and German economics, as to the relative significance of state action and private enterprise; but common historical origins and later common needs led ultimately to a surprising similarity of methods of dealing at least with the most pressing problem of state regulation, the regulation of public utilities. Thus in France the old *étatiste* traditions of the monarchy and the revolution, thrust into the background by the age of private railway building and banking, have been revived by the new age of electricity. One aspect is the state's participation, by means of financial aid, in the development of hydroelectric power and in the electrification of fully one third of all French municipalities, which because of their rural character had developed neither municipal nor concessionaire services.

In Germany the towns, serving since the Middle Ages as the pioneers and models of public administration, have in recent years become dominant in supplying water, gas and electricity, despite the initiative of private and especially foreign enterprises during the greater part of the nineteenth century. Shortly before the World War 82 percent of the total German gas production was furnished by works owned or controlled by municipalities, a situation altered only recently by the development of long distance transmission of coke oven gas produced in conjunction with the mining of coal. But what the municipalities, after the failure of cities like Frankfurt and Cologne to control their own mines, are bound to lose in the production and distribution of gas public enterprise is steadily gaining in the field of electricity generation and distribution. Of the total German electricity supply in 1929 only 12.6 percent came from private enterprise; plants of the Reich provided

10 percent, of the states 10.6 percent and of the municipalities 32.8 percent, while mixed public and private ownership provided 33.2 percent. In some cases, as in the Rheinisch-Westfälische Elektrizitätswerk, ownership is predominantly private; in others, as in the Vereinigte Elektrizitätswerke Westfalen, ownership is in large part public. This mixed ownership includes local supplementary and distributive works as well as great central generating plants. Yet in Great Britain, where the municipality has not been so independent or the economic initiative of the central government so prominent, the municipal supply of electricity in 1928 (66 percent) was double the German figure, and while only 40 percent of the gas supply was furnished by municipal works, 80 percent of the tramway services were municipal as compared with only 50 percent in Germany. For about a generation Great Britain has been the home of "municipal socialism."

Even more important than figures are the actual economic relations of public and private influence in the management of public utilities, whose most interesting features often escape statistical measurement. Between the one extreme and the other there is a great variety of blends and transitions, from the farming out of publicly owned enterprises through numerous forms of government participation in capital ownership or management to the different forms of government regulation of service, rates, securities, accounts and reports. Mixed ownership in Germany has not fulfilled the great expectations it aroused, probably because of the increasing ambitions of public administrations and the greater tax privileges accorded to purely municipal as against mixed concerns. Public ownership itself has been differentiated, according to whether an enterprise has remained part of the general public administration and its budget or has become a separate corporation, although still entirely publicly owned and managed. The organization as independent public corporations of the German national railroads and the post office in 1924 marks a definite epoch in the economic policy of a country in which precisely these enterprises had been important elements and financial props of the general imperial and state administrations. This example has been followed in varying degrees not only by railroad and postal services in Belgium, France and Switzerland but also and chiefly by all sorts of minor public services in Germany itself. The major aim of this develop-

ment was to save the services in question from financial and technical interference by state and municipal parliaments and their party politics.

Approximately the same stage of development has been reached in England from another direction. As an alternative to public ownership, the favorite device of utility organization is the public corporation; here, although ownership of capital is largely private, the return is limited to a fiscal interest charge and is thus assimilated to bond ownership, while management is placed in the hands of expert government appointees for the specific purpose of evading democratic party influences. This seems theoretically a better blend of the elements of "private" and "public" ownership than the older German system of merging both as private shareholders under an elective management. Large interests organized after this model include the docks of the ports of London and Liverpool and the British Broadcasting Corporation. From 1923 to 1926 radio broadcasting in England was under government regulation to insure "reasonable" service and dividends. Since then more intensive government regulation has been imposed. The broadcasting company is granted a ten-year franchise, which may be revoked and cannot be assigned or transferred; the postmaster general has absolute control over the service, which in a national emergency may be taken over by the government without compensation. It would seem therefore that monopoly under proper control and regulation is the most desirable form of public utility organization.

In the post-war struggle in Germany between public and private ownership and management of public utilities, the former has been favored by exemption from heavy fiscal burdens, such as corporation and sales taxes. The respective merits of the retention or abolition of the exemption privileges have been the subject of heated debate. The argument in favor of abolition, that the privileges, besides injuring private competitors, might easily help to weaken strict business accountability and thus make public enterprise inefficient, has gained even greater weight through the practise of German municipalities of fixing and maintaining utility rates which threaten to hamper the natural increase, if not to produce an actual decrease, in the demand for these services. It must be said in fairness, however, that this practise was not wholly the result of the spendthrift inclinations of municipalities; it was brought about also by the illogical reorganization of the German sys-

tem of taxation after 1919, which centralized the major part of the revenue in the imperial administration during a period when socialist programs and economic unrest were imposing heavy demands upon municipal finances. Of considerable economic interest are the various attempts, expressed in financial legislation, administrative measures and judicial decisions, to circumscribe the domain of privileged municipal enterprise in the public utility field by the concept of the *Versorgungsbetrieb*. Service falling under the concept of *Versorgungsbetrieb* were enumerated positively, as including water, gas, electricity, transit and harbor accommodations, or negatively, as excluding wharves, docks and shipping lines; or general positive and negative characteristics were enumerated, such as the dependence of municipal populations upon a particular service, which is curiously equivalent to privileging a monopoly. Because of the debate on the tax privileges of public utilities, recent decisions of the German courts in financial cases have revised in the opposite direction the old demands for tax exemptions of "public benefit" enterprises (*gemeinnützige Betriebe*) and have disallowed exemptions, at least where it can be proved that considerable net profits have been earned by an enterprise.

The emergence of monopolistic powers in connection with the public ownership and management of utilities is accompanied by another and contrasting development in this field, the international investment of capital. The "neutral" countries of Europe (Holland, Belgium, Switzerland and Sweden) with their favorable corporation and taxation laws and their abundance of capital, especially of foreign origin, have recently encouraged the formation of more than one great international public utility trust. But the leading countries, particularly the United States, have likewise extended their financial power over the utilities of other countries, not only indirectly, through their foreign investments and their banks, but directly, through such great utility enterprises as the International Telephone and Telegraph Company with its network of European interests and affiliations. There is an increasing use of the holding company to form pan-European combinations of public utilities, and some of the largest also have important utility interests in other parts of the world.

Public regulation of the activities of international public utility combinations, whether by national or international initiative and authority,

is indicated by many problems and developments. In a field so closely related to public utilities as the petroleum industry, with its complex transport problems and economic importance, the British government has already become a large shareholder in the Anglo-Persian Oil Company; Disraeli's purchase of the khedival shares in the Suez Canal Company was an earlier and bolder piece of imperial planning at a time when the problem of public utilities had hardly yet arisen. The history of the Italian Istituto Nazionale delle Assicurazioni, founded by Giolitti in 1912, records the intervention of a liberal government in order to control and combat the influence of foreign finance capital in a branch of business so traditionally private as life insurance.

The transitory boundaries separating the sphere of public utilities proper from the wider spheres in which the concept may possibly be applied are characteristic of the present stage of capitalistic economy in a society of civilized masses, even where these masses do not settle in cities with millions of inhabitants. Together with the mineral and other basic raw material industries the public utilities furnish the test cases in the battle between the old individualistic and the new collective principles of competition and enterprise. The situation indicates that this battle is not likely to end in clear victory for one or the other. While critics of private monopoly express a general distrust of interference by parliamentary democracy, debate as to the relative advantages of private enterprise and bureaucratic management is by no means settled. Conversion of the interests of shareholders into fixed charges, as in British public corporations, is feasible only in utilities where monopolistic situations have definitely destroyed the possibility of competition. It is suggestive that the economic theory and practise of Italian Fascism lays stress on cooperation between the individualistic entrepreneur and the controlling and directing state; thus, in accord with the similar English and German experience, even such great state enterprises as soil improvement and industrial reconstruction are organized as independent corporations under state control.

PUBLIC WELFARE. The term public welfare has come to be used in the United States as connoting certain aspects of the welfare of the public which are vested in governmental authority. Organized welfare, or social, work, as conducted under the auspices of privately controlled philanthropic agencies, is distinguished from public welfare, which may be called public social work. It must not be supposed, however, that any service rendered by a governmental agency and financed through public funds, such as paving city streets, for example, is a public welfare activity. The term has become arbitrarily restricted to governmental services rendered on behalf of certain individuals or groups within the public: namely, those who lack the means of subsistence; those who need protection because of their immaturity or incapacity; those who need to be guarded against various diseases and infections; those who are without adequate family or parental guidance; and those whose behavior constitutes a threat to the general welfare.

No more than the term social work, however, does the term public welfare possess absolute conceptual clarity. Both in theory and in governmental practise there is considerable variation as to the types of state activities which are to be regarded as "welfare" activities. The social theorists contend for an extremely wide conception. Thus Kelso defines public welfare as "that objective in social service which affords to the individual the highest degree of freedom of thought and action commensurate with the like privileges in his fellows," and Odum as "that very definite service of democratic government which provides organization, technique and means for making democracy effective in the unequal places." According to the first of these definitions the entire activity of government might be included in public welfare. Yet public education is usually set apart. Indeed the two concepts are so distinct that Odum remarks: "What public education was to the last half of the last century in the development of the democratic ideal, public welfare may well be to the first half of this century." Although public health is usually regarded as part of public welfare, it undoubtedly represents a highly specialized and distinct service, which opinion generally has accepted as a normal activity of

government for the benefit not only of the disadvantaged members of the community but of the general public as well. There is a distinct tendency for welfare services to come into existence in response to the needs of the least capable members of the community and then to be extended to larger and larger groups until the duty of serving the whole public is recognized, a tendency which explains in large part the indefiniteness and instability of the concept of public welfare.

Its underlying vagueness is reflected in the actual organization of the government departments. The sole concern of a public welfare department may be public health. On the other hand, its powers may be so wide as to include the conduct of legal aid bureaus, the inspection of tenement houses, the presentation of band concerts and the conduct of comfort stations and public baths. The fact moreover that a governmental department is called "a board of charities" does not necessarily rule out the probability of its control of very inclusive public welfare functions as well as others of a very miscellaneous character. Thus a board of charities may supervise a state fair.

While the various public welfare activities have existed in the United States for many decades, the concept of public welfare itself seems to be of comparatively recent origin. It may have been suggested by the term general welfare contained in both the preamble to and the text of the Constitution of the United States, which imposes upon Congress the duty "to provide for the common Defence and general Welfare." The latter term, however, certainly had a very restricted meaning. At most some of the founding fathers may have hoped to make it a justification for certain public improvements.

The concept of public welfare seems rather to have arisen as a substitute for the old idea of "charities and corrections." Public relief in the United States, developing upon the basis of the English poor law, had been entirely local until the 1860's, when the state boards of charities or charities and corrections began to be created, the first in Massachusetts in 1863. Later, with the development of social work and private social work agencies, it began to be felt that the idea of charities and corrections was too narrow to express the social functions of the state in a democracy. To the idea of charity as well as to its institutional embodiments a social stigma attached. It was held moreover that public social agencies should carry on work which was pre-

ventive as well as curative and reformatory. Although many social workers at first opposed government extension of social work services, they increased steadily in scope.

The first Board of Public Welfare seems to have been created by Kansas City in 1910. Since then the movement for public welfare boards has been widespread in all parts of the United States. They now exist not only for the municipalities and counties but also for the commonwealths (*see* INSTITUTIONS, PUBLIC). Centralization, however, has not proceeded beyond the state institutions, whose work remains unrelated to that of local agencies. There also has been proposed the organization of a federal department of public welfare to combine such services as the Bureau of the Public Health Service in the Department of the Treasury, the Children's Bureau in the Department of Labor and the Office of Education in the Department of the Interior, but the plan has been opposed partly on constitutional grounds and partly for reasons of practicality: it has been argued that no one official would be sufficiently competent to direct health, education, crime prevention, housing, child welfare and relief activities.

The concept of public welfare is based upon the broadest interpretation of the democratic ideal. Because of its own lack of definiteness it stimulates the continuous extension of public social services. But the role of public welfare in a democratic country, such as the United States, involves a somewhat paradoxical situation. The democratic assumption is inclusive, presumably, of the total citizenship; it would seem therefore that in a democratic state the social services which the term public welfare ordinarily embraces would be thoroughly integrated not only in the governmental machinery but in the popular consciousness. Until recently, however, the contrary has been true. Most social services in the United States, with the possible exception of education and health, have been initiated and financed by private contributions from individuals. Various factors have encouraged this tendency. The pioneering tradition has placed an unusual emphasis upon individual initiative and self-reliance, and the unprecedented accumulation of surplus wealth in the control either of individuals or of foundations and trusts has made the continuation of private welfare possible; so long as these large reservoirs of surplus wealth could be canalized into social services, there existed neither the demand nor the inclination to develop the agencies of public welfare.

Moreover the growth of centralized public welfare services was prevented by the existence of a high degree of local governmental autonomy and by the early suspicious attitude of social workers toward governmental relief and particularly outdoor relief, a position traceable in large part to the corruption of American politics and to the lack of opportunity for trained social workers to participate and direct the government services.

A particularly marked change has set in since the panic of 1929. Governmental departments of public welfare have enormously increased the size of their budgets and widened the scope of their activities. Indeed the drift toward public welfare and away from privately controlled and financed social services has been more pronounced during the past two decades than during the entire preceding century. In 1931 New York state appropriated the sum of \$20,000,000 for emergency relief, creating a Temporary Emergency Relief Administration to cooperate with local agencies in furnishing both home and work relief. Four other states, New Jersey, Oklahoma, Pennsylvania and Rhode Island, made large appropriations in 1931.

The provision of both indoor and outdoor governmental relief has been increasing despite the existence of narrow constitutional limitations, which survive from the period of the dominance of individualism. The limitations on state aid are of two types: the first prohibits local governments from appropriating, granting or donating money in aid of individuals—often, however, certain classes, such as the poor, the blind, the aged and orphans are excepted; and the second imposes limitations on state and local borrowing for such a purpose. In recent years, however, the decisions construing the constitutional limitations have been markedly liberal. It has been held that the prohibition of state aid to individuals was intended to apply only to attempts to foster business enterprise. The police power, which in situations of emergency has a wide reach, has also been invoked.

While the further extension of public social services in the United States seems probable, the future of the concept of public welfare itself seems less certain. In a state which has socialized its wealth it would lose all meaning. But it is possible also for public welfare to disintegrate as a general concept because of the autonomous and independent growth of the various social services. In addition to public education and health, child welfare likewise is already clearly

delimited as a form of social activity. Unless the governmental departments of public welfare succeed in securing a high degree of centralized control over the various social services, which in view of the extreme diversity of the problems with which they deal seems unlikely, the concept of public welfare itself is bound steadily to decline in importance, for it is not likely to endure as a theoretical conception apart from its recognition in governmental organization. Moreover the adoption of the various forms of social insurance, which at present are extremely limited in the United States, is bound to have the same effect, since social insurance tends to supplant the relief of poverty, the historical root of the public welfare concept. By creating individual legal rights social insurance undermines the welfare idea, which still carries with it a suggestion of favor. The tendency of this development, if it occurs, will be strongly reminiscent of the fate of philosophy, which once embraced almost the whole of human knowledge but with the independent development of the various sciences has lost almost all specific content.

In European countries state welfare activities emerged during the transition from feudalism to capitalism. In the mediaeval community the welfare of dependents, defectives and delinquents was conceived to be a responsibility of relatives, of the guilds or of the church. With the destruction of the economic and political power of the church the administration of charity became a state function. The need for it grew with the miseries of industrialism. In the period after the World War the demand for state relief became increasingly acute, particularly in such countries as England and Germany. In the latter country even the social legislation which had been continuously extended since the days of Bismarck proved inadequate. The deflation in Germany impoverished the whole middle class and led in 1924 to a reorganization of state relief. While previously the federal government had been accustomed to turn over relief funds to the local governments, the new law organized state and district welfare boards.

An inclusive concept of public welfare, however, is not recognized in all European countries to the same extent as in the United States. Yet the need for a broader term than "poor relief" has been quite generally felt, particularly since the impoverished were individuals who in normal times and circumstances would have been able to take care of themselves. Thus in England the term "public assistance" has become in-

creasingly common, while in Germany the terms *Fürsorgewesen* and *Wohlfahrtspflege* have tended to displace the old *Armenwesen*. Both the former terms, which antedate the war period, having apparently been invented in the post-Bismarckian period of social legislation, are now often used interchangeably, since the definitions of few writers agree. *Wohlfahrtspflege* seems to be the broader concept, and *öffentliche Wohlfahrtspflege* approaches most nearly the American concept of public welfare. Indeed Germany is the one European country which has a more extensive literature on the subject than exists in the United States.

Finally, various welfare activities are conducted under international auspices. Although some of these, particularly in the field of public health, antedate the war, they were rather limited in scope until the creation of the League of Nations. The League now has a Health Organization as well as a Social Questions and a Traffic in Opium section. In the post-war period of disorganization it did much for the repatriation of war prisoners and the relief of refugees. It has also concerned itself with the traffic in women and with child welfare. The work of the International Labor Office likewise has had an important influence on social welfare activities in many countries. Public welfare is thus no longer a purely national concern.

PUBLIC WORKS. The term public works covers all construction projects undertaken by governmental agencies, national or local, and financed out of public funds. This includes construction work performed by autonomous bodies which are creatures of governmental agencies, such as the Port of New York Authority or the Port of London Authority, the British Central Electricity Board and the New York-New Jersey Tunnel Commission. Construction activities of state owned but independently operated transportation systems, such as the railroads in Germany, come within the same category. Some types of building, notably schools, fall partly into one, partly into the other class. Similarly public utility projects may be either private undertakings, as are the great bulk in the United States, or public projects, such as municipal power plants and the Tennessee valley development.

The aggregate volume of public works has increased with the material and technical advance of mankind, although discontinuously with the rise and fall of great civilizations, being clearly greater during eras of high material achievement than in earlier periods of growth and later ages of relapse or decay. Until perhaps the eighteenth century the amount of public building in the western world could hardly have been equal to that of the Roman world in its prime. With the spread of the industrial revolution private and public building alike must have expanded rapidly. Yet in the earlier stages of this process of economic transformation the

relative volume of public works may well have declined, as the economic functions of government were narrowly circumscribed under the influence of the dominant doctrine of *laissez faire*. With the decline of this economic philosophy, however, and with the progressive assumption of additional economic functions by the state the volume of public works has grown both absolutely and relatively to private construction.

The scope of public works has undergone modifications with a number of factors. Different civilizations spent their public funds on dissimilar construction projects, although there is a surprising continuity in the fundamental nature of many public works. Even in particular periods the nature of public works expenditures varies as between different countries. Greece spent a great deal on temples and public buildings and relatively little on sanitation. The drainage system of Athens was inferior to that of prehistoric Crete and of Rome. More important than this difference in scale of values is the obvious influence of the geographical nature of the country upon the type of public works undertaken.

The scope of governmental public works projects also varies as between different countries today, according as they tend more or less to adopt the method of government ownership of public utilities and other economic activities (see **GOVERNMENT OWNERSHIP**). In those countries where social legislation has been carried further than in the United States notable slum clearance and municipal housing schemes have been put into effect wholly or in part with public funds. In backward and newly developing countries the proportion of all construction undertaken by governments is likely to be relatively larger than in advanced industrialized communities. The limiting case of public works is afforded by the Union of Soviet Socialist Republics, where with the elimination of private property in capital goods all construction becomes public construction.

Because of these differences international comparisons of total public works expenditures would be extremely difficult; indeed they become impossible by reason of the almost total lack of comprehensive and reliable estimates for individual countries due to the notorious difficulty of extracting the figures from hundreds of frequently obscure official reports and private sources. Fortunately, however, such estimates, classified by a variety of criteria, exist for the United States for the years following the World

War. In other cases only incomplete data are available. Illustrations will therefore be drawn chiefly from the United States.

The increase in outlays for public works in the United States since the war has been rapid. Aggregate annual expenditures for all public construction purposes throughout the country mounted steadily between 1919 and 1929 from probably about \$1,500,000,000 to \$3,500,000,000. Estimates for years since 1923, based on a revision and extension of estimates of the National Bureau of Economic Research, are as follows (in \$1,000,000):

1923	2123	1928	3631
1924	2652	1929	3555
1925	2812	1930	3632
1926	2974	1931	3100
1927	3706	1932	2000

These amounts represent between 30 and 40 percent of the total volume of all construction, public and private, during these years, the proportion having steadily increased. It amounted in 1928 to between 25 and 30 percent of all governmental expenditures. Total orders given by public authorities in Germany in the year 1927 have been estimated at from 6,000,000,000 to 6,500,000,000 marks; for reasons indicated above, however, no direct comparison is legitimate. Partial figures for other countries show in most cases a steep rise until the onset of the depression. In comparison with public works expenditures strictly defined, the estimated construction and maintenance expenditures of public utilities (railroad, electric power, telephone and electric railway companies) in the United States grew from \$2,657,000,000 in 1923 to \$3,265,000,000 in 1929, declining thereafter to \$1,332,000,000 in 1932.

Numerous and varied elements enter into the determination to construct particular public works projects. Such factors as desirability, feasibility, the needs of particular localities or groups and the pressure exercised by sectional interests likely to be benefited by the improvement vary so greatly according to place, time, financial considerations and other circumstances that no broad generalizations are possible. In many instances decisions have been influenced in the United States by "log rolling" and "pork barrel" legislation on the part of sections seeking to obtain advantages at the expense of the community as a whole. There are also good grounds for the widespread conviction that a substantial although indeterminable portion of the con-

struction dollar, particularly of local governments, often goes into political graft and that decisions by local governmental units to engage in certain construction activities are affected by the interests of these corrupt politicians.

The traditional procedures employed by governmental agencies in undertaking permanent improvements show the most extreme differences both in fundamentals and in details. While a few cities in the United States, such as Cincinnati and Schenectady, attempt to plan their public projects some years ahead under a long term improvement program and a capital budget, many more approximate the practise of New York City, which has neither but proceeds in haphazard manner. The ordinary budget of the city of New York includes very few items for permanent improvements except roads. Capital outlays amounting to between one and two hundred million dollars annually are financed almost wholly by borrowing; yet no attempt is made to formulate a comprehensive budget or program for these expenditures. Instead projects are authorized piecemeal without serious consideration of their relative importance or adequate financial provision for their completion; congestion, inefficiency, delay and waste result. Cook county, Illinois, which includes the city of Chicago, is a notoriously extreme example of chaos in local government; but everywhere in the United States there is a multiplicity of authorities, with varying degrees of financial autonomy, responsible for undertaking public works.

By far the most important single item in construction expenditures in the United States in recent years has been the construction and maintenance of roads, streets and bridges, which has equaled or exceeded the aggregate amount expended throughout the country on all other types of public works. In 1923-30 the cost of this item more than doubled, as the following table shows. This very rapid growth of road

YEAR	AMOUNT (In \$1,- 000,000)	PER- CENTAGE OF TOTAL PUBLIC CON- STRUC- TION OUTLAYS	YEAR	AMOUNT (In \$1,- 000,000)	PER- CENTAGE OF TOTAL PUBLIC CON- STRUC- TION OUTLAYS
1923	991	47	1927	2123	57
1924	1346	51	1928	2025	56
1925	1331	47	1929	1938	55
1926	1553	52	1930	2160	59

building expenditures has been a relatively

recent development brought about by the radical transformation in transport effected by the automobile. In other countries where the automobile is not in equally extensive use, road building expenditures are correspondingly smaller, although the trend has in most countries been sharply upward.

In Great Britain at least one third and often more of the annual capital expenditures by central and local authorities in recent years have been for housing. Estimates of state controlled new capital outlays, excluding those of semi-public organizations, like the Port of London Authority, the British Broadcasting Corporation and the Metropolitan Water Board, but including those of the Central Electricity Board and capital construction carried out by local authorities, amounted to £121,400,000 in 1929-30, £146,800,000 in 1930-31 and £108,800,000 in 1931-32. In Italy railways and roads have of late held foremost place among expenditures on public works undertaken directly by the state, and roads among those undertaken by local authorities.

The item second in importance to roads and bridges in public construction expenditures in the United States is educational buildings, amounting in recent normal years to about \$300,000,000 annually; next come hospitals and similar institutions (with outlays about two fifths as great), public buildings, water front developments, sewage systems and water supply facilities. Expenditures for lighting systems, docks, piers and parks have been relatively low. The variation in the distribution of these expenditures by purposes, as between different governmental units and different periods, is, however, considerable. Thus New York City's largest item of capital outlays, subway construction, which from 1919 to 1929 made up two fifths of its total construction expenditures, is quite exceptional, as are outlays in the United States on municipally owned power plants.

Prior to the depression nearly 50 percent of the total volume of public works in the United States was undertaken by the municipalities. County authorities in the aggregate were responsible for about 25 percent, the forty-eight state governments for something over 15 percent, and the federal government for the remaining 10 percent. By 1932, however, this last percentage had risen to over 25, owing to greatly increased federal outlays and the concurrent drastic decline in local expenditures.

During the post-war decade municipal out-

lays on capital improvements grew with great rapidity as a result of the pressing requirements of a fast growing urban population with mounting standards of living for increased provision of streets and transportation facilities, better sanitary and lighting systems, enlarged and improved educational structures, hospitals, public buildings and the like. For this period school building expenditures constitute the largest single item, averaging about 30 percent of the total in a representative sample of fourteen selected cities. Not much less was spent on roads and bridges. Subway construction, which in many years forms a larger percentage, is accounted for almost entirely by New York City. Hospital buildings form a substantial portion throughout, followed in order of importance by sewage systems, public buildings, lighting systems, water supply construction, dock improvements, water front developments, incinerators and park buildings.

In general the public works of state and county governments in the United States are much less varied than those of the cities and are represented largely by road building. For example, total public works disbursements of the state government of Michigan between 1925 and 1930 varied between 25 and 37 percent of total governmental expenditures; 90 percent of these construction outlays were for roads and bridges. Even in New York, where state government expenditures are more diversified, the amount spent by the state for this purpose, including federal aid to the state and state aid to its counties and towns, averaged 65 percent of total construction outlays between 1919 and 1929. During these years road building outlays rose from \$11,100,000 to \$48,300,000 out of total construction expenses amounting to \$24,600,000 and \$80,300,000 respectively. Over the same period disbursements for the building of prisons, hospitals, educational structures, state offices and the like increased from \$3,500,000 to \$23,700,000.

The construction expenditures of the federal government are much larger and more diversified than those of any other single governmental unit in the United States. Apart from the building of warships and aircraft these funds are used for inland waterways, great irrigation projects and harbor works, road building and the construction of army posts, veterans' hospitals, federal penitentiaries, customhouses, post offices, Indian schools, immigration stations and many other objects. Since the war a great change has

taken place in the relative importance of these items. In 1919, of total outlays on all construction, including floating equipment, amounting to \$788,000,000, nearly \$459,000,000 was used by the Department of the Navy and more than \$200,000,000 by the Quartermaster Corps of the Department of War, while the Bureau of Public Roads spent less than \$4,000,000 on roads. The last mentioned item has grown steadily in importance and now occupies the leading place among federal public works other than floating equipment, amounting to nearly one third of the total federal construction outlays and averaging more than \$90,000,000 annually since 1924. According to the Federal Employment Stabilization Board, total federal expenditures for new construction, repairs and alterations for fiscal years ending June 30, exclusive of floating equipment and aircraft, have been as follows (in \$1,000,000):

1920	212	1924	235	1929	308
1921	246	1925	271	1930	325
1922	215	1926	256	1931	474
1923	197	1927	256	1932	567
		1928	274		

Public works are sometimes undertaken jointly by two or more governmental units or by an autonomous public body created specially for that purpose or by governmental agencies in conjunction with private concerns upon a basis of cost division, while, finally, there has been developed in advanced countries an elaborate system of grants-in-aid (*q.v.*) and other types of assistance from central to local governments to facilitate the financing of public works. An example of the first category is the construction of the Holland Tunnel, a project financed by the states of New York and New Jersey, while the development of international waterways (*q.v.*) is an example of similar cooperation between sovereign nations. The class of public works undertaken by autonomous public bodies is exemplified in the bridges and freight terminal facilities erected by the Port of New York Authority, a New York-New Jersey interstate commission empowered to contract loans on its own credit, and the Interstate Bridge Commission, charged with constructing the Lake Champlain bridge, a New York-Vermont project. In Great Britain the construction work performed by the Port of London Authority, the British Broadcasting Corporation and the Central Electricity Board has much the same character. Occasionally, apart from subsidies (*q.v.*) overt or concealed, which

central governments make a practise of granting to private industries, such as shipping and aviation, to foster their development, public construction work is also undertaken jointly by governmental agencies and private interests. Thus the cost of railroad grade crossing elimination is usually shared in the United States by the state government and the railroad involved, with or without contributions from the county or city concerned.

The system of grants-in-aid from central to local governments for the encouragement of certain types of public works is widely used in one form or another. The federal government in the United States has since 1921 made appropriations to the several states for cooperative highway construction, which since 1925 have run at the rate of \$75,000,000 annually, this sum being virtually doubled by various acts passed in 1930. State governments also make grants to local subdivisions for road building. In Great Britain the central government directly contributes out of the Road Fund 50 to 75 percent of the capital costs of Class I and II roads and also grants substantial subsidies for housing and school building in the form of contributions to the loan charges.

Most public works in the United States are constructed under a system of contracts awarded by public competitive bidding (*see PUBLIC CONTRACTS*). Governmental agencies generally also maintain a labor force of their own for the construction or more usually the maintenance of roads in particular (*see PUBLIC EMPLOYMENT*). In the execution of public contracts attempts have often been made to set up minimum requirements as to such matters as wages and hours, but it has frequently been found difficult to enforce them. Contracts for public works have in some cases been utilized to stimulate producers' cooperatives and building guilds. This was true in Italy and France before the war and in the case of the short lived building guilds in England, Germany and Palestine after the war (*see PRODUCERS' COOPERATION*).

Figures of construction employment in the United States are notoriously inadequate and no accurate measure is possible of the numbers engaged directly or indirectly on public construction. Perhaps 800,000 persons on the average were employed directly on all public construction during the years 1927 to 1930. In addition it has been computed that for each worker employed directly on public construction perhaps two are given employment indirectly

in the manufacture and transportation of building materials and equipment. Moreover there is the still further employment created as a result of the demand exercised by these workers for consumers' goods. The "secondary" employment thus created by public works during depressions has been calculated as being perhaps roughly as large again, in appropriate circumstances, as the "primary" employment given directly and indirectly by construction expenditures.

In most countries public works are financed in varying proportions from current revenue and borrowed funds. In the United States the federal government has hitherto paid for its construction works wholly out of general funds, federal securities being floated upon their depletion. In recent years frequent proposals have been made for setting up a separate capital budget. Taken as a whole the states, counties and cities have derived their construction revenues about three fifths from general funds and two fifths from bond issues floated usually for specific capital improvements. But practise varies greatly. While some cities, such as New York, finance their outlays almost entirely by bond sales, others, like Boston, incline toward a pay as you go policy. The situation is similar with regard to states. About half the total funds for state highway and bridge work are derived from motor vehicle fees and gasoline tax receipts; those for local highways and bridges come largely from local road tax levies. In Great Britain the Road Fund is self-supporting, by far the greater portion being contributed by the proceeds of the horse power tax; the great bulk of other capital construction is financed by borrowing, with or without the assistance of grants from the central government. Many local improvements are paid for in the United States by means of special assessments. Still another method of financing is through the imposition of charges or tolls for the use of the facilities afforded by the project in question, a device utilized, for instance, in connection with the Holland Tunnel and the bridges built by the Port of New York Authority.

In recent years proposals for utilizing public works as an agency of economic stabilization in an unstable economic system have received much attention. In essence the suggestion is that public works should be planned and budgeted far enough in advance so that they may be conducted on a flexible schedule, operations being timed to fluctuate inversely with general cyclical

movements of business, retarded in periods of prosperity and speeded up in times of industrial stagnation. In the past the tendency has been for public works to be undertaken in large volume in good times both because of increased popular demand and because governments have the necessary revenue or are more willing to borrow. Conversely, depressions have usually found public authorities with a heavy load of debt and impaired borrowing powers. The expansion of public construction in times of prosperity has increased the pressure on the capital market and the labor supply and consequently encouraged inflationary tendencies; and its contraction in periods of depression has reinforced the reduction of private spending by a curtailment of public expenditures. It is argued that an elastic system of controlled public works would correct both these evils by giving when needed a general stimulus or check to economic activity as a whole.

Repeated recourse has long been had to the expedient of providing employment for the jobless on emergency relief works. Even the building of the Great Pyramid of Egypt and the beautification of the Acropolis under Pericles have been attributed to a desire to make work for unemployed masses. The idea of making public construction serve as a balance wheel of industry is, however, relatively new. Public works proposals have been distinguished from pure work relief proposals, at least in theory, by the requirements that under the former are to be included only such works as are useful and not created solely for the purpose of keeping men busy, and that on public works only properly equipped persons are employed at the rate of wages prevailing for the particular type of work and not at relief wages. In practise, however, chiefly because of the absence of sufficient properly planned works, relief work of an unproductive and occasionally wasteful nature has often been resorted to.

As early as 1902 the French government officially endorsed the policy of reserving important public works for future periods of unemployment. Prussia, Great Britain, Sweden, Norway, Finland and other European states followed France in adopting partially or in considering the principle of regulated public works. The International Labor Organization has advocated controlled public works since its first conference in 1919. Examples during the last fifteen years of the postponement of certain construction projects for periods of slackened business activ-

ity are found in France, Germany, Italy, Norway, Sweden and other countries; conversely, there are few countries which have not put works in hand earlier than they would normally have been undertaken in order to afford unemployment relief in bad times, especially during the post-war period and the recent slumps. Frequently, however, as in the case of the German productive unemployment relief schemes, these attempts have been more in the nature of pure relief works than controlled public works as defined above. In the United States New Jersey and Idaho in 1915, Pennsylvania in 1917, California in 1921 and Wisconsin in 1923 passed legislation providing for public works as a remedy for unemployment, but these measures either remained dead letters or have had insignificant results. Although the principle received official endorsement in 1923 from the President's Conference on Unemployment, the repeated efforts, particularly numerous after 1929, to pass federal legislation to this end were fruitless until 1931. In that year the Wagner Bill was passed, setting up a permanent Federal Employment Stabilization Board for the advance planning of federal construction programs and their acceleration in periods of business depression. This is the first instance where the theory has been put into actual large scale operation. The failure to speed public works after the recession, despite the federal government's urgent appeal to local authorities, was due to the fact that the latter were not prepared with carefully formulated plans to accelerate construction at short notice and that increased financial burdens coupled with adverse credit conditions which made impossible the flotation of large security issues forced the drastic contraction of construction expenditures. The federal government, however, did succeed in hastening projects already planned and also increased its road building grants to the states. In July, 1932, Congress appropriated \$300,000,000 for federal public works and authorized loans from the Reconstruction Finance Corporation up to the aggregate sum of \$1,500,000,000 to states, counties, cities and in some cases private corporations, for "self-liquidating" construction. This represented the first important instance in the United States of the utilization of the credit of the central government to aid local borrowing for public works, a device which through the agency of the Public Works Loans Board had been employed in England since 1817 and had supplied most of the funds for housing and similar

projects undertaken by the smaller municipalities. In June, 1933, under the provisions of the National Industrial Recovery Act, the president was empowered to make emergency expenditures on public works up to a total of \$3,300,000,000.

The success of a policy of controlled public works is conditioned largely by the relative volume which can be readily advanced or postponed. This depends in turn upon the thoroughness with which advance plans have been prepared and upon almost infinitely varied local conditions. Perhaps 50 percent, however, could be so reallocated. But the long range planning and budgeting of public works is an essential prerequisite if a great variety of unavoidable administrative, technical and financial difficulties of a very time consuming character are to be surmounted successfully. All projects in varying measure require time for drawing plans and specifications, selecting and acquiring sites, making authorizations and granting appropriations.

The criticism is sometimes put forward that the greatest possible increase in public works would not be sufficiently large to offset variations in private building, much less in industry in general, as between years of prosperity and depression. Total construction expenditures, public and private, declined from over \$10,000,000,000 in 1928 to about \$4,000,000,000 in 1932. Allowing for the decrease in construction costs in the interval, this is equivalent to a fall in physical volume from 100 to about 55. Had local authorities, state, county and city, expanded their construction expenditures as greatly as did the federal government during the depression, the dollar value of construction would have remained almost constant while the physical volume would have increased.

Granting that this would be expecting too much, the effectiveness of the device depends less upon the amount of the increase or decrease than upon its correct timing. An expansion or contraction of public works at the appropriate moment can have an influence upon business in general out of all proportion to its magnitude. Even if under the most favorable conditions a flexible public works policy could not eliminate all cyclical fluctuations, it still might succeed in mitigating their violence. Many incidental benefits also would accrue. Government agencies would gain greatly by planning and undertaking their public improvements in orderly sequence instead of haphazardly. Building costs are usu-

ally lower in periods of depression: between 1928 and 1932 they fell in the ratio of 100 to 70 or 75. Borrowing at reasonable rates is also usually easier provided that—an important proviso—the credit of the particular governmental unit has not been weakened by excessive borrowing in times of prosperity.

The correct timing of controlled public works is a somewhat vexed question. The assumption usually made that they should be expanded rapidly as early as possible during a depression is open to some question unless it is carefully qualified. If the recession has occurred after a period of excessive and unhealthy inflation, the attempt to sustain business at the prevailing high level may be unwise and economically unsound. Under such circumstances the right time to launch an expanded program is not in the early stages of the depression but only after the strictly unavoidable amount of liquidation has been effected. At such times, however, a stimulus may be needed to arrest a continued contraction of business brought about by the sheer cumulative momentum of the downward process. It is not possible to decide in advance and *a priori* when that point is likely to be reached. The decision must in practise be difficult, and the success of any action taken will be contingent in some degree upon the insight with which current data are interpreted and future tendencies forecast. The corresponding difficulty of knowing when and to what extent public works should be retarded on the upswing is of course equally great. However, the greater the degree of stabilization effected either by private industry through control over its own operations or by a flexible schedule of public works, the easier will be the solution of the problem of correct timing. The case against public works in depression collapses when it is asked at what other phase of the business cycle they could better be put in hand, in view of the fact that governments must always be responsible for a certain volume of public construction. Public works programs are less likely to raise building costs and the cost of borrowing at the bottom of a depression, when private outlays have fallen to a minimum, than during the boom period. The danger of incorrect timing is inherent in the problem of public works expenditures as such, and indeed in that of all government expenditures, and cannot be evaded by a policy of inaction.

The stimulation of business through the expansion of public works is in the last analysis an

inflationary or counter deflationary measure, and the converse in periods of upswing. As such it raises the difficult problems of monetary theory and practise. Under an international monetary system, such as the gold standard, which demands an interrelated price and income structure of all countries adhering to it, the policy can be pursued by any one country only within somewhat narrowly restricted limits, unless through international cooperation other countries are following the same path. A country which in isolation embarks on inflation or attempts to check the course of deflation through expanded public works faces the danger that its adherence to gold will be threatened. Even abundant gold reserves accumulated in previous periods of prosperity can, if prices seem likely to diverge far from harmony with the world gold level, be exhausted rapidly by an external drain resulting from an adverse balance of payments, sudden movements of short term liquid funds or a flight of capital as well as by internal hoarding.

A policy of controlled public works, unless adopted internationally, is therefore at bottom inconsistent with the underlying principles of a freely automatic international standard based on gold, although not necessarily with a modified gold standard operated under central bank co-operation. The greatest obstacle to the expansion of public works during the present depression has throughout been precisely the fear that vigorous expansion would threaten the budget and the gold base, although many who recognized this danger did not regard it as a decisive objection. Departure from gold removes this difficulty by conferring greater freedom of action in matters of domestic monetary policy. It has been argued that under systems of irredeemable paper or otherwise "controlled" currencies which allow any level of prices to be established, recourse to a public works policy is no longer necessary since credit expansion could be attained directly. The traditional method, however, of reduced rediscount rates reenforced by appropriate open market operations may not of itself suffice in a severe depression to encourage business activity or effect expansion. Large public works programs by increasing expenditures and purchasing power directly stimulate both capital goods industries and the demand for consumer goods.

The objection has sometimes been advanced that capital raised by public authorities for construction work in times of depression merely

diverts resources from private industry to public enterprise, especially by heightening the cost of borrowing, and therefore cannot create any addition to the sum total of employment. The argument rests upon the fallacious assumption of a rigidly limited and inflexible volume of credit. Since there is usually during depression periods a surplus of idle funds seeking secure investment at attractive returns, which private business is unable or unwilling to utilize in the face of uncertainty, declining prices and excess productive capacity, its use by public bodies need involve no transfer inasmuch as the capital would otherwise not have been employed at all. Expansion itself provides the resources which make expansion possible: the funds needed to finance increased public construction outlays come partly from reduced expenditures on direct relief and partly by creating bank credits or preventing their continued contraction. The experience of governments has generally been that they could raise money in the capital market without increasing the difficulties of private enterprises. It should be emphasized, however, that a public works program undertaken in conjunction with an appropriate central bank policy can prove successful, especially under an international metallic monetary standard, only if government credit is secure, the capital market strong and the demand for bonds elastic.

The further objection to public works expansion in depression that the additional debt contracted involves a future increased burden of taxation arises from a confusion of thought. Business recovery brings increased tax receipts without the imposition of additional taxation. Equally baseless is the charge of inevitable waste. There need be no excessive waste if projects have been planned ahead, but such as occurred would be insignificant in comparison with the economic wastage of idle and deteriorating manpower and capital equipment. Besides, since the unemployed have to be supported in any event out of public or private funds, the real net direct cost of public works, apart from their indirect stimulating effects, is much less than it appears, while in addition the community receives something in return for its expenditures.

For the adequate financing of public works in periods of depression arrangements must previously be made for the rapid provision of funds when needed. The actual form the reserve should take is a matter of some dispute and suitable methods are not necessarily the same in all cases. One proposal is that reserve funds should

be accumulated and invested in gilt edged securities or deposited in a bank; another is that they should be held in the form of banknotes, so that the circulation would be alternately contracted and expanded. Actual funds, however, need not be accumulated in advance at all. It is necessary only that adequate credit reserves be created and, in the case of municipalities in the United States, that a much larger unencumbered margin of constitutional borrowing power be preserved. Public construction would then be undertaken out of loans in periods of depression and these would be amortized at an accelerated rate during years of prosperity out of budget surpluses. Aggregate expenditures on public works over a period of years would not be increased but would be allocated differently in point of time. Again, money which would normally go to reduce public debt could in depressions be used for public works.

None of these measures, it should be noted, is capable of coping effectively with unemployment of a more or less permanent character resulting not from cyclical fluctuations but from deeper seated forces involving basic economic readjustments, such as Great Britain and Germany have experienced since the war. Where, however, the maladjustment is not national but confined to certain localities, public works projects may perhaps be used effectively as a means of easing the transition of workers in these localities to other lines of work. This was done, for example, in 1863 to alleviate the effects of the depression in the Lancashire cotton industry in England which had resulted from the American Civil War. It has been proposed by Sir William Beveridge as a device for meeting the problem raised by the depressed coal mining areas in England.

The greater the degree of international cooperation in the execution of an elastic public works policy, the more successful it is likely to prove. In the past it has been found extremely difficult to secure such agreement on concerted policies between central banks and treasuries, even in periods of acute stress. The extension likewise of the concept of the stabilizing influence of controlled public works to the similar utilization of other governmental expenditures will render easier the smoothing off or elimination of cyclical variation in business activity. In both cases the purposes of the policy would clearly be furthered considerably by greater centralization of control over public works planning in place of the present confusion created by the

multiplicity of authorities responsible for construction work.

Any evaluation of a policy of flexible public works as an agency of economic stabilization must depend in the last analysis upon the particular theory held concerning the fundamental nature of the business cycle and the effectiveness of "artificial" correctives under a system of free private competitive enterprise. All economists agree as to the importance of securing a proper relationship between costs and receipts. Those, however, who incline to the "monetary" view and advocate deliberate control of the price level will tend to approve a policy of flexible public outlays; on the other hand, those who regard business depressions as due to the development of structural maladjustments impossible to remedy through monetary action and necessitating for recovery the drastic reduction of costs and the writing down of past liabilities are likely to condemn increased public expenditures out of borrowing. Although in practise the points of view of economists are not susceptible of such sharp and rigid classification, their attitude to an elastic public construction policy must ultimately be determined by the degree of their faith in the possibilities of the conscious guidance of economic activity through monetary management as opposed to the reputedly automatic readjustments of a freely competitive order.

PUBLICITY has two distinctive although related uses of importance to society: as an instrument for public control of governmental and industrial activities and as a technique for directing the interest or good will of the public toward some individual or organization. In both cases it is a characteristically modern phenomenon, a product of the "great society," brought into play because of the complex activities of the modern economic order and given its character

istic stamp by the newspaper and other modern agencies of communication. As a corrective for political and economic abuses publicity has been repeatedly invoked by reformers and public men in America from the closing years of the nineteenth century. One of the earliest pleas for publicity for political affairs was made by Woodrow Wilson in an essay on "Cabinet Government in the United States" (*International Review*, vol. vii, 1879, p. 146-63), in which, with reference to the use of the committee system for the effective work of legislation, he urged that congressmen "should legislate as if in the presence of the whole country" and that "only in such an atmosphere of publicity . . . could representative government flourish." Toward the close of the nineteenth century publicity enjoyed a great vogue as a curative for the evils of monopoly then uppermost in the public mind through the growth of trusts. John Graham Brooks in 1899 declared that "the forced publicity for private as well as for public corporations in Massachusetts makes any dangerous degree of stock-watering extremely difficult." Henry C. Adams, to whom had been entrusted the setting up of a system of railroad accounts for the Interstate Commerce Commission, wrote in 1902: "Secrecy in the administration of a power which in any way touches the interests of the community, gives birth to the suspicion that the power is unwisely or tyrannously administered. . . . The task of publicity is to allay this suspicion, and the statutory definition of publicity, in any particular case, must be as broad as the ground of suspicion which makes appeal to it necessary. . . . Indeed, from whatever point of view the trust problem is considered, publicity stands as the first step in its solution" ("What is Publicity?" in *North American Review*, vol. clxxv, p. 895-904). The muckrakers in the first decade of the twentieth century took up the cry for publicity in the operations and accounts of the corporations and gave it wide currency. President Theodore Roosevelt borrowed it from them as part of his program of monopoly control. In a speech in 1902 he defined publicity as "the making public, both to the governmental authorities and to the people at large, the essential facts in which the public is concerned. . . . The mere fact of the publication would cure some grave evils, for the light of day is a deterrent to wrong-doing." He pledged this same doctrine in his message to the first session of the Fifty-seventh Congress, which enacted his exhortation

into legislation; so that in his message to the second session of the Fifty-eighth Congress in 1904 he was able to report the formation in the Department of Commerce and Labor of the Bureau of Corporations with for the first time "authority to secure proper publicity of such proceedings of these great corporations as the public has the right to know."

The demand for publicity was extended to fields other than that of corporate control. In his message to Congress in December, 1904, referring to the antisocial working conditions brought to public attention in the course of the Colorado mining strike, President Roosevelt declared that "much can be done by the government in labor matters merely by giving publicity to certain conditions." But the principal field into which the movement for publicity was extended was that of governmental operation, especially in municipal government, where the greatest opportunity for corruption existed. After the reform movement which had brought Seth Low into the New York mayoralty collapsed, in the view of many of its supporters largely because of a lack of widespread information concerning the underlying issues, an attempt was made to remedy this situation by the establishment six years later of the Bureau of Municipal Research. Its first director, Henry Bruère, described its program as primarily one of publicity. All these beginnings and tentatives, in the field of both corporation and governmental publicity, were gathered up and given their most complete expression in Woodrow Wilson's campaign speeches, later published in book form as *The New Freedom*. "Publicity," he wrote, "is one of the purifying elements of politics. The best thing that you can do with anything that is crooked is to lift it up where people can see that it is crooked, and then it will either straighten itself out or disappear. Nothing checks all the bad practices of politics like public exposure."

But despite the clarity and simplicity of this formula for governmental reform the struggle for publicity continues. Publicity for income tax returns was sought after the World War and was secured through the efforts of a small group of politically independent congressmen in 1924 when Senator Norris' amendment for full publicity of income tax returns and refunds was adopted. It was, however, abandoned after one year, because of the opposition of more powerful forces within the Republican party. Publicity reappeared as a political issue in the presidential

campaign of 1932 when the Democratic nominee, Franklin D. Roosevelt, gave as the first three planks in his eight-plank program for the control of the power companies: full publicity on security issues, earnings and investments; publicity on stock ownership; and publicity as to intercompany contracts and arrangements. Just as the so-called Pujo Committee in 1913 had sought to bring under public scrutiny the operations of the "Money Trust," so in 1933, in reference to the exposure by the Senate investigation of financial favors conferred by J. P. Morgan and Company upon men of high public standing, Samuel Untermyer, formerly the counsel for the Pujo Committee, declared his belief that "relentless publicity of the names of purchasers and underwriters of securities . . . would in itself largely prevent the abuses of the power in the distribution of such gratuitous favors."

Thus, although publicity has for some thirty-five years been deemed an indispensable and effective means of destroying political and economic abuses, the achievement of its end has not yet been attained. This technique of control, upon which the entire progressive movement since the beginning of the century had relied so strongly, was not, however, entirely ineffective. It was part of the machinery set up under the government regulatory commissions, especially the Interstate Commerce Commission and the Federal Trade Commission; it was used by state governments, notably Massachusetts, in the administration of minimum wage laws; it became part of the program of municipal research leagues in the principal cities and furnished the basis of a movement for wide governmental reporting. But on the whole the period may be considered to have imposed too great a faith in the unaided curative powers of publicity, and this faith was probably one of the factors which barred the way to a search for the more far-reaching causes of economic and governmental ills.

Paradoxically, the need for publicity in the control of business led to the creation of another type of publicity, by which those who had been the targets for reformers sought to establish their good character in the court of American public opinion. As a consequence largely of the muckrakers' exposure of "invisible government" in city, state and nation, of rebates by railroads and of other forms of corruption, corporations and their heads began to seek favorable publicity which would make them appear benevo-

lent. Publicity, that is, the securing of publicity for others, became thus an occupation, a calling distinct from advertising, in the first decade of the twentieth century. Large corporations developed publicity departments whose chiefs later became known as public relations counsels. Their function was to assuage public hostility and create public good will, fend off hostile newspaper criticism, stimulate consumption of their commodity and mold public opinion along lines favorable to the enterprise. They were to act at once as a buffer between a perhaps tactless captain of industry or an impersonal corporation and a hypersensitive public opinion and also in some instances more constructively as a creator of that opinion. When it was discovered recently that the power corporations had been utilizing the device of publicity, which they had borrowed from the movement for government control, for their own very opposite purposes of molding opinion in schools and colleges favorable to non-interference by the government in public utility enterprises, it was clear that there had been accomplished a neat and complete reversal in the uses of publicity.

The ancestry of the public relations counselor by another line of descent was the press agent, for some decades back an adjunct only of the circus and the theater. Known also as the advance man, this representative of divers traveling shows would precede the enterprise and attract attention by various flamboyant means. P. T. Barnum, impresario of human oddities and freaks, was a prototype of the later press agent; Harry Reichenbach, who made many a theatrical and "movie" reputation by the nimbleness of his wits, may be mentioned as a contemporary example. Here advertising and press agency were intimately related, although their functions were somewhat different and might fairly, if arbitrarily, be distinguished: advertising was bought and paid for through newspapers, posters and billboards; and the arts of press agency sought through ingenious and devious ways to draw public attention to the entertainment in question. Theatrical companies have for generations been preceded on the road by press agents who both "placed the advertising" and endeavored, in return for the advertising and in addition to it, to secure other publicity for their attractions. The newspaper story of the actress whose jewels, valued at a fantastic figure, had been stolen, became the type and later the burlesque of this sort of publicity.

In the earlier days of American life, when

modern communications had not yet been developed and news traveled slowly, public opinion was formed by discussion in town taverns and country stores. Methods of indoctrinating the public with ideas were then, broadly speaking, frank and above board, through platform and press. Theodore Roosevelt was one of the first public officials to perceive the full importance of shaping public opinion by modern methods. It was a device of his to issue his public statements for the Monday morning newspapers, on the correct assumption that since Sunday is a day of minimum activity, his pronouncements would receive the most favorable display, or maximum publicity, in the Monday press. As social organization became more complex, the tempo of life was accelerated and public questions grew more numerous and more complicated, the problem of reaching the growing mass of people led to the transformation of publicity into an art and an industry. In the third decade of the twentieth century the propaganda on a giant scale in which nations had engaged during the World War gave great emphasis to the possibility of shaping events through indoctrination. In the same period the scramble for "free publicity," or "space grabbing," reached such lengths that it evoked repeated protest and discussion by American newspaper publishers and was the subject of constant critical attack in the leading newspaper trade journals. An analysis of newspapers during 1926 revealed that on the average more than half the "stories" published originate with publicity agents or publicity organizations. One analysis of the *New York Times* of December 29, 1926, gives these results: "Stories not suggested, created or supplied by some sort of publicity agency, 82; stories almost certainly of publicity origin, 147; doubtful, 26. Excluding the dubious instances, the presentation of publicity stuff is nearly 60%." The analyst points out further that he has excluded "all sport and society items and stories . . . some 50 real estate items and stories" which bear "the ear marks of interested activity," and corroborates the conclusion arrived at by others that "the better half of the news sifts through publicity screens."

The work of publicity has thus, on the one hand, been exalted into a dignified profession in the hands of public relations counsels, while, on the other, it continues to be a slightly organized haphazard attempt through strategy and chicanery to secure publicity for commercial products and for public performers of various types,

whose earning potentialities can thereby be increased. A favorable aspect of the publicity origin of news is found in the unprecedented accuracy of newspaper accounts emanating from the publicity departments of scientific institutions. Previously, reporting of scientific discoveries was notoriously garbled by a considerable section of the American press. Large public service corporations also, apart from the interested and favorable character of publicity issued, have added to the promptness and accuracy with which news of disasters, such as railroad wrecks, have reached the public. Philanthropic, educational and social work enterprises have likewise found it a useful, in fact an inevitable medium for bringing their purposes to the public attention and have enlisted, in their more conservative fashion, essentially the same techniques employed by business and theatrical enterprises. Although publicity is in its more sensational aspects carried almost to the point of being a racket, in its modified functioning it has become an integral institutional force of modern society.

PUCHTA, GEORG FRIEDRICH (1798–1846), German jurist. Puchta received his training in philosophy under Hegel in the Nuremberg Gymnasium and afterward came under the influence of Hegel's antipode, Savigny, and of Schelling. He taught Roman and canon law with great success in Erlangen, Munich, Marburg, Leipsic and Berlin, where in 1842 he became Savigny's successor. Although he had a rationalistic and dialectical mind and was far from a romantic, he became closely attached—in order, it has often been suspected, to achieve rapid success in his career—to the historical school of jurisprudence, of which he very soon became the leading spirit as regards both polemics and system. Attacking Hegel and other opponents of the school in a quite unscrupulous manner and formulating and arranging Savigny's ideas in a number of skilful textbooks, he exercised a tremendous influence on his own and the following generation. He gave a more profound basis to the fundamental doctrines of the historical school in his famous book on customary law, with the result that Savigny himself accepted Puchta's views and formulae in his later works. Puchta was also the first to adapt the new doctrine to the legal conception of the church. On the other hand, he exaggerated the formalistic and archaistic methods of his master in his purely dogmatic textbooks, which were written without any regard for economic needs, modern developments or just results. These defects were subjected to glaring illumination by his pupil Jhering, who made him the laughing stock of the younger generation, although present jurists, under the influence of neo-Hegelianism, seem inclined to judge him more charitably.

PUFENDORF, SAMUEL VON (1632–94), German jurist, statesman and historian. Pufendorf, the son of a Lutheran clergyman, was born in Saxony and studied at Leipsic and Jena. He

taught at Heidelberg and Lund and served as royal historiographer first at Stockholm and later at Berlin.

Pufendorf, leaning on Hobbes, was a representative of the natural law school of international law. Whereas Grotius had distinguished between natural and positive law of nations, Pufendorf considered all international law as a part of natural law. He could not conceive of any real international law arising from the customs and treaties of the nations. This view, although long abandoned by legal science, is historically important for its contribution to the development of general principles of jurisprudence. Pufendorf differed from Hobbes, however, in considering that man's natural condition is one of peace and that therefore peace need not be secured through contracts. But in contradiction to this fundamental principle Pufendorf held that war under certain conditions is necessary, although, as in the doctrine of Grotius, it is permissible only in a just cause. Any offense against international law is sufficient, whether or not the attacking state itself has been harmed by such transgression. The idea of sociability, that man is not alone and that each must stand up for all, is here applied to states. War in the service of law must not be commenced, however, before an attempt at peaceful solution has been made. Noteworthy also is Pufendorf's demand that no state be allowed to prohibit the export of its raw materials if another country suffers bitter need thereby. Pufendorf's views on international law are developed in his most important works, *De jure naturae et gentium, libri octo* (Lund 1672, new ed. Amsterdam 1715; tr. by B. Kennett and others, 5th ed. London 1749), the section from it, *De officio hominis et civis* (Lund 1673; new ed. with translation by F. G. Moore, 2 vols., Classics of International Law, no. x, Oxford 1927), and his earlier *Elementorum jurisprudentiae universalis, libri duo* (The Hague 1660; new ed. with translation by W. A. Oldfather, 2 vols., Classics of International Law, no. xv, Oxford 1931).

As a political theorist Pufendorf sought to present to the German people a clear and unadorned picture of their constitution. This he did in his famous work, *De statu imperii germanici, liber unus* (Geneva 1667, new ed. by F. Salomon. Weimar 1910; tr. into German by H. Bresslau, Berlin 1870), which he published under the pseudonym, Severinus von Monzambano. He characterized the German Empire as an anomalous and monstrous body (*irregulare...*

corpus et monstro simile). This anomalous character, he considered, was due to the decline of the monarchy, as a result of which the emperor had lost his most important rights to the estates and the empire had become something midway between a monarchy and a confederation. The continuous struggle between emperor and estates had destroyed the inner unity and strength of the empire. As a patriot, however, and without exaggerated optimism Pufendorf sought to pave the way for the reform of the organization of the empire. He attacked particularly the religious conflicts within Germany and he sought to limit the power of the Catholic church. Pufendorf's fundamental idea that the empire was a commonwealth similar to a federation was later taken up by Thomasius and exercised considerable influence in German political science.

Pufendorf's historical works are numerous. The most important are those dealing with the Swedish-German war, the history of Carl Gustav of Sweden and the Great Elector. Not only are they based on a thorough use of the archives, but they also set forth a view of events marked by great vision and keen political insight.

PULITZER, JOSEPH (1847-1911), American journalist. Pulitzer became part owner and editor of the St. Louis *Post-Dispatch* in 1878, but his career as an innovator in American newspaper life really began in 1883, when he bought the New York *World* from Jay Gould. Born in Hungary of German-Magyar-Jewish ancestry, he had brought with him to the United States in 1864 not only great shrewdness and energy but the liberal and idealistic spirit which marked many immigrants, especially political refugees, from central Europe. His hard fight with poverty, his friendship in St. Louis with Carl Schurz, Emil Prectorius and other Ger-

man-American liberals and his first hand observation of the seamy side of American life, particularly in Washington in 1876-77 as correspondent of Dana's *Sun*, tended to make him a somewhat radical reformer. His intention was to make the *World* a hard hitting exponent of democracy and social justice, basing its power on mass circulation. Through its aggressive news policy, skill in using popular features, such as the first comic strips, and frequent sensationalism the *World* became highly profitable; at the close of 1896 its Sunday circulation was 625,000, breaking all American records. But Pulitzer's principal interest was in maintaining a fearless and aggressive editorial policy. At times he made marked concessions to business exigencies, particularly when in 1897-98 competition with Hearst led the *World* into violent jingoism and advocacy of war with Spain over Cuba. But in general he set up an ideal of independence of any object save the public interest and in belligerent fashion lived up to it.

Three principal contributions to journalism may be traced to Pulitzer's *World* and in lesser degree to his *Evening World* and *Post-Dispatch*. In a period when nearly all American newspapers were still fettered to party, to special economic groups or to the counting room, his fighting independence was widely influential. He and his staff perfected, if they did not invent, the use of the news columns to support editorial attacks by campaigns of exposure. Repeated disclosures of municipal graft, state corruption and business abuses reached a climax in the crusade of 1905 against the mismanagement of the principal life insurance companies, which led to the Hughes investigation and the enactment of remedial laws by the New York state legislature. A third service lay in pushing to fruition ideas which were regarded as radical or visionary when he espoused them. Pulitzer's original program in 1883 included a federal income tax, inheritance taxes, thorough civil service reform, a revenue tariff and relentless prosecution of corruption.

Pulitzer was stricken with almost complete blindness in 1890, but he maintained close supervision of editorial policies to the end. He did not hesitate to adopt views repugnant to most of his readers, as when he bitterly attacked Cleveland's Venezuela policy and defended his use of troops in the Pullman strike. He leaned so generally to the Democratic side that the *World* came to be regarded as the principal journal of that party, yet he denounced Bryan's

currency views. He approved many of President Roosevelt's acts, yet assailed his centralization of governmental functions and use of the "big stick" in foreign affairs. The *World's* attacks upon persons, including Roosevelt, involved in the sale to the United States government of a French company's canal rights in Panama, in which the question was raised as to "who got the money" resulted in the indictment of Pulitzer and others for criminal libel; but the indictment was quashed by a federal judge and the decision sustained by the United States Supreme Court. Pulitzer's chief efforts, however, were bent to the restriction of trusts and other aggregations of wealth, and from 1885 to 1911 the *World* led all other newspapers in demanding the break up of monopolies by the antitrust laws, the extension of railroad regulation and a close watch on the "money power." Late in life he advocated warmly the professional training of journalists and by a gift of \$2,500,000 endowed a school of journalism in Columbia University.

PULLMAN, GEORGE MORTIMER (1831-97), American capitalist. The son of a mechanic and mover of barns and other frame buildings, Pullman obtained his first capital in similar operations. In 1858 and 1859 he remodeled two Chicago and Alton Railroad day coaches into crude sleepers, operated jointly with that road, but abandoned this undertaking in the early part of the Civil War. In 1864, at the cost of \$20,000, he built a much improved sleeping car with a folding upper berth and sliding seats which could be opened out into a couch; the sliding seat was not original with Pullman, having been introduced on the Baltimore and Ohio Railroad in 1845. In 1867 the Pullman Palace Car Company was formed, with a capitalization of \$1,000,000. Many improvements were developed, including the vestibule car of anti-telescoping construction and the betterment of the springs, ventilation and lighting. Continued litigation surrounded Pullman's patent claims. The company did not sell its sleeping cars but operated them itself; gradually it absorbed competitors until its operations included three fourths of the American railway mileage, with

large manufacturing and repair plants in three cities. By 1894 the Pullman Company had disbursed dividends of \$28,000,000, accumulated a surplus of \$25,000,000 and increased capital stock (most of it paid in) to \$36,000,000. Two years after Pullman's death the company became a monopoly through acquisition of the Wagner Palace Car Company, which involved a stock issue of \$20,000,000 in cooperation with the Morgan interests. Since its inception the Pullman Company has paid dividends of approximately \$350,000,000 in cash and \$250,000,000 in stock.

As an employer Pullman was an extreme reactionary with paternalistic leanings. He launched in 1880 the construction of the company owned town of Pullman, Illinois. Houses, paved streets, parks, athletic fields, schools, churches, shops and other facilities were provided for what he considered a model town. Attempts to make the town a profitable business venture and a means of binding the workers to the Pullman Company provoked continued friction. Drastic wage cuts, averaging 25 percent in the depression winter of 1893 (while dividends of \$2,800,000 were paid), coupled with slack work and no reduction in rentals led to an unsuccessful but peaceful strike conducted by the American Railway Union at the Pullman works on May 11, 1894. Pullman upheld individual bargaining and the supply and demand theory of wages and flatly rejected arbitration of the workers' claim for the pre-depression scale. Other members of the American Railway Union working on roads leading out of Chicago refused on June 26, 1894, to handle Pullman cars and a sympathetic strike was declared. Sharp conflict resulted marked by company subsidized violence and numerous arrests. The federal government and the railways broke the strike through the use of deputy marshals, injunctions and federal troops, which President Cleveland had sent against the protests of Governor Altgeld of Illinois. In 1899 the Supreme Court of Illinois ordered the company to divest itself of its non-industrial property holdings in Pullman, Illinois.

In addition to his presidency of the sleeping car company Pullman was a director in many railways, banks and industrial corporations in which he had large financial interests. His death marked the end of the family influence in the Pullman Company.

PULP AND PAPER INDUSTRY. Paper making is one of the oldest manufacturing arts and paper ranks among the most important staple needs of civilized man. The maintenance of the modern industrial and commercial system, the enormous expansion of the press, the institution of popular education, the elimination of illiteracy and the consequent widening of the reading public, in short all the constituent elements in modern civilization depend upon a continuous and abundant supply of paper. In response to a rapidly increasing demand the industry has experienced a phenomenal growth in the last few decades; while it is estimated that the world's population increased 10 percent between 1913 and 1927, the world's total production of paper was more than doubled in the same period. In the United States the pulp and paper industry, representing an investment of approximately \$1,500,000,000, ranks among the leading manufacturing industries; in Canada it heads the list of manufacturing industries in value of manufactured goods as well as in distribution of wages and salaries. Although paper can be manufactured from any fibrous material and small quantities of pulp are made of rags, grass, straw and other fibrous matter, the principal raw material in the manufacture of pulp is pulpwood, which supplies from 80 to 90 percent of the total pulp requirements of the paper industry. The paper industry is thus one of the most important outlets for forest products. In its turn paper serves as the raw material for the printing and publishing industry and for the so-called converted paper products group, which includes boxes, containers, cards, labels, tags and the like.

The first manufacture of paper must be credited to the Chinese, who developed the art of paper making as early as 130 A.D., using rags as the main raw material. For centuries the Chinese guarded the secret of their process, but ultimately it spread to Arabia and thence to Spain and Italy, until in the fourteenth century it was firmly established in western and central Europe. As reading and writing were confined to limited groups, the use of paper remained insignificant throughout the Middle Ages. The demand received its initial impetus with the in-

vention of printing in the middle of the fifteenth century. It continued to grow at an accelerated rate under the impact of the cultural movement engendered by the Renaissance and was further stimulated by the commercial expansion following the transoceanic discoveries, the political revolution of the eighteenth century and the industrial transformation at the opening of the nineteenth. A thriving trade in rags, the only important raw material known at the time, developed to supply the growing requirements of the industry. But the demand for paper soon outstripped the supply of rags, so that the industry was chronically handicapped by the shortage of raw material. The invention of paper making machinery in the early part of the nineteenth century, which multiplied the productive capacity of the industry, still further accentuated the shortage of raw material; this intensified the search for other fibrous materials to be used as substitutes for rags. About the middle of the nineteenth century the utilization of esparto grass was discovered and the processing of wood, which had been used experimentally since the early 1840's, was made commercially practicable in the early 1860's. The utilization of wood—a raw material which seemed at the time available in unlimited abundance—coupled with the application of efficient machinery ushered in a period of enormous expansion in the production of paper, which in 1929 amounted to over 23,400,000 tons. Most phenomenal was the growth of the industry in the United States, where the output increased from 127,000 tons in 1860 to over 11,000,000 tons in 1929, and in Canada, where it rose from an insignificant amount in 1880 to over 3,000,000 tons in 1929. The growth in output was impressive likewise in the Scandinavian countries and in others where abundant supplies of wood were available, although the pace did not approach that prevailing on the North American continent. The relatively low price of wood and lower costs of production made paper generally accessible to the vast masses of the people and stimulated consumption. In the period 1913 to 1927 per capita consumption of paper increased in the United States from 65 to 136 pounds, in Great Britain from 60 to 81 and in Germany from 47 to 58. A comparison of consumption rates in the industrial countries with the total world's per capita consumption of around 20 pounds indicates, assuming a further extension of industrial civilization, the potentialities of the future demand for paper and paper products.

Paper making involves two steps, the preparation of pulp and the manufacture of paper; in the first the fibers composing the wood are separated to form a pulp, and in the second they are fitted or matted into a continuous sheet. In the early history of the industry both processes were carried on in the same establishment. But with the discovery of wood as raw material and with the transition to large scale operation pulp making became a highly specialized activity, conducted in special plants, although frequently operated in conjunction with paper making establishments.

There are two distinct processes of converting wood into pulp: the mechanical method, by which the barked wood is pressed against rapidly revolving grindstones, and the chemical method, by which certain chemical reagents are used to disintegrate the fibers. The pulp obtained by the former process is of inferior quality in that it retains many elements contained in wood which are unfit for paper manufacture, so that its use is confined mainly to the manufacture of low grade paper, such as newsprint, in which low cost is of primary importance, whereas quality, durability and strength are of secondary consideration. Another variety of the mechanical method is the so-called semichemical pulp, according to which the pulpwood log is subjected to slight steaming before it is ground; this softens the woodblocks and produces a pulp of better quality and greater flexibility. The chemical method is more complicated and more costly, but the quality of the pulp is superior to that obtained by the mechanical method. The superiority consists in the fact that all non-fibrous matter is eliminated from the material, leaving for the paper machine a more or less pure fibrous matter, or cellulose, the real substance of paper. Chemical pulp produces therefore a finer and more durable type of paper. Depending on the chemical substance used in disintegrating the wood fibers, there are three varieties of chemical pulp: sulphite, soda and sulphate. In the manufacture of sulphite pulp, which is the type most widely used, the pulpwood is cooked in a solution of bisulphite of lime. The soda process is the oldest and the most costly of the three chemical methods. The chemical used is a caustic soda solution which combines with the acid components of the non-cellulose parts of the wood, leaving the pure fibers. This method is superior to the other two in that it may be applied to a wider range of woods. The sulphate process is a comparatively recent modification of

the soda process; sodium sulphate is substituted for the more expensive sodium carbonate.

With wood reduced to pulp, the stage shifts to the paper mill. Before the pulp is conveyed to the paper machine it has to undergo further treatment in the course of which all other constituent materials are added. Clay, calcium and other substances are required to fill up the spaces between the individual fibers, to increase the compactness of the paper and to produce a smooth surface. Dyeing and sizing also must be completed before the pulp is placed on the paper machine.

The task of the paper machine is to combine the uniform, separated fibers and by a process of horizontal felting and matting to shape them into the form of a sheet. The main part of the paper machine is a broad, endless belt of wire screen which is driven continuously forward. The wire is fine mesh with from sixty to seventy strands per inch. The pulp flows on the belt and the fibers become arranged in a horizontal deposit in the shape of a sheet. In order that the fibers may be interwoven in all directions, the wire is shaken laterally. The material traveling on the wire is much diluted, containing almost 99 percent water, and various devices serve to dehydrate the flowing pulp. From the wire the material passes in the shape of a soft paper sheet to a series of rolls, where it is pressed and dried. From this point the sheet approaches the "dryer part," consisting of huge steam heated rolls which extract most of the water, leaving from 7 to 10 percent in the finished product. In the finer grades of paper the product is subjected to further treatment, in which it receives a final polish.

The main types of paper produced by the industry are: newsprint, amounting to over 30 percent of the total world's output of paper and manufactured entirely of woodpulp composed of 80 percent groundwood, or mechanical, pulp and 20 percent sulphite pulp; book paper, produced of chemical woodpulp, occasionally with an admixture of pulp made of rags, which is used for the printing of books or magazines and mail advertising; writing paper, manufactured of sulphite woodpulp and of rag pulp; wrapping paper, made of sulphate and sulphite pulp with an occasional admixture of mechanical pulp and pulp made of other fibrous material; paper board, made of chemical pulp and waste paper and used for boxes; and several miscellaneous types of paper, such as tissue paper, building boards and the like.

The utilization of wood as raw material and the application of modern machinery to the process of paper making are the two outstanding factors which have shaped the development of the modern pulp and paper industry. Prior to the introduction of machinery paper making was a manual art. Production was carried on in small establishments and the total capital required in setting up a paper making establishment hardly exceeded \$5000. But the invention of paper making machinery signalized a transition to large scale operation involving considerable expenditure of capital. According to most estimates it costs from \$5,000,000 to \$6,000,000 to build an integrated mill with a daily capacity of 100 tons of pulp and a similar amount of paper—which is about the minimum capacity for profitable operation. This estimate does not include the cost of power, raw material, working capital and the heavy capital outlay and risks involved in the purchase and maintenance of timber areas sufficient in size and growth to assure a steady and conveniently located supply of pulpwood. The natural tendency in the paper industry therefore seems to be in the direction of concentration, particularly in the newsprint and other branches of the industry in which low cost and mass output are of primary consideration.

Of still greater significance in shaping the development in the pulp and paper industry in modern times was the supplanting of rags by wood. The industry in its early stages tended to be located in or near large population centers, which constituted the main source of supply of rags and provided an outlet for the finished product. Thus in the United States, for instance, of the total number of 63 mills in existence in 1787,

48 were concentrated in Pennsylvania, with Philadelphia as the paper center. With the development of wood as the main raw material the center of the pulp and paper industry shifted to countries and areas abundantly supplied with wood resources, particularly spruce, balsam and hemlock trees. As the operation of pulp and paper mills also requires extensive power supply, the availability of water power sites was an additional factor in the determination of the location of the industry. In Europe the industry tended to concentrate in the Scandinavian countries, in certain parts of Germany and Austria and to some extent in Russia, which looms as a potential factor in future development. On the continent of North America the industry concentrated largely in the heavily wooded northeastern region, along the Pacific and more recently in the southern states of the United States, in the eastern provinces of Canada and in Newfoundland. The close dependence of the location of the industry upon availability of abundant and easily accessible wood supply is particularly pronounced in the production of all varieties of pulp and in the manufacture of low cost types of paper, such as newsprint and wrapping paper, in which the cost of raw material is a vital factor in the price of the finished product and long distance transportation of pulpwood or pulp would be prohibitive. It is less pronounced in the manufacture of the finer grades of paper, in which skill and equipment play a more important part and manufacturing costs constitute a larger item in the price of the finished product. This circumstance explains the fact that England and France, although they lack wood resources, figure prom-

inently in the manufacture of certain types of high grade paper; they supplement their scanty domestic sources of wood by importing raw material either as pulpwood or in its semimanufactured stage as woodpulp.

Because of its abundant forest resources, accessible power sites, growing population and availability of investment funds the North American continent leads in the output of pulp and paper, producing over 60 percent of the total world's output. The United States alone claims approximately 47 percent of the world's productive capacity. The relative importance of the various kinds of paper produced in the United States in 1929 was as follows: paper boards constituted 26 percent of the total value of the output of the industry, book paper 19, wrapping paper 17, writing and cover paper 13, newsprint 9, the remainder being distributed among other types of paper. The relatively small share of newsprint in the total output is due largely to the exhaustion of easily accessible supplies of pulpwood in the United States and reflects the general tendency among American producers to shift from the production of low priced products to the manufacture of higher grades, where the cost of raw material is not the primary consideration. In Canada the pulp and paper industry has experienced a phenomenal growth in the last two decades, most of the increase occurring in the production of newsprint, in which Canada outstrips the United States, producing over one third of the total world's newsprint and exporting in 1931 over 61 percent of the world's total export of that commodity. The bulk of newsprint exports from Canada is absorbed by the United States. While the rapid

growth of the newsprint industry in Canada in the last two decades may undoubtedly be credited to the vast timber resources and water power facilities within its borders, the policy of the provincial authorities of restricting the export of pulpwood from crownlands, which comprise about 80 percent of the total wooded area of the dominion, and the withdrawal of the United States' tariff on the importation of newsprint in 1913 helped to some extent to accelerate the rate at which the center of newsprint production shifted from the northeastern states of the United States to the eastern provinces of Canada. The movement to extend the restrictions to cover the exportation of pulpwood from private lands by an embargo of the dominion government, which gained momentum in the 1920's, failed partly because of the opposition of the pulpwood exporters and partly because of fear of reprisals on the part of the United States and competition from other sources of supply.

The speed with which the newsprint industry shifted to new areas in its search for more abundant supplies of raw material led to a duplication and overextension of production facilities and inevitably to the financial breakdown of the largest producers. It is estimated that the present productive capacity is amply sufficient to take care of consumption, even according to the most optimistic forecasts, for as distant a date as 1940. Meanwhile the entire industry is in a demoralized condition, burdened with high overhead cost and an inelastic structure of supply and facing a protracted period of financial difficulties. A similar situation prevails in the wrapping paper division of the industry; here the substitution of the sulphite method of pulp making by

the cheaper sulphate pulp has brought about the migration of parts of the industry to the south, where cheap labor and abundant supplies of wood easily subjected to the sulphate treatment make possible production at a lower cost than in the north. The result has been a considerable duplication of plants, severe competition and mounting losses. A group of paper companies representing 35 percent of the productive capacity of the industry reported a loss of 19 percent of their total working capital in 1932. The financial vulnerability of the paper companies is further increased by the heavy bonded indebtedness, which renders the capital structure too rigid and burdens the industry with fixed charges difficult to maintain in years of business decline; the result is that some of the largest producing companies, particularly in Canada, were in receivership in 1933.

The struggle for markets led to the development of monopolistic practises, which were the subject of investigation by the Federal Trade Commission in 1929. The inquiry failed to disclose monopolistic combination but revealed that the International Paper and Power Company, one of the largest producers, had attempted to secure control of newspapers and publications through purchase of their securities in order to assure a steady outlet for its product. The company has since divested itself of such securities. There is also the reverse process, whereby newspapers acquire control of paper companies in order to be assured of a supply of paper at lower costs made possible by capacity operation. In the search for new sources of revenue many paper companies enlarged their facilities for power production and entered the field of public utilities, as is evidenced in the case of the International Paper and Power Company, whose report for 1929 reveals that more than half of the total assets, more than one third of total sales and two thirds of the net earnings were accounted for by the electric power plants and revenues derived therefrom.

With the exception of the paper board division, in which the 7 largest of several hundred producers control less than 25 percent of the industry, and possibly of the low grade book paper division, in which 40 manufacturers control less than half of the total productive capacity, the pulp and paper industry in the United States shows considerable concentration. In the wrapping paper division the 10 largest producers control over 37 percent of the total productive capacity; in the field of high grade book paper

fewer than 10 companies control more than half of the total capacity, while the 3 largest producers of newsprint in the United States and the 3 largest in Canada produce close to 50 percent of the output of that commodity in each country. As distinct from integration and concentration fostered by the economic character of the industry, there is hardly a branch in the paper industry which has not at one time or another attempted to effect combination of producers for the purpose of exerting monopolistic control over prices and output, but except for brief periods none of the attempts have been successful.

Outside of the North American continent Germany leads the list of paper producers with a diversified, integrated and thoroughly cartelized paper industry, which, although forced to import some of its raw material, exports its finished product to the extent of from one fifth to one fourth of the total paper output. In Great Britain the paper industry was for a long time favored by a plentiful supply of cotton and linen rags, by-products of the textile industry. This advantage, however, disappeared with the emergence of wood as the main raw material. In the absence of domestic forest resources the industry depends almost entirely upon importation of pulpwood and pulp from the Scandinavian countries and Russia and of large amounts of esparto from Algiers, Tunis and Spain. In spite of this reliance upon foreign supplies of raw material Great Britain, next to Germany, is the second largest producer of paper in Europe and figures prominently in the export of the finer grades of paper. The advent of wood proved a considerable handicap also to France, which at the beginning of the nineteenth century was one of the leading paper exporters of the world but now does not produce enough to cover the domestic requirements, although it still retains an important position in the production and exportation of certain special types of paper. The Scandinavian countries and Finland developed a pulp and paper industry catering primarily to the foreign market: Sweden, one of the largest producers of pulp outside of North America, Norway and Finland export over half their production of pulp and over three fourths of their paper output, amounting to 25 percent of the total paper export trade. Finland figures also as a large exporter of pulpwood. As in Canada, attempts were made by Finnish manufacturers to restrict or prohibit the exportation of raw material so as to stimulate the domestic pulp and paper industry, but the opposition of the owners

of forests and exporters of pulpwood and the threat of the enormous competitive potentialities of Soviet Russia worked counter to the adoption of a restrictive policy. The Soviet Union has all the elements necessary to large expansion of its paper making facilities, but in 1933 although it exported pulpwood, production of paper was hardly sufficient to satisfy domestic requirements.

Of the oriental countries Japan developed a modern paper industry based on fairly abundant supply of domestic pulpwood and on the forest reserves in Sakhalin. In addition a large part of the domestic demand for paper is satisfied by a native paper product produced by hand from specially cultivated plants. In China the production of paper is still carried on in from 2 to 3000 small establishments, which in the main follow the methods of centuries ago. While the Latin American countries constitute a large market for European and North American products, some of the countries of South America are definitely becoming independent of supplies from abroad. Argentina, handicapped by the lack of forest resources, is attempting to perfect the utilization of its output of straw, the by-product of its vast grain crops; and Brazil, whose paper output already supplies from two thirds to three fourths of the domestic paper needs, is searching for new ways to utilize a wider range of its tropical trees, which because of their rapid rate of reproduction would provide an almost inexhaustible source of raw material for paper manufacture.

The location of the pulp and paper industry in areas removed from large industrial centers and the high degree of concentration of the more important branches of the industry have restricted considerably the possibilities of trade union organization. While there are several pulp and paper trade unions in the United States and in Canada, they comprise only a small portion of the total number of people employed in the industry. The recognition of the principle of collective bargaining inserted in the code of the paper industry under the provisions of the National Industrial Recovery Act of 1933 may strengthen the trade union organization in the United States. In countries of Europe with longer and stronger tradition of trade unionism the proportion of organized pulp and paper workers is correspondingly higher than in North America. The number of wage earners employed in the industry in the United States in 1929 was 103,320 and the number of office workers, 11,744; for Canada the respective figures are 29,846 and 3738. The average annual

pay per wage earner amounted in Canada to over \$11.00 in 1931 with an average working week of 48 hours. In Germany the average annual wage was over 2500 marks in 1929. In the United States the code has divided the country into three zones: the northern, the central and the southern, fixing the hourly rate at 38 cents, 35 cents and 30 cents respectively and limiting the work week, with some exceptions, to 40 hours. These wage rates constitute in all cases slight increases over those prevailing prior to the conclusion of the code agreement. As in all highly mechanized industries, the volume of employment is affected by technological improvements. According to official German estimates the productive capacity of paper making machines per 24 hours has increased from 88,000 pounds of paper to from 260,000 to 308,000 pounds of paper of almost double width; while the productive capacity of a grinding machine has increased almost 100 percent in the same period. Consequently in the last two decades the number of workers required in the production of 2200 pounds of newsprint has been reduced from 7 to 2 and less. These estimates are borne out by the fact that in Canada an increase of over 300 percent in the combined output of pulp and paper between 1917 and 1929 was accompanied by an increase of somewhat less than 50 percent in the total number of employees. Because of the complexity of paper making machinery with its many rotating parts and squeeze rolls the paper industry shows a high rate of accidents as well as of permanent disabilities.

Apart from the problem of overproduction, which can be rectified in time, the most important problem facing the industry is that of assuring a steady supply of pulpwood. While the consumption of paper is not likely to continue to increase as rapidly as in the last decades, a further growth of population, the penetration of the printed word into many new countries with hitherto illiterate populations and the widening range of industrial uses to which pulp and paper are being adapted point to a further increase in the pulpwood requirements of the industry. It is also generally agreed that for a long time to come wood is likely to remain the chief raw material in the manufacture of paper. The conservation of pulpwood resources therefore is of prime importance to the continued operation of the industry. According to one authoritative source which estimates that the maximum available net yield of pulpwood is sufficient to sustain an annual production of 13,000,000 tons of pulp

the industry is already making serious inroads into forest reserves. This estimate, however, is based solely on the supply of coniferous trees and overlooks technological improvements tending to widen the range of trees which may be converted into pulp on a commercial basis. Paper is already being manufactured from pulp derived from eucalyptus, bamboo and related species. A shortage of pulpwood will promptly be reflected in a higher price for the raw material and will encourage the cultivation of pulpwood trees on very short rotation; in New Zealand and other countries thousands of acres of fast growing species have already been planted. Moreover the large capital involved in the pulp and paper industry and its dependence upon a sustained supply of wood from the original timber area encourage the owners of the industry to adopt a crop rather than a mining basis in the exploitation of pulpwood.

PULSZKY, ÁGOST (1846-1901), Hungarian legal philosopher and statesman. The son of Ferencz Pulszky, revolutionary emissary of La-

jos Kossuth, Pulszky studied in London and Turin, was professor of law at the University of Budapest from 1875 to 1894, liberal member of the Chamber of Deputies from 1871 to 1901 and secretary in the Ministry of Education from 1895 to 1896. The west European atmosphere in which he passed his youth was not without effect upon his scientific work, the importance of which lies in the synthesis of the legal philosophy of the historical school and sociological jurisprudence. As a disciple of Comte and Herbert Spencer, Pulszky was a firm adherent of the theory of evolution. He conceived a succession of societies, each dominated by an "ideal" derived from its most vital interest. He found the basis of law, which is always in accord with the level of technological development, in the organization of the resources of human activity. His philosophy of law reconciles the moral freedom of Kant with a jurisprudence which is subject to natural laws. Pulszky's chief service remains his pioneering work in laying the foundations of sociology in Hungary and in establishing in 1900 the sociological society which united the young intellectual forces of the pre-war period in the cause of the unbiased study of the social problem. Pulszky's scientific activity was not in entire harmony with his unreserved support of the pseudo-liberal domination of the feudal classes. Nevertheless, the enduring content of his achievements was his influence as teacher and scholar upon young Hungary, which drew from his range of ideas a knowledge of western cultural aspirations. Even though Pulszky, as empiricist and eclectic, was no radical personality, by his doctrine of the limitless possibilities of social evolution he showed several generations the way to a practical program of life.

PUNISHMENT. The word punishment (French *peine*, Latin *poena*, Greek *poine*) derives from the Greek root *pu*, meaning to cleanse. In Attic prose *poine*, like the Low German *bröke* (*Brüche*), signified a fine. Thus an earlier stage in the development of punishment is preserved as a linguistic fossil. The word *Strafe*, in the sense of a rebuke or chastening, first appears in German juristic texts of the fourteenth century. While the coercive element in the Greek *poine* arises from religious conceptions—*poine* overtakes the evildoer as a spirit of revenge, sometimes at the hands of others, sometimes through the dispensation of fate, generally through his own misdeeds—punishment presupposes regulated state intervention.

Since punishment serves human ends, is meted out by men and is applied to them, it is primarily a psychological problem. In its first empirical as well as in later rational forms punishment is an imitation of processes observed by man in nature. All living matter avoids whatever is harmful. Hence man constructs an artificial danger to confront a being endowed with organs as sensitive to danger as those of man himself. It might, as a result, be generally expected that man would pause between the intention and the realization of a socially harmful action.

Theoretically punishment must invariably be effective, always restraining man from a projected punishable action, for only thus can this artificially created danger exercise regularly its full deterrent effect. This effect depends upon the fulfilment of two conditions. First, the threatened damage must affect human instincts as a pain stimulus. Where, however, man's instincts of self-preservation are weakened, senile or perverted, they will seek rather than avoid pain stimulus. Secondly, the artificial threat to existence inherent in the punishment must surpass any prospective gain, in the widest sense of the word, if it is to act as a deterrent. The legislator here proceeds from the concept of an average, which is not often to be found in real life. It is always possible that an expected gain will appear greater or more certain than the prospective punishment, especially since the danger threatened by a state power is no natural phenomenon with automatic incidence but one which can be effected only through a lengthy

process of police and judicial investigation. The large number of attempted and successful suicides and a whole series of self-destructive perversions of the instincts show that in modern civilization, perhaps contrary to the situation prevalent in primitive society, the instinct of self-preservation is not sufficiently stable and unchanging to make punishment a guaranteed part of the mechanism of social compulsion. Furthermore certain physiological conditions, such as puberty, and the desire for adventure characteristic of many chronically infantile natures can convert danger from a deterrent into an incitement. Finally, the polarity of slight danger and great gain can have undesired effects. Even uncertainty of punishment connected with certainty of the desired gain or the remoteness in time of the punishment linked with the immediacy of the fruits of crime may sometimes introduce additional complications into the psychological problems involved in punishment.

The administration of punishment, however, is no simple give and take between punisher and punished: there is a sociology as well as a psychology of punishment. Every act of punishment also reverberates upon the general population. Since an exact examination of the secondary impact of punishment is not feasible, this field has become a refuge for unscientific claims. Endeavors are made to attribute to methods of punishment whose ineffectiveness or harmfulness, as far as the offender is concerned, is transparent at least some effectiveness in deterring others. It is of course true that the prospect of punishment serves to deter in situations where no reliable moral impulse has yet developed, especially where the prospective victim is a collective entity, such as the state as tax collector or an insurance company, whose suffering is not regarded in the same light as that of a living being. It is true too that there are people whose state of moral indecision is crystallized in the direction of lawful action by the pressure of threatened punishment. But in general the effect of deterrence has been overestimated. For example, although primitive peoples believed in the avenging intervention of an omniscient and omnipotent divinity, crime was not thereby dispelled from the world. Conversely, there is a tendency to underestimate the effect of state punitive methods on the popular cultural standard. When punishing an offender the state, the most imposing and powerful model for moral action, instils in the masses suggestions of behavior. Its punitive practises can educate or

poison the watching, experiencing, acting public.

The genesis of punishment is to be sought in many human institutions. It appeared in the family with the increasing collapse of the matriarchate and the transfer of family leadership under the patriarchate to the physically stronger male, who exercised disciplinary power over his wife, children and slaves. The right to punish thus became attached to the *patria potestas*. Outside of the family group the chief's discipline in war was also a basis of punishment. Under martial conditions quick terrifying punishments requiring little reflection, consultation or expenditure of force were universally adopted. The tension of war itself tended to encourage hasty resort to weapons.

In outlawry (Roman *proscriptio*, German *Friedloslegung*) a diluted form of lynch law may quite justifiably be discerned. That there is involved here a rationalized substitution for an outburst of passion may be concluded from the remains of primitive destruction of domiciles, a process known in German law as *Wüstung*. When the massacre of the offender gave way to his banishment, the razing of his property remained an outlet for emotional tension. Attic ideas of pollution may be taken as evidence that religious notions played a role in outlawry. Originally outlawry meant death, but with the growth of mutual relations among men banishment was substituted. In Greek the same word meant banishment and place of refuge.

Another root of punishment lies in the blood feud, which still prevails in remote corners of the world. Blood vengeance is a simple psychological reaction antecedent to any utilitarian considerations. Every man harbors despotic impulses, the urge to power. The strongest sense of power is conveyed by the destruction of an opponent, while at the same time a sense of security is gained. To strike out is not only to win release from fear; the emotional accompaniment of retaliation and destruction is gratifying in the highest degree. If it is realized that under primitive conditions struggle accompanies the securing of all property (means of subsistence, women), it will be understood that the feeling of struggle can easily acquire a value of its own. It must not be forgotten, however, that the blood feud was at the same time a form of the death cult serving to appease departed spirits. The desuetude of the blood feud came about in various ways. Its liquidation through composition was perhaps facilitated by the ideas related to the cult of death. The deceased could be pro-

pitiated by gifts which enriched his family and benefited him by virtue of their sacrificial nature. The spirit of the slain was blessed with a vision of the material well being of the family group to whose fate he was linked.

Specific forms of punishment have been extremely diverse. They exhibit a jumble of purposes: vengeance, deterrence, expiation and, finally, reformation. The death penalty preceded all other punishments. Suppressed from time to time, it still persists. It is possible to grasp the tremendous tenacity of the death penalty in the emotional life of human beings as well as its importance in state practise only if two considerations are constantly kept in mind. In the first place, there are close affinities between the death penalty and deeply rooted sacrificial conceptions. Human sacrifice was an inexorable exaction to avert the anger of divinity. In the second place, for the religious man earthly existence was but a preparation for the kingdom of heaven. To take from him an existence which is but a provisional and introductory stage and, after and through the expiation of his crime, to give him a much prized existence in the hereafter were something quite different from the final obliteration which terrifies the unbeliever. To the mind of the unquestioning believer errors of earthly justice can be remedied with relative ease; in the light of such sentiments the argument as to the irreparability of a judicial blunder loses all weight, for compensation can be made without difficulty in another life. Yet modern skepticism has not led to the abrogation of the death penalty, which has been undermined rather by the gradual realization of its complete inefficacy.

The decline of corporal punishment is perhaps even more striking than that of the death penalty. Mutilating punishments have either been almost entirely abandoned or become disguised as "measures of security." But this development has not been a consequence of theoretical considerations; it is attributable, as in the case of the death penalty, to the fact that they have had noticeably bad results. The death penalty has at least the virtues of its pronounced shortcomings: the certainty of security is absolute. The victim of the lash, however, returns to society embittered by his experience. On the other hand, the fact that flogging releases a particular affective tension in the punisher causes a recurrent demand for it by a certain type of person at particular times. Because of the intimate connection between sadistic and maso-

chistic impulses resort to the lash is particularly irrational in cases of brutal crime.

Imprisonment is the chief modern penalty. Known only in limited forms in antiquity and the Middle Ages, it was introduced toward the end of the sixteenth century as a punishment for the increasing number of minor crimes which it was impossible and undesirable to punish with death. The modern prison is often not much better than the seventeenth century combination of poorhouse, jail and madhouse. Imprisonment has come to be recognized as a cruel and demoralizing punishment. Yet curiously enough its extension was bound up with the Enlightenment, whose great protagonists saw in it an opportunity to end the excesses and brutalities of the older forms of punishment. Moreover it was admirably suited to the exact measurement of penalties in relation to the gravity of the particular crime.

Nevertheless, imprisonment first made possible the study of the criminal, who had previously been subject to observation only in the fleeting period between his crime and his execution. In a sense therefore it represents the foundation of modern penology. The deprivation of freedom has the advantage of encompassing the end of social security to a certain extent without visibly destroying the criminal. It is true that the growing power of judges to impose short or indeterminate sentences and to admit offenders to probation has considerably weakened imprisonment as a measure of security. Furthermore the unavoidable agglomeration of criminal individuals in a jail complicates the pedagogical problem. But the question of how to avoid the execution of sentences of imprisonment has become as significant as the problem of how to secure, in cases of confirmed criminality, a measure of social protection in long term imprisonment without uselessly increasing the pain of confinement. The fine would offer an alternative to imprisonment for minor offenses but for the fact that many offenders are unable to pay, in which case the fine is commuted to imprisonment. A more rational substitute would be the conversion of the sum of the fine into hours of labor, an idea, however, which must seem utopian in an epoch of mass unemployment.

Some of the oldest forms of punishment still survive to compete with imprisonment. Deportation has been employed by European nations for the past two thousand years. In the form of penal transportation it has been used to settle

new lands. When the transportation has been to penal colonies, the punishment has been tantamount to imprisonment at a distance. Here the desire for social security has dominated. Removal to a deathly climate has often meant the early end of the offender. There have never been applied in deportation scientific notions as to the utilization of certain stimulating or soothing climatic factors in the treatment of particular criminal tendencies.

Punishment by disgrace is declining rapidly. Some forms of it corresponded only to particular complexes of ideas, such as the loss of burial rights and the obliteration of memory in late Roman criminal law. Other punishments by disgrace, such as the stocks and the pillory, depend for their effect on the compactness of a village or small community. The metropolis has destroyed those intimate bonds which were the basis of numerous mediaeval punishments by disgrace. Some modern analogies, such as the total or partial loss of civil rights, are in reality accessory property punishments; others, such as the prohibition of residence in a particular community, contribute to the complete and lasting deracination of the offender. The formal publication of penal judgments has been suggested by some penologists as a punishment by disgrace. It must not be forgotten, however, that mere subjection to punishment acts as a disgrace.

The growth of scientific criminology since the Enlightenment has caused a profound reorientation with regard to the function of punishment; not only the protection of society but the reformation of the offender have been recognized as its objectives. It is justified by many as a measure of social defense rather than upon the basis of moral responsibility.

Yet many obstacles stand in the way of a truly scientific technique and psychology of punishment. Rational treatment is conditioned by the long history of criminal punishment. This history began with magical and religious conceptions, and only gradually did punishment rise to the point where appropriateness was a consideration. The fossils of punishment remain; in some periods ancient superstitious conceptions break through the surface to reappear suddenly in mass behavior under the mask of some pseudo-rational justification.

Another vital difficulty lies in the fact that criminals excite the emotional reactions of the victim or the fearful. As soon as such tensions exist, there is a relapse to summary and blind

defensive reflexes. The resultant emphasis upon retaliation, terrorization, defense of authority, complicate or even prevent any causal analysis of the real problem. There follows a retrogression to those subjective methods which humanity has tested over thousands of years and finally abandoned as ineffective; the punisher readopts them as substitutes for measures which are in reality less satisfying at the moment.

If punishment is to be regarded simply as a problem in the effective treatment of human beings, the question arises as to why there should be punishment at all. The answer is offered that punishment is a mechanism of social selectivity. Men who have characteristics more or less unsuited to social life are subjected to a selective process by means of certain state mechanisms. This process begins with very light, easily reversible selective instruments, such as fines or mild imprisonment, and culminates in the most harsh eliminative methods. Punishment is an artificial hardening of life through means ranging from the cautious exploration of a personality to the mechanical effacement of the individual. Earlier selective methods, generally crude and undifferentiated, have been replaced by a system of graduated effects. The most extreme application of selectivity, total elimination, may be achieved not only by capital punishment but by death in prison, by the suicide of the criminal or by mortality in free life, which may often be traced to the economic decline resulting from the stigma of a prison sentence. The ordinary purposes of punishment—reformation, cure, deterrence, security—may easily be regarded as successive steps in the application of the selective process.

A powerful factor in preventing the scientific application of punishment is the fear that civil liberty will be imperiled if the treatment of the offender is entrusted to the scientific penologist. The reform of the penal law began after the French Revolution with the abolition of arbitrary punishments. The maxim *nulla poena sine lege* was established as the fundamental premise of the criminal law. Barriers were erected against the discretion of the judge. At most penalties must vary between fixed minima and maxima. Today the offense still primarily determines the type of punitive treatment, although a more discriminating viewpoint is applied with respect to special categories of criminals, such as juveniles, the demented and recidivists, under what are known legally as "extenuating" and "aggravating" circumstances. In so far as punishment

is a means of rendering the socially dangerous harmless in the broadest sense of the term, the physical and psychic condition of the subject must be known. Furthermore it is important to have a knowledge of the environmental influences which have surrounded the offender and which, in conjunction with particular predispositions, have induced his criminal reaction. Only thus is it possible to give reality to the individualization of punishment.

The science of punishment—which as yet does not exist—will have to be based on a science of criminal causality, whose construction is proceeding gradually. The causal relations which are studied and disclosed will, on the one hand, serve to construct a prophylactic system and, on the other, to supply the basis for a punitive science. Presumably the state arsenal for the struggle against crime will be enriched by a number of methods not at present included under the term punishment. Resocialization will be achieved by a medical approach involving organotherapy and other techniques, by the most diverse corrective forms and security measures. A substitute for deterrence may be found in the successful investigatory work of a scientifically improved criminal police. The widened discretion of the criminal judge will be balanced by a scientific and humane cultivation of such discretion. The correction of erroneous diagnoses and misapplied therapy must be the task of a superior tribunal dealing with questions both of fact and of law. Finally, mass education toward an understanding of purposive punishment is essential; and if such powerful modern instruments for molding opinion as the press and the radio are utilized, it is not impossible. Such an effort at education and training should in time strike at the very roots of criminality.
